Genetics

The Genetics Graduate Program is a University wide program. Current faculty are in 14 Departments and four Colleges. The Genetics Program provides a well-balanced program of graduate course work and research training. The faculty conducts basic research in all areas of genetics, including molecular, cellular and developmental genetics; behavioral genetics, biomedical genetics, evolutionary, population and quantitative genetics, statistical genetics, and bioinformatics. Faculty research utilizes both traditional model organisms (fruit flies, mice and Arabidopsis) and non-traditional systems (cats, cockroaches, dairy cattle, dogs, maize, pigs, pine trees and more). Interdisciplinary research is encouraged.

Admission Requirements

Applicants may come from a number of undergraduate programs that include biological, agricultural, physical and mathematical science training. All applications are screened by an admissions committee, and the best qualified applicants will be accepted up to the number of spaces that are available for new students. The program uses the requirements set by the Graduate School to evaluate applications (GRE, unofficial transcripts from each previously attended college or university, three letters of recommendation, personal statement, and proof of English proficiency for non-US citizens). Competitive applicants will include research and other relevant experience as well as their interest and fit for the program in their personal statement.

Master's Degree Requirements

The M.S. degree requires a minimum of 30 credit hours, of which 14 hours are core course requirements, three hours are additional elective graduate courses with substantial genetics content, and three hours are other elective graduate courses. M.S. students majoring in Genetics are required to complete dissertation research with three credit hours of Master's Supervised Research, six credits of Master's Thesis Research, one credit of Master’s Thesis Prep, and one credit of Master’s Examination. M.S. students are also required to teach one semester of undergraduate courses and may enroll in three credits of Master’s Supervised Teaching. 12 hours of required courses are required for Genetics minors. The Master's of Genetics requires a minimum of 31 credit hours, of which 17 hours are core course requirements, six hours are additional elective genetics courses and eight hours are elective graduate courses.

Doctoral Degree Requirements

A total of 18 hours of seven core courses and 12 hours of elective graduate courses, nine of which have substantial genetics content, is required of all majors. Ph.D. students majoring in Genetics are required to complete dissertation research with three credit hours of Doctoral Supervised Research and a combination of Doctoral Dissertation Research, Doctoral Preliminary Examination, and Doctoral Dissertation Prep to total 39 hours. Students are also required to and teach two semesters of undergraduate courses and may enroll in six credits of Doctoral Supervised Teaching to be used toward the remaining 39 credit hours. 12 hours of required courses are required for Genetics minors.

Student Financial Support

Genetics graduate students are supported on Research and Teaching Assistantships (RAs and TAs). Specific pay varies depending on the assistantship, and students are paid bi-weekly. More information will be provided at the time of acceptance into the program.

Other Relevant Information

All M. S. and Ph. D. students rotate through three laboratories during their first semester. At the end of the semester, they choose a laboratory for their research activities consistent with their interests and available research projects. Provisions are available for a co-major and collaborative research in more than one laboratory.

Degrees

- Genetics (MR) (p. 898)
- Genetics (MS) (p. 901)
- Genetics (PhD) (p. 904)
- Genetics (Minor) (p. 906)

Operations Research

Operations Research (OR) is a graduate program of an interdisciplinary nature, governed by an administrative board and the program committee, and administered through the office of the program director.

Admission Requirements

Applications are accepted from undergraduate majors in all technical disciplines. Applicants should have had at least four math courses beyond calculus (e.g., courses in differential equations, linear algebra, probability and statistics, and mathematical analysis). Knowledge of a computer programming language is recommended, but not required. GRE scores are required of all new applicants.

Master's Degree Requirements

The Master of Operations Research degree is a terminal graduate degree for students who seek careers as OR practitioners in either the private or public sector. The M.S. degree is designed to prepare students for careers in research and development.

Doctoral Degree Requirements

The Ph.D. degree is intended for students to be research scientists in industry or teachers and researchers in academia. This degree requires a minimum of 72 hours of graduate credit beyond the bachelor's degree, including coursework in major and minor areas of concentration together with credit for doctoral research and dissertation preparation. A departmental written qualifying examination is required. For students who have completed a Master's degree from another institution prior to joining the Ph.D. program, a minimum of 54 hours of additional graduate credit are required.

Student Financial Support

Both teaching and research assistantships are available to qualified applicants. Award priority is given to Ph.D. then M.S. applicants. Outstanding students who are U.S. citizens and who shall be enrolled in the NC State Graduate School for the first time are eligible for the Engineering Dean's Graduate Fellowship Program.

Degrees

Interdisciplinary Minors

Minors

- Bioinformatics (Minor) (http://catalog.ncsu.edu/graduate/interdisciplinary/bioinformatics/bioinformatics-minor/)
- Biotechnology (Minor) (p. 917)
- Ecology (Minor) (p. 918)
- Environmental Remote Sensing & Image Analysis (Minor) (p. 918)
- Food Safety (Minor) (p. 919)
- Functional Genomics (Minor) (p. 894)
- Genetics (Minor) (p. 906)
- Geographic Information Systems (Minor) (p. 920)
- Interdisciplinary (Minor) (p. 921)
- Operations Research (Minor) (p. 916)
- Teamwork in Interdisciplinary Biomedical Research (Minor) (p. 921)
- Water Resources (Minor) (p. 922)
- Women's, Gender, and Sexuality Studies (Minor) (p. 923)

Biotechnology (Minor)

M.S. and Ph.D. minors in biotechnology are available to students who successfully complete at least eight credit hours in selected laboratory core courses and conduct their graduate thesis research in an area of biotechnology. At least one member of the student's thesis committee must be a member of the Biotechnology faculty. Research in biotechnology is focused in three main areas: recombinant DNA technology, bioprocessing/bioanalytical techniques, and in vitro culture techniques. The multidisciplinary nature of biotechnology means that a wide range of research topics and techniques are applicable.

Students wishing to pursue graduate studies leading to either a M.S. or Ph.D. minor in biotechnology must enroll and conduct their research in a participating department. For specific information about enrollment requirements, contact the participating departments of interest to you directly.

Plan Requirements

Code	Title	Hours	Counts towards
Required Course		**4**	
BIT 510	Core Technologies in Molecular and Cellular Biology [1]		
Elective Courses		**4**	
Select two of the following:			
BIT 564	Protein Purification		
BIT 565	Real-time PCR Techniques		
BIT 566	Animal Cell Culture Techniques		
BIT 567	PCR and DNA Fingerprinting		
BIT 568	Genome Mapping		
BIT 571	RNA Interference and Model Organisms		
BIT 573	Protein Interactions		
BIT 574	Plant Genetic Engineering		
BIT 577	Metagenomics		
BIT 578	Mapping the Brain		
BIT 579	High-Throughput Discovery		
BIT 580	Yeast Metabolic Engineering		
BIT 581	Plant Transformation		

BIT 815	Advanced Special Topics (Professional Development)	
BIT 815	Advanced Special Topics (Research Ethics)	
BIT 815	Advanced Special Topics (Capstone Biotechnology)	
Additional courses will be determined in conjunction with the academic committee		
Total Hours		**8**

[1] Students may place out of BIT 510 if they have had either a similar course as an undergraduate or if they have substantial practical experience and conceptual knowledge of the material covered. The approval to place out of BIT 510 is made by the Academic Advisor of the Biotechnology Program, in conjunction with consultation with the student's thesis advisor. If placing out of BIT 510, the student will instead take one additional 2-credit BIT lab course for a total of three (and will complete the minor requirements with 6 credits of coursework rather than 8).

Ecology (Minor)

Plan Requirements

Code	Title	Hours	Counts towards
Required Courses		**4**	
AEC 502	Introduction to Biological Research		
AEC 503	Foundations of Ecology		
Elective Courses		**5-8**	
Select five credit hours (MS) or eight credit hours (PhD) in conjunction with the academic committee [1]			
Total Hours		**9-12**	

[1] Courses must be outside the student's major discipline

Additional Requirements

- Must maintain an average of 3.0 (B) for courses taken to complete the Ecology minor.
- A graduate faculty member who conducts research in Ecology must serve on the students graduate advisory committee. This committee member should be chosen in consultation with the Ecology minor DGP.*
- The student must obtain approval from the Ecology minor DGP to enroll in the minor.
- If the student is doing a non-thesis degree program, the student must obtain approval from the Ecology minor DGP for their minor program of study (Graduate Student Plan of Work).

Environmental Remote Sensing & Image Analysis (Minor)

This minor provides graduate students the opportunity to develop a recognized academic credential in remote sensing and image analysis in conjunction with their major program of graduate study. Twelve credit hours, 6 credit hours of required courses and 6 credit hours of elective courses, is required to complete the minor.

Other Requirements

A GIST graduate faculty member must be on the student’s graduate committee. A list of currently approved faculty members can be provided to students upon request. If no graduate committee is required by the student’s program, the student must obtain approval of his or her minor program. Students enrolled in Option B Masters programs are not eligible to declare a minor. Certificate coursework and Minor coursework must be completely independent.

Plan Requirements

Code	Title	Hours	Counts towards
Core Courses		**6**	
GIS 512	Introduction to Environmental Remote Sensing		
or GIS 712	Environmental Earth Observation and Remote Sensing		
ST 533	Applied Spatial Statistics		
or ECE 514	Random Processes		
Elective Courses		**6**	
Select two courses of the following:[1]			
GIS 512	Introduction to Environmental Remote Sensing		
GIS 520	Spatial Problem Solving		
GIS 530	Spatial Data Foundations		
GIS 595	Special Topics in Geospatial Information Science		
GIS 584	Mapping and Analysis Using UAS		
GIS 712	Environmental Earth Observation and Remote Sensing		
SSC 545	Remote Sensing Applications in Soil Science and Agriculture		
BAE 536	GIS Applications in Precision Agriculture		
MEA 511	Introduction to Meteorological Remote Sensing		
ST 533	Applied Spatial Statistics		
ECE 751	Detection and Estimation Theory		
ECE 759	Pattern Recognition and Machine Learning Methods		
Total Hours		**12**	

[1] Additional courses may be decided in conjunction with the academic committee.

FSA 580	Professional Development and Ethics in Food Safety		
Total Hours		**0**	

Geographic Information Systems (Minor)

The Geographic Information Systems (GIS) minor provides an academic credential for students who want to develop some GIS application skills while pursuing a graduate degree in another discipline. It is designed for students who wish to master the basics of GIS analysis and to develop more advanced skills in a particular application area.

Other Requirements: A GIST graduate faculty member must be on the student's graduate committee. A list of currently approved faculty members can be provided to students upon request. If no graduate committee is required by the student's program, the student must obtain approval of his or her minor program. Students enrolled in Option B Masters programs are not eligible to declare a minor. Certificate coursework and Minor coursework must be completely independent.

Interdisciplinary (Minor)

Plan Requirements

The interdisciplinary minor requires two or more areas of coursework to be represented with a faculty member representing one of the areas of coursework. Students who are interested in an interdisciplinary minor should contact their Directors of Graduate Programs for more information.

Teamwork in Interdisciplinary Biomedical Research (Minor)

The objective of the proposed minor in Teamwork in Interdisciplinary Biomedical Research (TIBR) is to provide interdisciplinary team science training and professional development for future leaders in academia, government, and industry who will subsequently make groundbreaking molecular medicine discoveries, embrace and apply the concepts of rigor and reproducibility and responsible conduct of science, and participate in translating new discoveries into clinical applications for the benefit of human health.

Minor Admissions Requirements

1. They are pursuing a PhD degree and are in their 1st, 2nd, or 3rd year of graduate study.
2. Intended students are active in biomedical sciences, such as those pursuing degrees in Biomedical Engineering (BME) and Comparative Biological Sciences (CBS), among others.

Minimum Grade Requirements for the Minor Courses

A grade of S (pass/fail courses) or B (graded courses) must be achieved in each course counted towards the minor.

Plan Requirements

Code	Title	Hours	Counts towards
Required Courses		**13**	
CBS 660	Fundamentals of Comparative Molecular Medicine		
CBS 661	Principles of Collaboration and Team Science		
CBS 563	Leadership in Interdisciplinary Biomedical Sciences		
Young Scholars Program Courses *			
CBS 886	Interdisciplinary Research Team Mentoring		
Total Hours		**13**	

* Participation in Young Scholars Program (YSP) or equivalent (3 credits), taken two times, CBS 886 is suggested.

Water Resources (Minor)

The interdisciplinary, interdepartmental graduate minor in water resources is designed for students majoring in the many disciplines of natural resources, science, engineering, technology, and social sciences that are relevant to water resources. The minor exposes students to water resources courses and faculty members within and outside their major fields of study.

The graduate minor in water resources (WR) requires successful completion ("B-" or better in each individual WR course, GPA of 3.0 or better across all WR courses counted toward the minor) of at least 9 credits of WR courses chosen from the lists below. At least 3 of the 9 credits (for M.S. students) or 6 of the 9 credits (for Ph.D. students) must be from outside the student's major department. For M.S. students (not Ph.D. students), up to 3 credits at the 400-level may be included if these credits are from outside the student's major department. For students earning an M.S. before enrolling in a Ph.D. program, courses taken to satisfy a WR minor in the M.S. program can not be counted toward a WR minor in the subsequent Ph.D. program. However, WR courses taken during the M.S. program may count toward a WR minor in the subsequent Ph.D. program if the M.S. program did not include a WR minor.

Plan Requirements

- At least 3 (MS) or 6 (PhD) credit hours must be from outside major

Women's, Gender, and Sexuality Studies (Minor)

The minor provides graduate students in the humanities, social sciences and sciences with the theories and methodologies to study women and gender relations. The minor is intended to support and further students' research in their own field.

- Nine hours of graduate credit are required with a B or better in each course.
- No more than three hours of coursework may overlap between the major department coursework requirement and the Women's, Gender and Sexuality Studies minor. Students may choose from the courses listed on the website and/or a list of approved special topics courses.
- Because the Minor is an interdisciplinary one, at least one of the courses needs to be in a field different from that of the graduate program in which the student is enrolled.
- All courses must be taught by the Women's, Gender and Sexuality Studies Affiliated Faculty.
- An Affiliated Faculty member (not in the field of the degree graduate program) must sit on the master's or dissertation committee.

Plan Requirements

Code	Title	Hours	Counts towards
Required Courses			
Select nine credit hours of the following: [1]		9	
WGS/ANT 544	Cross-Cultural Perspectives on Women		
WGS/ECD 540	Gender Issues In Counseling		
WGS/HI 547	Women in America: From Contact to the Civil War		
WGS/HI 548	American Women in the Twentieth Century		
WGS/REL 573	Religion, Gender, and Reproductive Technologies		
WGS/PSY 706	Psychology of Gender		

WGS/SOC 737	Sociology Of Gender	
SOC 739	Social Psychology Of Inequality	
Total Hours		**9**

[1] Special topics courses in a variety of disciplines are offered each semester and may be taken with the approval of the Women's and Gender Studies Director.

NC State Graduate Handbook

The Graduate Handbook provides an overview of Graduate School functions and resources, as well as the rules, regulations, and procedures administered by the Graduate School.

It is the responsibility of all graduate students to know and understand their degree requirements. Students are responsible for the fulfillment of those requirements.

NC State also lists official policies, regulations and rules (PRRs) on the university's PRR website (https://policies.ncsu.edu/). Links to pertinent PRRs are found in the Graduate Handbook sections that contain PRR information.

Graduate Administration

Applications and Admissions

Graduate Degrees: Policies and Procedures

Financial Assistance

Codes of Conduct

1.1 Graduate School Responsibilities

The mission of the Graduate School is to serve as a catalyst for excellence in graduate education at NC State through:

- promoting the highest quality education for students and postdoctoral scholars, including outstanding academic experiences, opportunities to engage in cutting-edge research, and professional development that prepares students and postdoctoral scholars for success in their fields;
- advancing the diversity of graduate education at NC State and of the professoriate nationwide through recruitment, retention, and support of underrepresented minority groups;
- fostering an environment in which graduate faculty can reach their potential as teachers, researchers, and mentors to graduate students;
- encouraging research and graduate programs that address the critical issues that challenge our state, our nation, and our world;
- achieving recognition of NC State as a model for leadership and innovation in graduate education in North America.

1.2 Graduate Student Responsibilities

By accepting admission to NC State University, graduate students indicate that they are ultimately responsible for adhering to the policies and procedures that govern their education at the university. That responsibility requires that all graduate students know where to find

the rules and regulations of the Graduate School and any additional requirements of their specific programs.

Students are expected to adhere to either the requirements in place at the time they matriculate at NC State or any subsequent versions of the requirements approved during their continuous enrollment. Students must use an entire set of requirements; they may not piece together a set of requirements from various versions. If a student is readmitted, they must use the requirements in place at that time or any subsequent versions, but they cannot choose requirements from their previous enrolled status.

The Graduate Handbook defines the **minimum** requirements of the Graduate School and describes procedures that must be followed. Individual program requirements may be found in the Graduate Catalog (p. 66) and should be available through the department office or its website.

All students must also abide by standards of conduct established by NC State. The Graduate Handbook section on Codes of Conduct provides web links to Policies, Procedures, and Rules (https://policies.ncsu.edu/).

1.3 Graduate Faculty

Faculty participation in graduate education is a critical element of university life. The engagement with students as advisors and mentors plays a critical role in developing future researchers and instilling in them the qualities required for degree completion. Membership in the graduate faculty is a privilege.

A. Graduate Faculty

- All full-time tenured and tenure-earning faculty will be granted Graduate Faculty status based on a majority vote of a department's graduate faculty at the time of hire. Emeritus faculty and those on phased retirement retain their Graduate Faculty status.
- Full-time faculty in non-tenure positions (e.g., clinical, extension, practicum, research, teaching, professor of practice, and federal contractual employees, such as USDA, DOI, U.S. Forest Service) may be granted Graduate Faculty status upon a majority vote of the graduate faculty in the department/program in which they are employed.
- Graduate faculty at another university who are in a joint department/program with one at NC State are considered graduate faculty at NC State.
- If a chair of an advisory committee leaves NC State for another position, s/he may continue as chair for one more year. After that period, s/he can only co-chair with another member of the Graduate Faculty.

B. Affiliate Graduate Faculty

- All non-tenure-line faculty who are on temporary appointments or are not paid by the university and who are expected to serve on master's or doctoral advisory committees and/or teach graduate courses will be granted Affiliate Graduate Faculty status by departmental vote (see Section E). Such faculty include those who are adjunct, visiting, and interinstitutional (Duke and UNC-Chapel Hill). Faculty at other universities or others seeking Affiliate Graduate Faculty status require a majority vote of approval by the graduate faculty in the department/program they are to be affiliated with.

C. External Members and Technical Consultants

- Affiliate Graduate Faculty status is not required for the participation of external members of committees and technical consultants (see 3.2 Advisory Committees (p. 936) for definitions and credentials of these roles).

D. Responsibilities of Graduate Faculty

The responsibilities associated with membership in the Graduate Faculty include:

- teaching courses at the graduate level (i.e., courses at the 500-900 levels)
- participating as a chair, co-chair, or member of master's and doctoral advisory committees
- serving as Graduate School Representative when requested by the Graduate School

The roles associated with membership in the Graduate Affiliate Faculty include:

- teaching courses at the graduate level (i.e., courses at the 500-900 levels)
- participating as a member of advisory committees

E. Application for Graduate Faculty and Affiliate Graduate Faculty Status

- Because new tenured or tenure-track faculty become members of the graduate faculty at the time of hire, there is no separate application process for membership in the Graduate Faculty. To ensure that Graduate Faculty status is granted, the Graduate Faculty Nomination form must be submitted to the Graduate School for processing.
- Before members of the Graduate Faculty can serve in another department/program, however, their membership generally should be voted on by the Graduate Faculty in that department/program. It may be approved by the given program's DGP in consultation with the program's faculty.
- For non-tenure-line faculty seeking Affiliate Graduate Faculty status, the department head or DGP forwards the Graduate Nomination Form along with a current CV to the Graduate School. As part of that process, members of the Graduate Faculty of the appropriate department/program vote and those results must be included on the Affiliate Graduate Faculty Nomination Form.

F. Requirements to Teach Graduate Courses at NC State

The Request to Teach Graduate Courses form should be completed and submitted to the Graduate School for instructors who are not members of the Graduate Faculty. For instructors who do not have a terminal degree in the discipline in which they will be teaching, a thorough justification outlining their alternative credentials is required for approval by the Graduate School.

G. Removal of Graduate Faculty/Affiliate Graduate Faculty Members

- Members of the Graduate Faculty of a specific department or program may initiate removal of a current Graduate Faculty member

based on the failure to carry out the responsibilities (see Section D) or for other good cause. The department must vote on this recommendation and consult with the college dean, and if it is decided that a faculty member should be removed from the Graduate Faculty, the head or DGP (in the case of non-departmental programs) makes this recommendation in the form of a memo to the Dean of the Graduate School. The memo should include the vote of the members of the department's/program's Graduate Faculty. The dean of the Graduate School is then authorized to remove the person from the Graduate Faculty.

- If the member has Graduate Faculty status in more than one department/program, the status would be maintained unless all relevant entities voted to remove the member.

1.4 Directors of Graduate Programs

Appointment Process

Each department offering graduate study is required to appoint a Director of Graduate Programs (https://grad.ncsu.edu/about/people/dgp/) (DGP) from among its Graduate Faculty. The Department Head, or Dean in the case of interdisciplinary programs, submits this designation in writing to the Graduate Dean. The Director of Graduate Programs plays a critical role in overseeing graduate education at the department/program level in variety of arenas as outlined below.

Responsibilities

Communication

- Handles all correspondence between the graduate program and the Graduate School and between the Graduate School and the program;
- Transmits information from the Graduate School to students;
- Submits requests for scheduling preliminary and final oral examinations and graduation checkouts;
- Communicates with the Office of International Services (OIS) and serves as a critical academic authority for matters that may affect students' visa status.

Oversight

- Conducts the daily administration of departmental graduate programs;
- Recommends admission or denial of graduate applicants;
- Approves students' Graduate Plans of Work after approval by the student's Graduate Committee; submits plans to the Graduate School.

Interaction with Students

- Plays a lead role in recruiting graduate students;
- Conducts orientation of new graduate students;
- Serves as the program's point of contact for concerns that students may have;
- Assigns graduate students to assistantships.

Advising

- Advises students requesting admission to the graduate program;
- Serves as temporary advisor to new graduate students, providing them information and advice including but not limited to course selection and scheduling, faculty interests, procedural matters, and University resources;
- Monitors graduate students' progress and graduation credits;
- Assists new students in selecting a major advisor;
- Advises students on various aspects of program progress and completion as needed.

Fellowship Support

- Assists the Graduate School in developing fellowship proposals, including recruitment of graduate faculty to draft proposals and participate in proposed fellowship project;
- Nominates eligible students for individual fellowships and transmits their applications to the Graduate School;
- Supports the Graduate School in managing fellowship awards to the program's graduate students.

Program Development and Evaluation

- Initiates program-related proposals to the Administrative Board of the Graduate School (Admin Board), either informally through contact with Graduate Deans or formally through written proposals to be considered at Admin Board meetings; seeks approval of College Graduate Studies Committee and College Associate Dean for Academic Affairs prior to submitting to Admin Board;
- Assists the Graduate School in conducting the annual and 8-year (or shorter as required by accrediting bodies) reviews of the graduate program, by initiating the self-study process upon notification by the Graduate School.

1.5 Graduate Services Coordinators

The Graduate Services Coordinators (https://grad.ncsu.edu/about/people/gsc/) serves as the principal administrative liaisons between the student, the Graduate Program Director, the graduate program, and the Graduate School. In this capacity, the Graduate Services Coordinator:

1. Processes admissions applications, collects all supplemental documents required by individual programs, and submits the materials and recommendations to the Graduate School;
2. Prompts students to meet critical Graduate School milestones to promote retention and timely completion, including preparing Plans of Work, appointing advisory committees, adding and dropping courses, maintaining continuous registration, monitoring graduation applications, and requesting the scheduling of oral exams;
3. Assists students and Director of Graduate Programs in preparing and submitting various forms and documents that require Graduate School approval. These include, but are not limited to, requests for leaves of absence, Graduate Plans of Work, committee appointments, requests for preliminary and final oral exams, grade changes, transfer requests, and reinstatements;
4. Develops proficiency in using the Student Information System (SIS), the Graduate School Information System databases, and other information systems to facilitate all graduate-student-related correspondence with the Graduate School.

1.6 Graduate School Representatives

The Graduate School Representative has a unique role on the doctoral examination committee. The Representative protects the interests of the student, the advisory committee, and the Graduate School. The Graduate School Representative is also an “unbiased person” to whom the Dean may turn for judgment and counsel. [Recommended by the Administrative Board of the Graduate School and approved by the Dean of the Graduate School on 10/27/86.]

A. Appointment Process

If a doctoral graduate committee has no representation outside of the student’s graduate program, a Graduate School Representative is required. Co-chairs can never be considered unbiased, even if they are from outside the student’s graduate program, and would therefore never be able to substitute for the Graduate School Representative.

The Dean of the Graduate School chooses Representatives at random from the Graduate Faculty. Each member of the Graduate Faculty is expected to serve in this capacity. The Dean appoints the Graduate School Representative after the doctoral student’s Plan of Graduate Work is approved. An effort is also made to make no more than two such assignments to a faculty member at any one time. It is the responsibility of the student to schedule preliminary and final examinations that are satisfactory to the Graduate School Representative and to provide the Representative with a copy of the dissertation one week before the final oral.

B. Responsibilities

The primary responsibility of the Graduate School Representative is that of an observer. Consequently, the Representative should be invited to participate in both the preliminary and final oral examinations, but should never take a dominant role in the exams. The Representative is expected to contribute to the scholarly atmosphere of the examination. Moreover, the experiences of faculty members who serve as Graduate School Representatives should improve the overall quality of graduate education.

The Graduate School Representative also signs the official examination form and may include comments. The Representative expected to express concerns (if they exist) and encouraged to note any exceptional strengths of the examination. The Graduate School Representative should:

1. Sign the form without comment;
2. Sign the form and note any specific comments; or
3. Sign the form and note that a letter to the Graduate School Dean will follow (with copies to the committee).

The Representative may wish to comment on:

1. the appropriateness of the committee;
2. the adequacy of the Plan of Graduate Work;
3. the appropriateness of the examination questions and procedures;
4. the quality of the student’s performance; and/or
5. reservations about the dissertation.

A signature with no comments indicates that the Representative believes that the examination was properly conducted and does not take exception to the findings of the committee. The signature does not imply the Representative’s approval of the substance of the examination or dissertation. In the event the Graduate School Representative indicates any substantive reservation, the Dean of the Graduate School will investigate and decide the course of action.

Note: Serving as a Graduate School Representative is a requirement of Graduate Faculty status. Exceptions are made only on an individual basis and in cases of emergency.

1.7 Administrative Board of the Graduate School

A. Mission

The Administrative Board of the Graduate School advises the Dean of the Graduate School on all matters pertaining to graduate education at NC State.

B. Membership

Voting Members

The Administrative Board is comprised of 23 voting members. The voting members consist of elected as well as appointed members and represent all colleges, interdisciplinary graduate programs, the Faculty Senate and the Graduate Student Association (GSA). Each college is represented by two Graduate Faculty members. One representative is elected by the college’s Graduate Faculty as coordinated by the Associate Dean or college designee responsible for graduate education. The second representative is appointed by the College Dean. The interdisciplinary member is appointed by the Dean of the Graduate School. Board members representing the Faculty Senate and GSA are appointed annually by the Chair/President of those organizations.

Terms of elected members and interdisciplinary representative are three years starting on July 1, and these members may serve for two consecutive terms, although they may serve subsequent terms following a hiatus. The terms for each college’s representatives should be staggered so that both members do not exit the Board simultaneously. Although the expectation is that members will complete their entire term, if that is not possible, then a replacement may be identified by the respective college or unit to complete the remainder of the term. The Board’s Coordinator will notify university units in April of a Board member’s ending term. The unit should provide the name of the new Board member to the Administrative Board Coordinator no later than May 15.

Non-Voting Members

Non-voting members represent and provide insight from other important university offices including one representative from the Distance Education and Learning Technology Applications (DELTA), the Southeastern SACS Liaison, and Registration and Records. The Graduate School is also represented by non-voting members to provide insight about Graduate School administration and policies.

The current list of Board members and their contact information can be found at https://grad.ncsu.edu/about/people/admin-board (https://grad.ncsu.edu/about/people/admin-board/).

C. Meetings

The Administrative Board is chaired by the Dean of the Graduate School and meets biweekly during the academic year.

Agendas and minutes from previous meetings will be posted to the Graduate School website (https://grad.ncsu.edu/about/people/admin-board/minutes (https://grad.ncsu.edu/about/people/admin-board/minutes/)) at least one week prior to each meeting.

A quorum (12 voting members) must be present to hold a meeting of the Administrative Board. If a quorum is not met, the meeting and all agenda items will be postponed until the next scheduled meeting.

Given the nine-month appointments of many faculty members, board members are expected to be available from August 1 through May 15 to review action items for the academic year, but are generally not expected to review items over the summer.

1.8 Common Administrative Board Actions

A. Course Actions

The Board reviews and recommends for approval course actions for the creation, deactivation, and revision of all graduate and professional (#500-level) courses. These course proposals may be submitted at any time. However, if the desired effective term for a new course is the immediately following semester, the Administrative Board Coordinator must receive proposals by the following deadlines:

Date Due to Administrative Board Coordinator	Desired Effective Term
February 1	Summer
March 15	Fall
September 15	Spring

B. Program Actions

The Board reviews and recommends the following program actions:

- new graduate degree programs, concentrations, and certificates
- discontinuation of degree programs, concentrations, or certificates
- revision of degree program curriculum requirements
- changes to the title or in the CIP code of an existing degree program or concentration

C. Workflow

All items reviewed by the Administrative Board follow the following steps (for a more comprehensive listing of the steps see https://grad.ncsu.edu/faculty-and-staff/program-development (https://grad.ncsu.edu/faculty-and-staff/program-development/)):

1. Proposals are initiated in the program/department;
2. Upon program/department approval, the proposals are routed through the college for review by the respective Graduate Studies Committee and the college dean; interdisciplinary programs may require the approval of multiple colleges;
3. Upon college dean approval, the proposals are sent to the Administrative Board Coordinator in the Graduate School;
4. Proposals are reviewed by the Assistant Dean for Program Development;
5. Proposals are reviewed by three Administrative Board voting members;
6. Proposals are placed on the meeting agenda for review and vote by the full Board;
7. After Board recommendation and Graduate Dean approval, no additional approvals are required for curriculum revisions and concentrations. Course actions are sent to Registration & Records for implementation and program actions are sent to the Provost's office to continue through the university and, where applicable, UNC system routing processes.

Note: at any point in this process, the proposal may be sent back to the instructor, program, or department for revision.

D. Graduate Policies

Reviews, revises, and recommends for approval revisions to graduate policies contained within the Graduate Handbook.

E. Memoranda of Agreement/ Understanding

Reviews and recommends degree-related agreements, including both domestic and foreign, that pertain to the graduate academics. The routing for these memoranda is identical to that for new programs (see above).

F. Extensions to Time Limits beyond Two Years

Although the Graduate School recommends extensions to the time limits of up to two years, for extensions exceeding these limits, students accompanied by their major professor and DGP must present the rationale for a continued extension to the Administrative Board. The Board will determine whether or not a further extension should be granted.

G. Degree Conferral

Each semester recommends the conferral of graduate degrees for both master's and doctoral degrees, with the exception of the Doctor of Veterinary Medicine.

H. Posthumous Degrees

Posthumous degrees may be requested for graduate students who are close to completing their degree requirements (see 3.20 – Graduation for additional details (p. 955)).

2.1 Applications

A. Receiving the Application

All applicants to graduate programs and/or certificates must submit the online NC State University Graduate School Application Form (https://grad.ncsu.edu/apply/), including a statement of purpose and the North Carolina Residency Form (if necessary for tuition purposes). Recommenders identified by the applicant during the online application process also submit references online. An unofficial transcript from each college or university previously attended should be uploaded. The

Graduate School encourages applicants to pay all application fees by credit card.

Required Documents

Applications for degree-seeking graduate students are not complete until the Graduate School receives a non-refundable application fee and the following documents (for Certificate applications see Section x.x).

- An unofficial transcript from all colleges and universities where they have or will obtain a degree; (Note: Applicants currently attending or who have previously attended NC State are not required to provide an NC State transcript.)
- Three recommendations from people who know the prospective student's academic record and potential for graduate study;
- Online North Carolina Residency Form if claiming NC residence for tuition purposes submitted within one (1) week of application submission;
- Additional program requirements, such as official GRE or other standardized test scores, statements of purpose, portfolios or other work samples (documentation of these additional programmatic requirements can be linked to through the Fields of Graduate Instruction website); and
- Where applicable, official TOEFL or IELTS scores.All supporting documents should be uploaded to the application prior to submission, and cannot be updated after submission. Other than official transcripts, paper documents should not be mailed to the Graduate School.

Transcript Requirements

Legible, unofficial copies of transcripts should be uploaded to the application for review purposes. Upon recommendation of admission, the University requires that official transcripts that document all prior conferred/awarded degrees be on file in the student's permanent record at NC State. The transcript(s) must include a statement of any degree(s) awarded. At the time of application, some students are enrolled in a degree program and can only provide an incomplete official transcript at the time an admission decision is reached. The official, complete transcript(s), including statements of all degrees awarded, must be submitted to the Graduate School no later than the last day of classes of the first semester they are enrolled. An initial hold will be placed on a student's registration if they fail to supply the transcripts with possible termination should they not be provided.

Deadlines for Applications

The Graduate School must receive the application and all supporting documents no later than the deadlines specified by the Graduate School and/or the program; numerous programs have earlier deadlines than those established by the Graduate School. Applicants are responsible for meeting any earlier deadline established by a graduate program to which the prospective student is applying (see the Fields of Graduate Instruction website for links to program deadlines).

Conditions of Admission

Final acceptance at NC State is contingent upon completion and official documentation of any degree (bachelor's or master's) listed in an applicant's application. It is the applicant's responsibility to maintain a level of academic performance that meets university and program admission standards. Poor performance during the last semester(s) could jeopardize an applicant's admission. Likewise, students currently enrolled in Post Baccalaureate Studies (PBS) or who request an admissions deferral and take PBS coursework must also maintain a level of academic performance that meets the university's and program's admission standards. Failure to comply with these conditions could, at the discretion of the program and/or Graduate School, be grounds for changing the admission status.

Length of Application Validity

An application is valid for 12 months from the date it was submitted by the applicant.

Number of Programs for Which Applicant Can Be Considered

An application is only valid for admission consideration by one graduate program. If an applicant wants to be considered for admission to additional programs, they must re-apply and pay an additional application fee for each program they apply to.

B. Waiving the Application Fee

Under exceptional circumstances, the Graduate School may waive the application fee. (https://ncsu.service-now.com/gradschool/?id=kb_article&sys_id=5eab88dbdbce4f40de08f1a51d9619cf)

C. Processing Applications

All Applications

Applicants must ensure that all of the required materials are submitted. When the Graduate School receives a completed application and the application fee, an admission record is created for the applicant and their application is made available to the program of interest.The DGP and the graduate program review the completed files of all applicants in accordance with the Graduate School's guidelines for final admission or denial decisions. The DGPs then submit their recommendations to the Graduate School.

The Graduate School reviews the departmental recommendations and, in cases where the Graduate School concurs with an admission decision, requests official transcripts. Once the official transcripts are received and verified, the Graduate School posts the final admission decision. When the Graduate School denies a program's recommendation for admission, the program has the option of supplying further justification to the Graduate School. However, the Graduate School has the final decision.

International Applications

Before international applicants' admission status can be finalized, they will need to submit a completed Certificate of Financial Responsibility (CFR) and/or a Visa Clearance Form (VCF), depending upon their visa status, directly to the Graduate School. Once the CFR and/or VCF are approved, applicants must accept the offer of admission before a Certificate of Eligibility (Form I-20 or DS-2019) will be created (see Section x.x for detailed information on International Applications).

D. Reapplication

Students denied admission into a graduate program may be reconsidered for admission at a later time upon submission of a new application and supporting materials.

2.2 Application Deadlines

A. U.S. Applicants and Permanent Residents

The following dates are Graduate School application deadlines. Many programs have earlier deadlines (see URL). Applicants should submit applications and all supporting documents on or before the Graduate School or program deadline, whichever is earlier.

Application and Fee Due in Graduate Admissions Office

Semester	Deadline
Fall	June 25
Spring	November 25
Summer I	March 25
Summer II	May 10

B. International Applicants

The following dates are Graduate School application deadlines for international applicants. . Many programs have earlier deadlines (see URL). International applicants should submit applications and all supporting documents on or before the Graduate School or program deadline, whichever is earlier.

Application and Fee Due in Graduate Admissions Office

Semester	Deadline
Fall	March 1
Spring	July 15
Summer I	December 15
Summer II	December 15

C. Late Applications

1. Departments are under no obligation to review or consider any applications received past their program deadlines.
2. Should departments wish to consider late applications, they may do so without requesting special waivers from the Graduate School.

2.3 Graduate School Admissions

A. Types of Admission

The criteria used for admissions decisions vary by program, reflect an evaluation of the applicant's potential for graduate work, and consider the ability of a program to accommodate additional students. Departmental admissions committees consider requests for admission and forward their recommendations to the Graduate School. However, Graduate School regulations govern the criteria for the classification of graduate student status. Programs should first determine the appropriate status of the student before forwarding their admission recommendations to the Dean of the Graduate School.

There are three types of admission to graduate study at NC State:

- Full-graduate standing
- Provisional
- Graduate-unclassified

B. Full Graduate Standing

To be considered for admission in full graduate standing, applicants must have:

- (a) a four-year bachelor's degree (or equivalent) from a regionally accredited college or university. Exceptions to standard accreditation may be granted for applicants with international degrees, including applicants with three-year degrees from institutions in Europe participating in the Bologna Process.
- (b) a GPA of at least 3.00 (on a 4.00 scale) in their undergraduate degrees.

C. Provisional Admission

Students may be granted provisional status when they do not fully meet all the necessary requirements for admission to the Graduate School, but their circumstances warrant provisional admission.

1. Students with related bachelor's degree and overall bachelor's GPAs that fall below 3.000 on a four (4)-point scale)Provisional admission may be granted to students with related bachelor's degrees from regionally accredited institutions whose GPAs fall below 3.00 standards for admission to full graduate standing when:
   a. unavoidable, extenuating circumstances affected their undergraduate averages, or
   b. progressive improvement in their undergraduate work warrants provisional admission.Students can attain full-graduate standing after completing nine or more graduate credit hours with a minimum 3.000 GPA. Courses taken for S/U grade cannot be used as part of the minimum.A graduate student is not eligible for appointment to an assistantship or fellowship while on provisional status.
2. Students with non-related bachelor's degrees (from accredited institutions)The Graduate School may grant provisional admission to applicants with bachelor's degrees from accredited institutions who lack undergraduate work considered essential for graduate study in a major field.The Graduate School grants full-graduate standing when the deficiencies responsible for the provisional status are corrected through additional coursework. The student must also maintain a satisfactory academic record (3.000 GPA) on all coursework taken in a graduate classification. The graduate program must also recommend that full graduate standing be granted to the student seeking admission.

D. Graduate-Unclassified Status

The Graduate-Unclassified status is a temporary classification for students, such as foreign visitors (see Section 2.4), who are not candidates for degrees. Students may take courses for graduate credit but may not apply more than 12 credits to any program leading to an advanced degree at NC State.

Unclassified graduate students must meet the same admissions requirements that apply to graduate students in full standing. Individuals interested in applying for admission as Graduate-Unclassified Students should contact the graduate program of interest.

E. Eligibility for Student Status in a Graduate Program

Students who graduate from a degree program can no longer register as students in that program unless they are formally admitted to a new graduate classification (e.g., from a master's to a doctoral degree). Students with specific educational goals not encompassed by traditional degree programs may request admission in the "Graduate-Unclassified Status" or register in the "Post-Baccalaureate Studies" program through Registration and Records (https://registrar.ncsu.edu/).

F. Process of Admission or Denial

Using the online DGP Decision Recommendation form, the Director of Graduate Programs (DGP) indicates via a checkbox on the form that all information is accurate (including GPA information) and that the decision recommendation is ready for communication to the applicant.

After reviewing the applicant's file and, if necessary, consulting with the appropriate DGP, the Graduate School notifies the applicant of acceptance or denial of admission. The DGP and the applicant will have access to this letter via the online system. DGPs should only notify an applicant regarding admission after the official notification of admission is posted online by the Graduate School. A template departmental admission letter is available for that use.

G. Advanced Enrollment Deposits

1. Some graduate programs require a deposit for newly admitted masters and doctoral students to enroll. Admitted students must confirm their intent to enroll via the link in their online decision letter by filling out the enrollment form and paying their enrollment deposit. The non-refundable deposit will be credited toward tuition for the student's admit term; there is also a processing charge. The deadline to submit the enrollment deposit will be June 15 for Fall and Summer terms/sessions, and November 15 for Spring, or within two weeks of an admission decision rendered after these deadlines.
2. Advanced enrollment deposits are term specific. Should a student receive approval for deferment of their admission to a future term after having paid the advanced enrollment deposit, they must request a deferral of their enrollment deposit by notifying the Graduate School by September 1 of the year in which they were originally admitted. Failure to request a deposit deferral by the due date will result in forfeiture and a new deposit will be required for the future term. Exceptions cannot be granted to this policy.
3. Sponsored students (research assistants, teaching assistants and fellows) are required to pay the enrollment deposit. When tuition awards are posted to these students' financial accounts, the amount of the advanced enrollment deposit will go toward student fees. If student fees are covered under the sponsorship, then the deposit amount will be refunded by the University Cashier's office.

H. Exceptions to Standard Admission

1. Doctoral applicants with previous doctoral degrees. An individual who has a doctoral degree will be denied admission to a doctoral program at NC State. The Dean of the Graduate School may make exceptions based upon departmental recommendations.
2. Applicants to graduate programs without bachelor's degrees but with professional degrees. The Graduate School may consider an applicant who does not possess a bachelor's degree, but who has earned a D.D.S., D.V.M., J.D., PharmD, or M.D. degree from a regionally accredited institution for admission to a graduate program.
3. Applicants who have a previous Master's degree in the program to which they are seeking admission. The Graduate School will not admit or transfer a student to a Master's program if the student already holds a Master's degree in the same discipline. Exceptions may be considered if a statement of justification is provided by the DGP and is then approved by the Dean of the Graduate School.

I. Date of Admission

1. Deferral of Admission. Registration is automatically canceled when students do not enroll for the semester or summer session for which they received admission. Any applicant wishing to defer the admission date must submit a written request to the graduate program. Both the graduate program and the Graduate School must approve the request. The maximum time that a student may be granted a deferral is one year.
2. Ineligibility for leave of absence prior to enrollment. Leaves of absence are available only to currently enrolled students or students already on an approved leave of absence. Students who are admitted for an upcoming semester, but are unable to register, must request a deferment in writing to their graduate program and Director of Graduate Programs.

J. Readmission

Students must reapply if they are terminated at NC State because of non-compliance with the continuous registration policy and wish to resume study in their original graduate program. The student must submit a new application and pay the application fee, submitting all materials as if applying for the first time. However, letters of recommendation and GRE scores less than five years old that are on file in the Graduate School or department may be transferred to the second application, upon request.

If the program approves the student's request for readmission, the Director of Graduate Programs must submit both a letter of justification and an online DGP Decision Recommendation form to the Graduate School on the student's behalf. The Graduate School makes the final decision on the student's readmission.

K. Contractual Readmission for Master's Students

In rare circumstances, a program may request that the Graduate School contractually readmit a student. Contractual readmission permits students, who had **previously enrolled in a master's program** at NC State and obtained GPAs below a 3.00, to pursue a **master's degree in another field** and have their GPAs reset. The program requesting this readmission must be different from the one in which the student was originally enrolled. Students must complete the Graduate Contractual Readmission form and this must be approved by the new program's DGP and the Graduate School. This process will not remove the previous coursework from their NC State transcript, but it will allow the calculation of the graduate GPA to commence when they enroll in the new program. Furthermore, this process requires a break in enrollment; the coursework for the prior program must have been completed **at least two years** prior to the term in which the student will re-enroll.

L. International Admission Pending Receipt of Certain Documents

International students cannot be admitted until the Graduate School receives additional documentation required by both the US Citizenship and Immigration Services (https://www.uscis.gov/) (USCIS) and the Graduate School (see Section 2.4 (p. 933)).

M. NC State Faculty Enrollment in Degree Programs

Any NC State faculty member, regular or special, may enroll in an NC State program to pursue an advanced degree, provided they have the prior approval of their Department Head and Dean. Annual renewal or rescinding of approval must occur by letter in the faculty member's personnel file. The Department Head and Dean are responsible for ensuring that no conflict of commitment, conflict of interest, unethical or improper actions, or privileges are incurred in this process.

N. Post-Baccalaureate Studies (PBS) Classification

Those who wish to undertake academic work beyond the bachelor's degree, but are not currently admitted to a graduate degree program, may enroll under the Post-Baccalaureate Studies (PBS) classification. This classification is open only to US citizens, permanent residents, and international students who are sponsored by an agency of the US government or are married to an NC State student. Registration is through Registration and Records.

Rules for Participation in PBS

The following are university minimum requirements, although home departments may have more restrictive requirements.

1. All applicants must have a bachelor's degree from a regionally accredited institution of higher education.
2. All classes taken for credit by PBS students will be graded in the usual manner that applies for the particular course (A+ through F or S/U). All courses taken at NC State will appear on the student's transcript.
3. Registration is limited to a maximum of two courses per semester. Individuals who are employed full-time should limit their PBS registrations to one course per semester.
4. The GPA of a graduate student who has credits in the PBS category will be based on all courses taken at the 400-800 level. If PBS courses are included in a student's degree program, his/her degree clock for time-to-completion starts with the first course approved for inclusion in the Plan of Work.
5. If a student's graduate degree program is terminated, he/she cannot use courses taken in PBS status after termination for credit toward the same graduate degree program.
6. The student's advisory committee must approve all coursework accepted for degree credit. Requests for degree credit for courses completed in the PBS classification are considered after admission to a graduate degree program when the student's Plan of Graduate Work is filed with the Graduate School.
7. The PBS classification carries with it no implication that the student will be admitted to the Graduate School in any degree classification or that courses taken will be accepted for degree credit.
8. PBS students are required to familiarize themselves with Graduate School and departmental policies and to seek further advice or clarification as needed.

O. Teaching Certificate Renewal

Public-school personnel who are primarily interested in "certification credit" may enroll in the PBS program without forwarding transcripts of previous work to the Graduate School. However, these students must be admitted in the Graduate-Unclassified status before completing their certification. The College of Education determines the applicant's qualifications for enrollment.

P. English Proficiency Requirements for International Applicants

To be eligible for admission to graduate study at NCSU, all non-US citizen applicants (i.e., non-resident aliens and permanent residents) must demonstrate proficiency in English at a level necessary to be successful in a graduate program at NC State. This requirement can be met for most applicants in one of the following ways; however, some programs may require additional evidence of English proficiency:

1. Provide Test of English as a Foreign Language (https://www.ets.org/toefl/) (TOEFL) with a total score of at least 80 on the Internet-based Test (iBT), and with minimum test scores for each section of:
   - Listening 18 points
   - Reading 18 points
   - Writing 18 points
   - Speaking 18 points – for admission, 23 points – for TA appointment where TA has direct verbal interactions with students, 26 points – for TA appointment where TA presents lectures in the class or laboratory NOTE: The current computer- and paper-based versions of the TOEFL test will be given until the iBT version is implemented in a particular location. Computer-based TOEFL scores must be 213 or higher (with at least 17 on three sections and no section score below 13). The paper-based test requires a score of 550 or higher (with scores of 50 on at least two of the three sections and no section score below 45).
2. Provide International English Language Testing System (https://www.ielts.org/) (IELTS) scores with an overall band score of at least 6.5. Minimum test scores for each section are listed below:
   - Listening 6.5
   - Reading 6.5
   - Writing 6.5
   - Speaking 6.5 – for admission, 7.0 – for TA appointment
3. Provide Duolingo (https://englishtest.duolingo.com/) with a total score of 110 or better.
4. be a citizen of a country where English is the official language (https://grad.ncsu.edu/students/rules-and-regulations/handbook/english-as-official-language/) and the language of instruction in higher education;
5. have successfully completed at least one year of full-time study in a degree program at a regionally accredited four-year US College or university.

TOEFL or IELTS test scores must be no older than two years (24 months) prior to the beginning of the requested entry term.

2.4 Admission of Non-U.S. Citizens

International (non-U.S. citizen) applicants and U.S. Lawful Permanent Residents may be recommended for admission by the academic department, but cannot be granted official admission by the Graduate School until certain critical documents are received and approved by the International Admissions Specialist. The requirements in this section are only for admission purposes and do not reflect or affect an admitted student's tuition or tax residency determination.

Applicants who are foreign nationals abroad, U.S. Lawful Permanent Residents, DACA recipients or non-U.S. citizens already residing in the U.S. must complete additional paperwork, known as the Visa Clearance Form and/or Certificate of Financial Responsibility, as part of their application, which will be reviewed by the International Admissions Specialist in the Graduate School. Eligible international applicants who are abroad will be issued a visa document by the Graduate School to apply for the student visa required to study in the United States. Current NC State students will have their new visa document issued by the Office of International Services (OIS) (https://internationalservices.ncsu.edu/). OIS staff members also provide immigration and cross-cultural assistance to students on F or J nonimmigrant visas throughout their program at NC State.

A. Visa Types and Eligibility

Under immigration law, international students are divided according to their immigration classification. Each visa type has its own eligibility requirements and restrictions.

1. F-1 Student – a resident of a foreign country who is coming to the U.S. temporarily and solely for the purpose of attending a full-time degree program. An F-1 student is required to demonstrate full financial support to obtain the F-1 visa and I-20 visa eligibility document and be admitted to the U.S. There are numerous requirements and restrictions regarding enrollment, employment, travel, etc., and detailed information is available from OIS. Graduate certificate programs, online/distance programs, and part-time programs are not eligible for the F-1 visa status.
2. J-1 Exchange Visitor – a classification that serves a variety of educational purposes. Under this status, students, scholars, professors, and researchers may come to the U.S. temporarily for the purpose of educational exchanges under the sponsorship of an approved organization or institution. Students often enter the U.S. in J-1 Exchange Visitor status when they are participants in sponsored activities such as the Fulbright program.
3. Other Visa Types – in addition to F-1 and J-1, there are other visa types represented among the international student population at NC State, such as H-1B, TN, O, E visas, and DACA recipients. Applicants already in the U.S. in these non-student visa types must submit proof of their legal status and may apply for any type of program if they will maintain this visa type for the duration of their program.
4. Lawful Permanent Residents of the U.S. (“Green Card holders”) – may apply for any type of program, but will need to submit their Permanent Residence Card (“Green Card”) during the admission process. Permanent Residents may pay the domestic student application fee price.

B. English Proficiency Requirements

In order to be eligible for admission to the Graduate School, all non-U.S. citizen applicants (including U.S. Permanent Residents) must demonstrate proficiency in the English language at a level necessary to be successful in a graduate program at NC State (see English Proficiency Requirements (p. 930)).

C. Visa Clearance Form

Applicants who are U.S. Lawful Permanent Residents or non-citizens already residing in the U.S. must complete the Visa Clearance Form (VCF) as part of their application. International applicants already in the U.S. in a status that allows study must indicate on the Visa Clearance Form whether they wish to remain in their current nonimmigrant status or change their status to the F-1 student visa status. Because processing times at U.S. Citizenship and Immigration Services are sometimes long and there are many factors that must be taken into consideration when deciding to change one’s status, applicants considering changing status should contact the International Admissions Specialist early in the admission process. A link to the online Visa Clearance Form is available in the applicant’s portal when the Graduate School sends the academic acceptance letter; applicants cannot access it or complete it until this point in time. The applicant should complete this form as soon as possible once it becomes available to enable the Graduate School to grant official admission.

D. Certificate of Financial Responsibility

The Certificate of Financial Responsibility (CFR) is only required for those applicants who will be applying for or are already in the student visa status (F-1 or J-1). The CFR requires the candidate to provide evidence of the financial resources necessary to cover all expenses, including those of any accompanying dependents, for each year of study. Once approved, the Graduate School (or OIS if a current NC State student) will then issue the Certificate of Eligibility Form I-20 for an F-1 visa or Form DS-2019 for a J-1 visa, depending on which status the applicant qualifies for. International applicants can check on the status of their application/admission, including when the Certificate of Eligibility was issued, by going to: http://www.ncsu.edu/applygrad (http://www.ncsu.edu/applygrad/). A Lawful Permanent Resident of the U.S. (“Green Card holder”) or any other non-citizen not requiring a student visa is not required to demonstrate financial ability on the CFR and needs only to complete and submit the Visa Clearance Form.

E. Health Insurance Requirement

Hospitalization costs in the U.S. are high and having appropriate health insurance is a requirement for all international students at NC State in F-1 or J-1 status. All international students in F-1 or J-1 status must purchase the University student health and accident insurance plan (or opt out through the universities hard-waiver program if other acceptable health insurance has already been purchased) throughout their program of study at NC State. Those who do not maintain this required insurance will have a hold placed on their ability to register.

F. Letters of Assurance for Research Participation

The Board has determined that no international students are required to sign Letters of Assurance, such as those occasioned by the Export Control Act, as a condition of participating in research activities.

G. Full-time Status Requirement

International students in F-1 or J-1 status must carry a full course load in each regular semester to comply with the US Citizenship and Immigration Services (https://www.uscis.gov/) (USCIS) regulations. Please refer to Section 3.15 for information on determining full- and part-time status.

H. Assistantship and Employment Limitations

International students in F-1 or J-1 status may not hold graduate assistantships or a combination of assistantships/positions that exceed 20 hours of service work per week during Fall and Spring semesters since this jeopardizes their student status with USCIS. However, these students can have appointments up to 1.0 FTE during the Summer sessions if the summer is considered a vacation term for the student and they will be returning the following fall. For those employed in other capacities on-campus, please visit the OIS on-campus employment webpage (https://internationalservices.ncsu.edu/student-employment/on-campus-employment/) for policies and restrictions. International students should consult with OIS before accepting any type of employment. Employment regulations vary by visa type.

I. Three-Year Bachelors Degrees

Admissions rules require that an applicant have a bachelor's degree from an accredited college or university as determined by a regional or general accrediting agency. These accrediting agencies define bachelor's degrees, in the U.S. custom, as requiring four years to complete. In reality, it may take longer or shorter to complete the degree, but the amount of work involved is typically the same. Confusion may arise as to the equivalence of three year bachelor's degrees offered in some countries. Some are treated as equivalent to the U.S. bachelor's (see below) whereas others may require outside evaluation.

1. The Graduate School only accepts three-year bachelors degrees from member institutions (http://www.ehea.info/pid34250/members.html) within the Bologna Process (http://www.ehea.info/). If the institution is not part of this organization, the applicant will be asked to provide an evaluation of their higher education background by an international credential evaluation company. If the evaluation determines that the background is not equivalent to a U.S. bachelor's degree, admission will be denied. If the academic background includes a master's degree, that should be evaluated along with the three-year degree to see if the combination is equivalent to a four-year U.S. bachelor's degree. If any part of the master's degree is needed for equivalency, the student will not be entitled to the 18 hour allowance toward a Ph.D. program granted to holders of a previous master's degree. On the other hand, they will be afforded the extra two semesters under the Graduate Student Support Plan for students without a previous master's.
2. We accept international credential evaluations from members of NACES (http://www.naces.org/members.htm) (National Association of Credential Evaluation Services) or AICE (http://www.aice-eval.org/) (Association of International Credential Evaluators). Others may be acceptable as well, but please check with the Graduate School if a question arises as to the appropriateness of the evaluation.
3. The University of Wisconsin hosts a directory of foreign institutions (http://www.grad.wisc.edu/admin/gradcoordinators/iadmiss/) describing their institutional academic environment and the expectations UW has for applicants from these institutions. This should only be used as a guide.

2.5 Medical History and Immunizations Requirements

All graduate students admitted to a degree program are required by State law to submit a report of medical history and immunization documentation prior to initial registration. Both forms are available online through the HealthyPackPortal (https://healthypack.dasa.ncsu.edu/healthweb/). This report must document immunization against tetanus/diphtheria, measles, German measles, polio, and for international students from a high risk country, show results of a tuberculin skin test (must be completed at U.S facility) or TB blood test. Graduate students who have recently completed their undergraduate work at NC State must update their medical history. Student Health Services (https://healthypack.dasa.ncsu.edu/) must receive the required reports at least 30 days before registration. If the student does not meet this requirement, dismissal from school is mandatory under the law.

3.1 Graduate School Minimum Requirements

A. Master of Arts and Master of Science

All Master of Science and Master of Arts degree programs are planned with the objective of making possible a reasonable, comprehensive mastery of the subject matter in a chosen field. In most cases, the Master of Science and Master of Arts programs provide training and experience in research in order to familiarize the student with the methods, ideals and goals of independent investigation. In these cases, representative of most Master of Science and Master of Arts degree programs, a thesis is required. A small number of Master of Science and Master of Arts programs do not require a thesis.

Students in the Master of Arts or Master of Science programs follow the individual program and the Graduate School requirements that were in effect when they entered the program.

The following are minimum requirements for a degree in Master of Science or Master of Arts degree programs:

1. A minimum of 30 semester hours of graduate work in the degree program, unless the specific program requires more hours.
2. A reading knowledge of a foreign language (in a few programs; see Section 3.5 (p. 939))
3. A comprehensive written examination (in some programs)
4. A thesis (in most programs)
5. A comprehensive oral examination (except Option B programs)

Note: Requirements for ALL master's degrees must be completed within six (6) calendar years. For further information about the time limited for degrees, see Section 3.4 (p. 939).

B. Master's Degree in a Designated Field

A number of departments and programs offer master's degrees in designated fields. These are professional degrees and do not require a thesis. Master's Thesis Research (XXX 695) may not be included as part of the Plan of Work.

Requirements include the following:

1. A minimum of 30 semester hours of graduate work in the degree program (unless the specific program requires more hours).
2. A comprehensive written examination (in some programs)
3. A comprehensive oral examination (except Option B programs)

C. Option B Master's Degree

The Option B Master's degree requires that students adhere to the general guidelines for a Master of Arts or Master of Science degree with the following exceptions:

1. A comprehensive oral exam is not required
2. A thesis is not required
3. Master's Thesis Research (XXX 695) may not be included as part of the Plan of Work
4. Individual departments define other requirements for their Option B program, such as additional course work or final projects
5. Option B Master's degree programs cannot carry an officially designated minor
6. Students have a single assigned advisor rather than an advisory committee.

Changing Master's Programs to "Option B"

Master's degree programs that require final oral examinations may petition the Graduate School for permission to operate the program with a single advisor and to eliminate the final oral examination (Option B). Option B Master's degree programs may not carry an officially designated minor.

Petitions need the approval of school/college-level Graduate Studies Committees and must be made for an entire degree program, rather than for individual students. The Administrative Board of the Graduate School will review each petition and make appropriate recommendations to the Dean of the Graduate School. The petition form is entitled Proposal for Changing Non-Thesis Graduate Degree Program Requirements to Option B.

D. Credit Hour Requirements for Master's Degrees

[Recommended by the Administrative Board of the Graduate School and approved by the Dean of the Graduate School on 6/17/2009]

A minimum of 30 semester credit hours is required for all master's degrees. Students may take more than the minimum hours required by their programs. The Graduate School does not give credit for non-credit course work (i.e. non-departmental seminars, workshops, short courses, conferences, and any "life experience" offerings). Furthermore, the Graduate School does not allow credit by examination.

The following are specific credit-hour limitations:

1. At least 18 credit hours must be graduate credits earned while the student is enrolled in the graduate program.
2. The remaining 12 credit hours or more, depending on the requirements of the specific program, may be transferred from any of the sources or any combination thereof set forth below as transfer credit.
3. At least 18 credit hours of letter-graded courses ("A," "B," "C", etc.) must be included in the program. These must be NC State or inter-institutional courses.
4. No more than six credit hours of 400-level (undergraduate) courses may be counted toward the degree, and they may not come from the major field.
5. Credit hours for the following courses may NOT be used to satisfy the 30-credit hour requirement: Non-Thesis Master's Examination (XXX 690), Summer Thesis Research (XXX 696), Non-Thesis Master's Continuous Registration (XXX 688 and XXX 689).
6. No more than 12 credit hours may be used to satisfy degree requirements for another master's degree program at NC State, unless the student did not complete the other program. (See Section 3.11.A Multiple Master's Degrees).
7. Courses at the 900 level may not be counted toward a master's degree.

Transfer of Credits

1. Transfer of graduate credits earned at other universities. A course that was completed at another college or university may be considered for transfer to a master's program provided that:
   a. The course is classified as a graduate course.
   b. It was completed while the student was in a graduate or post-baccalaureate classification.
   c. It was not taken as a part of a previous master's degree program at another institution.
   d. The grade in the course is B or better. Courses with grades of B- or lower will not be allowed to transfer.
   e. The college or university is accredited by one of the following six U.S. regional accrediting agencies: the Southern Association of Colleges and Schools, the Middle States Association of Colleges and Schools, the New England Association of Colleges and Schools, the North Central Association of Colleges and Schools, the Northwest Association of Colleges and Schools, or the Western Association of Colleges and Schools.

   Exceptions are allowed for transfer from international institutions if the department or program provides the Graduate School with adequate documentation that the course is relevant to the graduate degree and comparable to an equivalent course at NC State, and that the course was taught by faculty who are qualified to teach at the level of a master's degree. Where the grading system and grading culture in such institutions differ from that at NC State, students may (with the help of the Study Abroad Office) provide a letter to the Graduate School establishing the minimum average grade required for a graduate degree from that institution. That grade will be taken as the minimum grade for transfer in lieu of the "B" noted in 1(d) above.
2. Transfer of graduate credits earned while enrolled in an undergraduate program at NC State University. A course that was completed while the student was enrolled as an undergraduate at NC State University may be considered for transfer to a master's program or graduate certificate provided that it is at the 400-level (subject to the restrictions state in subsection D.4 above) or higher, that the earned grade is B or better, that it was not counted toward fulfillment of undergraduate requirements, and that it is verified by the undergraduate coordinator and recommended by the DGP. No credit will be allowed for a course completed in an undergraduate classification at another institution. Courses with grades of B- or

lower will not be allowed to transfer. (NOTE: Students admitted into a Accelerated Bachelor's/Master's (ABM) program may use up to 12 hours of graduate credit [500 or 700 level] to satisfy requirements for both the bachelor's and the master's degrees.)

3. Transfer of graduate credits earned while enrolled in a previous graduate degree program at NC State University. A graduate course that was completed while the student was enrolled in a previous graduate program at NC State University may be considered for transfer to a master's program, provided that: (a) The course was a letter-graded ("A," "B," "C," etc.) 500- or 700-level course and that the grade is B or better. Courses with grades of B- or lower will not be allowed to transfer; and (b) it was not taken as a part of a completed master's degree at another institution. Courses from other institutions cannot be transferred into a graduate certificate.
4. Transfer of Post-Baccalaureate Studies (PBS) graduate credits earned at NC State University. A graduate course that was completed while the student was enrolled in PBS status at NC State University may be considered for transfer to a master's or certificate program provided that it is at the 500 level or higher and that the grade is B or better. Courses with grades of B- or lower will not be allowed to transfer. All PBS credits that are used to satisfy requirements of a specific master's degree or graduate certificate must be earned before the student is admitted to that degree program. A maximum of 12 credit hours taken while in PBS status may be transferred into a master's degree program; a maximum of 6 credits taken in PBS status may be transferred into a graduate certificate. See Section 2.3 (p. 930) for information on admission to PBS classification. If a student's graduate degree program or certficate is terminated, s/he cannot use courses taken in PBS status after termination for credit toward the same graduate degree program.

Submitting Transfer Credit for Graduate School Approval

When the graduate program submits the online Plan of Graduate Work through MyPack Portal, the DGP submits a letter requesting that any transfer credit be accepted as part of the student's master's program. An official transcript indicating the work to be transferred must accompany the letter.

E. Doctor of Philosophy and Doctor of Education

Doctoral students must demonstrate their ability to undertake scholarly research by writing a dissertation reporting the results of an original investigation, by passing a series of written and oral preliminary examinations in the field of specialization and related areas of knowledge, and by successfully defending the dissertation.

The following are requirements for the Doctor of Philosophy and Doctor of Education degree programs:

1. At least two (2) residence credit points secured in continuous semesters' residence as a graduate student at the University.
2. Doctoral degrees at North Carolina State University require a minimum of 72 graduate credit hours beyond the bachelor's degree.
3. Students cannot take 400-level courses or lower as part of the credit-hour requirement.
4. Students cannot use 900-level courses to satisfy the credit-hour requirement.
5. For a student who has a master's degree from a university other than NC State, a maximum of 18 hours of relevant graduate credit from the master's degree may be applied toward this minimum, upon the recommendation of the student's Graduate Advisory Committee. Therefore, the minimum credit-hour requirement in this case is 54 credit hours. Students whose previous master's was combined with a three-year bachelor's degree from a non-Bologna institution to meet the minimum requirements for admission will not be entitled to this 18 credit allowance and will not be considered to have a previous master's.
6. If a student completes a master's degree at NC State and continues for a doctoral degree without a break in time, up to 36 relevant credit hours taken while in master's status may be used to meet minimum requirements for the doctoral degree. If there is a break in time between completing the master's (at NC State) and beginning the doctorate (at NC State), the allowance is limited to 18 hours. Either allowance may include those 400-level courses taken as an approved part of the master's degree.
7. A graduate course that was completed while the student was enrolled in PBS status at NC State University may be considered for transfer to a doctoral program provided that it is a 500- or 700-level course and that the grade is B or better (see Section 2.3 (p. 930) for information on admission to PBS classification). Courses with grades of B- or lower will not be allowed to transfer. All PBS credits that are used to satisfy requirements of a specific doctoral degree must be earned before the student is admitted to that degree program. These courses must be evaluated and recommended by the student's advisory committee on the basis of appropriateness and currency of the course material. In such cases, the student's degree clock starts with the first of these courses approved for inclusion in a plan of work (POW). Final approval is given by the DGP upon submission of the POW to the Graduate School. A maximum of 12 credit hours taken while in PBS status may be transferred into a doctoral degree program.
8. Students who hold a Ph.D. are generally not admissible for a second Ph.D. unless a "special exception" is requested and granted (see Section 2.3 (p. 930) and REG 2.15.01).
9. A successful preliminary comprehensive examination (written and oral components)
10. A dissertation.
11. A successful final comprehensive oral examination (dissertation defense).

Note: Doctoral students must attain candidacy for the degree within six (6) calendar years. The time limit for completing all requirements for the Doctor of Philosophy and Doctor of Education degrees is noted in Section 3.4 (p. 939).

3.2 Advisory Committees

The primary function of the committee is to advise the student in all aspects of the educational program and to monitor and evaluate progress toward and completion of the degree. Thus, the committee must be active throughout students' programs, beginning with helping students prepare their Plans of Work. The committee should provide an intellectually stimulating foundation for the student's professional as well as scholarly development and should be sensitive to any difficulties in the student's progress. The committee certifies whether the student has met NC State's standards for a graduate degree. Advising and guiding the student on how best to fulfill the degree requirements is a critical element of this responsibility.

It is the students' responsibility, in consultation with their graduate advisors, to select graduate advisory committees. The graduate advisor(s) serves as chair or co-chair of the committee. The Director of Graduate Programs approves and electronically submits the advisory committee names to the Graduate School for final approval as part of the Plan of Work.

A. Advisory Committee Requirement and Composition

1. Committee administrative structure
   a. Every committee shall have a chair or co-chairs.
   b. The co-chair designation implies equally shared responsibilities in guiding the student through to degree completion.
2. Master's students
   a. For master's students in all programs except Option B, the committee consists of a minimum of three graduate faculty members, inclusive of the committee chair. The Graduate School verifies the committee when the DGP submits the Plan of Work that includes the committee information.
   b. If a minor has not been declared, it is up to the individual program whether to require external representation on the committee.
   c. If a minor has been declared, one member of the committee must be from the minor field.
   d. In a master's program in which the minor is classified as interdisciplinary, the minor must be represented by a committee member.
   e. Option B master's students do not have a committee. The Graduate School will verify the appropriate major advisor when the DGP submits the students' Plans of Work.
3. Doctoral students
   a. Doctoral committees require a minimum of four graduate faculty members
   b. If a doctoral graduate committee has no outside representation beyond the student's graduate program by a member of the graduate faculty, a Graduate School Representative is required. This representative is not a voting committee member.
   c. If the student has declared a minor, one of the committee members must be from the minor field.
   d. The committee membership is submitted for approval as part of the Plan of Work
   e. At the time that the committee is approved, the Graduate School appoints the Graduate School Representative (see Section 1.6 (p. 927)) to serve on the doctoral committee, if required.

B. Functions, Responsibilities and Requirements of the Advisory Committee

The chair/co-chair and the other members of the advisory committee are responsible for the following aspects of the thesis or dissertation and the associated research experience:

1. approval of the subject matter and methodology of the thesis or dissertation research;
2. approval of the organization, content, and format of the thesis or dissertation according to NC State required and optional formatting guidelines as provided in the Thesis and Dissertation Guide;
3. review of and comment on drafts of various sections of the thesis or dissertation, including:
   a. the quality of data and evidence,
   b. logical reasoning, and
   c. the editorial, linguistic and bibliographic quality;
4. evaluation of the thesis or dissertation as a basis for certification that the student has fulfilled that portion of the degree requirements for which he or she is a candidate.

For non-thesis master's degrees that require a final examination, the advisory committee is responsible for administering that exam.

C. Committee Members from Other Institutions

The selection of outside committee members will generally depend upon the student's major interest and research. If the program recommends the appointment of a committee member who is not an NC State graduate faculty member, it should be made clear to that person that he or she will be expected to participate as a full committee member.

There are three types of non-NC State faculty who may be appointed to a graduate committee: inter-institutional faculty, external (voting) members, and technical consultants.

1. Interinstitutional Graduate Faculty
   a. Graduate Faculty from UNC-CH and Duke. A member of the graduate faculty from the University of North Carolina at Chapel Hill or Duke University may serve as one of the required committee members when appropriate. These are automatic appointments, although the members are vetted by the DGP of the program, the Associate Dean of the College involved, and the Dean of the Graduate School.Members of professional programs at these institutions, such as faculty at the School of Law or Medical School at UNC or Duke, cannot serve automatically unless their appointment at their respective institution explicitly states that they are on the graduate faculty. A Graduate Advisory Committee Appointment Form for Interinstitutional Member must be completed for faculty from these institutions. Should their appointment be for that professional school only, then they must follow the guidelines discussed for External Members and/or Technical Consultants (see below).
   b. Cooperative Doctoral Program Graduate Faculty from UNC-System Institutions. In addition to the non-degree-specific interinstitutional arrangement of NC State, UNC, UNC-G and Duke, NC State has established cooperative doctoral programs with other UNC-system institutions.
2. External Members. A faculty member from another university (who is not an interinstitutional graduate faculty member) or a professional from industry or government with credentials comparable to those required for membership on the graduate faculty, may serve as an external member, in addition to the number of committee members normally required (four for doctoral degrees and three for master's degrees).
   a. Appointment. To appoint an external member, the DGP must submit a Graduate Advisory Committee Appointment Form for External Member/Technical Consultant along with the proposed external member's curriculum vitae.
   b. Responsibilities. External members will have full voting privileges and are expected to participate in the student's preliminary and final examinations. They will also be consulted in the development of the student's Plan of Graduate Work and will approve the thesis or dissertation.

3. Technical Consultants. A person from industry, a governmental agency, or a university may, upon recommendation of the committee and the DGP, serve as a technical consultant along with the required committee members.
   a. Appointment. To appoint a technical consultant, a Graduate Advisory Committee Appointment Form for External Member/ Technical Consultant must be submitted to the Graduate School, along with a statement describing the Technical Consultant's potential contribution to the student's research or project.
   b. Responsibilities. Technical consultants serve in an advisory capacity to students in the conduct of research for their dissertation, thesis or master's project. Technical consultants are expected to participate in the student's preliminary and final examinations and may sign the thesis. However, they will not vote on the outcome of the examinations.

D. Substitution of Committee Members for Exams

Under extenuating circumstances, it may be necessary for a member of a graduate advisory committee to have a substitute at committee meetings or an exam. The substitution of a committee member on an oral examination must be requested in writing by the DGP and approved by the Graduate School in advance of the examination. It is extremely important to have clear communication between committee members and substitutes so that new expectations or concerns do not arise at the time of the final oral examination.

E. Permanent Changes in Committee Members

1. Changes before Final Examinations for Master's Students and before the Preliminary Examination of PhD Students. Should students, in consultation with their advisors, wish to change any of the committee members, they must submit a revised Plan of Graduate Work with the new members, indicating that this change has been approved by the advisor and by the DGP. Approvals of the students, the committee members, and the DGP must be included. The DGP must submit the revised Plan of Work to the Graduate School.Disagreements within committees or between students and committee members over the quality of students' performance are not grounds for reconstituting the committee. If students believe that they have been unjustly or unfairly treated in efforts to resolve committee conflicts, they have the right to grieve this issue, according to the current University Grievance Procedures for Graduate Students.
2. Changes after the Preliminary Examination. Changes in doctoral committee membership after preliminary exams requires signatures of both outgoing and incoming committee members and the student, as well as justification for the committee change. Approval by the Graduate School is required before holding any examinations.

3.3 Graduate Plan of Work

A. Description

The Graduate Plan of Work is a document that serves both as a guide to successful degree completion and a contract between students and their programs. In this way, it serves to reduce the potential for misunderstandings about degree requirements and outlines the expected academic progress students should make. It is especially helpful when it is evaluated on at least an annual basis by students with their advisor(s), and, where applicable, their advisory committees, with any needed modifications recorded at that time. It should be viewed as a "living document" that reflects changes that may occur as students continue to develop and refine their academic programs.

B. Contents of a Graduate Plan of Work

At the time of final submission Graduate Plan of Work must include:

1. a list of the coursework to be undertaken
2. accurate information about any transfer credits to be used for the degree. Any request to include transfer credit should be submitted to the Graduate School prior to the start of the student's graduate program or no later than before the end of the first semester
3. the thesis or dissertation topic (except in non-thesis master's programs)
4. the name of the student's major professor
5. the members of the student's advisory committee

C. Formulation and Submission Process

The Graduate Plan of Work must be:

1. developed by the student in collaboration with his/her major professor and, where applicable, advisory committee
2. approved by the committee and the Director of the Graduate Program (DGP) or department head prior to submission to the Graduate School for approval
3. submitted online through MyPack Portal
4. evaluated by the Graduate School, which will inform the program as to whether or not the Graduate Plan of Work meets the Graduate School requirements. The Graduate School will deny approval of any student's Graduate Plan of Work until all documents necessary to complete that student's permanent file are received (e.g., signed Patent Agreement, Transfer of Credit form, if applicable). If any materials are missing, the Graduate Plan of Work will be denied with the reason for the denial communicated to the DGP and the student.

D. Timing of Submission

As the Graduate Plan of Work serves as a guide to promote successful progression through a given graduate program, it is important that various components of it be completed in a timely manner. Failure to complete the various components of the Graduate Plan of Work may result in a registration hold being placed on a student's record.

1. All Graduate Students: Course Component of the Graduate Plan of Work
   - By the end of their first year, and preferably earlier than that, students in all graduate programs must submit at least a preliminary course schedule using "place holders" where necessary, defining the specific courses or, at a minimum, courses in a curricular area, including electives, required to fulfill the degree requirements for their respective degree programs.
2. Thesis Master's/Doctoral Students: Committee and Other Milestone Components of the Graduate Plan of Work
   - By the completion of 18 hours, but no later than the third term of enrollment, those graduate students enrolled in master's programs that require a thesis or in doctoral programs must submit additional elements of the Graduate Plan of Work that include the topic of their thesis/dissertation research, their committee chair(s), committee members, and estimated completion times for important milestones, such as the

preliminary and final oral examinations. Students in Option B master's programs requiring projects should also submit their topic and the name of their project advisor.

3. Submission of Final Graduate Plan of Work
    - The final version of the Graduate Plan of Work must be submitted before a master's student's final examination and before a doctoral student's preliminary oral examination. For Option B students, this should be submitted prior to the completion of their Application to Graduate in their final semester.

E. Revising a Graduate Plan of Work

The expectation is that the Graduate Plan of Work will be reviewed and revised annually to reflect students' academic trajectories as they become better defined during their academic careers. Given that an annual progress report is required (Section 3.4 (p. 939)) as part of this process, the student's major professor and, where appropriate, advisory committee should review the Graduate Plan of Work to evaluate progress, suggest potential revisions, and provide guidance as necessary.

F. Annual Progress Evaluation

The Graduate School requires all graduate programs to complete an annual evaluation of progress toward degree for each graduate student. This evaluation process should involve the student, at least one academic advisor/committee chair, and the DGP. As part of each annual evaluation, the student's major advisor should review the POW to evaluate progress, suggest potential revisions, and provide guidance as appropriate. Each evaluation must include the following items:

1. the student's report of activities and achievements for the preceding year (e.g., courses, honors, milestones achieved, and professional development);
2. the student's own evaluation of his or her progress;
3. an evaluative response to the student's progress report by at least one faculty advisor/committee chair; and
4. a completed POW (see POW requirements).

3.4 Time Limits

A. Master's Degrees

Students must complete all requirements for the master's degree within six calendar years. The student's degree clock for time to completion starts with the first course approved for inclusion in the plan of work or the date of admission to the program, whichever comes first. The time limit remains at six years even if a student was on approved leave of absence during the six-year period.

B. Doctoral Degrees

All doctoral students must complete all degree requirements within ten calendar years; for information about the time limits for completing the preliminary oral examination, see Section 3.5 (p. 939). The time limit remains at ten years even if a student was on approved leave of absence during the ten-year period. The student's degree clock for time-to-completion starts with the first course approved for inclusion in the Plan of Work or the date of admission to the program, whichever occurred earlier. Academic colleges/schools or programs may have more restrictive requirements than the above stated University policy.

C. Time-Limit Extensions

The Graduate School may grant exception to the above time limits for a period of up to two years, which can include, but is not limited to: military obligations, family and medical circumstances, and life events. The Dean, or designee, will consider and evaluate the specific nature of the circumstances, the reasons that prompted the advisor and DGP to make the request, the impact the proposed extension would have on the validity of coursework and research, as well as a detailed timeline outlining how and when various degree requirements completed (see Time Limit Extension form (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/)).

For requests beyond two years, the Graduate School will undertake an initial review to determine if they should go forward. If a positive decision is reached, such appeals must be presented to the Administrative Board of the Graduate School by the advisor or their designee. That body will render decision as to whether or not the request should be granted.

3.5 Comprehensive Examinations

Comprehensive examinations are a critical step in degree completion in evaluating the relevant breadth of knowledge in master's and doctoral students. Throughout the process, the chair of the candidate's advisory committee has the obligation to maintain a scholarly atmosphere and to keep academic integrity and the student's best interest foremost.

A. Doctoral Students

- Doctoral students schedule their oral preliminary and final examinations in consultation with their advisory committees. It is the responsibility of doctoral students to contact committee members and, where appropriate, the appointed Graduate School Representative to establish a date and time convenient to all members before officially requesting that the examination be scheduled. The Graduate School, upon approval, will send notification of the exam date to the committee and Graduate Representative. For both preliminary and final oral examinations, the Graduate School requires that DGPs submit a Request to Schedule Doctoral Oral Examination form 10 working days prior to the proposed exam date. The 10-day window does not commence until all other requirements are completed, including a final, approved Plan of Work and a Patent Agreement.
- Two weeks prior to the final examination, the student must also provide the committee with a copy of the dissertation. This deadline may be earlier in cases that involve research directly funded by a company (see Section 3.7 – Theses and Dissertations)

B. Master's Degree

1. Written examinations (Optional)
    - A degree program may require written examinations covering the subject matter of the major and the minor in which the student is enrolled. When required, such examinations must be successfully completed prior to the submission of a Request for a Permit to Schedule the Master's Oral Examination. Information concerning written examination schedules should be obtained from the student's program.
2. Oral examinations
    - Candidates for master's degrees (except those in Option B programs) must pass a comprehensive oral examination to demonstrate to the advisory committee that they possess a reasonable mastery of the subject matter of the major and minor

fields and that this knowledge can be used with promptness and accuracy.

a. Scheduling an exam – Master's students schedule their oral examinations in consultation with their advisory committees. To do this, students must submit a Request for a Permit to Schedule the Master's Oral Examination to their DGPs who approve and submit it to the Graduate School two weeks prior to the date of the examination. The two-week window does not commence until all other requirements are completed, including a final, approved Plan of Work and a Patent Agreement.

b. Format of the exam – This exam takes the form of a traditional thesis defense in those programs requiring theses. This examination may not be held until all other requirements, except completion of the coursework taken during the final semester, are satisfied. After obtaining DGP approval, a student must file a Request to Schedule Master's Oral Examination with the Dean of the Graduate School only after the above conditions are met. For students in non-thesis, non-Option B master's, the program determines the format of the oral exam.

c. Passing the oral examination – Within a week of completing the exam, the student's DGP must forward a permit form (Admission to the Final Master's Oral Examination) that displays the date that the exam was conducted, the result of the examination, and the signatures of all advisory committee members to the Graduate School. A unanimous vote of approval of the advisory committee is required for passing the oral examination.

d. Conditional pass – Students may get a conditional pass contingent upon completion of additional work to the satisfaction of the advisory committee. A formal re-examination may not be required in this case. The DGP must notify the Graduate School within a week after the exam of the conditional pass, the reasons for the conditional pass, and also when the conditions have been removed. The date upon which the Graduate School is notified of the pass establishes the student's graduation date.

e. Failure to pass the oral examination – A student who fails the oral examination is terminated from graduate work at NC State unless the graduate advisory committee unanimously requests a re-examination. Only a single re-examination will be allowed. If the DGP or the Graduate School denies the request, the student's program is terminated.

C. Doctoral Degree

1. Preliminary written examinations
   - Each doctoral student is required to take a preliminary examination, consisting of written and oral components, after they have completed their coursework. As indicated in Section 3.4, all doctoral students must attain candidacy for the degree within four years of starting their program or after they have completed 48 hours of coursework, whichever is later.

   a. Format of the exam. The written portion of the examination may be conducted in one of two ways.
      - If applicable, the written portion of the examination may be conducted in one of two ways.
      - The committee decides on the specific format of this exam, and each member of the advisory committee prepares a set of questions for the student's response, and the answers to each set are returned to the appropriate faculty member for evaluation.
      - Standardized departmental examinations may be used for all students in a program. These examinations are given at specified times during the year, and scheduled dates must be announced at least a semester in advance. Where written departmental examinations of this kind are used, the student will be expected to notify the department of their intent to sit for this examination. Regardless of which method is employed, the questions involved may cover any phase of the coursework taken by the student during graduate study or any subject logically related to an understanding of the subject matter in the major and minor areas of study. The questions are designed to measure the student's mastery of his/her field and the adequacy of preparation for research.

   b. Notification of completion. Committee chair(s) must notify the DGP when a student has completed the written examination.

2. Preliminary oral examinations
   - The oral examination is designed to test the student's ability to relate factual knowledge to specific circumstances, to use this knowledge with accuracy and promptness and to demonstrate a comprehensive understanding of the field of specialization and related areas.
   - Upon satisfactory completion of the written portion of the preliminary examination, the DGP must submit a Request to Schedule the Doctoral Oral Examination to schedule the preliminary oral examination. If the Graduate School Representative has already been assigned to the student's committee, then the Graduate School will respond to the request within one week of its receipt. If the Graduate School Representative has yet to be assigned, the Graduate School may take up to two weeks to respond to the request.
   - After the Graduate School has approved the scheduling of the preliminary oral examination, the signed and dated request form is emailed to the committee chair, committee members, Graduate School Representative, and graduate student listed on the form.

   a. Format of the examination. Though the format of the oral preliminary examination may vary according to the culture of individual graduate programs, as a general guideline such examinations generally include the following three elements.
      - Presentation by the candidate. The candidate makes a presentation of a research proposal. This presentation may be open if the program wishes it to be, but NC State graduate faculty may not be excluded, and the committee chair or Graduate School Representative can restrict the session to all but graduate faculty as deemed necessary.
      - Questioning of the candidate. Anyone attending the presentation will be allowed to ask questions of the candidate at the conclusion of the presentation.
      - Deliberation and decision. Only the advisory committee and the Graduate School Representative, if one has been appointed, will be allowed to participate in the deliberation and decision."

   b. Outcomes
      - Passing the preliminary examination. A unanimous vote of approval of the advisory committee is required for passing the preliminary examination. Approval may be conditional, however, and require students to meet specific requirements prescribed by their advisory committee. These conditions must be written in a clear and distinct way and communicated in such a manner that the student clearly understands what is expected; they must also be submitted to the DGP and the Graduate School.

- Failure to pass the preliminary examination. A student who fails the preliminary examination is terminated from graduate work at NC State unless the graduate advisory committee unanimously requests a re-examination. Only a single re-examination will be allowed; it can encompass written, oral, or both components as determined by the advisory committee. If the DGP or the Graduate School denies the request, the student's program is terminated.

3. Candidacy
   - A doctoral student is admitted to candidacy by the Graduate School upon successfully passing the preliminary examinations. This does not include students receiving a conditional pass.
4. Final Oral Examination
   - As with the preliminary oral examination, the chair of the student's advisory committee oversees the final oral examination. Students in consultation with their advisors submit a Request to Schedule the Doctoral Oral Examination to their DGP, indicating that they wish to schedule the final oral examination.
   - The final oral examination is scheduled after the dissertation is complete except for such revisions as may be necessary as a result of the examination, but not before all required coursework has been completed.
   - After the Graduate School has approved the scheduling of the final oral examination, the signed and dated request form is emailed to the committee chair, committee members, Graduate School Representative, and graduate student listed on the form. A file copy of the approved request form will be sent to the DGP.
   - The student should be sure to include the most current title of the dissertation, as the Graduate School mails information about the scheduled examination to the NC State Official Bulletin for publication.

   a. Format of final examination. Though the format of the doctoral examination may vary according to the culture of individual graduate programs, all examinations include three elements:
      - Presentation by the candidate. The candidate typically presents the methodology used, the data collected, and the conclusions reached as reported in the dissertation. For the purpose of dissemination of research, it is required that the presentation of the dissertation be open to the university community.
      - Questioning of the candidate. Any member of the university community is allowed to ask questions of the candidate. The questioning phase may continue with a closed session in which the advisory committee questions the candidate.
      - Deliberation and decision. Only the advisory committee and the Graduate School Representative are present.Throughout the process, the chair of the candidate's advisory committee has the obligation to maintain a scholarly atmosphere and to keep academic integrity and the student's best interest foremost.

   b. Outcome of final examination
      - Passing the final oral examination. A unanimous vote of approval of the advisory committee is required to pass the final oral examination. In the case of a conditional pass, the specific requirements must be submitted to the student as well as the Graduate School attached to the Exam Results form. Final approval by the advisory committee is dependent upon a student's successful completion of those conditions.
      - Failure to pass the final oral examination. Should a student fail the final examination, this terminates a student's academic program unless the advisory committee recommends a re-examination.

D. Format for Remote Oral Exams

It is expected that oral examinations be conducted with all parties in the same room; however, it is recognized that circumstances may prevent this from happening. While technology can provide solutions for such situations, it should never be the case that remote exams are held simply as a matter of convenience. The student and major professor or at least a co-chair must be present in person.

When members attend examinations remotely, it is the responsibility of the chair of the committee to maintain the academic integrity of the exam and to ensure that the spirit of the requirements outlined in 3.6.B or 3.6.C above are followed. The technology used must allow all parties to interact visually and aurally to accomplish this. Failure of the technology during the exam will require that the exam be suspended until it is in functioning order or rescheduled for a later time.

It is the DGP's responsibility to ensure that the reasons for a remote exam are valid and to submit a request to conduct the exam to the Graduate School in conjunction with the Request for a Permit to Schedule the Master's or Doctoral Oral Examination.

3.6 Theses and Dissertations

A. Theses

In degree programs requiring preparation of a thesis, master's students must undertake an original investigation into a subject that has been approved by the student's advisory committee. All theses must be submitted in accordance with the Electronic Thesis and Dissertation (ETD) Guide (https://grad.ncsu.edu/students/etd/). Theses should be submitted to the advisory committees at least two weeks prior to the final defense.

B. Dissertations

The doctoral dissertation must present the results of the student's original investigation in the field of primary interest. It must represent a contribution to knowledge, adequately supported by data, and be written in a manner consistent with the highest standards of scholarship. All dissertations must be submitted in accordance with the ETD Guide. Publication is expected and encouraged. Dissertations should be submitted to the advisory committees at least two weeks prior to the final defense.

C. Company-Funded Research

For thesis or dissertation research that is funded by a company, students and their advisors must ensure that there is a clear agreement as to the ability to place the results in an ETD and, should there be proprietary information, that a mechanism be in place to ensure that the ETD remains viable. Furthermore, if a company's requires approval of the document prior to a defense, this will require additional lead time to insure that only the appropriate information is included.

D. Submission Procedures for Theses and Dissertations

1. All advisory committee members must approve the thesis/dissertation prior to submission to the library for publication.

2. After receiving an unconditional pass on the final oral exam, the student must submit the thesis/dissertation electronically to the ETD system.
3. A thesis/dissertation must be submitted by the ETD deadlines as published in the Graduate School Calendar.
4. At the time of dissertation submission, students are also required to submit the required forms and fee as outlined on the ETD website. The Graduate School will not award the degree until these forms and fees have been submitted.

E. Publication in Compliance with Nondisclosure Provisions

Theses and dissertations containing disclosures of patentable discoveries may be embargoed by submitting a request through the ETD system. They may be granted for up to one year. Placing an embargo on a thesis or dissertation until a patent application is filed will not prevent a student from graduating on time.

3.7 Master's Degree: Summary of Procedures

A. Requirements for All Master’s Degree Students

1. Application materials and required fees received.
2. Application materials reviewed by graduate program.
3. Graduate program forwards recommendation regarding applicant’s admissibility to the Dean of the Graduate School.
4. The Dean of the Graduate School reviews the recommendation and the student is notified of the action taken on the request for admission.
5. Outstanding transcripts, if any, showing any or all post-secondary coursework attempted and degree(s) conferred since application should be submitted by student to the Graduate School, prior to matriculation.
6. Student arrives, reports to the graduate program, is assigned a graduate advisor and develops a roster of courses and credits with the advisor.
7. Student subject to continuous registration policy until graduation.
8. Student approves Patent Agreement via Student Self-Service in the MyPack portal.
9. Student develops a Plan of Graduate Work in consultation with and the approval of his/her graduate advisor and Director of Graduate Programs (DGP). The Plan of Work must be submitted via SIS to the Graduate School where graduate records staff will review it and advise the program of any changes that need to be made before the Request for a Permit to Schedule the Master’s Oral Examination (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/) or the Graduation application can be approved by the Graduate School.
10. Student passes language examination, if required.
11. Student passes written examination, if required.
12. Student must Apply to Graduate in MyPack Portal by the “apply to graduate deadline” in the term in which they plan to graduate.
13. A GPA of at least 3.000 for the degree requirements as well as on overall graduate course work at NC State is required for graduation.
14. All degree requirements must be completed within six calendar years, beginning with the date the student takes courses carrying graduate credit applicable to the degree program, unless a more restrictive time limit has been established by the program or academic college/school.

B. Option B Programs

The student must Apply to Graduate via MyPack Portal and the DGP set the Graduation Approval page to “Departmental Review Complete” no later than the “apply to graduate deadline” for the term in which the student anticipates graduation. The deadline appears in the Graduate School Calendar (https://grad.ncsu.edu/events/).

C. Master’s of Discipline or Non-thesis Programs (excluding Option B)

1. Graduate advisory committee of three or more Graduate Faculty members is appointed by the DGP.
2. When all requirements except completion of the course work in the final semester are satisfied, DGP submits to the Graduate School the Request for a Permit to Schedule the Master’s Oral Examination.
3. If Graduate School requirements are met, a Request for a Permit to Schedule the Master’s Oral Examination is approved by the Graduate School within 10 working days of receipt of the request and the permit, Admission to the Final Master’s Oral Examination, is issued.
4. Final examination is scheduled and conducted.
5. Final examination report, including date and result of the examination, submitted to the Graduate School by the DGP. The Graduate School should receive the report within five working days of the examination.
6. The deadline date for unconditionally passing the final examination in order for the student to graduate in a given semester or summer session appears in the Graduate School Calendar.

D. Thesis Programs

1. Graduate advisory committee of three or more Graduate Faculty members is appointed by the DGP.
2. A preliminary copy of the thesis is submitted to the chair of the student’s advisory committee.
3. When all requirements except completion of the course work in the final semester are satisfied and after the thesis is complete except for such revisions as may be necessary as a result of the exam, the DGP submits to the Graduate School the Request for a Permit to Schedule the Master’s Oral Examination.
4. If Graduate School requirements are met, the Request for a Permit to Schedule the Master’s Oral Examination is approved by the Graduate School within 10 working days of receipt of the request, and the permit, Admission to the Final Master’s Oral Examination, is issued.
5. At least two weeks prior to the final oral examination, the chair of the student’s advisory committee submits the thesis, if required, to the other members of the advisory committee for review.
6. Final examination is scheduled and conducted.
7. The Admission to the Final Master’s Oral Examination form is completed by the committee members, including date and result, and submitted to the Graduate School by the DGP. The Graduate School should receive the report within five working days of the examination.
8. Student submits the required PDF file into the Electronic Thesis and Dissertation (https://grad.ncsu.edu/students/etd/) (ETD) Submission System for the thesis review within 24 hours of passing the defense.

The date the student properly submits the required PDF file into the ETD Submission System is the date of the thesis review.

9. The deadline for submitting the thesis to the Graduate School in order for the student to graduate in a given semester or summer session appears in the Graduate School Calendar.
10. The thesis is reviewed by the Graduate School to ensure that the format conforms to the specifications prescribed in the Thesis and Dissertation Guide.
11. The thesis must then be approved by the advisory committee members prior to publication by the library.

3.8 Doctoral Degree: Summary of Requirements

1. Application materials and required fees received.
2. Application materials reviewed by graduate program.
3. Graduate program forwards recommendation regarding applicant's admissibility to the Graduate School.
4. The Graduate School reviews the recommendation and the student is notified of the action taken on the request for admission.
5. Outstanding official transcripts, if any, showing any or all post-secondary degrees conferred since application should be submitted by student to the Graduate School prior to matriculation.
6. Student matriculates, is assigned a graduate advisor, and develops a Plan of Work with the advisor/DGP.
7. Student submits online Patent Agreement through Student Self-Service in MyPack Portal.
8. Student formulates an advisory committees of at least four members of the Graduate Faculty. The Graduate School also selects a Graduate School Representative, if required.
9. Plan of Work is prepared by the student in consultation with the advisory committee.
10. Preliminary oral examinations in the major and, where required, minor fields are scheduled. The results are sent to the Graduate School.
11. At least two weeks prior to the final oral examination, the chair of the student's advisory committee submits the dissertation to advisory committee members for review.
12. The chair submits, through the DGP, the request to the Graduate School to Schedule the Doctoral Oral Examination (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/) at least two weeks prior to the examination. Upon approval of the request, the student and the examining committee, including the Graduate School Representative are notified of the time and place of the examination.
13. Students must submit their dissertation to the ETD System. Deadlines appear in the Graduate School Calendar. In addition, they must submit all required forms and fees prior to final approval.
14. Student must apply to graduate in MyPack Portal by the deadline in the term in which they plan to graduate to be placed on the graduation list, have their name printed in the graduation program, have the diploma ordered, and the transcript posted.
15. All coursework scheduled in a graduate degree classification must be completed prior to graduation.
16. The cumulative and program GPA must be at least 3.000 to graduate.
17. All degree requirements must be completed within ten calendar years of the admission term or the date of the first course used in the Plan of Work, whichever is earlier, unless a program has a more restrictive time limit.

3.9 Change in Degree Level or Program

Graduate students in good academic standing may change their degree level or degree program after the completion of one semester.

A. Requirements for Changing Degree Level/Program

1. Graduate students are not required to re- apply to change their degree level or program.
2. Students must consult with their advisors and current Director of Graduate Programs (DGP).
3. The student must sign a Request for Change of Degree Status or Curriculum form and submit it to the DGP of the program in which the student is currently enrolled.
4. No change in level/program will be effective without the approval of:
   a. the DGP of the program in which the student is currently enrolled;
   b. the DGP of the new program into which the student is requesting transfer; and
   c. the Graduate School. Upon approval of the request, the Graduate School will notify both departments, where applicable, and transfer the student's records to the appropriate department.

B. Final Semester Transfers

If students request a change in degree level/program in their final semester, the deadline for submission is six weeks after the first day of classes in that semester.

C. Process for International Students

International students who have had a degree level/program approved must obtain a new I-20 from the Office of International Services (https://internationalservices.ncsu.edu/). The U.S. Citizenship and Immigration Services (https://www.uscis.gov/) requires a new visa when an academic program changes.

3.10 Dual Master's Degrees

Students enrolled in a master's degree program at NC State University may pursue additional master's degrees simultaneously provided that:

1. the Director of Graduate Programs (DGP) of each program approves the pursuit of multiple degrees;
2. an approved Plan of Work for each master's degree is submitted;
3. 18 hours are unique to each degree program; and
4. all other requirements and Graduate School rules are met for each degree;
5. the time limits in place for the initial degree apply to all others.

3.11 Master's Degrees while in Doctoral Status

A. Master’s Degrees in the Same Field as the Doctoral Degree

Students admitted to doctoral programs at NC State may be awarded a master’s degree in the same field as the doctoral program provided that all of the following conditions are satisfied:

1. The student does not already have a master’s degree in the same field.
2. All Graduate School, College, and Department/Program requirements for the master’s degree are satisfied.
3. The graduate program may require students to transfer into the master’s program from the doctoral program (or other master’s). Once a doctoral student is transferred into a master’s program, the student must complete the requirements for the master’s degree before returning to the doctoral program.
4. All requirements must be completed before the six-year time limit for master’s degrees.
5. The minimum of 72 credit hours required for the doctoral degree is met, including the credits used for the master’s degree.
6. International doctoral students who wish to obtain a master’s degree in a different program from their doctoral program with the intention of applying for Optional Practical Training in the field of the master’s curriculum must transfer to the new curriculum at the master’s level to be eligible for this training.
    - International doctoral graduate students must communicate their intentions to the DGP in each department as well as to the Office of International Services (OIS). Failure to do so could result in a violation of non-immigrant status and subsequent ineligibility for any type of employment.
    - Students in F-1 status who transfer to a new master’s program must obtain new I-20.

B. Master’s Degree in a Different Field from the Doctoral Degree

Graduate programs have the option of making their master’s degrees available to students pursuing doctoral degrees in other programs without the students transferring to the master’s program. For doctoral students to get degrees in master’s programs, the following conditions must be satisfied.

1. The student may not have a master’s degree or a doctorate in the field of the proposed master’s.
2. The student’s request must be approved by the DGP of the student’s doctoral program, the DGP of the proposed master’s program, and the Graduate School.
3. The student must make satisfactory academic progress toward the fulfillment of the doctoral degree requirements as outlined in the doctoral Plan of Work (this may consist only of doctoral research credits). Such students are limited to six credit hours per semester towards the master’s degree.
4. A minimum of 72 credit hours is required for the doctoral degree, including the credits used for a master’s degree at NC State University in the same field. The maximum number of credit hours that can be used from master’s level work is 36.
5. All Graduate School, College and Department/Program requirements for the master’s degree must be satisfied.
6. International doctoral students who wish to obtain a master’s degree in a different program from their doctoral program with the intention of applying for Optional Practical Training in the field of the master’s curriculum must transfer to the new curriculum at the master’s level to be eligible for this training.
    - International doctoral graduate students must communicate their intentions to the DGP in each department as well as to the Office of International Services (OIS). Failure to do so could result in a violation of non-immigrant status and subsequent ineligibility for any type of employment.
    - Students in F-1 status who transfer to a new master’s program must obtain new I-20.
7. In rare instances where a student wishes to enroll in more than one master’s program while enrolled in doctoral status, they must consult with the DGPs of the relevant programs and to be approved requires the documentation presented above.

C. Credit-Hour Requirements for Master’s Degrees while in Doctoral Status

1. A minimum of 18 hours must be unique to each master’s degree, but up to 36 hours can be shared with the doctoral program.
2. Combining credit hours from two or more master’s degrees is not permitted to satisfy the total doctoral credit hour requirement; i.e. courses from the master’s degrees are not additive.

D. Completion of Master’s Degree Requirements while in Doctoral Status

1. The DGP for the master’s program must notify the Graduate School that the student has met, or will meet in the current semester, the requirements for the master’s degree by submitting:
    - a Plan of Work for that degree,
    - an approved patent agreement (via Student Self-Service in MyPack Portal) that includes the names of the members of the master’s advisory committee (or advisor for Option B programs), and
    - a Plan of Work or a list of courses that are to be used to satisfy the master’s requirements.
2. It is the responsibility of the student to meet all deadlines for graduation with a master’s degree. The master’s degree should be awarded when the degree requirements are fulfilled.

E. Eligibility for Graduate Student Support Plan Tuition Support

The number of semesters of eligibility for tuition support under the Graduate Student Support Plan does not change as a result of the student’s electing to pursue a master’s degree in another program along the way to the Ph.D. The Graduate School maintains current online information and requirements for the Graduate Student Support Plan (https://grad.ncsu.edu/students/gssp/).

3.11a Co-Majors and Minors

Co-Majors

Graduate students wishing to co-major must obtain approval from both programs. Co-majors must meet all requirements for majors in both

programs. A representative from each program must also be included on the student's advisory committee. A student may not co-major in two different degree levels, i.e. a master's in one discipline and a doctoral in another.

One degree is awarded and the co-major is noted on the transcript. Enrolled co-majors will be classified in only one program for record purposes. *[Recommended by the Administrative Board of the Graduate School and approved by the Dean of the Graduate School on 9/23/93.]*

1. Master's Students: Students may co-major at the master's level in programs with identical degrees, although the degrees do not necessarily have to have identical requirements (e.g., two Master of Science programs, one with a thesis requirement and one without). No student is required to declare a minor.
2. Doctoral Students: Students may co-major at the doctoral level with the approval of both programs and with the appointment of a co-chair from each program on the advisory committee. The co-chairs will have equal responsibilities for directing and mentoring the student (see Section 3.2 Advisory Committees, A.1.c). Co-majors are not permitted between Doctor of Philosophy and Doctor of Education degree programs.

Minors

The Graduate School does not require a minor, although individual programs may require one. If a program does not require a minor, the graduate student has the option of choosing one, except in an Option B master's program in which a minor is not allowed. The minor work will usually be from a single discipline or field that in the judgment of the advisory committee provides relevant support to the major field. However, the committee has the alternative of developing an interdisciplinary minor if it best serves the needs of the student. *[Recommended by the Administrative Board of the Graduate School and approved by the Dean of the Graduate School on 12/12/91.]*

When a student selects a minor, the advisory committee must include a representative from the minor field. The minor credits on the Plan of Graduate Work must be approved by the graduate advisory committee member representing the minor, and, in some cases, the Director of Graduate Programs (DGP) from the minor program.

Minors That Require Approval of DGP of Minor Program

Students wishing to minor in Biotechnology, Plant Physiology, Statistics, and Water Resources, must obtain the approval from the respective DGP.

1. Doctoral Students: For doctoral students, this approval must be obtained from the minor field's DGP and then indicated on the Plan of Graduate Work submitted after the completion of 12 graduate hours at NC State.
2. Master's Students: For master's students, this approval must be obtained from the minor field's DGP at the onset of course work in the minor field so that they are able to meet any specific requirements in that minor well before the time they wish to schedule their final oral examination.

3.12 Accelerated Bachelor's/ Master's Program

The Accelerated Bachelors/Master's (ABM) degree program allows exceptional undergraduate students at NC State an opportunity to complete the requirements for both the bachelor's and master's degrees at an accelerated pace. These undergraduate students may double count up to 12 graduate-level credits (500 or 700 level) and obtain a master's degree within 12 months of completing the bachelor's degree.

ABMs provides an opportunity for the Directors of Graduate Programs (DGPs) to recruit rising juniors to their graduate programs. However, approval to pursue an ABM degree program does not guarantee an admission to the Graduate School. Admission is contingent on meeting eligibility requirements at the time of entering the graduate program.

A. Creating an Accelerated Bachelor's/ Master's Program

There are two options for creating ABM programs. The first option is a disciplinary model in which a bachelor's program and a master's program in the same department or in departments of closely related disciplines establish an ABM degree. Prior to admission of any student into such a degree program, the program must be developed by the undergraduate and graduate units and approved by the associated college(s) Deans, the Administrative Board of the Graduate School, and the Dean of the Graduate School.

The other option is an individualized model in which a student is in a department that has not established a formal ABM program or is in a department in one discipline and wants to pursue a master's degree in a different discipline. For this option, an ABM arrangement must be made between the student and the Director of Graduate Programs the graduate degree program and must be approved by the coordinator of the undergraduate program in which students are obtaining their bachelor's. The Director of Graduate Program must recommend admission to the Graduate School and this must be approved by the Dean of the Graduate School.

B. Student Eligibility Requirements

1. Students may apply once they have completed a minimum of seventy-five credit hours in their undergraduate programs, including credits earned from advanced placement, but prior to the completion of their bachelor's.
2. Transfer students must have completed a minimum of 24 hours as a full-time student at NC State.
3. Students must have a minimum overall undergraduate grade point average (GPA) of 3.500 at NC State at the time of admission into the ABM program. This GPA must be maintained throughout their undergraduate program to remain in an ABM program.
4. Students must receive a grade of B or better in the double counted graduate-level courses (500 or 700 level) while maintaining a 3.500 GPA. Courses with a grade of B- or below cannot be double counted between the two degrees.
5. If students' undergraduate GPAs drop below 3.500, the DGP must inform the directors of their undergraduate programs and the students in writing of their ineligibility. A copy of this letter must also be sent to the Graduate School.

6. A student who is ineligible to participate in or withdraws from the ABM program, cannot double count any courses for both bachelor's and master's degrees.
7. Students in the ABM must receive the bachelor's degree prior to entering graduate status.

C. Application to the Accelerated Bachelor's/Master's Program

1. Interested students that meet the GPA requirement should schedule a meeting with their Directors of Undergraduate and Graduate Programs to develop tentative academic plans for the bachelor's and master's degree programs. The Graduate School requires an approved ABM Plan of Work form to admit a student into an ABM program. The ABM Plan of Graduate Work should clearly indicate:
   - the courses (a maximum of 12 graduate credit hours, 500 or 700 level) that will be double counted for both bachelor's and master's degrees,
   - the courses that will be taken after matriculating into the graduate program,
   - the graduation date for the master's degree that meets the time limit for the ABM program.
2. While still an undergraduate, students must submit the standard application for admission to the Graduate School including an application fee and other documents/standardized test scores required by individual programs.
3. Any deviations from the approved ABM Plan of Work form, require that the updates be approved by the Directors of Undergraduate and Graduate Programs as well as the Graduate School.

D. Withdrawal

Student may withdraw at any time from an ABM program by informing the Directors of Undergraduate and Graduate programs in writing. A copy of this request must also be sent to the Graduate School.

3.13 Graduate Certificate Programs

A. Definition

A Graduate Certificate Program (GCP) is a prescribed set of related graduate-level academic courses, designed by an academic department or program. To receive a certificate, non-degree-seeking students must submit an application and fee through the Graduate School and obtain admission, whereas enrolled graduate students are required to submit the Graduate Certificate Plan Entry form. Certificates cannot be conferred retroactively for students not continuously enrolled in a graduate degree program when the required coursework was completed. Upon completion, the GCP will be designated on the student's transcript and the student shall receive a certificate from Registration and Records entitled "Graduate Certificate in…." Students enrolled in graduate certificate programs may be eligible for federal financial aid. Contact the Financial Aid Office (https://online-distance.ncsu.edu/cost/financial-aid/) for more information.

B. Minimum Requirements for Graduate Certificate Programs

1. All students enrolled in a GCP must have a bachelor's degree from a regionally accredited institution of higher education; the transcript of this degree indicating conferral date must be submitted to the Graduate School.
2. All GCP coursework must be taken at NC State. **Transfer credit from other institutions is not allowed.**
3. The minimum number of credits required for a GCP is 12.
4. For most GCP, required courses must be regular graduate-level academic courses; 400-level courses may only be used for those certificates where a course at that level has been approved by the Administrative Board as part of the GCP's approval process.
5. All courses should be letter graded, although three credits of S/U-graded coursework can be used where the courses are relevant to the certificate and S/U is the only grading option.
6. GCP students do not have the option of taking the courses for "credit only" if they intend for the course to be part of their GCP.
7. To receive a Graduate Certificate, a student must have a minimum 3.000 grade point average (GPA) on all certificate coursework. All grades on courses taken towards the certificate program in courses numbered 400 and above are included in the GPA.
8. A minimum grade of a C- is required to receive certificate credit for a course, although departments/programs may require a higher minimum and the overall GPA requirement must still be maintained.
9. GCPs must be completed within four years, beginning with the date the student commences courses applicable to the GCP, unless a more restrictive time limit has been established by the program or academic college/school.
10. Students can obtain multiple certificates from NC State. Each certificate must have at least nine credit hours that are unique to it; see Section C for certificates taken by students in a degree program.

C. Graduate Certificates and Graduate Degree Program

1. Internal and Shared Credit
   a. Graduate certificate courses taken while enrolled in a degree program may be double-counted with the degree courses to the extent that the courses unique to the degree remains eighteen hours for a master's or thirty-six hours for a doctorate.
   b. Interinstitutional courses count as NC State courses.
   c. Certificate and graduate minor coursework shall not be shared, i.e., a student getting a minor using a set of coursework may not also get a certificate using that same coursework.
2. Transferring Certificate Coursework into a Degree Program
   a. Up to 12 hours of certificate credit taken prior to enrollment in an NC State master's or doctoral degree program may be transferred into that degree program so long as eighteen hours remain unique to the master's and thirty-six hours to the doctorate.

3.14 Minimum Enrollment Requirements

A. Requirements of Continuous Enrollment

After students are admitted to the Graduate School and enroll for the first time, they are required to maintain continuous enrollment. This mandates that students enroll each Fall and Spring semester, excluding Summer terms, until they graduate. Failure to maintain continuous enrollment results in termination of academic program. To re-enroll following

termination, students must reapply for admission, pay the admission fee, and be granted admission by the program and the Graduate School (see Readmission, Section 2.3 (p. 930))

Exceptions

1. Leave of Absence
   Students who must interrupt their enrollment may, with a strong justification, request a leave of absence from graduate study for up to two semesters within a given graduate degree program. Students should initiate the request with their advisor and have it approved by their DGP before its submission to the Graduate School. The time spent on an approved leave of absence will be included in a degree's time limit; i.e., the degree "clock" does not stop, nor is it reset.
2. Withdrawal
   - Withdrawal prior to Census. An approved Leave of Absence is required of any graduate student who withdraws prior to Census.
   - Withdrawing after Census. Withdrawal following Census constitutes continuous enrollment; therefore, a Leave of Absence is not required.

Required Summer Enrollment

All students who take their final oral examination or submit their thesis/dissertation to the Graduate School during the Summer must be registered for at least one of the two summer sessions.

No Registration Requirement related to ETD Submission

To be eligible for no registration, students must have been registered in the preceding semester or Summer term. Furthermore, they must have unconditionally passed their final oral exam and submitted their ETD for review prior to the first day of a subsequent term (inclusive of Summer) are not required to register for that semester/term (see the Table below for more details).

Term Enrolled	Last Date for ETD Submission	No-Registration Semester[1]
Fall	The last business day prior to the start of Spring semester	Spring
Spring	The last business day prior to the start of the first Summer term	Summer (either I or II)
Summer I or II	The last business day prior to the start of the Fall term	Fall

*If students do not complete the ETD process by the term denoted here, they will be required to register for additional coursework to graduate.

Graduation without Registration

Students who complete all degree requirements prior to the first day of the Fall or Spring semester or the first Summer term may graduate during the next semester or Summer term without being registered provided:

1. they were registered in the immediately preceding semester or summer session; and
2. they apply to graduate during that subsequent term.

Students whose only remaining requirement for graduation is removal of an "IN" (Incomplete) grade are not required to be registered in the following semester or term to complete the work and graduate; however, only one registration-free semester or term is allowed. See Section 3.18 for more details.

B. Requirements for Full-/Half-Time Registration

Fall and Spring Semesters

Thesis master's or doctoral students

- Full-Time: To be full-time, students must be enrolled in at least 9 hours per semester. If they have accumulated or will accumulate sufficient hours to meet the degree requirements (a minimum of 30 and 72 for master's and doctoral degrees, respectively), they will be considered full-time until they complete their thesis or dissertation provided they enroll for at least 3 credit hours.
- Half-Time: To be half-time, students must enroll in a minimum of 4.5 but not more than 8.5 hours a semester unless they have fulfilled the hours required for program (see details above).

Master's students enrolled in a program not requiring a thesis

Master's students enrolled in plans allowing both a thesis and a non-thesis option will be classified as "non-thesis" students and subject to these rules until such time as a graduate Plan of Work designating the thesis-option is approved by the Graduate School.

- Full Time:To be full-time, students must be enrolled in at least 9 hours per semester.
- Half Time:To be half-time, students must enroll in a minimum of 4.5 but not more than 8.5 hours a semester.

International Students

The U.S. Citizenship and Immigration Services (USCIS) (https://www.uscis.gov/) requires international students on F-1 or J-1 visas to carry a full-time course of study to remain in status. Students in their final semester who have completed the minimum hours required for a degree can use the Reduced Course Load form to enroll in fewer hours.

Co-op Students

Co-op students registered for COP 500 will be considered full-time. Students registered for only COP 501 will be considered half-time.

Waiver of Hours

Graduate students who meet certain prescribed special conditions, may be certified as either a full-time or half-time in cases where they do not meet the requirements for such as outlined above. A waiver of the uniform academic load rules requires attestation on behalf of the student by their committee chair, academic advisor, or their Director of Graduate Program and approval by the University.

Summer Terms

- Graduate students are not required to register during the summer.
- Students not enrolled in the Summer maintain their access to the library, but other facilities that are funded by students fees, such as the gym and Student Health Services, cannot be accessed without paying for a summer membership.
- Students who are employed as Graduate Research Assistants, but who are not enrolled in the University during a period of at least five weeks, are subject to Social Security tax withholding. Specifically,

given Federal tax law as it relates to employment outside of student status, Social Security taxes will be withheld in June for RAs who are not registered in Summer Session I and in July for RAs who are not registered in Summer Session II. The source of funds that pays the stipend must pay the same amount of Social Security tax as is withheld from the student's paycheck during these months.

- Two special registration categories are available for Graduate Research Assistants who would not otherwise take courses in the summer: XXX 696 (Summer Thesis Research) and XXX 896 (Summer Dissertation Research), where XXX represents the course prefix of a specific department/program. Each of these courses is for 1 hour of credit, which is considered full-time enrollment for tax purposes, for the Summer and which run for 10 weeks, beginning the first day of Summer Session I and extend into Session II. Social Security taxes will not be withheld from the June or July paychecks of RAs who register for either 696 or 896.
- Please note that students who are not registered at least half time during the Summer are ineligible for Financial Aid during that period.

3.15 Course Registration

A. Graduate Course Levels

1. Graduate students typically enroll for courses at the 500 through 800 level.
2. Advanced undergraduate students may enroll in 500-level courses unless otherwise specified.
3. Only graduate or PBS students may enroll in 700- and 800-level courses.
4. A student may take up to 6 hours of 400-level courses for graduate credit provided that they are outside the student's major and the program is not at the doctoral level. No more than one 400-level course of up to 4 credit hours may be used for a graduate certificate.
5. Students may not count 900-level courses toward a graduate degree program or graduate certificate.

B. Course-Load Requirements (see Section 3.14)

C. Maximum Course Load

The maximum course load for graduate degree students is 15 credit hours in a semester and six credit hours in a summer session, although students on assistantships may have lower limits imposed by their advisors or programs. Graduate students who wish to enroll for more than 15 hours must complete a Schedule Revision form that is approved at the departmental, college, and Graduate School levels.

D. Credit-Only Course Limitations

Courses at the 500 and 700 level are letter graded and cannot be taken for "credit only."
Graduate students must take 400-level courses that are letter-graded if they intend for them to fulfill programmatic requirements.

E. Enrolling for Courses in MyPack Portal

After consulting with their advisor, students may register through MyPack Portal using their Unity ID and password. Students cannot register before their enrollment access is scheduled. If an advisor has not yet been appointed, the student should consult their DGP to determine appropriate coursework.

Course descriptions are available through the Registration and Records online Course Catalog (https://webappprd.acs.ncsu.edu/php/coursecat/directory.php).

Instructor consent is required for all practica, individual special topics or special problems courses, internships, and thesis or dissertation research.

F. Adding Courses

1. During the first week of a semester, students may add courses via MyPack Portal without permission; during the second week, course additions require instructor permission.
2. Summer courses can be added during the first two days of a session without permission and during the third and fourth days with instructor permission.
3. To add a student to a course after the Census date, a Schedule Revision Form (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/) is required.

G. Dropping Courses

All 500-800 level courses may be dropped through MyPack Portal without grades during the first eight weeks of a semester and during the first two weeks of a summer session. Tuition will not be refunded for any courses dropped after the Census date.

A Schedule Revision Form (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/) is required to drop a course after the deadline. Late dropping of courses requires documented medical reasons or other verified evidence of hardship. Courses may not be dropped after final grades have posted.

H. Dropping Non-Traditional Courses

For courses that deviate from the regular semester/session calendars, students should refer to their class syllabus and/or contact their instructor to verify the last day to drop a course without a grade.

I. Requirements for Auditing Courses

To audit a course, graduate students must have the approval of their advisor and the course instructor. While auditors receive no course credit, they are expected to attend class. Should an instructor conclude that an auditor has failed to attend, the instructor may assign a grade of "NR" (no recognition given for an audit). Graduate students may audit one course a semester tuition free; additional audits will require tuition payment.

J. Taking Courses for Credit at Other North Carolina Institutions

Interinstitutional Registration Program

- NC State participates in an Interinstitutional Registration program. Under this agreement, NC State graduate students are permitted to register for classes on one of the other campuses as approved by their advisory committees provided those courses are not offered at NC State.
- Even though taking a course on another campus, the student is exclusively under the administrative direction of the NC State Graduate School. Enrollment for courses on other campuses will

take place on this campus following guidelines from Registration and Records. The Graduate School considers such courses part of the student's normal load and the student will be billed for the courses through the NC State University Cashier's Office. During the summer, the procedure is somewhat different in that a student must be enrolled in a least one course on the NC State campus during the same session as the requested interinstitutional registration.

- As the grading systems of University of North Carolina at Chapel Hill and Duke differ from that of NC State, grades received under Interinstitutional Registration will be converted to the NC State system. For example, "H," "P," "L, and "F" grades earned at the University of North Carolina at Chapel Hill and "E," "G," "S" and "F" grades earned at Duke University will be converted to "A," "B," "C" and "F" grades, respectively.

Cooperating Raleigh Colleges

- The Cooperating Raleigh Colleges (CRC) is a program organized for the purpose of developing and conducting cooperative educational activities among Raleigh institutions. Graduate students may enroll in courses not offered by NC State. Registration and Records maintains CRC registration procedures.
- Any NC State graduate degree student who is enrolled in at least three graduate credit hours on the NC State campus may take a course through the CRC during the Fall or Spring semester, provided that:
  - (a) the course is not taught on the NC State campus;
  - (b) the advisory committee considers the course essential; and
  - (c) the student receives prior approval from the Graduate School.
- NC State students may not register for more than a total of six credits. Grades from CRC are not used in computing a student's NC State grade point average.
- Under this agreement, regular tuition and fees are paid to NC State. Students are responsible for any special fees.

3.16 Withdrawal from the University

Degree Seeking Students

A. Terminating an Active Program

1. A student who wishes to terminate his/her graduate program must first notify his/her department or program in writing.
2. The Director of Graduate Programs (DGP) then forwards the request to the Graduate School for approval.
3. If the student is not in good standing, the student will receive a 'Termination' notation on their transcripts. If the student is in good standing, the student receives a 'Termination without prejudice' notation on their transcripts.
4. If the student has preregistered, notification to withdraw must be approved before the last day of the drop period. The student is responsible for dropping all classes for the upcoming semester.

B. Withdrawal Prior to the End of the Official Drop Period (of the semester in which currently enrolled)

1. Withdrawal prior to the end of the drop period is a release from the University for the remainder of the semester.
2. Students considering withdrawal should consult their major advisor and DGP.
3. A student who wishes to drop all courses and who has preregistered and prepaid must go through the official withdrawal process which can be found at MyPack Portal: Student Self Service > Enrollment > Term Withdrawal.
4. NC State students carrying course work at another campus under the Interinstitutional Registration Program must also contact the Department of Registration and Records to initiate the paperwork necessary for removal from the class roll at the other institution.

C. Late Withdrawals

Graduate students may receive withdrawals after the last day of the official drop period but before the end of the semester. Students considering withdrawal should consult their major advisor and DGP. A student who wishes to pursue a withdrawal must go through the official withdrawal process can be found at MyPack Portal: Student Self Service > Enrollment > Term Withdrawal. Withdrawals will be considered under one or more of the following conditions:

1. Certification by a physician of inability to continue for medical reasons. Such medical petitions are subject to review by a University physician at the Student Health Center.
2. Certification by the Counseling Center or by an independent psychiatrist or psychologist of inability to continue for psychiatric/psychological reasons. In this case, the Counseling Center reserves the right to review pertinent records and to reexamine the student if necessary before recommending withdrawal. This is to certify that:
   a. there has been a significant decrease in the student's usual level of psychological functioning, and
   b. that regaining the previous level of functioning will involve a process of sufficient academic disruption to make continuing as a student unreasonable. In this situation a "hold" may be placed on the student's readmission pending certification by the Counseling Center or independent psychologist/psychiatrist that the student has regained an appropriate level of function and can be expected to maintain that usual level of psychological competence.
3. Documentation of a personal or family hardship that adversely affected the student's academic performance in a significant way.

The DGP, Dean of the College, and the Graduate School will review the student's request, consulting with the Counseling and Student Health Centers as appropriate. Once a final decision has been rendered, the student will be notified of that decision.

D. Retroactive Withdrawals

Requests for retroactive withdrawals may be made if the semester in which the student was registered has passed. Such withdrawals will normally be for an entire semester rather than for individual courses. Students considering such withdrawals should consult their major advisor and DGP. A student who wishes to pursue a retroactive withdrawal must go through the official withdrawal process through the Counseling Center. Withdrawals will be considered under one or more of the following conditions:

1. Certification by a physician of inability to perform during the semester in question. Such medical petitions are subject to review by a University physician if a request for consultation is made by the Counseling Center.

2. Certification by the Counseling Center, or by an independent psychiatrist or psychologist, of inability to perform during the semester in question for psychiatric/psychological reasons. In this case, the Counseling Center reserves the right to review pertinent records and to reexamine the student if necessary before recommending withdrawal. The certification must show a significant decrease in the student's usual level of psychological functioning resulting in severely diminished performance.
3. Documentation of a personal or family hardship that adversely affected the student's academic performance significantly during the semester in question.

The Counseling Center will communicate their recommendation to the Dean of the College in which the student was enrolled. The Dean of the College will review the student's request and the Counseling Center's recommendation, consulting with the student's DGP if appropriate, and make a recommendation to the Graduate School. The Dean of the Graduate School will approve or deny the student's request accordingly.

E. Effect of Withdrawal on Meeting Continuous Registration Requirement

Any student enrolled in a graduate program who is registered for a given semester or summer session and withdraws during the official registration period (typically the first 10 or 5 working days of a semester or summer session, respectively) must obtain a leave of absence to meet the requirement for continuous registration. However, those students withdrawing after the official registration period ends DO NOT need to obtain a leave of absence and will be considered by the Graduate School as having met their continuous registration requirement.

F. Effect of Withdrawal on Permanent Record

Neither courses nor grades are recorded on the permanent record for students who withdraw during the regular drop period. After the last day of the official drop period withdrawals without academic penalty are approved only under exceptional circumstances. In such cases, neither courses nor grades are recorded on the permanent record.

Graduate Certificate Students

G. Withdrawal Prior to the End of the Official Drop Period

Graduate certificate students should apply for withdrawal using Student Self Service in MyPack Portal through the end of the official drop period. Apply using the navigation: SIS > Student Self Service > Enrollment > Term Withdrawal. International students or students who are receiving financial aid must use the withdrawal form noted below rather than the online process.

H. Late Withdrawal

Withdrawal after the Drop Deadline requires submission of a completed Graduate Certificate Withdrawal form to the Graduate School for approval.

I. Effect of Withdrawal on Permanent Record

Neither courses nor grades are recorded on the permanent record for students who withdraw during the regular drop period. Withdrawal after the drop deadline may result in W grades for courses in which the student is enrolled. Extenuating circumstances may justify W grades not being issued.

3.17 Grades

A. General Information

1. Evaluation of a student's performance in a particular course or section is the prerogative of the instructor responsible for that course or section. No grade assigned to a student in a particular course or section may be changed without the consent of the faculty member responsible for that course or section unless required by the result of grievnace.
2. Each faculty member who assigns grades has the responsibility to implement grading procedures that are fair and equitable, and to provide a reasonable evaluation of the student's performance in the course.
3. At the beginning of the semester, faculty must include their grading scale and how grades will be determine in each course syllabus.

B. Types of Grading Systems

Performance in 500- and 700-level courses is evaluated on a scale ranging from "A+" through "F", with a plus/minus designation if selected by the instructor. Performance in most 600- and 800-level courses is evaluated as either "S" (Satisfactory) or "U" (Unsatisfactory); these grades are not used in computing the GPA.

C. Minimum Grade Requirements for Graduate Credit

A course in which a student earns below a C- or a "U" will not be included in the minimum hours required for a given degree. Depending on the course, students may be required to repeat it.

D. Regular Grading Scale and Grade Points

The following grade points are used in the calculation of grade point averages:

Grade	Points
A+	4.333
A	4
A-	3.667
B+	3.333
B	3
B-	2.667
C+	2.333
C	2
C-	1.667
D+	1.333
D	1
D-	0.667
F	0

E. Grade Point Average (GPA)

To determine a student's GPA, the total number of grade points earned is divided by the number of graded credit hours at the 400 level or higher that are attempted. The cumulative and semester GPAs will include the effect of any A+ grades awarded (at 4.33 grade points) up to a grade

point average of 4.000. The grade point average will be calculated to three decimal places.

F. Post-Baccalaureate Studies (PBS)

Up to 12 credits earned in PBS courses with at least a grade of “B” can be officially transferred into a student’s program; these courses are also included in the GPA.

G. Incompletes

The grade of Incomplete (“IN”) may be given in any course at the instructor’s discretion for work not completed because of a serious interruption in the student’s work not caused by their own negligence. An “IN” must not be used, however, as a substitute for an “F” or “U” when the student’s performance in the course is not passing. An “IN” is only appropriate when the student’s record in the course is such that the successful completion of particular assignments, projects, or tests missed as a result of a documented serious event would enable that student to receive at least a C. Only work missed may be completed; no additional assignments can be included.

A student who receives an “IN” must complete the unfinished work by the end of the next semester in which the student is enrolled, provided that this period is no longer than 12 months from the end of the semester or summer session in which the “IN” was received. Otherwise, the “IN” will be automatically converted to “F” or “U,” in accord with the grading option for a particular course. All grades of “IN” must be cleared prior to graduation. Students must not register again for any courses in which they have “IN” grades. Such registration does not remove “IN” grades, and the completion of the course on the second occasion will automatically result in an “F” for the incomplete course.

- Students whose only remaining requirement for graduation is removal of an “IN” are not required to register in the following semester to complete the work and graduate; however, only one registration-free semester is allowed.

In special cases, the Graduate School may grant an extension of a student’s incomplete grade. Either the online Grade Change system or an Extension of Incomplete Grade form must be submitted.

To discourage excessive and/or unwarranted use of incomplete grades and extensions for an individual student, an extension of an incomplete grade will not be granted by the Graduate School if the student holds incomplete grades in other courses at the time of the request.

H. External Transfer Credit

Except in the case of interinstitutional courses, grades transferred from another institution will not be included in the GPA. See Section 3.1 for more information about transferring graduate credits.

I. Repeating Courses

A graduate student may repeat a course in which a grade of “C-” or lower has been earned. Repeating a course where a grade of “C” or higher has been earned requires the specific recommendation of the advisory committee as well as the approval of the DGP and the Graduate School. Students who repeat a course, regardless of the grade previously earned, will have both grades counted in their GPA. The semester hours will be counted only once toward the required minimum hours.

J. Grade Changes (see Section 5 in NC State REG 02.50.03)

After grades are posted, they are not subject to change based on a change in an instructor’s judgment; nor are submitted grades to be revised on the basis of a second trial (e.g., a new examination or additional work undertaken or completed). Changes must be made within one calendar year after the date final grades were posted to correct an error of computation or transcription or where part of the student’s work has been overlooked.

To change a grade, the instructor submits a grade change accompanied by a justification. This change must be approved by the DGP and Department Head relevant to the course, the appropriate Associate Dean, and the Graduate School. “IN” or “LA” grade changes require only departmental approval.

3.18 Graduate Courses

A. Credentials Required for Teaching Graduate Courses

The Southern Association of Colleges and Schools Commission on Colleges (SACSCOC) requires that graduate courses be taught by faculty with an earned doctorate/terminal degree in the teaching discipline or a related discipline. To that end, the following requirements for the teaching of graduate courses are established:

1. Both primary and secondary instructors must be graduate faculty in the academic program offering the course or approved non-graduate faculty (see Section 1.3 of the Administrative Handbook, sub-sections C and E).
2. All instructors must have an active record in HR (Human Resources).
3. Sections of the following courses must be taught by associate or full members of the graduate faculty:
   - XXX 685 Master’s Supervised Teaching
   - XXX 686-687 Master’s Other Teaching
   - XXX 690 Master’s Exams
   - XXX 691-699 Master’s Research
   - XXX 885 Doctoral Supervised Teaching
   - XXX 886-887 Doctoral Other Teaching
   - XXX 890 Doctoral Exams
   - XXX 891-899 Doctoral Research
4. Support personnel do not need to be graduate faculty but they must have 0% teaching load assigned.
5. All sections must have valid instructors listed (STAFF or blank is not acceptable).

B. Graduate Courses

Course Number	Explanation
5XX	Letter Graded Master’s Courses
6XX	S-U Graded Master’s Courses
7XX	Letter Graded Doctoral Courses (ALL 7XX courses are restricted to the following classification of students: MR, DR, SR, SP and GR)

8XX	S-U Graded Doctoral Courses (ALL 8XX courses, with the exception of those specifically listed at the end of this section, are restricted to the following classification of students: MR, DR, SR, SP and GR)
9XX	Professional Courses in the College of Veterinary Medicine are not graduate courses and may not be counted in Plans of Work for graduate degrees.

C. 500-Level Letter Graded Master's Courses

Course Number	Explanation
500-589	Undesignated
590-599	Letter Graded Special Topic Master's Courses

Note: Courses at the 500 level are letter graded. Students cannot enroll in these courses for 'credit only.'

D. 600-Level S/U Graded Master's Courses

Course Number	Explanation
600-609	**Introductory, Seminars, Colloquiums**
600	Introduction to Graduate Study (in department or program)
601	Seminar (in department or program)
602-606	Seminar in <specialization> (in department or program)
607	Advanced Seminar
609	Colloquium
610-617	**Topics Courses**
610	Special Topics (in department or program)
611-613	Special Topics in <specialization> (in department or program)
615	Advanced Special Topics (in department or program)
616-617	Advanced Special Topics in <specialization> (in department or program)
620-626	**Problems Courses**
620	Special Problems (in department or program)
621-622	Special Problems in <specialization> (in department or program)
623-624	Miscellaneous Special Problems
625-626	Advanced Special Problems
630-634	**Independent/Individual Study**
630	Independent Study (in department or program)
631-634	Other independent or individual study courses
635-639	**Readings**
635	Readings (in department or program)
636-639	Advanced Readings
640-649	**Practicums**
640	Prepracticum
641-649	Practicum in <specialization> (in department or program)
650-659	**Internships**
650	Internship (in department or program)
651-659	Internship in <specialization> (in department or program)
660-669	**Miscellaneous**
660-669	Miscellaneous that do not fit into any other category
670-671	**Lab Rotations**
670-671	Lab Rotations
675-679	**Projects**
675-679	Project courses (of all types)
680-684	**Directed Study**
680-682	Directed Study (in department)
683-684	Advanced Directed Study
685-687	**Teaching**
685	Master's Supervised Teaching
686-687	Other Teaching
690	**Exams**
690	Master's Exams
691-699	**Research**
693	Master's Supervised Research
695	Master's Thesis Research
696	Summer Thesis Research
697	Final Research Project
699	Master's Thesis Preparation

Note: Courses at the 600 level are S/U graded. Students cannot enroll in these courses for a letter grade. Registration in 600-level courses is restricted to graduate or PBS status.

E. 700-Level Letter Graded Doctoral Courses

Course Number	Explanation
700-789	Undesignated
790-799	Letter Graded Special Topic Doctoral Courses

Note: Courses at the 700 level are letter graded. Students cannot enroll in these courses for 'credit only.' Registration in 700-level courses is restricted to graduate or PBS status.

F. 800-Level S/U Graded Doctoral Courses

Course Number	Explanation
800-809	**Introductory, Seminars, Colloquiums**
800	Introduction to Graduate Study (in department or program)
801	Seminar (in department or program)
802-806	Seminar in <specialization> (in department or program)
807	Advanced Seminar
809	Colloquium
810-817	**Topics Courses**
810	Special Topics (in department or program)
811-813	Special Topics in <specialization> (in department or program)
815	Advanced Special Topics (in department or program)
816-817	Advanced Special Topics in <specialization> (in department or program)
820-826	**Problems Courses**
820	Special Problems (in department or program)
821-822	Special Problems in <specialization> (in department or program)
823-824	Miscellaneous Special Problems
825-826	Advanced Special Problems
830-834	**Independent/Individual Study**
830	Independent Study (in department or program)
831-834	Other independent or individual study courses
835-839	**Readings**
835	Readings (in department or program)
836-839	Advanced Readings
840-849	**Practicums**
840	Prepracticum
841-849	Practicum in <specialization> (in department or program)
850-859	**Internships**
850	Internship (in department or program)
851-859	Internship in <specialization> (in department or program)
860-869	**Miscellaneous**
860-869	Miscellaneous that do not fit into any other category
870-871	**Lab Rotations**
870-871	Lab Rotations
875-879	**Projects**
875-879	Project courses (of all types)
880-884	**Directed Study**
880-882	Directed Study (in department)
883-884	Advanced Directed Study
885-887	**Teaching**
885	Doctoral Supervised Teaching
886-887	Other Teaching
890	**Exams**
890	Doctoral Exams
891-899	**Research**
893	Doctoral Supervised Research
895	Doctoral Thesis Research
896	Summer Thesis Research
897	Final Research Project
899	Doctoral Thesis Preparation

Note: ALL 800-level S/U graded doctoral courses with the exception of those specifically listed below are restricted to graduate or PBS status.

G. Catalog Descriptions for Research, Teaching, and Examination Courses

- XXX 685 Master's Supervised Teaching. Restricted to master's student. 1-3. Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion.
- XXX 688 Non-Thesis Master's Continuous Registration – Half-Time Registration. Restricted to master's students. 1. For students in non-thesis master's programs who have completed all credit-hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc. As noted in the prerequisite above, the course-inventory system restricts enrollment in this course to master's students only (class MR).
- XXX 689 Non-Thesis Master's Continuous Registration – Full-Time Registration. Restricted to master's students. 3 credit hours. For students in non-thesis master's programs who have completed all credit-hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. As noted in the prerequisite above, the course-inventory system restricts enrollment in this course to master's students only (class MR). Students may register for this course a maximum of one semester. Registration restricted to 3 credits only.
- XXX 690 Master's Examination. Restricted to master's students. 1-6 credit hours. For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam. As noted in the prerequisite above, the course-inventory system restricts enrollment in courses with this number to master's students only (class MR). XXX 690 cannot be used to fulfill course requirements, cannot be listed on the Plan of Work for credit, and cannot be transferred to another program.
- XXX 693 Master's Supervised Research. Restricted to master's students. 1-9 credit hours. Instruction in research and research under the mentorship of a member of the Graduate Faculty. In spite of the noted prerequisite the course inventory system actually restricts enrollment in courses with this number to student class MR or DR.

- XXX 695 Master's Thesis Research. Restricted to master's students. 1-9 credit hours. Thesis research.
- XXX 696 Summer Thesis Research. Restricted to master's students. 1 credit hour. Thesis research. Ten-week course beginning the first day of Summer Session I. XXX 696 cannot be used to fulfill course requirements, cannot be listed on the Plan of Work for credit, and cannot be transferred to another program.
- XXX 699 Master's Thesis Preparation. Restricted to master's student. 1-3 credit hours. For students who are writing their theses. May be counted in the Plan of Work.
- XXX 885 Doctoral Supervised Teaching. Restricted to doctoral students. 1-3 credit hours. Teaching experience under the mentorship of faculty who assist the student in planning for a teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion. 885 Doctoral Supervised Teaching courses are restricted to Doctoral students only (class DR) by the course-inventory system as indicated by the prerequisite noted above.
- XXX 890 Doctoral Preliminary Examination. Restricted to doctoral students. 1-9 credit hours. For students who are preparing for and taking written and/or oral preliminary exams. 890 Doctoral Preliminary Examination courses are restricted by the course-inventory system to Doctoral students only (class DR) as indicated by the prerequisite noted above. XXX 890 cannot be used to fulfill course requirements, cannot be listed on the Plan of Work for credit, and cannot be transferred to another program.
- XXX 893 Doctoral Supervised Research. Restricted to doctoral students. 1-9 credit hours. Instruction in research and research under the mentorship of a member of the Graduate Faculty. 893 Doctoral Supervised Research courses are restricted to Doctoral students only (class DR) as indicated by the prerequisite noted above.
- XXX 895 Doctoral Dissertation Research. Restricted to doctoral students. 1-9 credit hours. Dissertation research. 895 Doctoral Dissertation Research courses are restricted to Doctoral students only (class DR) as indicated by the prerequisite noted above.
- XXX 896 Summer Dissertation Research. Restricted to doctoral students. 1 credit hour. Dissertation research. Ten-week course beginning the first day of Summer Session I. 895 Doctoral Dissertation Research courses are restricted to Doctoral students only (class DR) as indicated by the prerequisite noted above. XXX 896 cannot be used to fulfill course requirements, cannot be listed on the Plan of Work for credit, and cannot be transferred to another program.
- XXX 899 Doctoral Dissertation Preparation. Restricted to doctoral students. 1-3 credit hours. For students who are writing their dissertation. May count toward the Graduate Plan of Work.

Master's students going on to pursue a Ph.D. can register for Ph.D. coursework during their last semester of the master's degree instead of 689, 695, or 699 provided they have completed the master's degree requirements.

The courses are all variable credit, but none are zero credit courses.

1. The number of credits students register for in the courses should not exceed the upper limits stated in the descriptions.
2. As a general rule, master's students should not register for 8XX-level courses and doctoral students should not register for 6XX-level courses. The course inventory allows scheduling of students in the classes FR, JR, SO, SR. in courses numbered 800 where the course prefix is II.

H. Credit Hours for Intensive Graduate Courses

A maximum of one credit hour will be awarded per week of full-time study for graduate courses offered by NC State University. At least 60 days before such a course is taught, the syllabus must be submitted to the Graduate School for approval.

I. Syllabus Requirement for Graduate Courses

All instructors of graduate courses are required, no later than the first class, to provide students with a written or electronic course syllabus which contains the information listed in NC State's Syllabus Regulation (https://policies.ncsu.edu/regulation/reg-02-20-07/) (REG 02.20.07).

A syllabus must be approved by the Administrative Board of the Graduate School as part of a new course proposal.

3.19 Academic Difficulty

Graduate students may be terminated from the program at any time if, in the judgment of the degree-granting Department/Program and the Graduate School, a student fails to make satisfactory progress towards the completion of the degree (regardless of grades) or violates the NC State Code of Student Conduct. The definition of satisfactory progress toward completion of the degree program may differ among degree-offering units. Examples of unsatisfactory progress may include, but are not limited to, inadequate GPA, inadequate research and/or research skill or progress, failure to obtain satisfactory grades in required courses for the program, or failing the preliminary or final oral examination.

An overall GPA of at least 3.000 is required for graduation.

A. Academic Warning

Graduate students are given a notice of academic warning if they have accumulated 18 or fewer hours at the 400 level or above and have less than a 3.000 GPA. Students on academic warning may continue to hold an assistantship or fellowship provided the DGP supplies a justification as well as continuing to receive financial aid.

B. Academic Probation

Graduate students will be placed on academic probation if they have accumulated more than 18 hours at the 400 level or above and have a GPA in the range of 2.667 to 2.999. Students placed on academic probation will be ineligible for financial aid and appointment or reappointment to an assistantship or fellowship.

C. Termination

Graduate students will be terminated from their program of study if they have accumulated more than 18 hours at the 400 level or above and have a GPA below 2.667, or if they have accumulated 30 or more hours and have less than a 3.000 GPA. When terminated, a student may no longer register in a graduate classification (see Section 3.16 – Withdrawal from the University (p. 949) for more information on program termination.)

If a student's graduate degree program is terminated, s/he cannot use courses taken in PBS status after termination for credit toward the same graduate degree program.

D. Reinstatement

Under extenuating circumstances, the Director of Graduate Programs (DGP) may recommend and provide justification to the Graduate School to reinstate a student's graduate classification using the Reinstatement Form (https://www3.acs.ncsu.edu/gsoars4/reinstatement/search.php). This recommendation must be in writing and must be signed and approved by the advisory committee and the DGP or the Department Head before it will be considered. It must include a reasonable academic and mentoring plan for achieving at least a 3.000 average.

If approved, the Graduate School will execute a "Matriculation" action in SIS, accompanied by a confirmation letter to the DGP and a request to Registration and Records to update the student's academic standing. To register, the "advising service indicator" must be removed by either the Graduate School or the program as early as the following day. Students who request reinstatement of their assistantships/fellowships should ask their DGP to submit a request to the Graduate School along with the academic reinstatement request (https://www3.acs.ncsu.edu/gsoars4/reinstatement/search.php). The expectation is that the student's GPA will be at least a 3.000 at the end of the semester. Please refer to Section 4.2 (p. 959).

3.20 Graduation

A. Official Graduations

There are three official graduations per year at NC State: at the end of the Fall and Spring semesters and at the end of the second Summer session. Formal commencement exercises are held at the end of the Fall and Spring semesters; any student who completed their degree during a summer session is eligible to participate in the Fall commencement exercises. All students scheduled to graduate in the Fall or Spring semesters are strongly encouraged to attend the respective commencement. Any doctoral candidate wishing to have the degree conferred in absentia must notify the Graduate School in writing; master's candidates should contact their departments or programs. The diploma will include the program or, in the case of dual PhDs, both programs will be noted; concentrations will not be included.

Students may not participate in a University commencement ceremony until all degree requirements are met.

B. Date of Degree Conferral

The date of completion of the course of study is Commencement Day for a given semester or the last day of classes in the second summer session.

To graduate by that date, students in Ph.D./Ed.D. programs and in thesis master's programs must submit their dissertations/theses by the Graduate School's ETD deadlines (https://grad.ncsu.edu/students/etd/etd-deadlines/).

C. Graduation Clearance Period

Students who are on the graduation list but have outstanding requirements (incomplete grades, corrections in theses or dissertations, etc.) are put on "hold" by the Graduate School for a period of 30 days following graduation. The Director of Graduate Programs (DGPs) and Graduate Service Coordinators (GSCs) will be notified of this action. If these outstanding requirements are not completed within 30 days following the conferral date, the graduation application will be denied. The student must reapply for graduation in a future term once those requirements are completed.

D. Student Requests for Graduate School Certification of Completion of Certain Requirements

Graduate students who have completed all program requirements and are awaiting graduation can request the Graduate School to write a letter for a prospective employer or graduate program certifying that these requirements have been met. The Graduate School will respond to a request to certify completion of requirements within five working days of the receipt of the request in the Graduate School.

E. Posthumous Degrees

Programs can petition the Administrative Board of the Graduate School to award posthumous degrees. In most cases, these petitions have been approved for students who had completed a portion of their thesis or dissertation or at least the research upon which the final project would have been based. DGPs should contact the Graduate Dean for guidance in the preparation of the request for the Board's consideration.

3.21 Diplomas

To receive a diploma, a student must use the 'Apply for Graduation' link in MyPack Portal for the term in which they plan to graduate by the deadline noted in the Graduate School Calendar (Student Self Service > Degree Progress/Graduation > Apply for Graduation).

Doctoral students graduating in the Spring and Fall are awarded their diplomas during the commencement exercises. Both master's and doctoral students graduating at the end of second summer session, or those students receiving permission to receive the degree in absentia will be mailed their diploma from Registration and Records.

Students earning a Master of Arts, Master of Science, Doctor of Education or Doctor of Philosophy degree will receive diplomas designating the degree and the major or program of study; subplans or concentrations will be denoted on the transcript, but not on the diploma. Students earning a master degree in a designated field will receive diplomas indicating the field of specialization, e.g., Master of Forestry.

3.22 University Patent Agreement and Copyright Procedures

All students must sign the Patent Agreement via Student Self-Service in MyPack Portal by the completion of 12 hours or before they start their research, whichever is earlier.

For more details, refer to the Patent and Copyright Procedures (https://policies.ncsu.edu/policy/pol-10-00-01/) of NC State and the NC State policy on copyright regulation (https://policies.ncsu.edu/regulation/reg-01-25-03/).

3.23 Release of Student Information

Written Permission of Student Required to Release Records

In compliance with the Family Educational Rights and Privacy Act of 1974 (Buckley Amendment), the Graduate School will require written permission of the student before releasing any information in the student's educational record to any party outside of the University. The student must complete an Authorization to Release Information (https://grad.ncsu.edu/faculty-and-staff/forms/graduate-school-forms/) and submit it to the Graduate School Records Unit.

Student Requests for Graduate School Certification of Completion of Certain Requirements

Graduate students who have completed all program requirements and are awaiting graduation can request the Graduate School to write a letter to a prospective employer or graduate program certifying that these requirements have been met. The Graduate School will provide these certifications, but requires that the student submit the Authorization to Release Information form. The Graduate School will respond to a request to certify completion of requirements within five working days of the receipt of the request in the Graduate School.

3.24 Schedule of Required Documents

Required Forms/Actions [1]

Complete, official transcripts from universities and colleges attended, including degrees and dates awarded

When Required: Before the beginning of the first semester of enrollment

Who Initiates: Student is responsible for providing official transcripts to the Graduate School.

Patent Agreement

When Required: Before the end of the first semester of enrollment

Who Initiates: Initiated by student online via Student Self-Services in *MyPack Portal*.

Appointment of Advisory Committee and submission of Plan of Work

When Required: During second semester or earlier

Who Initiates: Initiated by student with Advisor and Committee. Approved and submitted to the Graduate School by the DGP (doctoral students only)

Assignment of Graduate School Representative, if required (doctoral students only)

When Required: After Plan of Graduate Work has been approved by Graduate School

Who Initiates: Appointed by the Graduate School

Request to Schedule the Preliminary Oral Examination (http://www.ncsu.edu/grad/faculty-and-staff/forms-list.html) (doctoral students only)

When Required: After written preliminary exams have been passed, but no later than one semester prior to final oral exam. Request must be received in Graduate School at least 2 weeks prior to proposed exam date.

Who Initiates: Initiated by student and submitted to the Graduate School by the DGP

Report on Outcome of Preliminary Oral Examination (doctoral students only)

When Required: Immediately after oral examination is completed

Who Initiates: Submitted to the Graduate School by the DGP within 5 working days of exam

Application to Graduate (replaces old Diploma Order Request card)

When Required: Thesis Students – when Final Oral Exam is Scheduled but no later than the Apply to Graduate Deadline

Who Initiates: Initiated by student online via *MyPack Portal*, by navigating to *Student Self Services, Degree Progress/Graduation, Apply for Graduation*

Request to Schedule the Final Oral Examination (http://www.ncsu.edu/grad/faculty-and-staff/forms-list.html) (doctoral students only)

When Required: Must be received in Graduate School at least 2 weeks prior to proposed exam date (see right), and no earlier than 4 calendar months after successful completion of preliminary exam

Who Initiates: Initiated by student and submitted to the Graduate School by the DGP.

Student must also apply to graduate at the same time via *MyPack Portal*.

Request for a Permit to Schedule the Master's Oral Examination (http://www.ncsu.edu/grad/faculty-and-staff/forms-list.html) (master's students only)

When Required: Must be received in the Graduate School at least 10 working days before the examination is scheduled

Who Initiates: Initiated by student and submitted to the Graduate School by DGP.

Student must also apply to graduate at the same time via *MyPack Portal*.

Report on Outcome of Final Oral Examination (http://www.ncsu.edu/grad/faculty-and-staff/forms-list.html) (master's or doctoral)

When Required: Immediately after final oral exam

Who Initiates: Submitted to the Graduate School by the DGP

Draft submission of thesis or dissertation to Graduate School for thesis review

When Required: Immediately after final examination is successfully completed (***within 24 hours of receiving an unconditional pass***). This must be completed by the graduation deadline for the semester as noted in the Graduate School Calendar (http://www.ncsu.edu/grad/faculty-and-staff/calendars.html).

Who Initiates: Student must electronically submit the draft PDF file to the Thesis Editor via the ETD submission system for the thesis review.

Final submission of thesis or dissertation to Graduate School for Graduate School acceptance

When Required: Final error free file must be submitted before the deadline for the semester as noted in the Graduate School Calendar (http://www.ncsu.edu/grad/faculty-and-staff/calendars.html).

Who Initiates: Student must electronically submit the final error free file to the Thesis Editor via the ETD submission system for acceptance by the Graduate School.

Final committee approval of thesis or dissertation

When Required: Online approval by the student's advisory committee, through *MyPack Portal* before the deadline for the semester as noted on the ETD web page.

Who Initiates: Student unconditionally passes the final exam and the ETD is accepted by the Thesis Editor.

[1] Receipt of materials in the Graduate School can be by campus mail, hand delivery, fax, or e-mail, as appropriate.

4.1 Assistantships, Fellowships, Traineeships, and Grants

Students admitted to the Graduate School may be awarded financial support in the form of an assistantship or fellowship (sometimes referred to as a traineeship). These programs provide financial support to enable students to focus their work on their degrees. Student's assignments should be in direct or general support of the teaching, research or extension missions of the university for the mutual benefit of the graduate students and his/her graduate program.

A. Eligibility

In order to be eligible for graduate teaching, research, or extension assistantships and fellowships (traineeships), students must be admitted into the Graduate School in full graduate standing and be enrolled in the fall and spring semesters. Students must also be in good academic standing (with a 3.000 grade point average or higher), unless granted an exception by the Graduate School. Some fellowships (traineeships) have additional eligibility requirements, e.g., a GPA higher than 3.000 or a specific research focus. It is the responsibility of the student to consult the Director of Graduate Programs (DGP) for information on specific eligibility requirements. . Graduate Certificate Students are eligible for appointment as Graduate Service Assistants but not research, teaching or extension assistantships.

The position of the Graduate School is that any graduate student holding a graduate research, teaching, or extension assistantship requiring 20 hours of work per week or more (i.e. half-time or greater) must, as a condition of such assistantship, maintain his/her status as a full-time student, and therefore, should not be otherwise employed. The reason for this position is to encourage students to work on their degrees rather than part-time jobs and to ensure that additional employment is approved by the student's department. If a department wishes to increase a graduate assistant's financial support, the stipend should be increased. If additional time is required, the student's FTE should be adjusted accordingly. International graduate students on F-1 and J-1 visas are limited to 20 hours of service work per week.

B. Definitions

The following definitions have been recommended by the Administrative Board of the Graduate School and approved by the Graduate School. Graduate departments and programs have the responsibility of determining whether or not the assignments given to their graduate student assistants are in direct or general support of the teaching, research or extension missions of the university.

1. Graduate Teaching Assistant – A student who is appointed in an academic department or program and
   a. directly participates in the teaching mission of the unit as instructor of record, lab instructor, recitation leader, lab or lecture assistant, or who has responsibilities in direct support of classroom instruction in the unit, such as setting up labs or working in an instructional computer lab; or
   b. provides general support to the teaching mission of the department or program.
2. Graduate Research Assistant – A student who is appointed in an academic department or program and
   a. directly participates in the research mission of the unit, or an on-campus or off-campus organization that is affiliated with the unit, in the design of experiments, data collection, analysis, or reporting of research results in the student's field of study, where research may, but is not required to, contribute directly to the student's thesis or dissertation; or
   b. provides general support to the research mission of the unit or discipline.
3. Graduate Extension Assistant – A student who is appointed in an academic department or program and
   a. directly participates in the extension, outreach and engagement mission of the unit, or an on-campus or off-campus organization that is affiliated with the unit, in the design of projects, data collection, analysis, application, or reporting of results in the

student's field of study, where these activities may, but are not required to, contribute directly to the student's thesis or dissertation; or

b. supports the extension, outreach and engagement mission of the unit or discipline, including substantive interaction with individuals or groups beyond the university.

4. Graduate Services Assistant – A student who is appointed to a position that serves the university outside of an academic department or program's teaching or research mission during the academic year.
5. Graduate Fellow (Trainee) -A student who is provided a stipend that has no corresponding service obligation. Stipends from graduate fellowships (traineeships) are based on academic scholarship and/or financial need criteria. Students may contact the DGP for information on fellowships (traineeships) that may also provide tuition, fees and/or educational expense allowances.

C. Responsibilities

1. Graduate Teaching Assistants – A 1/2-time Graduate Teaching Assistant is required to spend approximately 20 hours per week fulfilling assigned teaching responsibilities associated with the stipend. These duties may be independent of teaching activities that contribute to the requirements of the degree program. Time commitment for students whose appointment is less than or greater than 1/2-time are in the same proportion to a 40-hour week as that of the 1/2-time appointment, i.e., 10 hours for a 1/4-time appointment and 30 hours for a 3/4-time appointment.
   a. Orientation to Teaching for New Graduate Teaching Assistants. All new Graduate Teaching Assistants and other graduate students with newly assigned teaching responsibilities are required to attend a University-wide Teaching Orientation, which has traditionally been held each August, shortly before classes start. The Orientation is sponsored by the Graduate School.
   b. International Teaching Assistant (ITA) Screening. All International Teaching Assistants (ITAs) whose responsibilities include significant interaction with undergraduates in a classroom or laboratory must be screened for oral English proficiency before they are permitted to assume these responsibilities. If the screening process indicates that an ITA needs to improve his or her spoken English significantly in order to communicate effectively with his or her students, he or she must take FLE 400 (American English Pronunciation for International Students) or FLE 401 (Oral Communication and Teaching Skills for International Teaching Assistants) before being re-screened.Screening Process. Screening sessions for new and continuing ITAs are held each August, November, January, and April. DGPs and Graduate Services Coordinators will receive a request that they sign up students online for the SPEAK test six to eight weeks prior to each screening. It is the responsibility of the DGPs or Graduate Services Coordinators to notify the students of their test date, time, and location.

      The Spoken English Assessment Test (SPEAK), an institutional version of the Educational Testing Service's Test of Spoken English, screens ITAs for proficiency in oral English. Administered in the Foreign Language Laboratory and rated by specialists in English as a Second Language, the SPEAK test consists of a series of prompts for which each student's responses are recorded. No special preparation is necessary. After each student's test is graded, scores are posted on a secure website for departmental access. The score will determine what responsibilities each ITA may assume.

      Depending on their scores, ITAs may be cleared for either lead teaching responsibility in a classroom or lab or for limited teaching responsibility in settings where a faculty member or experienced TA has primary teaching responsibility. If an ITA is cleared only for limited teaching responsibility, before being assigned full responsibility for a class, lab, discussion section, etc., he or she must take FLE 400 or FLE 401, be re-screened, and achieve the score appropriate for full teaching responsibility. ITAs whose scores indicate that their spoken English must improve before they can assume even limited teaching responsibilities should not be assigned any duties that require significant verbal interaction with undergraduates. If their departments wish them to assume either limited or full teaching responsibilities, these students must first take FLE 400 and/or 401 and then be re-screened and achieve the appropriate score for either limited or full responsibility.
2. Graduate Research Assistants – A 1/2-time Graduate Research Assistant is required to spend approximately 20 hours per week fulfilling the assigned research responsibilities associated with the stipend. These duties may be independent of research activities that contribute to the requirements of the degree program. Time commitment for students whose appointment is less than or greater than 1/2-time are in the same proportion to a 40-hour week as that of the 1/2-time appointment, i.e., 10 hours for a 1/4-time appointment and 30 hours for a 3/4-time appointment.
3. Graduate Extension Assistants – A 1/2-time Graduate Extension Assistant is required to spend approximately 20 hours per week fulfilling his/her assigned extension, outreach and engagement responsibilities associated with the stipend. This may be independent of time spent in research or teaching or extension, outreach and engagement activities that are part of the academic requirements of the degree program. Time commitment for students whose appointment is less than or greater than 1/2-time are in the same proportion to a 40-hour week as that of the 1/2-time appointment, i.e. 10 hours for a 1/4-time appointment and 30 hours for a 3/4-time appointment.
4. Graduate Services Assistants – A 1/2-time Graduate Services Assistant is required to spend approximately 20 hours per week fulfilling assigned responsibilities associated with the stipend. Commonly, the duties are independent of time spent in research or teaching activities contributing to the requirements of the degree program. Time commitment for students whose appointment is less than or greater than half-time are in the same proportion to a 40-hour week as that of the 1/2-time appointment, i.e., 10 hours for a 1/4-time appointment and 30 hours for a 3/4-time appointment.
5. Graduate Fellows (Trainees) – Graduate fellows (trainees) have no service obligation. However, they must fulfill all research and teaching requirements of their degree programs and, in many cases, additional requirements stipulated by their fellowship (traineeship) programs.

D. Benefits of Assistantships and Fellowships

1. Graduate Teaching Assistants, Graduate Research Assistants, Graduate Extension Assistants, and Graduate Fellows (Trainees) are provided health insurance through the Graduate Student Health

Insurance (GSHI) Plan under the conditions specified in the Graduate Student Support Plan.

2. Graduate Teaching Assistants, Graduate Research Assistants, Graduate Extension Assistants, and Graduate Fellows (Trainees) are provided in-state tuition and tuition remission as specified in the Graduate Student Support Plan (https://grad.ncsu.edu/students/gssp/).
3. The Graduate Student Support Plan excludes the participation of Graduate Services Assistants in health insurance, instate tuition and tuition remission benefits.
4. Student assistants, i.e., biweekly appointees, will under no conditions be eligible for the health insurance plan or the tuition benefits of the Graduate Student Support Plan.
5. Many fellowships and traineeships include “cost-of-education” (COE) or “educational enhancement” funds in addition to funds for stipends, tuition, and health insurance. The Graduate School processes all expenditures of these funds. By the first of September, the Graduate School Fellowship Office sends each department/program a list of all its current Fellows (Trainees) who have access to COE funds. These funds may be used for research- and course-related books, supplies, equipment, and travel. Fellows are informed of this support in their award letters and are provided instructions as to making expenditures.

4.2 RA and TA Appointments

A. Appointing Students to Graduate Assistantships

All Graduate Teaching Assistants (GTAs), Graduate Research Assistants (GRAs), and Graduate Services Assistants (GSAs) are appointed in the University’s HR System and are paid on the University’s biweekly payroll cycle. Students must sign up for direct deposit through Employee Self-Service in MyPack Portal.

Graduate students who are paid on a temporary/hourly basis may not be given the title Graduate Research Assistant, Graduate Teaching Assistant, Graduate Extension Assistant, or Graduate Services Assistant. Temporary appointees may be referred to as student workers.

- Graduate Teaching Assistants: Appointed in the University HR system under Job Code A138, A178, A438, A478/Employee Class GRD, Department ID from 11#### -20####.
- Graduate Research Assistants: Appointed in the University HR System under Job Code A148, A178, A448, A478/Employee Class GRD, Department ID from 11#### -20####.
- Graduate Extension Assistants: Appointed in the University HR System under Job Code A428, A438, A448, A478/Employee Class GRD, Department ID from 11#### -20####.
- Graduate Services Assistants: Appointed in the University HR System under Job Code A198/Employee Class GRD.

B. Procedures for Paying Fellowship Stipends/Awards

NC State University, effective July 1, 1997 (updated June 1, 2012)

All graduate fellowship stipends/awards are entered in the University’s Financial Aid System by the Graduate School based on information provided by departments on the Graduate Fellowship Payment Information Form. A copy of the graduate fellowship stipend/award letter attached to the Graduate Fellowship Payment Information Form must be forwarded to the Graduate School for all new fellowship stipends/awards by the 15th of the month in which disbursements begin.

Students receive monthly payments through the Cashier’s Office, and students must sign up for direct deposit through Student Financials in MyPack Portal.

1. Determining the Primary or Supplemental Status of a Fellowship

   A primary fellowship is one that pays a stipend/award of $3,000 or more for the Fall or Spring academic term. Health insurance benefits, in-state tuition awards, and tuition remission (if applicable) must be provided under the terms and conditions of the Graduate Student Support Plan, if the student meets the Plan’s registration requirements. A primary fellowship is responsible for the total cost of the health insurance benefits, in-state tuition, and tuition remission matching (if applicable). Tuition remission match is 25% of the out-of-state tuition amount and is only applicable to out-of-state students. Health insurance coverage remains in force only as long as the fellowship appointment remains in effect. If any part of the benefits package (where applicable) cannot be paid by the fellowship funds, the college must cover it from other sources of funds.

   A supplemental fellowship is one that pays a stipend/award less than $3,000 for the Fall or Spring academic term. Supplemental fellowships are not used to determine eligibility for health insurance, in-state tuition awards, or tuition remission. Recipients of supplemental fellowships will not be eligible for health insurance and tuition remission unless they have other qualifying assistantship appointments or primary fellowships.
2. Fellowship Assignment Guidelines

   The following guidelines apply to fellowships in order to distinguish them from assistantships and retain their “exempt from withholding” status:

   All fellowship assignments will be entered in the SIS Financial Aid System with an stipend/award amount and the dates for disbursement. The designation of the fellowship as primary or supplemental will be determined by both the award amount and the dates for disbursement.

   Examples are:
   a. If a student will be paid a graduate fellowship of $14,000 in equal monthly installments over an academic year (fall and spring terms), the stipend/award amount entered into the Financial Aid System will be $14,000. The effective date will be 8/1/XX and the end date will be 5/31/XX, with disbursements paid August through May. This is a primary fellowship.
   b. If a student will be paid a graduate fellowship of $5,000 in equal monthly installments over an academic year (Fall and Spring Terms), the stipend/award amount entered into the Financial Aid System will be $5,000. The effective date will be 8/1/XX and the end date will be 5/31/XX, with disbursements paid August through May. This is a supplemental fellowship.

Note: Fellowship payments default to equal monthly amounts over the disbursement period. The default disbursement schedule/monthly amount can be overridden when needed. The reason for the adjustment should be provided on the Graduate Fellowship Payment Information Form.

c. If a student will be paid $2,500 in August, and $2,500 in January, a stipend/award of $5,000 will be entered in Financial Aid. The first $2,500 installment will be designated for the Fall term with disbursement in August, and the second $2,500 installment will be designated for Spring term with disbursement in January. Since the payments are not continuous, this is a supplemental fellowship; please keep in mind that in order to qualify for continuous health insurance benefits throughout the academic year, the student must be receiving continuous biweekly "primary" fellowship payments.

The process to determine a graduate student's eligibility for health insurance benefits, in-state tuition, and tuition remission will read this stipend/award in Financial Aid in the same way it reads a graduate assistantship appointment in the HR System. In the case of a primary fellowship, eligibility and payment responsibility for graduate student support will be determined on the value of the primary fellowship stipend/award alone.

If the country of legal residence is not the US, taxes will be withheld, or not, based on the country of residence.

In addition to the stipend/award amount, many fellowships include the cost of education and/or educational enhancement funds. These funds may be used to pay the fellow's tuition, fees, books, supplies, travel, and other costs that directly support the student's educational program. These funds will be managed by the fellow's department or college and in some cases, the Graduate School. Expenditure of these funds will continue to be processed through Accounts Payable as it has in the past.

A No-Pay Graduate Fellowship job record will be entered in the HR System by the Graduate School based on information provided in the Graduate Fellowship Payment Information Form; this No-Pay job record will provide the student with access to the University's Marketplace and Travel Systems. Cost of education and educational enhancement funds will not be used to determine eligibility for the health insurance benefits, in-state tuition awards, or tuition remission.

C. Terms and Conditions of Assistantship Appointments

When appointing students to Graduate Research/Teaching/Extension Assistantships, the terms and conditions for the appointment must be presented in writing to the student. The Terms and Conditions for Appointment document may be used as a stand-alone document. If the department chooses to send its own letter of appointment, the Conditions for Appointment statement must be attached. Also, a checklist, Items to be Included in Letters of Offer Along With Generic Form of Conditions for Appointment, is provided to ensure that departments include all necessary information in their assistantship offer letters.

The "Terms and Conditions" document must be used to make clear the expectations the University has for Teaching, Research and Extension Assistantships and for the individual on these appointments to know the conditions upon which they are appointed and the benefits they are entitled to in exchange for their performance.

Procedures

1. Initial Graduate Assistantship Appointment

   Each student who is offered a Graduate Research/Teaching/Extension Assistantship will be notified in writing of the terms and conditions of their appointment. The following documentation is required for all new or initial Graduate Research/Teaching/Extension Assistantship appointments:

   a. Completed and signed Terms and Conditions for Appointment document OR the Conditions for Appointment document, along with a letter of offer stating the "terms" of appointment
   b. I-9 and e-Verify completed through Guardian.The department submits completed and signed documents attached to the HR System Personnel Action Form (PAF) to the Graduate School. No assistantship is in effect until (a) all documentation is submitted and approved by the Graduate School, and (b) the appointment has been entered into the Human Resources (HR) System. The information in the HR System must match the terms and conditions document. The appointment end date from the terms and conditions document represents the last day the student will be paid, and the date is entered in the HR System as both the "appointment end date" and the "expected job end date." Graduate assistant appointments are systematically terminated in the HR System based on the "expected job end date."

2. Extension of Graduate Assistantship appointment or additional Graduate appointment

   A change to the appointment such as an extension of the current appointment that is not reflected in the initial "Terms and Conditions" document or the initial "Conditions for Appointment" document and letter of offer necessitates a new, signed Terms and Conditions document reflecting the change(s). Both the student and the Director of Graduate Programs (DGP) must be in agreement to change the terms and conditions of the existing appointment.

   For example, if the initial Terms and Conditions of the Graduate Assistantship indicated support for a three (3) year appointment, the initial document would cover continuous payments for that three-year period of time unless changes were made to the terms of the appointment. If the initial "Terms and Conditions" document reflected support for a one (1) year Graduate Assistantship, this initial document would cover continuous payments as a Graduate Assistant for the one-year term only.

   Any appointment not covered in the initial Terms and Conditions requires a new Terms and Conditions document. Appointments that are extended necessitate a new, signed Terms and Conditions. Payroll actions extending the appointment must be processed in the HR System at least three weeks prior to the planned exit date to insure that continuous pay is not disrupted. The department submits completed and signed documents attached to the HR System Personnel Action Form (PAF) to the Graduate School. No

reappointment is in effect until (a) all documentation is submitted and approved by the Graduate School, and (b) the appointment has been entered into the Human Resources (HR) System.

3. Termination of Graduate Assistantship prior to the end of the contract

   If a graduate assistant resigns prior to the end of the contract stated in his/her "Terms and Conditions" document, a letter of resignation or a memorandum documenting the resignation is required. A copy of the required back-up documentation in #8 of the "Terms and Conditions" document attached to the HR System Personnel Action Form (PAF) must be forwarded to the Graduate School once the termination action has been entered and approved in the HR System.

   If a department terminates a graduate assistant prior to the end of the contract stated in the "Terms and Conditions" document, a copy of the required back-up documentation in #8 of the "Terms and Conditions" document attached to the HR System Personnel Action Form (PAF) must be forwarded to the Graduate School once the termination action has been entered and approved in the HR System.

4. Reinstatement of Assistantship

   Students who have their assistantship terminated due to academic difficulty must have their DGP submit a separate request for reinstatement and academic exception to their Graduate School Liaison.

5. Human Resources (HR) System

   Data entry in the HR System must reflect the current appointment(s). This includes title, compensation rate, FTE, and dates of appointment, as reflected in the "Terms and Conditions" document.

6. Terms and Conditions for Self-Supporting Students

   Self-supporting students enrolling at NC State may be asked by their department to complete the Terms and Conditions for Self-Supporting Students document when they enter a graduate program. This document outlines their academic obligations, but in no way obligates the University to any financial responsibility for the student.

D. Assistantship Course Load

Students appointed to assistantships should consider the number of credit hours for which they register in any given fall or spring semester in light of the duties expected of them as a result of the assistantship. Limits to the number of credits such students may register for in a semester may be imposed by individual advisers or by programs. In such cases, registration should be established in consultation with the student's adviser and/or DGP.

E. Taxation of Assistantships and Fellowships

All scholarship and fellowship payments are reportable on the recipient's income tax returns. This includes the amount of any tuition remission a student may have received, which is treated as a fellowship for tax purposes.

All assistantship payments are considered wages and will be paid and reported by the University payroll system. They will be subject to tax withholding.

The University Payroll Office can answer questions concerning current tax issues. Also refer to the Internal Revenue Service and/or NC Department of Revenue.

F. Managing Fellowships and Grants

In addition to fellowships and traineeships administered by individual colleges and departments, the Graduate School administers a number of fellowships (traineeships) and grants. These include:

1. "Portable" fellowships awarded by foundations and government agencies, which individual students "bring" to the University and which the Graduate School is asked to administer;
2. Federally funded fellowships (traineeships) awarded to the University as a result of grant proposals, which are often used to recruit students to specific interdisciplinary programs of study and research;
3. Institutional fellowships funded with income from university fellowship endowments;
4. Grants to support graduate student diversity (see below).

Regarding University-awarded fellowships, in most cases students are nominated by their graduate programs or colleges rather than applying directly for the fellowships. Recipients are selected either by the Credentials and Awards Committee of the Administrative Board of the Graduate School or by a selections committee of faculty who help direct a specific training program.

1. Fellowship Information and Nominations Procedures

   Graduate School Fellowship Information on the Graduate School web site provides an overview of types of funding available for graduate education, descriptions of selected NC State fellowships administered by the Graduate School, and searchable databases for nationally competitive fellowships and other funding opportunities. Both campus-based and national fellowship competitions are routinely announced in the NC State Online Bulletin. For University-wide fellowships, calls for nominations are sent to DGPs and/or Associate Deans, depending on the selections process. For training grants, which are much narrower in scope, calls for nominations are e-mailed to the training faculty identified in the grant proposal or to DGPs whose programs are eligible to nominate trainees. To nominate students for diversity grants, DGPs should contact the Graduate School. Further information on all funding opportunities is available by contacting Dr. David Shafer, Assistant Dean of the Graduate School.

2. Generating Fellowship (Traineeship) Programs

   Researching opportunities and submitting proposals for new fellowship (traineeship) programs is a coordinated effort among the NC State Graduate School, faculty, and the Proposal Development Unit (PDU), which is part of the Office of Research, Innovation, and Economic Development. The PDU provides support for faculty producing large-scale proposals for graduate fellowships with a goal of enhancing competitiveness for research and graduate fellowship funding. In most cases, funded fellowship proposals are administered by the Graduate School.

3. Managing Fellowship (Traineeships) and Diversity Grants: The Role of the Graduate School

   For all fellowships (traineeships) and grants administered by the Graduate School, the Graduate School appoints the students through the Financial Aid System and sets up their accounts. If their award qualifies them for the Graduate Student Support Plan, the Graduate School also pays their tuition, health insurance, and any other fees covered by the fellowship or traineeship, as well as the monthly stipend.

   For fellowships and grants with a need-based stipend, the Graduate School also calculates the appropriate stipend/award level. If the fellowship brings with it an educational enhancement allowance for books, supplies, professional travel, etc., the Graduate School sets up an account for these funds and monitors their disbursement. Finally, the Graduate School monitors the academic progress of students receiving funding from fellowships, traineeships, and grants to ensure that they are meeting the academic requirements of their funding.

   For institutionally awarded fellowship and traineeship programs and for diversity grants, the Graduate School, in consultation with the training faculty, has some or all of the following additional responsibilities:
   a. Sending out calls for nominations and collecting nomination/application materials
   b. Coordinating the selections process for the faculty selections committee
   c. Sending out award letters
   d. Coordinating arrangements for orientation of new fellows and trainees
   e. Coordinating the annual evaluation of fellows (trainees) and the training programs themselves
   f. Coordinating competitions to fill any traineeship vacancies
   g. Monitoring trainees' participation in required professional development programs
   h. Coordinating related professional development activities such as seminars and mini-grant competitions for which the Graduate School is responsible
   i. Submitting reports to the funding agency.
4. Managing Graduate Fellowships (Traineeships) and Grants: The Role of Directors of Graduate Programs (DGPs) and Other Graduate Faculty

   Depending on the requirements of the fellowships (traineeships) or grants of students in their programs, DGPs and training faculty have one or more of the following responsibilities:
   a. Mentoring fellows (trainees) and grant recipients to ensure that they are effectively integrated into their graduate programs, that they understand and fulfill the conditions of their awards, and that they make satisfactory progress toward the degree.
   b. Notifying the Graduate School if the department or program does not receive the student's stipend check on time.
   c. Submitting annual evaluations of fellows (trainees) who are their advisees and seeing that these advisees submit annual activity reports to the Graduate School on time.
   d. Notifying the Graduate School of any student whose fellowship (traineeship) or grant should be terminated because:
      - the student is switching to a degree program or research focus ineligible for fellowship (traineeship) funding;
      - the student has accepted outside employment that makes him or her ineligible for his or her award; or
      - the student is withdrawing from the University.
   e. Working with department heads to ensure that the department or program honors any financial commitments associated with accepting students with a specific financial award, such as the following:
      - For those programs that require them, providing supplements to the stipend awarded through the grant;
      - For supplemental fellowships or grants that require them, ensuring that the student also has an assistantship stipend per semester;
      - Using tuition remission slots for out-of-state students in fellowship programs that require tuition remission as part of an institutional match;
      - Ensuring that fellows (trainees) participate in those professional development activities outlined in the traineeship proposal, such as Preparing the Professoriate, research ethics training, internships, or service learning;
      - If applicable, providing support for the student beyond the length of the fellowship (traineeship) until the degree is completed, provided that the student is making satisfactory progress toward the degree and usually for no more than a total of five years of combined support.
5. Diversity Grants for Students from Underrepresented Groups

   Diversity Enhancement Grants are funded by the State of North Carolina for students who are accepted in master's or Ph.D. programs at NC State. Criteria for selection include: academic record, character, creativity, educational and economic background, race and ethnicity, gender, exceptional personal talents, unique work or service experience, and leadership potential. Applicants must add to the goal of increasing diversity in graduate education at North Carolina State University. Recipients are awarded stipends based on financial need for the academic year, with an option of additional support for study in the summer session.

5.1 Discipline and Grievance Procedures

Graduate Student Discipline Procedures

Disciplinary procedures that apply when a graduate student is charged with academic misconduct in violation of the Code of Student Conduct and the misconduct involves the graduate student's thesis or dissertation are contained in REG 11.35.03 (Graduate Student Discipline Procedures).

Allegations of research misconduct involving a graduate student's thesis or dissertation are subject to REG 10.00.02 (Responding to Allegations of Research Misconduct).

REG 11.35.02 (Student Discipline Procedures) govern all other alleged violations of the Code of Student Conduct by graduate students.

Grievance Procedures for Graduate Students

Most problems encountered by graduate students can be resolved through communication between the student and the party whose action created the problem. If that is not the case, REG 11.40.02 (Grievance Procedure for Graduate Students outlines both informal and formal methods for resolving the problem.

Graduate Catalog Archives (2003-2020)

Incoming students are governed by the rules and regulations in force the semester they are accepted into a program. Previous Graduate Catalogs can be downloaded in PDF format here.

Doctor of Veterinary Medicine

At the NC State College of Veterinary Medicine, world leading faculty lead extraordinary programs in learning and discovery. We instruct students in a range of scientific disciplines related to health and disease control in animals. In addition to teaching foundational classes in medical topics, students are trained in clinical skills needed to diagnose and treat illness in animals.

The clinical program at NC State Veterinary Medicine provides a heavy emphasis for actual “hands-on” clinical practice and is demanding both physically and mentally. Students select “focus areas” to increase their depth of training in their intended area of post-graduate activity, while still retaining a broad based veterinary education.

Faculty also encourage and challenge students to develop the personal and professional knowledge and skills needed to serve a global community. For detailed information regarding our program, choose an area of interest from the menu on the left hand side of this page.

The Evolution of an Expert

Our goal is to prepare graduates who step into the profession with the most up-to-date veterinary medical knowledge possible, skills that prepare them to practice veterinary medicine at the top of their fields, an awareness of the veterinary issues at a local, national, and international level, and a dedication to the continued pursuit of knowledge throughout their professional lives. As such, we have built into our curriculum the following measures of success in each of these important areas:

Knowledge

A graduate will effectively use knowledge of comparative medical science in the provision of veterinary clinical care and other contexts in which veterinary medicine plays a key role. This is characterized as the ability to:

- possess and apply the knowledge needed to solve animal health problems
- locate the needed knowledge efficiently and successfully, using contemporary media and technology to access and manage information
- critically evaluate information and its sources
- integrate medical and scientific information and apply it to the solution of animal health problems

Skills

A graduate will effectively use cognitive and psychomotor skills in the practice of veterinary clinical care and other contexts in which veterinary medicine plays a key role. This will be characterized as the ability to:

- identify, define and analyze clinical problems of a diverse range of species
- identify or create processes to solve clinical problems in a diverse range of species
- interpret facts and data in the context of the clinical problems to be solved
- design preventative and therapeutic plans for common medical problems of animals and animal-human disease interactions
- perform surgical and medical procedures needed to care for veterinary patients, demonstrating acceptable standards of animal handling, pain control, sterility, instrument and device handling, tissue handling and safety
- perform imaging and other diagnostic procedures and accurately interpret obtained data used for the diagnosis and treatment of disease in animals
- use scientific methods for the investigation of problems and use research-based information in the clinical care of veterinary patients

Awareness

A graduate will effectively use awareness of local, national, international and professional communities in which he or she practices to meet the needs of society in an effective and ethical manner. This will be characterized as the ability to:

- acknowledge personal responsibility for one’s value judgments and behavior
- understand and accept social, cultural, global and environmental responsibilities, particularly as they relate to animal welfare, sustainability of animal resources, and one health
- demonstrate professionalism in the face of societal diversity, including racial, ethnic, gender, sexual orientation, socio-economic and cultural differences
- work with, manage, and lead others in ways that facilitate their contribution to the organization and the wider community
- use communication as a tool for interacting and relating to others, demonstrating patience, compassion and empathy
- make effective use of oral, written, and visual means to critique, negotiate, create and communicate understanding
- apply sound business and management principles to the organizations in which one works
- operate within the legal constraints of the society in which one lives
- exhibit truth, honesty, integrity, open-mindedness, fairness and generosity

Life-long Learning

A graduate will continuously update his or her knowledge, skills and awareness. This will be characterized as the ability to:

- be independent learners who take responsibility for their own learning and practice continuous reflection, self-evaluation and self-improvement
- critically evaluate one’s current knowledge, skills and awareness, recognizing areas for improvement
- be open to new ideas, methods and ways of thinking be able to identify processes and strategies to learn and meet new challenges
- have a personal vision and goals and be able to work towards these in a sustainable way

Applicants are evaluated on their academic performance (https://cvm.ncsu.edu/education/dvm/admission/eligibility/), their understanding of the veterinary medical profession, their achievements, and their professional potential.

Pre-veterinary students can pursue any undergraduate major they choose, and the required pre-professional courses can be obtained

through the curricula of a number of fields of study. An undergraduate degree, however, is not required for admission. *"Pre-vet" is not a major*; it is a track that can be chosen within a major. Popular majors for pre-professional students include animal science, poultry science, zoology, biology, biochemistry, and microbiology. Applicants must only complete prerequisite courses to fulfill academic admission requirements (https://cvm.ncsu.edu/education/dvm/admission/faq/).

NC STATE ANNOUNCES THE FOLLOWING ADVISORY TO ADMISSIONS REQUIREMENTS FOR THE 2021 ADMISSIONS CYCLE:

1. **P/F grades:** NC State will allow a Pass in P/F or Satisfactory in the S/U grading systems for prerequisites completed in Spring or Summer 2020
   - courses submitted in the P/F or S/U scale will not be factored into the Required Course GPA calculation
2. **GRE:** NC State has waived the GRE General Test for the 2021 admissions cycle
   - If you have already taken the test, please do not send scores to NC State directly or to NC State via VMCAS. A decision about requiring the GRE for the 2022 admissions cycle will be made in Fall 2020.
3. **LORs:** NC State will continue to require three (3) letters of recommendations. Additionally, we still highly recommend that 2 of 3 letters come from DVMs or PhD scientists with whom you have worked.
4. **Experience Hours:** NC State will continue to require 200 hours of veterinary experience hours for the 2021 admissions cycle.

Letter grades with at least a C- or better will be required in all semesters following Spring and Summer 2020 as long as COVID-19 restrictions have been lifted. **A "Pass" or "Satisfactory" grade for a prerequisite taken in Spring or Summer 2020 will be accepted in any future admissions cycle.**

Please contact the Student Services Office at dvminformation@ncsu.edu if you have any questions about these changes.

The academic professional program calls for two phases of education: a preclinical three-year phase and a clinical phase in the fourth year of training. The first through the third years of the professional program are concerned with a gradual progression from a basic science presentation to a more clinical application of veterinary science. Two summer-vacation periods are allowed in the first three years of the professional program.

- DVM Program (p. 966)

Doctor of Veterinary Medicine Program

The academic professional program calls for two phases of education: a preclinical three-year phase and a clinical phase in the fourth year of training. The first through the third years of the professional program are concerned with a gradual progression from a basic science presentation to a more clinical application of veterinary science. Two summer-vacation periods are allowed in the first three years of the professional program.

The clinical program at NC State Veterinary Medicine provides a heavy emphasis for actual “hands-on” clinical practice and is demanding both physically and mentally. Students select “focus areas” to increase their depth of training in their intended area of post-graduate activity, while still retaining a broad based veterinary education. There are ten focus areas from which to choose:

- Clinician Scientist
- Epidemiology, Public Health, and Public Policy
- Equine Practice
- Food Animal
- Laboratory Animal Medicine
- Mixed Animal Practice
- Pathology
- Small Animal Practice
- Small and Exotic Animal Medicine
- Zoological Medicine

In the first year, a DVM student will be able to describe the evolution, development, function and identification of normal microscopic and gross anatomy, explain the physiological and biochemical basis for common tests used in the diagnostic process, and learn how to effectively communicate in small groups in a professional veterinary context.

	Hours	**14**
	Total Hours	**30**

Fourth-year students must complete required and elective rotations that vary depending on the students' selected focus area (https://cvm.ncsu.edu/education/dvm/program/focus-areas/). Students must complete 43 credits in the senior year: 40 credits of clinical rotations and three credits in Clinical Conference. The clinic year consists of 24 blocks, two-to-three weeks in length, with up to four vacation blocks and three extramural experiences (Clinician Scientist, Epidemiology, & Food Animal Focus Areas have different extramural requirements). A total of 168 credit hours are required for graduation. Clinical Conference presentations are required of each senior.

The clinic scheduling process begins in fall of third year with information sessions with senior clinicians and/or clinical coordinators, Academic Affairs, and Students Services.

VMP 990	Extramural Experiences - Large Animal (Topics include: Extramural Experiences in Equine; Extramural Experiences in Food Animal/ Mixed Animal)	2

Course Descriptions

The course descriptions are arranged first in alphabetical order according to course prefix reflecting the department or discipline of the course. Some courses are cross-listed, indicating that they are offered in two or more departments or disciplines. Within each of the prefix groups, the course descriptions are arranged by course number. Numbers 100-299 are courses intended primarily for freshmen and sophomores. Numbers 300-499 are courses intended primarily for juniors and seniors; numbers 490-498 are seminar, project, or special topics courses; number 499 is for undergraduate research.

Courses numbered 500 - 600 are taught at the Masters level and most are available to advanced undergraduates. Doctoral courses are numbered 700 - 899. Graduate courses numbered at the 500 and 700 levels are letter graded (A+ through F), while 600 and 800 level courses are S/U graded. Courses regularly letter graded (A+ through F) may not be taken for S/U grading by graduate students. Courses numbered in the 900 series are open to College of Veterinary Medicine students.

A typical course description shows the prefix, number, and title followed by prerequisite, credit and offering information. Prerequisites are courses or levels of achievement that a student is expected to have completed successfully prior to enrolling in a course. Corequisites are courses which should be taken concurrently by students who have not previously completed the corequisites. Prerequisites or corequisites for a given course may be waived by the instructor of the course or section. It is the student's responsibility to satisfy prerequisites, or obtain from the instructor written waiver of prerequisites, for any course in which he or she may enroll. Failure to satisfy prerequisites may result in removal from enrollment in the course. Consent of the department is required for all practicum and individual special topics or special problems courses as well as internships and thesis or dissertation research. Some courses also have restrictive statements, such as "Credit in both MA 141 and MA 131 is not allowed." Restrictive statements for a given course may be waived only by a college dean.

An example of credit information is: **ACC 200 Introduction to Managerial Accounting** *3.*The 3 indicates the number of semester hours credit awarded for satisfactory completion of the course. Some courses are offered for variable credit, and a listing of 1-6 indicates that from one to six semester hours of credit may be earned as arranged by the department writing the course.

A

B

C

D

E

Academy of Data Science (DSC)

DSC 495 Special Topics in Data Science (1-6 credit hours)
Offered as needed to present material not normally available in regular departmental course offerings or for offering new courses on a trial basis. Students may repeat this course under a different topic.

Typically offered in Fall, Spring, and Summer

Accounting (ACC)

ACC 200 Introduction to Managerial Accounting (3 credit hours)
Analysis of accounting data that are useful in managerial decision making and in the control and evaluation of the decisions made within business organizations. An introduction to basic models, financial statement analysis, cost behavior analysis and cost control procedures.

Prerequisite: ACC 210
Typically offered in Fall, Spring, and Summer

ACC 210 Concepts of Financial Reporting (3 credit hours)
Financial reporting concepts, the accounting information generating process, reporting practices, financial statement preparation, and the interpretation and analysis of financial statements. Basic accounting principles and concepts, the accounting cycle, income measurement, and internal controls.

Typically offered in Fall, Spring, and Summer

ACC 220 Introduction to Managerial Accounting (3 credit hours)
The course is designed to provide students with a basic understanding of managerial accounting concepts. Students will analyze accounting data that are useful in managerial decision making and in the control and evaluation of the decisions made within business organizations. Credit will not be allowed for both ACC 220 and ACC 200.

Prerequisite: ACC 210
Typically offered in Fall, Spring, and Summer

ACC 230 Individual Income Taxation (3 credit hours)
The course focuses on the fundamental concepts of individual income taxation. It is suitable for business and nonbusiness students. Students will apply tax law learned in the course to a real world setting by conducting tax research and preparing actual income tax forms and returns.

Typically offered in Spring and Summer

ACC 280 Survey of Financial and Managerial Accounting (3 credit hours)
This course covers the basic principles and concepts of financial and managerial accounting. Students will learn about the role of accounting in business including how to prepare basic financial statements and how accounting information is used by: (1) external stakeholders (i.e., stockholders, creditors and government) to evaluate the financial performance of an organization; and (2) internal users (management) to fulfill the planning, control and performance evaluation functions.

This course cannot be used to satisfy degree requirements for the accounting degree or the business degree within the Poole College of Management. This course does not substitute for either ACC 210 or ACC 220.
Typically offered in Fall, Spring, and Summer

ACC 295 Special Topics in Accounting (1-6 credit hours)
Presentation of accounting material at the 200-level not normally available in regular course offerings, or offering of new courses on a trial basis. Course may be taken multiple times only if topic is different.

Typically offered in Fall, Spring, and Summer

ACC 310 Intermediate Financial Accounting I (3 credit hours)
This course introduces the conceptual framework of financial accounting and process of developing professional standards along with the foundations of accounting and reporting systems. Students are provided an in-depth analysis of the income statement, the balance sheet, the statement of cash flows, and the reporting process. The course also covers measurement and reporting issues for major categories of assets on the balance sheet.

Prerequisite: ACC 210 with a C+ or better
Typically offered in Fall, Spring, and Summer

ACC 311 Intermediate Financial Accounting II (3 credit hours)
A continuation of topics introduced in Intermediate Financial Accounting I [ACC 310]. Topics include the Statement of Cash Flows, the Statement of Stockholders Equity, accounting for investments in equity and debt securities, liabilities, leasing, pension and post-retirement benefit plans, deferred income taxes, revenue recognition, and various forms of stock-based compensation plans.

Prerequisite: ACC 310 with grade of C- or better
Typically offered in Fall, Spring, and Summer

ACC 330 An Introduction To Income Taxation (3 credit hours)
Basic income tax principles and procedures (including research and planning) with an emphasis on all types of entities and business transactions. Exposure to a range of tax concepts within the framework of financial reporting.

Prerequisite: ACC 210 with a grade of C- or better
Typically offered in Fall and Spring

ACC 340 Accounting Information Systems (3 credit hours)
Accounting is an information system that supports business processes and decision-making through record-keeping, reporting, and control. This course covers transaction cycles, related internal controls, and the use of computer applications (Microsoft Excel and Access, SAP, and Sage 50) to collect, organize, analyze, and report accounting data. Students will design, develop, and implement a database in this course.

Prerequisite: BUS 340 and ACC 210 with a grade of C- or better
Typically offered in Fall, Spring, and Summer

ACC 411 Business Valuation (3 credit hours)
Conceptual framework of how businesses work, value generation and reporting. Interpretation of financial statements and their use in valuation of the firm.

Prerequisite: ACC 210, BUS 320, and (BUS/ST 350 or ST 312 or ST 370 or ST 372)
Typically offered in Fall and Spring

ACC 420 Cost Accounting for Effective Management (3 credit hours)
Cost Accounting for Effective Management focuses on the development and use of managerial accounting information in planning, control, and decision making activities and in designing and implementing business strategies. Integration of performance measurement and cost control with corporate strategy.

Prerequisite: ACC 210 with C- or better and ACC 200 or ACC 220 with a C- or better
Typically offered in Fall and Spring

ACC 440 Enterprise Resource Planning Systems (3 credit hours)
Enterprise resource planning (ERP) systems are business systems that integrate and streamline data across the company into one complete system that supports the needs of the entire organization. Course content includes ERP marketplace, ERP technology, business process redesign and process mapping, planning, package selection, implementation and operation of ERP systems, ERP module functionality, and visualization of ERP data. As NCSU is a member of the SAP University Alliance, you will have the opportunity to obtain hands-on experience with the SAP ERP system and SAP data analytics software. Credit will not be allowed for both ACC 440 and MBA 515.

Prerequisite: BUS 340
Typically offered in Fall and Spring

ACC 450 Auditing and Assurance Services (3 credit hours)
Introduction to auditing practice and theory. Focuses on developing skills for interpreting business strategies and identifying related business risks that may impact the risk of material misstatement in financial statements, describing internal control solutions to those risks, identifying evidential sources, and designing strategies to provide assurance about the financial statements, internal control over financial reporting, and other business information.

Prerequisite: ACC 311 with a C- or better and ACC 340 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Fall, Spring, and Summer

ACC 451 Internal Auditing (3 credit hours)
An overview of the theory, practice, and design of internal audit activities. Examine industry standards and the professional practices of the internal audit. Evaluate risk and controls related to operations, information technology, fraud, and compliance. Design and manage assurance activities. Assess audit evidence and communicate engagement results.

Prerequisite: ACC 210 with grade of C- or better and ACC 340
Typically offered in Fall and Spring

ACC 458/BUS 458 Analytics: From Data to Decisions (3 credit hours)
Students will develop and apply their data analytics skills by analyzing case studies built around real business problems and real data. Case studies are designed around the full analytics lifecycle which encompasses the business problem, data, analysis, and decision. Students will learn to identify and explain business problems that can be addressed with analytics. They also will learn to determine which analytic methods are best suited to solve particular problems and will evaluate the impact of applying analytic methods. Finally, they will learn to explain the results of an analytic model and how those results impact the business "bottom line.

Prerequisite: BUS 351
Typically offered in Fall and Spring

ACC 459 Analytics in Accounting and Finance (3 credit hours)
To enhance the understanding and integration of financial statement preparation, management reporting, analytics, and forecasting necessary to control and improve performance. The course is designed to work through the major process life-cycles and tools deployed within accounting and finance organizations that support the information needs that executives depend on for decisions that create competitive advantage. The course reflects, through simulation and practical application, the role that Corporate Finance plays in support of a firm's strategies and business operations. The course is designed for students with career interests that include operational accounting, financial analysis, financial planning, corporate finance, information systems, business and operations management, public accounting, and consulting.

Prerequisite: ACC 311 and BUS 351
Typically offered in Fall and Spring

ACC 460 Governmental and Nonprofit Accounting (3 credit hours)
Accounting and reporting for state and local governments, including budgeting and financial analysis. Accounting for nonprofit organizations emphasizing voluntary health and welfare organizations.

Prerequisite: ACC 210
Typically offered in Fall only

ACC 495 Special Topics in Accounting (1-6 credit hours)
Presentation of material not normally available in regular course offerings, or offering of new courses on a trial basis.

ACC 498 Independent Study in Accounting (1-6 credit hours)
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction on a tutorial basis. Credits and content determined by faculty member in consultation with the associate department head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ACC 499 Internship in ACC (1-6 credit hours)
A full-time accounting-related professional internship. Participants will communicate with instructor weekly over the course of the internship to discuss progress and insights. A post-internship interview and paper is also required. Internships may vary in duration from 8 to 15 weeks. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department. This form can be obtained from the Accounting department or from the Poole Office of Undergraduate Programs.

Prerequisite: Completion of ACC 310 and ACC 311. Restricted to accounting majors. Departmental approval required.
Typically offered in Spring and Summer

ACC 508 Advanced Commercial Law (3 credit hours)
A study of law and regulation as a structure in which to develop business goals and strategies. Students will examine those elements of law and regulation that are a context for ethical business behavior. Students will also study the provisions oflaw and regulation including case-law that must be followed as a part of the strategic planning process and in the process of implementing business methods and procedures.

Prerequisite: MAC Program
Typically offered in Spring only

ACC 510 Advanced Financial Accounting (3 credit hours)
Study of complex financial reporting topics affecting U.S. corporations. Focus on the underlying business rationales associated with transactions/events triggering the complex financial reporting issue. Topics will include international accounting, consolidations, mergers and acquisitions, derivatives, SEC reporting, and other emerging issues.

Prerequisite: MAC Program
Typically offered in Spring and Summer

ACC 519 Applied Financial Management (3 credit hours)
A study of key business decision made and tools used by CFOs in their executive management roles. Students will focus on managerial analysis tools (e.g., business plans; budgeting) and finance issues (e.g., funding alternatives, treasury, and cash management). The course will include management skills related to the CFO, such as negotiations, leadership, delegation, interactions with boards, etc.

Prerequisite: MAC Program
Typically offered in Fall and Summer

ACC 520 Advanced Management Accounting (3 credit hours)
A study of how accounting and operating information is used in management planning and decision making. Students will apply advanced costing models and design and evaluate management decision making information systems. Topics will include issues that are appropriate for consideration by executive management and the board of directors.

Prerequisite: MAC Program
Typically offered in Spring only

ACC 530 Advanced Income Tax (3 credit hours)
A study of the tax consequences of business, financial, and personal wealth-planning transactions. Students will examine the economic or legal context of transactions along with the non-tax motives of the transacting parties. The course will consider the efficiency of tax strategies in terms of their impact on net cash flows and other financial reporting effects.

Prerequisite: MAC Program
Typically offered in Fall only

ACC 533 Accounting and Tax Research (3 credit hours)
A study of research methods, procedures and tools used to develop solutions to technical and policy-oriented business problems. Students will consult various competent authorities on taxation, accounting, auditing, and general business in the development of business problem solving techniques.

Prerequisite: MAC Program
Typically offered in Fall only

ACC 540 IT Risks and Controls (3 credit hours)
A study of how business strategies use information technology (IT) as an efficient enabler of redesigned core business processes. Students will focus on how the use of IT affects risk management by eliminating certain risks and introducing others. Students will examine IT control solutions used to address IT risks and will address issues affecting assurance engagements related to IT systems.

Prerequisite: MAC Program
Typically offered in Fall only

ACC 545 Information Technology Audit (3 credit hours)
Organizational managers and board members recognize the importance of effectively managing information technology (IT) assets - to meet business objectives and to thoughtfully manage IT related business risks. This course examines the key principles related to auditing information technology processes and related controls, and is designed to meet the increasing needs of audit, compliance, security, and risk management professionals. There are no required prerequisites for this course, however, it is helpful to have had ACC540.

R: PCOM Graduate Students
Typically offered in Spring only

ACC 550 Advanced Auditing (3 credit hours)
A study of the impact of business risks on the design and performance of audit procedures to detect material misstatements in financial statements. Students will be exposed, through a case-based approach, to significant business issues related to audit planning, risk assessment and auditor response, corporate governance, reporting, and other significant business issues affecting audit professionals in their first years of employment.

Prerequisite: MAC Program
Typically offered in Spring and Summer

ACC 560 Tools for Tax Analytics (1 credit hours)
In this course we will teach the skills needed to identify many of the situations where the method of accounting for tax purposes for revenue and expense differs from that used in financial accounting. Focus will be placed on analyzing and outlining those differences in a concise and visual manner in order to assist upper management understand the tax implications of their operational and financial accounting decisions. To assist us in this, we will utilize analytic tools that are regarded as required knowledge by today's tax departments. After a brief review of basic analytics skills, we will focus on more advanced analytic tools which will be reinforced with tax-focused examples and assignments specifically to allow the student to apply these featured analytics topics in tax situations. An undergraduate degree and basic tax and accounting knowledge required.

R: Graduate Standing or PBS
Typically offered in Fall, Spring, and Summer

ACC 561 Database Management in Tax (1 credit hours)
In this course, we will teach the skills needed to understand and identify many aspects of the state income tax apportionment process. Focus will be placed on the calculations and analyses required to present the state and local tax information in such a manner as to assist upper management in the business-expansion decision-making process. The tax apportionment process requires a solid understanding of database management. To assist us in this, we will utilize database management tools that are considered required knowledge by today's tax departments. After a brief review of introductory database management topics, we will focus on more advanced database management topics which will be reinforced with tax-focused examples and assignments specifically created to allow students to see these featured database management topics when applied to tax scenarios. An undergraduate degree and basic tax and accounting knowledge required.

R: Graduate Standing or PBS
Typically offered in Fall, Spring, and Summer

ACC 562 Forecasting Effective Tax Rates and Scenario Analysis - Introduction (1 credit hours)
In this course we will examine the different definitions of book income and taxable income with a focus on accounting for income taxes under ASC 740. Students will contrast the principles of conservatism reflected by generally accepted accounting principles and by the tax law. In addition, students will learn how to utilize regression analysis and scenario analysis to provide additional insights about these tax topics and to forecast future effective tax rates. Tax-focused examples and assignments created specifically to allow the student to apply regression analysis in tax situations will reinforce the technology covered in this course. In addition to utilizing regression analysis, this course will examine tax technical subjects to provide the student sufficient knowledge to complete the examples and assignments. An undergraduate degree and basic tax and accounting knowledge required.

R: Graduate Standing or PBS
Typically offered in Fall, Spring, and Summer

ACC 563 Forecasting Effective Tax Rates and Scenario Analysis - Advanced Application (1 credit hours)
In this course we will continue to examine the different definitions of book income and taxable income but the primary focus will be on examining tax disclosures in financial statements and gaining an understanding of how they can be used for financial statement analysis. We will also carry out regression and scenario analysis to provide additional insights into disclosed tax information. These types of insights are of significant benefit and often utilized in decision making by company management and financial analysts employed by investment funds. The skills learned will be reinforced with tax-focused examples and assignments created specifically to allow the student to apply regression and scenario analysis in tax situations. In addition to utilizing regression and scenario analysis, this course will examine tax technical subjects to provide the student sufficient knowledge to complete the examples and assignments. An undergraduate degree and basic tax and accounting knowledge required.

P: ACC 562
Typically offered in Fall, Spring, and Summer

ACC 564 Project Management and Process Documentation in Tax (1 credit hours)
In this course we will focus on tax project management and tax process documentation skills. Students will develop an understanding of project management in the context of a tax provision process assessment for a hypothetical company, Project Clarity. Students will also develop an understanding of internal control best practices and how they apply to a corporate tax department's tax provision process. In addition, they will develop the skills necessary to identify improvements within the tax provision process and learn how to prepare a flow chart of the process. An undergraduate degree and basic tax and accounting knowledge required.

R: Graduate Standing or PBS
Typically offered in Fall, Spring, and Summer

ACC 565 Visual Analytics in Tax (1 credit hours)
We will teach visual analytics to enhance the value and quality of the tax information provided to decision makers in an organization. All aspects of tax including planning, tax provision work, compliance and controversy work will be covered. The focus will be on state and local nexus, sales and use taxes, and foreign bank account reporting (FBAR) requirements. Students will also learn to manipulate data into a visual front end so that those reviewing the data with the purpose of decision-making will have an easier time reading and interpreting the data analytics. An undergraduate degree and basic tax and accounting knowledge required.

P: ACC 560
Typically offered in Spring only

ACC 566 Database Management Applications in Tax (1 credit hours)
In this course, we will teach the skills needed to understand and identify more advanced aspects of the state income tax apportionment process, including combinations and consolidations. The student will gain knowledge in the areas of data query language, data definition language, and data manipulation language using structured query language. Students will learn more advanced tools to retrieve, define, store, and update state income tax data in a database management program. These tools will be reinforced with taxÂ focused examples and assignments specifically created to allow the student to see these featured topics when applied to tax scenarios. An undergraduate degree and basic tax and accounting knowledge required.

P: ACC 561
Typically offered in Fall, Spring, and Summer

ACC 569 Advanced Visual Analytics in Tax (1 credit hours)
Visualization helps us see and understand the story the data tells us. In this course, students will be introduced to an interactive data visualization tool which allows users to select specific tax information and customize the format of visualization to assist in the management decision making process. Students will learn how to use this tools to increase the relevance and usefulness of tax data. The software will be used in specific tax-related applications, including foreign bank account reporting exposure and compliance, country by country reporting, state income tax exposure, compliance data and risk analysis. An undergraduate degree and basic tax and accounting knowledge required.

P: ACC 565
Typically offered in Fall, Spring, and Summer

ACC 570 Data Security and Warehousing in Tax (1 credit hours)
The course is focused on the importance of data security with respect to all financial data but specifically tax data. It also covers the area of tax data warehousing from the standpoint of the differing financial detail needs of a tax department and the benefits of utilizing a Cloud solution. Students will gain insight into data securing learning protection of networks and cryptography with emphasis on the data security in a tax focused environment. An undergraduate degree and basic tax and accounting knowledge required.

R: Graduate Standing or PBS
Typically offered in Fall, Spring, and Summer

ACC 580 Data Analytics in Accounting (3 credit hours)
This course provides an opportunity to learn and apply various data analytics techniques to a business case to support management's decision making. This course utilizes analytics tools and technology in an advisory context. Specifically, you will be learning and using Excel, Access and PowerBI tools, as well as Word to summarize your analysis. Soft skills are essential in today's environment. This course also helps to strengthen these skills including written communication (formal and informal), critical thinking and data analytics.

R: MAC or MBA Program
Typically offered in Fall, Spring, and Summer

ACC 588 Special Topics in Accounting (1-6 credit hours)
Course objectives dependent upon unique circumstances motivating offering of course. Timely curriculum innovation the primary motivation. Departmental consent required.

Typically offered in Fall and Spring

ACC 600 Managerial and Career Effectiveness (1 credit hours)
Knowledge and skills needed to advance professional accounting career. Strategic communication of self and ideas in professional and classroom settings. Diagnosis of organizational culture. Impression management and appropriate business behavior. Leadership of individuals, group dynamics, and team building.

Prerequisite: MAC Program
Typically offered in Fall only

ACC 630 Independent Study (1-3 credit hours)
Advanced topics not otherwise included in curriculum by advanced graduate students on a tutorial basis. Determination of credits and content by participating faculty in consultation with Director of Graduate Programs. Departmental consent required

Typically offered in Spring only

Adult & Higher Education (EAC)

EAC 301 Introduction to Leadership Fundamentals (3 credit hours)
This course will provide basic understandings of the components of leadership that can be applied to their current and future leadership experiences on campus or in their individual communities, and to provide a model of critical reflection for those applications.

Prerequisite: Sophomore standing, Junior standing, or Senior standing
Typically offered in Fall and Spring

EAC 496 Special Topics in Adult Learning and Leadership (1-6 credit hours)
Exploration of specialized areas and topics of current interest in adult learning and leadership.

EAC 517 Current Issues in Higher Education (3 credit hours)
Examination of important social, political and economic issues affecting present and future operation of colleges and universities in America. Graduate standing or PBS status required.

Typically offered in Spring only

EAC 522 Foundations of Adult Education (3 credit hours)
Introduction to the field of adult education as an area of graduate study and practice. It is intended for those who have experience or desire to work with adult learners or with organizations that serve adult learner populations.

Typically offered in Fall only

EAC 532 Health Care Delivery Systems and Environments (3 credit hours)
Organization of health care delivery system, services and recourses. Focus on major social, economic, political and professional factors contributing to shaping the system and influencing change. Analysis of organizations and environments in regard to demand for health personnel and the implications for health occupations education.

Prerequisite: Graduate standing
Typically offered in Summer only

EAC 536 Issues and Trends In Education For the Health Professions (3 credit hours)
An analysis of educational and social factors influencing change in health professions education. Problems of student selection and program articulation, and implications for health occupations education and health services of recent legislation impacting health care.

Prerequisite: Graduate standing
Typically offered in Spring only

EAC 538 Instructional Strategies In Adult and Higher Education (3 credit hours)
Forms of instruction appropriate for the teaching of adults. Special emphasis upon methods for maximum involvement of the adult learner. Relevant concepts, theories and principles for selection, utilization and evaluation of instructional strategies with focus on integration of theory into practice. Development of student proficiency in use of applicable teaching techniques for adult and community college education through participation in classroom exercises.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

EAC 539 Teaching in the Online Environment (3 credit hours)
The course focuses on exploring the issues and considerations in online teaching and introduce students to some of the tools involved in the process. Students will develop strategies for teaching online and for managing the online classroom.

Typically offered in Fall and Spring

EAC 540 Foundations of Higher Education and Student Affairs (3 credit hours)
Examines knowledge that guides professional practice in higher education and student affairs, such as: history of higher education, professional development practices, student characteristics, group process, and helping and advising skills. Programmatic applications are emphasized through class assignments.

Typically offered in Fall only

EAC 541 Administration and Finance of Student Affairs (3 credit hours)
Examination of the role of student affairs in higher education institutions to include: organizational structures, leadership and decision-making, planning and budgeting, staffing and supervision.

Prerequisite: EAC 540
Typically offered in Spring only

EAC 542 Student Characteristics and the College Environment (3 credit hours)
Study of the history and philosophy of student affairs, the impact of college on students and current issues of concern to students and student affairs professionals. Good practices of student affairs in the context of student learning are identified and current literature is reviewed.

Typically offered in Spring only

EAC 543 Student Development Theory (3 credit hours)
Gain an understanding of the major student development theories and emerging professional literatures in this area. Provide opportunities for students to develop skills in applying student developmental theory to specific student affairs settings, issues, and populations.

Prerequisite: EAC 540
Typically offered in Fall only

EAC 544 History of the College Student Experience in the United States (3 credit hours)
This course will review the history of higher education in the United States from the colonial period to the present with particular attention to the ways in which shifting policies and practices in higher education institutions have affected the college student experience and the student affairs profession. Graduate standing or PBS status required.

EAC 545 Higher Education Masters Professional Seminar (3 credit hours)
Emphasizes application of concepts and theories learned in previously completed coursework to understand and analyze current issues facing student affairs professionals. Focuses particularly on the job search process and transition out of graduate school. Facilitates the transition from student to full-time student affairs professional through critical examination, synthesis, integration, and practical application of prior and concurrent coursework.

R: EAC 540 and EAC 542 and EAC 543
Typically offered in Spring only

EAC 551 Research in Adult & Higher Education (3 credit hours)
Introduces master's students studying adult learning and higher education to two major research paradigms in education, quantitative and qualitative research, and to the research literature of disciplines related to the education of adults. Students will learn how to distinguish between research and non-research materials, and how to evaluate quantitative and qualitative research studies on the basis of their research merit.

Prerequisite: Master's students in ACCE
Typically offered in Fall, Spring, and Summer

EAC 552 College Student Retention (3 credit hours)
Exploration of college student retention theories, relevant research, and exemplary retention programs. Examines student retention and completion within four-year colleges and universities as well as student persistence within and transfer from community colleges.

Typically offered in Spring only

EAC 555 Ethics in the Workplace and Education (3 credit hours)
Introduction to ethics and social responsibility in adult education, training, higher education and other work and educational environments in a global setting. Emphasis on addressing moral and ethical issues in the workplace and education by applying critical thinking and analysis processes to ethical dilemmas. Graduate standing or PBS status required.

Typically offered in Fall only

EAC 556 Organization Change in HRD: Theory & Practice (3 credit hours)
Organization Change in Human Resource Development provides an introduction to the theory and practice of change within the context of adult education programs, other organizations, communities and societies. Graduate standing or PBS status required.

Typically offered in Fall and Spring

EAC 559 The Adult Learner (3 credit hours)
An inquiry into the characteristics and background, learning processes, motivation and participation of adult learners in a variety of educational contexts. Emphasis on adult learning theories, models, principles and their application to educational design and delivery.

Typically offered in Fall, Spring, and Summer

EAC 560 Assessment & Evaluation in Adult & Higher Education (3 credit hours)
Introduces students to assessment and evaluation principles and practices from a range of perspectives. Covers uses and limitations of a broad range of assessment and evaluation approaches in adult education settings, with particular focus on college and university teaching.

Typically offered in Spring and Summer

EAC 580 Designing Instructional Systems in Training and Development (3 credit hours)
Introduction to instructional design models including needs assessment, systematic training design and development techniques and proactive strategies for evaluating training programs. Instructional design issues of work-based training, learner characteristics and effects of technology on instructional design, implementation and evaluation processes. Graduate standing or PBS status required.

Typically offered in Fall, Spring, and Summer

EAC 581 Advanced Instructional Design in Training and Development (3 credit hours)
In-depth analysis of instructional systems design (ISD) theory and practice using professional competency models. Organizational training requirements, development of performance objectives and measures, design of instructional materials, and address of evaluation issues in training programs in business and industry. Research and development of instructional design projects relating to ISD process and model. Graduate standing or PBS status required.

Typically offered in Fall and Spring

EAC 582 Organization and Operation Of Training and Development Programs (3 credit hours)
Overview of occupational education practice in business and industrial settings. Presentation of roles common to training and development specialists, including managerial concerns related to organization, operation and financial training and development programs.

Typically offered in Fall only

EAC 583 Needs Assessment and Task Analysis in Training and Development (3 credit hours)
Current needs assessment and task analysis methods and techniques used in business and industrial settings. Development of comprehensive needs assessment plans for diagnosing and documenting human performance deficiencies/improvement opportunities through training programs in business settings. Graduate standing or PBS status required.

Typically offered in Fall and Spring

EAC 584 Evaluating Training Transfer and Effectiveness (3 credit hours)
Philosophy, strategies, and procedures for evaluating effectiveness of training programs. Development of multi-level evaluation plan for use with training program to study outcomes and process of training from perception to organizational impact. Design of evaluation methods and instruments, data collection, analysis, and interpretation for each level of evaluation emphasizing transfer of training. Graduate standing or PBS status required.

Typically offered in Fall and Spring

EAC 585 Integrating Technology into Training Program (3 credit hours)
Appropriate technologies for design and delivery of effective training programs. Performance-based training models for distance and individualized learning through audio, video, computer-based, and multimedia technologies. Planning decisions for selecting/developing appropriate technologies to support specific training outcomes, adult learner characteristics, and organizational training resources. Graduate standing or PBS status required.

Typically offered in Fall, Spring, and Summer

EAC 586 Methods and Techniques Of Training and Development (3 credit hours)
Methods and techniques common to model occupational education programs in business and industrial settings. Focus on design and evaluation of effective learning programs and instructional methodologies. Graduate standing or PBS status required.

Typically offered in Fall and Spring

EAC 595 Special Topics (3-6 credit hours)
Typically offered in Fall, Spring, and Summer

EAC 602 Seminar In Adult and Higher Education (1-3 credit hours)
Identification and scientific analysis of major issues and problems relevant to adult education or higher education. Course credit at the master's level through active student participation in a formal seminar and scientific appraisal and solution of a selected problem. Student acquisition of a broad perspective of issues confronting adult educators and experiences in scientific analysis and solution of specific issues.

Prerequisite: Graduate standing

EAC 624 Topical Problems In Adult and Community College Education (1-3 credit hours)
Study and scientific analysis of problems in adult education and preparation of a scholarly research type of paper. Credits Arranged.

Prerequisite: Graduate standing or PBS status

EAC 630 Independent Study in Adult and Community College Education (1-3 credit hours)
Independent study for master's students in Adult and community College Education.

Typically offered in Fall, Spring, and Summer

EAC 651 Internship In Adult and Community College Education (1-9 credit hours)
Utilization of the participant-observer role with required participation in selected educational situations. Emphasis upon observational skills' development, the recording of relevant observations through written journals, analysis of experiences identifying critical incidents and projection of events and consequences. Student development and selection of possible alternative courses of action in various situations and evaluation of the consequences of the selected course of action.

Prerequisite: Nine hrs. in graduate level courses
Typically offered in Fall, Spring, and Summer

EAC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EAC 692 Research Projects In Education (1-3 credit hours)
A project or problem in research in education for graduate students, supervised by members of graduate faculty. Choice of research on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: EAC 732
Typically offered in Fall, Spring, and Summer

EAC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EAC 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EAC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

EAC 699/ECD 699/ECI 699/ELP 699/EMS 699/EOE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Spring only

EAC 700 Community College and Two-Year Postsecondary Education (3 credit hours)
Comprehensive community colleges and technical institutes and the state systems of which they are part: underlying concepts, design of educational needs to be serve, role in meeting these needs, historical development, issues in establishment and operation of state systems and individual institutions, unresolved issues and emerging trends.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

EAC 701 Administrative Concepts and Theories Applied To Adult and Community College Educ (3 credit hours)
For persons interested in building more consistent philosophy of educational administration, extension and strengthening of understanding of administrative concepts and processes, improved comprehension of theoretical and research foundations upon which administrative processes predicated, and increased ability for application of administrative concepts, theories and principles to management of complex education system.

Prerequisite: EAC 787 or a comparable course(s) on organizational theory
Typically offered in Spring only

EAC 703 The Programming Process In Adult and Community College Education (3 credit hours)
Principles and processes in programming, including basic theories and support of concepts in programming process. Attention to general programming framework, organizational needs and program roles of both professional and lay leaders.

Prerequisite: Graduate standing
Typically offered in Summer only

EAC 704 Leadership In Higher and Community College Education (3 credit hours)
Issues and concepts of leadership development and practice in two- and four-year colleges and universities; interpretation and communication of institutional values and understanding of organizational processes. Attention to role of organizational culture in management improvement and institutional performance in higher education institutions.

Typically offered in Summer only

EAC 705 Group Process In Adult and Higher Education (3 credit hours)
Application of research and theory in small group behavior to administration and teaching in adult and higher education settings. Opportunities for participant experience of various aspects of group behavior and practice of group leadership skills applicable to various group situations.

EAC 706 The College and University Presidency (3 credit hours)
Promotion of understanding of many facets of the college and university presidency. Investigation and analysis of college and university from the perspective of students's own careers and from the literature on the presidency. The president as institutional leader.

Prerequisite: EAC 700 or EAC 716
Typically offered in Spring only

EAC 707 The Politics Of Higher Education (3 credit hours)
Differing and changing perceptions of role of higher education in American society; politics of competition for priority of attention and resources; organizational alternatives in its control; relevant elements in structure and processes of government. References to other societies.

Prerequisite: Graduate standing or Management Development Certificate Program and six sem. hrs. of 500-level course work

EAC 708 Continuing Education for the Professions (3 credit hours)
Theoretical and research literature related to continuing education for the professions. Examination of role of educator in providing and managing continuing professional education.

Prerequisite: EAC 703, 759
Typically offered in Summer only

EAC 711 Reflective Practice and Research Inquiry (3 credit hours)
Initial doctoral seminar to enhance understanding of critically reflective practice, doctoral scholarly inquiry and current issues and debates in adult education scholarship and research.

Typically offered in Fall only

EAC 712 The Change Process in Adult Education (3 credit hours)
Provides an introduction to theory and practice of change within the context of adult education organizations, communities, and societies. Emphasis on theory and practice of change in adult education and training and developmental contexts.

Prerequisite: Adult Education Doctoral student
Typically offered in Spring only

EAC 716 History Of Higher Education In the United States (3 credit hours)
History of higher education from colonial period to the present. Emphasis on influence of philosophic, political, social and economic forces upon function and structure of higher education.

Prerequisite: Six hrs. of grad. ED courses
Typically offered in Fall only

EAC 730 Foundations of Adult, Higher, and Human Res Education (3 credit hours)
An inquiry into the characteristics and background, learning processes, motivation and participation of adult learners in a variety of educational contexts. Emphasis on adult learning theories, models, principles and their application to educational design and delivery. Doctoral status required.

Typically offered in Fall only

EAC 731 Technology in Adult, Higher, and Human Resource Education (3 credit hours)
Introduces the students to the role of technology in education. Positive and critical aspects will be addressed. Draws on theory and practice from numerous disciplines, including: adult education; distance education; educational, instructional and communication technologies; and, the teaching and learning sciences. Analysis of how education in the workplace, higher education and adult/community contexts is being transformed by technology. Evaluation of the complex interrelationships among education, learning and technology. Doctoral status required.

Typically offered in Fall only

EAC 732 Globalization Intl Issues Adult Higher Hum Res Ed (3 credit hours)
This core course focuses on globalization and its implications for the study and practice of adult, higher, and human resource education, as well as the evolution and increase of diverse international perspectives in the scholarship and policy arenas viewed from an interdisciplinary perspective. Doctoral status required.

Typically offered in Spring only

EAC 737 The Extension and Public Service Function In Higher Education (3 credit hours)
Examination of background, history, philosophy and contemporary nature of extension and public service function of institutions of higher education in U.S. Emphasis on adult education role of public and private universities and colleges. Specific focus on: general extension, industrial extension, engineering extension, cooperative extension and continuing education.

Prerequisite: EAC 710
Typically offered in Spring only

EAC 743 Adult Development and Learning (3 credit hours)
This course examines key theories and research on the physical, and related socio-cultural changes across the adult lifespan. Special emphasis in this course will be on the intellectual and psycho-social aspects of adult development. Key implications for educational programs and services, as well as research investigations of adults in learning environments, will be explored.

Prerequisite: EAC 739
Typically offered in Spring only

EAC 749 Finance in Higher Education (3 credit hours)
Examination of theory, research, practices and issues in development and management of financial resources in higher education.

Typically offered in Fall only

EAC 750 The Environment for Learning In Adult and Higher Education (3 credit hours)
Planning and management of the physical environment for effective adult learning. Applicability of concepts and theories of learning and teaching environment to needs analysis, planning, resource development, cooperation with professional designers,and construction, operations, conservation and maintenance of educational facilities, equipment and grounds.

Prerequisite: EAC 700 and Graduate standing or PBS status

EAC 759 Adult Learning Theory (3 credit hours)
Requisite involvement and undergirding of principles in adult education programs including theories and concepts. Emphasis on interrelationship of nature of adult learning, the nature of the subject matter and setting for learning occurrence. Applicability of relevant principles and pertinent research findings to adult learning.

Prerequisite: Six semester hours in ED
Typically offered in Spring only

EAC 760 Diversity in Higher Education (3 credit hours)
This course uses a multicultural competence framework to explore issues of diversity and social justice in higher education and the broader society. Issues of privilege, power, and oppression are explored and discussed in depth as well as the intersection of multiple identities and oppressions.

Typically offered in Spring only

EAC 761 Gender Studies in Adult Higher Education (3 credit hours)
Explores topics and issues related to the experiences of men and women in adult and higher education. This includes examination of meanings and applications of diverse feminisms, particularly as they apply to study of gendered patterns of student development in higher education.

Typically offered in Spring only

EAC 762 Spirituality in Higher Education (3 credit hours)
With a focus on spirituality and religion in higher education, this course provides an introduction to an emerging area of research and practice among higher education administrators and scholars. The course encourages the development of knowledge and skills to understand and engage in religious and worldview diversity in postsecondary educational contexts.

Typically offered in Spring only

EAC 765 Current Issues in Adult Education (3 credit hours)
Analysis of social, political, economic, and ethical issues influencing effective practice of adult education. Participant formulation and analysis of problems, issues, and challenges relevant to their practice and advanced graduate study.

Prerequisite: 15 Semester hours of graduate credit in the Department of Adult and Community College Education, including 3 semester hours of either quantative or qualitative research methods.
Typically offered in Spring only

EAC 767 Education Of Special Adult Populations (3 credit hours)
Analysis and development of adult education responses to needs and characteristics of special adult populations such as nonliterate, unemployed, handicapped and older adults.

Typically offered in Spring and Summer

EAC 778 Law and Higher Education (3 credit hours)
Constitutional, statutory and case law in relationship to higher education. Emphasis on faculty, student and staff rights and tort liability.

Prerequisite: Six hrs. graduate credit
Typically offered in Fall only

EAC 779 Concepts and Principles Of Evaluation Applied To Non-Formal Adult Education Prog (3 credit hours)
Introduction to evaluation of non-formal adult educational programs; course topics include purposes of evaluation, alternative concepts and techniques, stake holders and their concerns, specification of evidence, selection of standards for making judgments, gathering and analysis of data, use and dissemination of results and handling problems in evaluation.

Prerequisite: EAC 703
Typically offered in Spring only

EAC 786/EMS 786 Teaching in College (3 credit hours)
Focus on development of competencies to perform fundamental tasks of a college teacher as well as consideration of more long-range tasks such as course development and university responsibilities of a professor. In addition to attending lectures andother types of presentations, students make video tapes of their teaching, develop tests, design introductory courses in their teaching fields and consider current issues related to university and college teaching.

Typically offered in Fall only

EAC 787 Organizational Theories and Concepts in Higher Education (3 credit hours)
For present and potential administrators interested in increasing their understanding of organizational theories as a basis for administration of effective higher education programs.

Typically offered in Fall and Spring

EAC 788 Applied Qualitative Data Analysis (3 credit hours)
Intermediate graduate level course in applied qualitative methodology following an introductory course in qualitative methods. Focuses on analytical approaches and tools used with qualitative data, with particular emphasis on adult and higher education and human resource development.

Prerequisite: EAC 785

EAC 790 Advanced Qualitative Research Methods (3-6 credit hours)
Advanced guidance for students designing or preparing for qualitative study. Emphasis on developing deeper understanding of theoretical issues informing qualitative research, including assessing validity of data and justifying design. Student development of a research proposal.

Prerequisite: EAC 785
Typically offered in Fall only

EAC 795 Topical Problems in Adult and Community College Education (1-3 credit hours)

EAC 802 Seminar In Adult and Higher Education (1-3 credit hours)
Identification and scientific analysis of major issues and problems relevant to adult education or higher education. Course credit at the doctoral level through active student participation in a formal seminar and scientific appraisal and solution of a selected problem. Student acquisition of a broad perspective of issues confronting adult educators and experiences in scientific analysis and solution of specific issues.

Prerequisite: Graduate standing
Typically offered in Fall only

EAC 803 Research Seminar in Adult and Higher Education (3-6 credit hours)
Examination and application of frameworks, processes and compositional approaches in developing research proposals focusing on problems in adult education and higher education.

Prerequisite: 6 semester hours of course work in research methodology/ analysis
Typically offered in Spring only

EAC 824 Topical Problems In Adult and Higher Education (1-3 credit hours)
Study and scientific analysis of problems in adult and higher education at the doctoral level and preparation of a scholarly research paper or project. Credits Arranged.

Prerequisite: Graduate standing or PBS status

EAC 830 Independent Study in Adult and Higher Education (3 credit hours)
Independent study for doctoral students in Adult and Higher Education.

Typically offered in Fall, Spring, and Summer

EAC 851 Internship In Adult and Higher Education (1-9 credit hours)
Utilization of the participant-observer role with required participation in selected educational situations. Emphasis upon observational skills development, the recording of relevant observations through written journals, analysis of experiences identifying critical incidents and projection of events and consequences. Student development and selection of possible alternative courses of action in various situations and evaluation of the consequences of the selected course of action.

Prerequisite: Nine hrs. in graduate level courses
Typically offered in Fall, Spring, and Summer

EAC 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EAC 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EAC 892 Doctoral Research Project (1-3 credit hours)
A project or problem in research in education for graduate students, supervised by members of graduate faculty. Choice of research on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: EAC 732
Typically offered in Fall and Spring

EAC 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EAC 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EAC 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

EAC 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Advanced Analytics (AA)

AA 500 Analytics Tools and Techniques (3 credit hours)
This course equips the student with basic and advanced computer programming skills needed to use industry-standard analytics tools for data analysis, including but not limited to: data access and management, data cleaning, data mining, text mining, geospatial analytics, forecasting, and optimization. Restricted to AA majors.

Corequisite: AA 501
Typically offered in Summer only

AA 501 Analytics Foundations (3 credit hours)
This course equips the student with basic knowledge of statistics required for further study in analytics. Topics include, but are not limited to: Exploratory Data Analysis, Linear Regression, Multiple Linear Regression, Regression Diagnostics, Logistic Regression, ANOVA, Cluster Analysis, Analysis of Tables, and Survey Data Analysis. Restricted to AA major.

Corequisite: AA 670
Typically offered in Summer only

AA 502 Analytics Methods and Applications I (6 credit hours)
This course equips the students with the methods and applications of advanced analytics. Topics include, but are not limited to: Time Series and Forecasting, Geospatial Data Analytics, Linear Algebra, Data Mining, Survival Data Analysis and Logistic Regression Models. Restricted to AA major.

Prerequisite: AA 501 and AA 670; Corequisite: AA 504
Typically offered in Fall only

AA 503 Analytics Methods and Applications II (6 credit hours)
This course equips the student with the methods and applications of advanced analytics. Topics include, but are not limited to: Advanced Data Mining, Text Mining, Financial Analytics, Risk Analytics, Marketing Science and Customer Analytics, Linear and Non-Linear Programming. Restricted to AA major.

Prerequisite: AA 502; Corequisite: AA 505
Typically offered in Spring only

AA 504 Analytics Practicum I (6 credit hours)
This course equips the student with the knowledge and skills needed to conduct and present large-scale studies based on advanced analytics. Student teams conduct analysis using large amounts of real-world data. Restricted to AA major.

Prerequisite: AA 501 and AA 670; Corequisite: AA 502
Typically offered in Fall only

AA 505 Analytics Practicum II (6 credit hours)
A continuation of AA 504, this course equips the student with the knowledge and skills needed to conduct and present large-scale studies based on advanced analytics. Student team conduct analysis using large amounts of real-world data. Restricted to AA majors.

Prerequisite: AA 504; Corequisite: AA 503
Typically offered in Spring only

AA 591 Special Topics in Advanced Analytics (1-6 credit hours)
Special Topics in Advanced Analytics

AA 691 Special Topics in Advanced Analytics (1-6 credit hours)
Special Topics in Advanced Analytics

Aerospace Studies (AS)

AS 121 Heritage and Values I (1 credit hours)
AS 121 is the first semester of a survey course designed to introduce students to the United States Air Force and provide an overview of the basic characteristics, missions, and organization of the Air Force. Companion Lab AS201 required for active cadets.

Typically offered in Fall only

AS 122 Heritage and Values II (1 credit hours)
AS 122 is the second semester of a survey course designed to introduce students to the United States Air Force and provides an overview of the basic characteristics, missions, and organization of the Air Force. Companion Lab AS201 required for active cadets.

Typically offered in Spring only

AS 201 Freshman and Sophomore Leadership Laboratory (1 credit hours)
AS 201 is the leadership lab component for freshman and sophmore cadets enrolled in the AFROTC program. This laboratory is the hands-on military training where you will apply the knowledge and theory from your academic classes.

Typically offered in Fall and Spring

AS 221 Team and Leadership Fundamentals I (1 credit hours)
Part I of a two-semester course laying the foundation for teams and leadership. The topics include skills that will allow students/cadets to improve their leadership on a personal level and within a team. The courses will prepare students/cadets for their field training experience where they will be able to put the concepts learned into practice. Companion Lab AS201 required for active cadets.

Typically offered in Fall only

AS 222 Team and Leadership Fundamentals II (1 credit hours)
Part II of a two-semester course laying the foundation for teams and leadership. The topics include skills that will allow students/cadets to improve their leadership on a personal level and within a team. The courses will prepare students/cadets for their field training experience where they will be able to put the concepts learned into practice. Companion Lab AS201 required for active cadets.

Typically offered in Spring only

AS 321 Leading People and Effective Communication I (3 credit hours)
AS321 is a three-credit hour elective and part I of a two-semester course that teaches students/cadets advanced skills and knowledge in management and leadership. Topics include leadership and management fundamentals, ethics training and communication skills. Students will gain a more in-depth understanding of how to effectively lead people, as well as, hone their writing and briefing skills. Companion Lab AS401 required for active cadets.

Typically offered in Fall only

AS 322 Leading People and Effective Communication II (3 credit hours)
Part II of a two-semester course that teaches students/cadets advanced skills and knowledge in management and leadership. Topics include leadership and management fundamentals, ethics training and communication skills. Students will gain a more in-depth understanding of how to effectively lead people, as well as, hone their writing and briefing skills. Companion Lab AS401 required for active cadets.

Typically offered in Spring only

AS 401 Junior and Senior Leadership Laboratory (1 credit hours)
AS 401 is the leadership lab component for junior and senior cadets enrolled in the AFROTC program. This laboratory is the hands-on military training where you will apply the knowledge and theory from your academic classes. Additionally it provides cadets an opportunity to practice their leadership as they train the underclassmen cadets.

Typically offered in Fall and Spring

AS 421 National Security Affairs/Preparation for Active Duty I (3 credit hours)
AS 421 is a three credit hour course and is designed for college seniors. It will give students the foundation to understand their role as military officers in American society. Course examines the factors affecting national security; analyzes the evolution and formulation of U.S. defense policy, strategy, and joint doctrine; and investigates the methods for managing conflict. Companion Lab AS401 required for active cadets.

Typically offered in Fall only

AS 422 National Security Affairs/Preparation for Active Duty II (3 credit hours)
AS 422 is a three credit hour course and is designed for college seniors. It will give students the foundation to understand their role as military officers in American society. Course examines the factors affecting national security; analyzes the evolution and formulation of U.S. defense policy, strategy, and joint doctrine; and investigates the methods for managing conflict. This final semester provides information that will prepare the cadets for Active Duty. Companion Lab AS401 required for active cadets.

Typically offered in Spring only

AS 495 Special Topics in Aerospace Studies (2 credit hours)
Offered as needed to treat new or special subject matter relating to the Department of the Air Force.

Typically offered in Fall and Spring

Africana Studies (AFS)

AFS 230/MUS 230 Introduction to African-American Music (3 credit hours)
Comprehensive survey of African-American music in the United States from Colonial times to the present, with emphasis on its unique features and contributions to American culture.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall only

AFS 240 African Civilization (3 credit hours)
An interdisciplinary study of centers of African civilization from antiquity to the 1960s. Such centers include ancient Egypt, Nubia, Axum, Ghana, Mali, Songhai, Kilwa, Malinda, Sofola, Zinzibar and Monomotapa.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

AFS 241 Introduction to African American Studies (3 credit hours)
Introduces students to the field of African American/Black Studies. A transdisciplinary approach is used that includes humanistic and social scientific disciplines. The course offers an intellectual and methodological framework for understanding the past, present, and future of people of African descent in the United States of America. Topical areas are covered that capture the historical, political, economic, cultural, sociological and psychological experiences of African Americans.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

AFS 248/ENG 248 Survey of African-American Literature (3 credit hours)
African-American writing and its relationships to American culture and history. Covers such writers as Wheatley, Douglass, Chesnutt, Dunbar, DuBois, Hughes, Hurston, Wright, and Morrison.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

AFS 260/MUS 260 History of Jazz (3 credit hours)
History of jazz and the contributions of major artists. Emphasis of the various styles that have contributed to this American art form. Investigation of structural forms in the jazz idiom.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring and Summer

AFS 275/HI 275 Introduction to History of South and East Africa (3 credit hours)
The African kingdoms (Lunda, Buganda, and Zulu); the European encroachment; the origins of colonialism and the character of colonial societies and economies, South African apartheid; African protest, nationalism and independence.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

AFS 276/HI 276 Introduction to History of West Africa (3 credit hours)
The history of Western Africa. Forest civilizations and the slave trade, trade and the expansion of Islam, colonialism in West Africa; African nationalism and the achievement of independence; and postcolonial West Africa.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

AFS 305/SOC 305 Racial and Ethnic Relations (3 credit hours)
Study of the nature of the relationships among racial and ethnic groups in societies around the world but with emphasis on the United States. Explores topics such as inequalities of wealth, power, and status, racism, conflict, and social boundaries among groups. Current trends in intergroup relations are discussed.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

AFS 342 Introduction to the African Diaspora (3 credit hours)
Exploration of the global experiences of people of African descent. Geographical areas include the Americas, Europe, Asia, and the Caribbean. Exploration of the web of interrelated histories, social dynamics, and politico-economic processes affecting and reflecting world cultures and histories. Foundational course for the exploration of methodological issues and theoretical concerns in the field of African Diaspora Studies.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

AFS 343/REL 343 African American Religions (3 credit hours)
History of religions among Americans of African descent from the period of the development of the transatlantic slave trade to the present. Exploration of the complex ways religion has shaped the lifeworld of African Americans.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

AFS 344 Leadership in African American Communities (3 credit hours)
Historical, cultural and political examination of the dynamics of leadership in African American communities. Focus on structure of Leadership in the context of gender, ideology, and style. Interdisciplinary examination of impact of leaders on broader American society.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

AFS 345/PSY 345 Psychology and the African American Experience (3 credit hours)
Historical and cultural examination of the psychological experiences of African American experience from pre-American times to the present. Focus on mental health, personality, identity development, racism, oppression, psychological empowerment andan African-centered world view. Discussion of contemporary issues within the African American community.

Prerequisite: PSY 200 or PSY 201
GEP U.S. Diversity
Typically offered in Fall and Spring

AFS 346/ARS 346 Black Popular Culture (3 credit hours)
A multidisciplinary examination of contemporary black cultural expression in film, music, art, and the media. Emphasis on race, class, gender, and political discourse. This class may be scheduled with a small percentage of seats held for IDS Students Only.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

AFS 349/ENG 349 African Literature in English (3 credit hours)
Anglophone literature in Africa. Emphasis on the relationship between the African world-view and literary production and the persistent trend by African writers to connect literature with politics. Writers such as Achebe, Ngugi, Soyinka, and Serote.

Prerequisite: Sophomore standing and above
Typically offered in Spring only

AFS 372/HI 372 African-American History Through the Civil War, 1619-1865 (3 credit hours)
African background and continuity of the particular role, experience and influence of African Americans in the United States through the Civil War.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

AFS 373/HI 373 African-American History Since 1865 (3 credit hours)
The history of African-Americans from the Reconstruction era through the Civil Rights movement of the 1950s and 1960s to the present.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

AFS 375/ENG 375 African American Cinema (3 credit hours)
Survey and analysis of African American film culture from 1900-present. Examination of pre-Hollywood, classical Hollywood, and Independent filmmaking. Particular focus on independent filmmakers' response to dominant industry representations and the work of filmmakers who seek to create a specifically African American cinematic style.

P: ENG 101
GEP U.S. Diversity
Typically offered in Fall and Spring

AFS 380/WGS 380 Black Feminist Theory (3 credit hours)
Focused examination of Black feminist theory as a significant and distinct body of work. Interdisciplinary exploration of the impact of Black feminist theory on movements for social justice, the development of academic feminism generally, and the lived experience of Black women both in the United States and internationally.

Prerequisite: Any 200-level course in either WGS or AFS
GEP U.S. Diversity
Typically offered in Fall and Spring

AFS 409/PS 409 Black Political Participation in America (3 credit hours)
African American political participation in the United States; political culture, socialization, and mobilization, with a focus on the interaction between African Americans and actors, institutions, processes, and policies of the American political system.

Typically offered in Fall only

AFS 440 Senior Seminar in Africana Studies (3 credit hours)
In-depth examination of Africana Studies issues. Interdisciplinary exploration of key problems and proposed solutions for African communities on the African continent and throughout the world. Requires written research project using interdisciplinary approaches and critical analyses.

Prerequisite: AFS 342; Africana Studies Majors or Africana Studies Minors
Typically offered in Spring only

AFS 442 Issues in the African Diaspora (3 credit hours)
Multidisciplinary exploration of the interrelated histories, social dynamics, and politico-economic processes of the experiences of people of African descent throughout the world. Particular focus on the experiences of slavery, artistic expression, gender practices, and the impact of the nation-state.

GEP Humanities
Typically offered in Fall and Spring

AFS 448/ENG 548/AFS 548/ENG 448 African-American Literature (3 credit hours)
Survey of African-American literature and its relationships to American culture, with an emphasis on fiction and poetry since 1945. Writers such as Bontemps, Morrison, Hurston, Baldwin, Hayden, Brooks, Naylor, Harper, and Dove.

Requirement: Junior Standing
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Summer

AFS 455/HI 555/AFS 555/HI 455 History of the Civil Rights Movement (3 credit hours)
The black revolution; stages and leaders of the movement; successes and failures in the fight for desegregation, the vote, and economic opportunity; impact of Civil Rights movement on the United States. Credit will not be given both for AFS/HI 455 and AFS/HI 555.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

AFS 470 The Red Record and The Birth of a Nation (3 credit hours)
This course addresses the power of mass media and the tactics used by early black journalists to confront and subvert racist propaganda. Featured in this course are Ida B. Wells and her efforts in the late 19th and early 20th century to identify and call out justification for the lynching of Black people, especially Black men. We look at Wells' efforts, and what informed them, in juxtaposition with the film Birth of a Nation by director D. W. Griffith. The goal is for students to understand the enduring significance of the film as a piece of propaganda, and the foundation for the manner in which Hollywood situates and engages with the Black character.

GEP Humanities
Typically offered in Fall only

AFS 475/HI 575/AFS 575/HI 475 History of the Republic of South Africa (3 credit hours)
Evolution of the Republic of South Africa's society, with emphasis on the interaction of diverse peoples and cultures. Particular attention is given to the period since 1870. Credit will not be given for both HI (AFS) 475 and HI 575.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall and Spring

AFS 476/HI 576/AFS 576/HI 476 Leadership in Modern Africa (3 credit hours)
Recent sub-Saharan African political history (excluding South Africa). Overview of concepts, vocabulary, historical trends. Detailed examination of specific African countries as case studies, such as Ghana, Nigeria, Zimbabwe, Tanzania. Credit will not be given for both HI (AFS) 476 and HI 576.

Prerequisite: 3 hours of history
GEP Global Knowledge

AFS 479/HI 579/AFS 579/HI 479 Africa (sub-Saharan) in the Twentieth Century (3 credit hours)
Developments in sub-Saharan Africa during the colonial period, from the end of the nineteenth century to the advent of decolonization in the early 1960s. Interplay of political, social, economic and cultural factors in the experiences of African peoples during this period. Credit will not be given for both HI (AFS) 479 and HI 579

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

AFS 490 Africana Studies and Community Involvement (3 credit hours)
First part of a two semester service-learning experience. Provides interdisciplinary and experientially based opportunity for students to engage in community and classroom-based experiences that examine issues of relevance to African American people(or communities in the African Diaspora). Students apply and examine concepts addressed in class to their own practical experience in service to others. Development of interpersonal and professional skills. Focus on the values, beliefs, attitudes, and ideas that are central to definitions of democracy, social justice, civic resiliency, self-help, and public life.

Prerequisite: Africana Studies Majors or Africana Studies Minors
Typically offered in Fall only

AFS 491 Study Abroad in Africana Studies (3 credit hours)
Specific category of revolving set of field/seminar courses involving multidisciplinary focal areas taught in foreign countries through Africana Studies. Course includes pre-trip orientation and readings and onsite field experiences and lectures. Additional program fees, travel costs and appropriate immunizations are required beyond registration fees.

Typically offered in Summer only

AFS 497 Topics in African-American Studies (3 credit hours)
Multidisciplinary examination of selected topics in African-American studies.

Prerequisite: AFS 240
Typically offered in Fall and Spring

AFS 548/ENG 448/AFS 448/ENG 548 African-American Literature (3 credit hours)
Survey of African-American literature and its relationships to American culture, with an emphasis on fiction and poetry since 1945. Writers such as Bontemps, Morrison, Hurston, Baldwin, Hayden, Brooks, Naylor, Harper, and Dove.

Requirement: Junior Standing
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Summer

AFS 555/HI 455/AFS 455/HI 555 History of the Civil Rights Movement (3 credit hours)
The black revolution; stages and leaders of the movement; successes and failures in the fight for desegregation, the vote, and economic opportunity; impact of Civil Rights movement on the United States. Credit will not be given both for AFS/HI 455 and AFS/HI 555.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

AFS 575/HI 475/AFS 475/HI 575 History of the Republic of South Africa (3 credit hours)
Evolution of the Republic of South Africa's society, with emphasis on the interaction of diverse peoples and cultures. Particular attention is given to the period since 1870. Credit will not be given for both HI (AFS) 475 and HI 575.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall and Spring

AFS 576/HI 476/AFS 476/HI 576 Leadership in Modern Africa (3 credit hours)
Recent sub-Saharan African political history (excluding South Africa). Overview of concepts, vocabulary, historical trends. Detailed examination of specific African countries as case studies, such as Ghana, Nigeria, Zimbabwe, Tanzania. Credit will not be given for both HI (AFS) 476 and HI 576.

Prerequisite: 3 hours of history
GEP Global Knowledge

AFS 579/HI 479/AFS 479/HI 579 Africa (sub-Saharan) in the Twentieth Century (3 credit hours)
Developments in sub-Saharan Africa during the colonial period, from the end of the nineteenth century to the advent of decolonization in the early 1960s. Interplay of political, social, economic and cultural factors in the experiences of African peoples during this period. Credit will not be given for both HI (AFS) 479 and HI 579

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

Agricultural and Extension Education (AEE)

AEE 101 Introduction to Career and Technical Education (1 credit hours)
Overview of career and technical education programs, objectives, and outcomes in secondary schools. Philosophy of career and technical education and how career and technical education programs fit into the overall mission of secondary education. Mission of agricultural education, major program objectives, and introduction to the curricula taught within the state. Roles and responsibilities of CTE teachers with specific emphasis on agricultural education teachers' roles and responsibilities.Historical context of agricultural education and other career and technical education programs, including major legislation affecting development of career and technical education.

Typically offered in Fall only

AEE 103 Fundamentals of Agricultural and Extension Education (1 credit hours)
Introduction to the scope, purpose, and objectives of university education with an emphasis on agricultural education, extension education, and agricultural communications. Students will explore College and departmental resources, academic policiesand procedures, the agricultural industry, career opportunities, and current trends and issues in agriculture. Cannot receive credit for both AEE 103 and ALS 103

Typically offered in Fall only

AEE 141 Computer Applications in the Agricultural Institute (2 credit hours)
Introduction to computing concepts and the computing infrastructure in the Agricultural Institute. Use of computing hardware and software to perform common tasks, explore networked computer resources and solve problems associated with the various curricula in the Agricultural Institute. BOSTICK

Typically offered in Spring only

AEE 206 Introduction to Teaching Agriculture (3 credit hours)
Introduction to teaching agricultural education in middle and secondary schools and collaborative efforts for teaching agricultural education to adults as rural community situations dictate. Field experiences include three hours per week of structured observations of classroom teachers, teacher assistant activities, and reflections of the experience.

Typically offered in Fall only

AEE 208/ANS 208/PB 208 Agricultural Biotechnology: Issues and Implications (3 credit hours)
Trends and issues of agricultural biotechnology in today's society are addressed while covering the basic biological science behind the technology. Applications of and policy issues associated with plant, animal, and environmental biotechnology used in the agricultural industry are examined from an interdisciplinary approach.

Prerequisite: (BIO 105 or BIO 115 or BIO 181 or BIO 183)
GEP Interdisciplinary Perspectives
Typically offered in Spring and Summer

AEE 226 Computer Applications and Information Technology in Agricultural & Extension Ed (3 credit hours)
Use of computers and commercially produced agricultural software; the computer as a management tool; agricultural occupational applications of the computer; a multimedia instructional tool in agricultural classrooms and training situations; use of technology for processing information and imaging; network access; and electronic communications.

Typically offered in Fall and Spring

AEE 230 Introduction to Cooperative Extension (3 credit hours)
This course is designed for all students who are interested pursuing a career with the cooperative extension service. An introduction to the cooperative extension mission, philosophy, history, organization,structure, administration, program areas, extension program development, extension teaching and delivery methods, and the involvement and use of volunteers. Students are expected to provide their own transportation for outside of class activities and assignments.

Typically offered in Fall only

AEE 303 Administration and Supervision of Student Organizations (3 credit hours)
Principles and techniques for organizing, administering and supervising student organization activities.

Prerequisite: AEE 206
Typically offered in Spring only

AEE 311 Communication Methods and Media (3 credit hours)
Foundations of agricultural communications. Technologies of agricultural communication and the systematic approach to the development of agricultural communication materials. Development of applied skills in design, production, evaluation, and dissemination of information unique to agricultural sciences and media.

Prerequisite: ENG 101
Typically offered in Fall and Spring

AEE 322 Experiential Learning in Agriculture (3 credit hours)
Planning, organizing, implementing, supervising and evaluating Supervised Agricultural Experience (SAE) programs in agriculture.

Prerequisite: AEE 206
Typically offered in Fall only

AEE 323 Leadership Development in Agriculture and Life Sciences (3 credit hours)
AEE 323 is designed to introduce you to the awesome complexity of leadership. Leadership educators believe that leadership can be learned. In this course, we study leadership theory to help us understand our leadership potential, the potential of others, and the impact great leadership can have on people, organizations, and society. We separate skills you gain from going out and doing leadership (the do) from theories that provide foundations for leadership (the think). Effective leadership is important in all contexts, including food and agriculture. We believe it is ESSENTIAL that effective leaders both THINK and DO!

GEP Social Sciences
Typically offered in Fall and Spring

AEE 325 Planning and Delivering Non-Formal Education (3 credit hours)
Adult learning theory and practice, including planning non-formal educational programs for adults, methods of instructional delivery, effective use of instructional technology, marketing educational programs, and evaluation of educational outcomes.Microteaching (practice teaching presentations) and group presentations required as part of laboratory assignments.

Typically offered in Fall only

AEE 326 Teaching Diverse Learners in AED (3 credit hours)
Legislation and issues regarding diverse learners in middle and high school agricultural education are examined. Discussion and practice in planning and facilitating teaching strategies to help those with special needs in an agricultural setting are emphasized. Techniques to integrate reading and writing into the curriculum are identified and practiced. Field trips are required.

Prerequisite: AEE 206; Junior standing; and AED Majors only
Typically offered in Spring only

AEE 327 Conducting Summer Programs in Agricultural Education (1 credit hours)
Field experience emphasizing summer agricultural education programs. Individualized instruction for students during supervised agricultural experience visits and youth organization activities. Professional development and program improvement activities.

Prerequisite: AEE 206, AEE 303, AEE 322, and Corequisite of AEE 426
Typically offered in Fall only

AEE 350 Personal Leadership Development in Agriculture and Life Sciences (3 credit hours)
This course focuses on the development of each student's capacity to lead in ways that reflect their values and to address big, messy challenges through leadership. Students will examine human behavior through the lenses of authentic and adaptive leadership and work to develop their own capacity for authentic and adaptive leadership. They will apply critical and creative thinking processes to analyze adaptive challenges and develop potential solutions in the realms of agriculture, food, and natural resources.

GEP Social Sciences
Typically offered in Spring only

AEE 360 Developing Team Leadership in Agriculture and Life Sciences (3 credit hours)
Students in this course will study the impact of organized teams and team leaders on the development of agricultural organizations. Principles and techniques involved in creating, organizing and directing teams will be explored. Students will develop skills in team decision-making and communication. Topics of discussion will include: components of a group and team, relationships of group and team members, effectiveness of groups and teams, and communication within groups and teams. This course is designed for students who are interested in positions of leadership and who want to learn more about making the groups and teams they work with more effective.

Prerequisite: AEE 323-Leadership Development in Agriculture
Typically offered in Fall only

AEE 423 Practicum in Agricultural Extension/Industry (8 credit hours)
Participation in professional work experiences in preparation for effective leadership positions in the Cooperative Extension Service or the agribusiness industry.

Prerequisite: AEE 230, AEE 325, and Corequisite of AEE 490
Typically offered in Spring and Summer

AEE 424 Planning Agricultural Educational Programs (3 credit hours)
Principles of program planning applied to educational programs in agriculture; includes theory and field experiences in planning, organizing, and evaluating high school and adult education programs.

Prerequisite: AEE(ED) 426, Corequisite: AEE(ED) 427
Typically offered in Spring only

AEE 426 Methods of Teaching Agriculture (3 credit hours)
Discussion and practice in planning and presenting instruction in agriculture in formal and informal settings. Principles and application of approaches to teaching and organizing instruction, motivating students, developing instructional objectives, selecting and using teaching techniques, evaluating instruction, and managing classroom and laboratory instruction.

Prerequisite: Junior standing.
Typically offered in Fall only

AEE 427 Student Teaching in Agriculture (8 credit hours)
Skills and techniques involved in teaching vocational agriculture through practice in a public school setting with concurrent on-campus seminars.

Prerequisite: AEE (ED) 426; Admission to Professional Semester, Corequisite: AEE (ED) 490, AEE (ED) 424;
Typically offered in Spring only

AEE 433/AEE 533 Leadership and Management of Volunteers in Agricultural and Extension Education (3 credit hours)
This course is intended to prepare students to be effective managers of volunteer programs. Theory will be emphasized in the course because it is essential to be grounded in theory in order to apply it. Major topics of the course will include, but are not limited to: volunteer recruitment, training, evaluation and reward. Students will be required to be active in and outside of class sessions, including a 20-hour field experience. Students must provide their own transportation for field trips and outside of class activities. Cannot receive credit for both AEE 433 and 533.

Prerequisite: Junior standing
Typically offered in Fall only

AEE 435 Professional Presentations in Agricultural Organizations (3 credit hours)
This course teaches effective listening strategies, communication strategies, interpersonal skills and presentation strategies essential for use in today's workplace. AEE 435 includes strategies and techniques for effective presentations in the food, agricultural, natural resources, as well as other professions, with emphasis on oral and visual presentation techniques. Presentation skills and strategies for formal and informal situations including conferences, poster presentations along with leadership, conflict resolution, interviewing, negotiation, and group communication theory and strategies will be discussed. Restricted to CALS students; Jr or Sr level status required.

Typically offered in Fall and Spring

AEE 460 Organizational Leadership Development in Agriculture and Life Sciences (3 credit hours)
This course focuses on the impact of effective leadership in organizations in both theory and practice. Students will examine the major theories and studies that are most relevant and informative with the regard to leadership in organizations. Students will develop skills in decision-making, management of organizations, and ethical leadership related to agricultural organizations.

Prerequisite: AEE 323-Leadership Development in Agriculture
Typically offered in Spring only

AEE 478 Advanced Issues in Extension Education (3 credit hours)
Advanced issues and trends contributing to the administration, organization, and structure of extension education in a changing world. Senior standing required.

Prerequisite: AEE 230
Typically offered in Spring only

AEE 490 Seminar in Agricultural and Extension Education (3 credit hours)
Capstone experience in Leadership in Agricultural and Life Sciences for Agricultural Sciences majors. Students will apply theories and concepts from their leadership courses to a planned leadership experience. Reflection on and documentation of intentional leadership experiences will lead to a final presentation in the course of leadership lessons learned and areas for continued development.

Prerequisite: Senior Standing and students in 11AGSBS and 11EXTEDBS
Typically offered in Spring only

AEE 491 Seminar in Agricultural Education (1 credit hours)
This course helps students analyze the opportunities and challenges facing teachers of agriculture as they prepare for their careers. Topics include balancing work and professional life as a teacher, portfolio assessments of teachers and programs, classroom management, teacher liability, and preparation for the job search in agricultural education.

Corequisites: AEE 424 and AEE 427
Typically offered in Spring only

AEE 492 External Learning Experience in Agricultural and Extension Education (1-6 credit hours)
Learning experience within an academic framework that utilizes facilities and resources external to the campus. Contact and arrangements with prospective employers initiated by the student and approved by the faculty adviser, prospective employer, and the departmental teaching coordinator prior to the experience. Not intended for teaching licensure for students in AEE

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

AEE 493 Special Problems in Agriculture and Extension Education (1-6 credit hours)
A learning experience in agriculture and extension education within an academic framework that utilizes departmental campus facilities and resources. Arrangements must be initiated by the student and approved by a faculty adviser and the departmental teaching coordinator. Not intended for teacher licensure for students in AEE.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

AEE 495 Special Topics in Agricultural and Extension Education (1-3 credit hours)
Offered as needed to present material not normally available in regular course offerings or for offerings of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

AEE 501 Foundations Of Agricultural and Extension Education (3 credit hours)
Development and organization of agricultural and extension education in America from colonial times to the present. Emphasis on role of societal and scientific changes, the federal government and philosophy on evolution of agricultural and extension education.

Typically offered in Fall and Summer

AEE 503 Youth Program Management (3 credit hours)
Research, theory and principles of youth organization management. Analysis of youth development models and application of leadership theory in a youth organization. Using evaluation models to assess the effectiveness of major youth organization. Web-based course.

Typically offered in Spring only

AEE 505 Trends and Issues in Agricultural and Extension Education (3 credit hours)
Trends and Issues in Agricultural and Extension Education. Analysis and appraisal of current trends, problems and issues in Agricultural and Extension Education. May include but not limited to scientific, political, demographic, social, educational, technological, and environmental trends and issues that will contribute to the future structure and operation of agricultural and extension education in the United States.

Typically offered in Spring only

AEE 507 Comparative Agricultural and Extension Education (3 credit hours)
Organization and operation of formal and nonformal agricultural education and extension systems in the United States and in other countries. Field trip required - cost approx. $175.00.

Typically offered in Fall only

AEE 521 Program Planning in Agricultural and Extension Education (3 credit hours)
Consideration of the need for planning programs in education; objectives and evaluation of community programs; use of advisory group; organization and use of facilities.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

AEE 523 Adult Education in Agriculture (3 credit hours)
Designed to meet needs of leaders in adult education. Opportunity to study issues in working with adult groups. Attention given to the problem of fitting educational program for adults into public school and other educational programs and to methods of teaching adults.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

AEE 524 Coordinating the High School Agricultural Education Program (3 credit hours)
Principles of program planning applied to educational programs about agriculture; theory and field experiences in planning, organizing, and evaluating secondary agricultural education programs; development of plans for conducting all aspects of the complete agricultural education programs.

Typically offered in Spring only

AEE 526 Information Technologies in Agricultural and Extension Education (3 credit hours)
Principles, theory and techniques of using information technologies to provide instruction to learners, both in person and at a distance, in formal and non formal educational settings.

Typically offered in Spring only

AEE 533/AEE 433 Leadership and Management of Volunteers in Agricultural and Extension Education (3 credit hours)
This course is intended to prepare students to be effective managers of volunteer programs. Theory will be emphasized in the course because it is essential to be grounded in theory in order to apply it. Major topics of the course will include, but are not limited to: volunteer recruitment, training, evaluation and reward. Students will be required to be active in and outside of class sessions, including a 20-hour field experience. Students must provide their own transportation for field trips and outside of class activities. Cannot receive credit for both AEE 433 and 533.

Prerequisite: Junior standing
Typically offered in Fall and Spring

AEE 535 Teaching Agriculture in Secondary Schools (3 credit hours)
Application of theoretical models and research on effective teaching in secondary agricultural education programs. teaching strategies, planning required, and instructional management for students with varying backgrounds. Evaluation of student learning and teacher evaluation of instruction.

Typically offered in Fall only

AEE 577 Evaluation in Agricultural and Extension Education (3 credit hours)
Evaluation is an important part of many social science disciplines and grant projects. The intent of this course is to teach students how to plan and conduct a meaningful and useful evaluation. Students will gain knowledge and skills in planning evaluations; designing evaluation studies and evaluation instruments; collecting and analyzing data; and using evaluation results. Students will learn evaluation theoretical concepts and their application in real-life situations.

Restriction: Graduate Standing or PBS
Typically offered in Spring only

AEE 579 Research Design in Agricultural and Extension Education (3 credit hours)
Design of Research in Agricultural and Extension education. Development of proposals for thesis research or competitive grants. Critical analyses of research in the field and proposed research.

Typically offered in Fall only

AEE 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

AEE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

AEE 705 International Agricultural Development (3 credit hours)
This course provides an opportunity to learn about global agricultural and extension education issues, challenges and opportunities relating to agricultural development. The course emphasis is on building necessary knowledge and skills for analyzing global agricultural and extension education issues and formulating alternatives for agricultural development. This course has been designed to help graduate students understand agriculture and extension education with a global perspective.

Prerequisite: Graduate standing
Typically offered in Fall only

AEE 820 Special Problems in Agricultural and Extension Education (1-6 credit hours)
Exploration of topics of special interest not covered by existing courses by individual students under faculty member's directions. Readings and independent study, problems or research not related to a thesis.

Typically offered in Fall, Spring, and Summer

AEE 841 Practicum in Agricultural and Extension Education (1-6 credit hours)
Faculty-supervised practicum in an educational, extension or agricultural industry setting.

Typically offered in Fall, Spring, and Summer

AEE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

AEE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

AEE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

AEE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

AEE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Agricultural Economics (ARE)

ARE 104 Agricultural Business Management (3 credit hours)
Insights into the management skills of a successful agribusiness firm manager. A topical approach to analytical and planning techniques applicable to business decisions. Managerial concepts such as financial analysis, budgeting, investment analysis, capital acquisition, financial and risk management of agribusiness firms. HENDRICKSON

Typically offered in Fall, Spring, and Summer

ARE 106 Agri Business Law (3 credit hours)
The application of legal principles to agribusiness. Includes a review of our legal system contracts, real property, personal property torts, business organization, estate planning, and laws affecting agribusiness.

Typically offered in Fall and Spring

ARE 112 Agricultural & Agribusiness Marketing (3 credit hours)
Marketing concepts, techniques and management of the U.S. marketing system from agricultural production, agribusiness, and traditional business perspectives. Broad, basic knowledge of marketing objectives, the marketing environment, strategic planning, marketing information sources, consumer demographics and lifestyle characteristics, product planning, distribution planning, promotion planning, and price planning. PHILLIPS

Typically offered in Fall only

ARE 113 Principles of Salesmanship (3 credit hours)
How To" course in selling. Understanding customer's behavior, establishing and maintaining customer rapport, and negotiating a sale. Developing sales skills through discussion, role playing and demonstrations. Emphasis on building self-confidence through selling exercises involving class participation, special assignments, and targeted presentations. WEEMS

Typically offered in Fall and Spring

ARE 114 Value Added Agriculture and Niche Marketing (3 credit hours)
Value Added Agriculture and Niche Marketing are ways to increase farm revenue without having to go off farm for employment. This course is designed to provide insights into the opportunities that are available to increase farm revenue, to see what other farms are currently doing with value added within the region, and to create a value added business plan for expanding farm offerings. Site visits are required components of this course. University transportation provided to all site visits. Student transportation (estimated at $30 per student and site visit (estimated at $7 each for 2 sites) fees apply.

Typically offered in Fall only

ARE 115 Agribusiness Accounting (3 credit hours)
Introduction to basic accounting principles and concepts applicable to an agribusiness firm. Exposure to journals, ledgers and financial statements. Topics of the accounting cycle, inventories, payrolls, accounts receivable, income taxes and the potential use of computers. RUSS

Typically offered in Fall, Spring, and Summer

ARE 121 Agricultural Finance (3 credit hours)
Agricultural Finance teaches students introductory concepts for financial management decisions in agricultural/farm businesses. Topics include building a financial control process, developing risk management strategies, and analyzing investment opportunities. Emphasis is on developing skills necessary to create a financial business plan.

Restriction: AGI Only
Typically offered in Fall, Spring, and Summer

ARE 132 Management of Personnel (3 credit hours)
Personnel problems of recruiting, selecting, training, paying, and motivating employees of an agribusiness firm. Improving organizational effectiveness, functioning of a production supervisor, resolution of conflicts and leadership development. PHILLIPS

Typically offered in Fall and Spring

ARE 133 Agricultural & Environmental Policy (3 credit hours)
History of agricultural and environmental policy, policy formation, agricultural programs, effects of agricultural production on the environment, benefits and costs of agricultural and environmental policy, state of the environment, environmental regulations and their enforcement, optimal level of pollution, incentive-based environmental regulation, outlook for agricultural and environmental policy, and the sustainability of agriculture and of the environment. RUSS

Typically offered in Fall, Spring, and Summer

ARE 141 Personal Financial Management (3 credit hours)
Economic analysis of personal decisions related to consumer purchases, time value of money, taxes, financial risk management, investment strategies, retirement planning and estate planning. Relationship of an individual's life cycle to budgeting and financial goals. Background information on wise use of credit, home purchase, life insurance, property insurance, health insurance and investment fundamentals. PHILLIPS

Typically offered in Spring only

ARE 194 International Agribusiness Management Study Abroad (1-6 credit hours)
This course is designed to maximize student potential for success by developing a globally and multi-culturally competent agricultural and agribusiness workforce. This course addresses these issues by providing opportunities for students to study abroad in various locations around the world, with different destinations offered each academic year. Credit hours are variable based on length or travel and classroom instruction pre- and post-travel consistent with NCSU policies and practices. Course may be repeated for credit to visit different destinations only. Significant expenses for travel are involved. Please see the instructor for specific program details.

Typically offered in Spring and Summer

ARE 201/ARE 201A Introduction to Agricultural & Resource Economics (3 credit hours)
Introduction to economic principles of marginal benefits and costs with application to consumer and producer decisions. Functions of market exchange systems in determining prices and quantities and creation of wealth. Property rights and opportunities for exchange. Role of government in dealing with agricultural and resource problems. Macroeconomic analysis including inflation, unemployment, money and banking system. Credit will not be given for both ARE 201 and either EC 201 or EC 205.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ARE 201A/ARE 201 Introduction to Agricultural & Resource Economics (3 credit hours)
Introduction to economic principles of marginal benefits and costs with application to consumer and producer decisions. Functions of market exchange systems in determining prices and quantities and creation of wealth. Property rights and opportunities for exchange. Role of government in dealing with agricultural and resource problems. Macroeconomic analysis including inflation, unemployment, money and banking system. Credit will not be given for both ARE 201 and either EC 201 or EC 205.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ARE 215 Small Business Accounting (3 credit hours)
Record keeping for small businesses organized as sole proprietorships, partnerships, and family held corporations. Double entry accounting principals applied to service and merchandising businesses. General Journals, Combination Journals, Subsidiary Journals, Ledgers, Accounts Receivable, Accounts Payable, Posting, Worksheets. Financial Statements, Closing, Payrolls, Cost Basis, Depreciation, Section 179, Amortization, Financial Adjustments, and Income Tax Forms. Both manual and computerized systems. Semester project of keeping records for a business for a portion of the year.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall, Spring, and Summer

ARE 260 Marketing and Risk Management in the Pork Industry (1 credit hours)
A comprehensive overview of structure and trends in markets and marketing options available in the swine industry. Management of market risk with hedging or other contracts.

Prerequisite: ANS 150
Typically offered in Spring only

ARE 270 Principles of Agribusiness Entrepreneurship (3 credit hours)
Principles of Agribusiness Entrepreneurship is the first course of three in the Agribusiness Entrepreneurship course sequence. It teaches students the applied entrepreneurship skills needed to identify and create an opportunity in agribusiness and how to develop a business canvas model and conduct a feasibility analysis for a real business idea. Students attend class at the NC State E-Clinic in HQ Raleigh for four classes and transportation is included.

Corequisite: ARE 201
Typically offered in Fall and Spring

ARE 290 Professional Development in Agricultural Business Management (3 credit hours)
This course focuses on establishing professional development foundations for incoming students in Agricultural Business Management. The material emphasizes on diversity in the field and workplace, career exploration, and preparation for internship and work applications. Topics include self-reflection, goal-setting, professional development, resume building, job shadowing, and identity exploration from local, global, and workplace perspectives. Non-scheduled class time for field trips or out-of-class activities are required one day per semester for this class. If transportation will pose a problem for a student, the department will provide transportation. This course is restricted to students in the Agricultural Business Management major or admission by departmental approval.

Restriction: Agricultural Business Management major or departmental approval.
Typically offered in Fall, Spring, and Summer

ARE 295 Special Topics in Agricultural & Resource Economics (200 Level) (1-6 credit hours)
An offering of new freshman to sophmore-level courses on trial basis with topics varying based on offerings. Repetition with different course content acceptable up to 4 times and for a total of 12 units.

Typically offered in Fall, Spring, and Summer

ARE 301/EC 301 Intermediate Microeconomics (3 credit hours)
Functioning of the market economy, role of prices in determining the allocation of resources, the functioning of the firm in the economy, forces governing the production and consumption of economic goods.

Prerequisite: MA 121 or MA 131 or MA 141 and EC 201 or EC 205 or ARE 201
Typically offered in Fall and Spring

ARE 303 Farm Management (3 credit hours)
Analytical and planning techniques for making business decisions centered around farm business applications. Economic principles and management concepts such as budgeting, accounting, finance credit, investment analysis, business organization, risk,and taxes as related to practical problems of operating a farm business.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall only

ARE 304 Agribusiness Management (3 credit hours)
Management decision-making by food, fiber, horticulture, and forestry firms. Emphasis on current agribusiness topics such as information utilization, strategic planning, organization structures, competitor intelligence, pricing, leadership, crisis management, ethics, and human resource management. Business communications, agribusiness case studies, and a computerized management simulation game.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall, Spring, and Summer

ARE 306 Agricultural Law (3 credit hours)
Legal principles of practical importance in an agricultural setting: the court system; tort, contract and real and personal property law; legal aspects of organizing an agribusiness; environmental and labor regulations affecting agriculture; income and estate taxation of agriculture. Credit for both ARE 306 and BUS 307 is not allowed

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall, Spring, and Summer

ARE 309 Environmental Law & Economic Policy (3 credit hours)
Current federal and state environmental laws and regulations and their common law foundations. Relationship of the law and its regulatory mechanisms to economic policy issues: externalities, pollution taxes, incentives, permit trading, and cost-benefit analysis. Major environmental topics including water and wetlands, solid and hazardous wastes, pesticides, clean air, endangered species and nuisance actions. Overview of the legal system.

Prerequisite: ARE 201 or EC 201 or EC 205
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ARE 311 Agricultural Markets (3 credit hours)
Agricultural marketing system and economic forces affecting its structure and efficiency. Public policy issues affecting agricultural markets. Emphasis on the analysis of current sources of agricultural market information. Marketing and storage problems over time; futures markets and the management of risk; transportation and international trade; government agricultural programs.

Prerequisite: ARE 201 or EC 201 or EC 205
GEP Social Sciences
Typically offered in Fall only

ARE 312 Agribusiness Marketing (3 credit hours)
Application of marketing and economic principles to decision making in contemporary agribusiness firms. Marketing strategies, marketing research and information, segmentation and targeting, marketing mix, and market plans within food, fiber, natural resource, and production input industries. Professional selling skills and knowledge. Off-campus field experience and visiting lecturers from the agribusiness industry.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall, Spring, and Summer

ARE 321 Agricultural Financial Management (3 credit hours)
Fundamental concepts for financial management decision in agricultural/farm businesses. Emphasis on financial statement analysis of profitability, efficiency, liquidity, repayment capacity, risk, leverage, growth. Capital budgeting, investment decisions, farmland bid price determination, farm real estate appraisal. Financial markets and credit institutions serving agriculture, lending policies, loan analysis, interest rate determination. Financial structure, performance, condition of farm sector.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Spring only

ARE 323 Agribusiness Finance (3 credit hours)
ARE 323 teaches the history of monetary systems, the development of business finance tools and banking, and detailed creation and use of business financial statements, including Income Statements, Balance Sheets, and Statements of Cash Flow, within the context of the agribusiness industry. Two Finance courses are offered in the Agribusiness Management Major: ARE 321 - Agricultural Financial Management, which focuses on the history of finance in agriculture and financial planning for farmers and similar independent agricultural enterprises; and ARE 323 - Agribusiness Finance, which focuses on finance for larger agribusinesses and for managers of agribusiness divisions in larger organizations.

Prerequisites: (ARE 201 or EC 201) and (ACC 200 or ACC 210 or equivalent Introductory Accounting Course)
Typically offered in Fall, Spring, and Summer

ARE 332 Human Resource Management for Agribusiness (3 credit hours)
General introduction to human resource management in agribusinesses. Skills for agribusiness owners for efficient productivity from employees in a legal and ethical manner. Topics on labor economics, human resource legislation, employee planning and recruitment, and migrant labor issues. Emphasis on techniques for training, motivating, leading, and disciplining employees.

Prerequisite: ARE 201 or EC 201 or EC 205
Typically offered in Fall, Spring, and Summer

ARE 336/EC 336 Introduction to Resource and Environmental Economics (3 credit hours)
Application of basic economic tools to understand and evaluate environmental/resource policies. Concepts such as property rights, non-market goods, allocation over time, externalities, and public goods. Current policy issues such as global climate change, evaluating natural resource damages from oil spills, reducing the costs of regulations, protecting estuaries, and dealing with non-point source pollution.

Prerequisite: ARE 201 or EC 201 or EC 205
GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

ARE 345 Global Agribusiness Management (3 credit hours)
Global trade is the largest growth area in American agribusiness, and knowledge of international agribusiness markets is one of the primary qualifications desired from college graduates entering the workforce. This course provides detailed knowledge of the six major regions for agribusiness trade worldwide, to prepare students to understand, speak intelligently about, and capitalize on opportunities for NC and US agribusiness products in the global marketplace. Students will be required to provide their own transportation to local markets and incidental expenses for meals representative of the six major regions connected with class assignments. Please see the Instructor for details.

Prerequisite: EC 201 or 205 or ARE 201
GEP Global Knowledge
Typically offered in Spring only

ARE 370 Agribusiness New Venture Development (3 credit hours)
Agribusiness New Venture Development is the second course of three in the Agribusiness Entrepreneurship course sequence. It teaches students how to develop a new venture idea into a business model. Students learn how to collect and interpret data needed to evaluate new businesses and to evaluate new ventures in existing businesses or institutions. Students develop actionable plans for start-up businesses or ventures. Student teams gain experience pitching their business models to prospective investors and partners. Students attend class at the NC State EClinic in HQ Raleigh for five classes and transportation is provided.

Prerequisite: ARE 270
Typically offered in Fall and Spring

ARE 395 Special Topics in Agricultural and Resource Economics (300 level) (1-6 credit hours)
An offering of new junior-level courses on trial basis with topics varying based on offerings. Repetition with different course content acceptable up to 4 times and total of 12 units.

Typically offered in Fall, Spring, and Summer

ARE 404 Advanced Agribusiness Management (3 credit hours)
An advanced course in business planning that integrates the risk and uncertainty associated with production, marketing, and financial management strategies of agribusiness firms. Focuses on the fundamental components required to develop a strategicbusiness plan and design a viable business strategy in the context of the firm's market and its internal environment. Special attention is given to the application of economic theory and analysis to business decision-making processes. 80% of enrollment is restricted to Agricultural & Resource Economics students with the remaining 20% open for all other majors.

Prerequisite: (ARE 303 or ARE 304), ARE 321, and (ARE 311 or ARE 312)

ARE 412 Advanced Agribusiness Marketing (3 credit hours)
ARE provides opportunities for undergraduates to gain experience with the practical application of Marketing principles with real and fictitious Agribusiness products through two courses taken on campus: ARE 412 and ARE 413. These opportunities are provided to students that are specifically interested in pursuing a Marketing or Sales position after graduation, especially when an internship is not an option. The practical applications often require two semesters (one full academic year) to complete, so student involved in projects are encouraged to take ARE 412 in the Fall and ARE 413 in the Spring. Projects very each year.

Prerequisite: ARE/EC 201 or EC 205; Pre- or Co-requisite: ARE 312 or BUS 360
Typically offered in Fall only

ARE 413 Applied Agribusiness Marketing (3 credit hours)
ARE provides opportunities for undergraduates to gain experience with the practical application of marketing principles with real and fictitious agribusiness products through two courses taken on campus, ARE 412 and ARE 413. These opportunities are provided to students that are specifically interested in pursuing a Marketing or Sales position after graduation, especially when an internship is not an option. The practical applications often require two semesters (one full academic year) to complete, so students involved in projects are encouraged to take ARE 412 in the Fall, and ARE 413 in the Spring. Projects vary each year. This course is an elective for ABM, BBM, and related CALS majors. Departmental approval required to enroll in course.

Prerequisite: ARE 201/EC 201 or EC 205, ARE 312, ARE 412
Typically offered in Spring only

ARE 415 Introduction to Commodity Futures Markets (3 credit hours)
An economic introduction to futures and options contracts and exchanges, with primary focus on agricultural and natural resource commodities.

Prerequisites: ARE 201 or EC 201 or EC 205 or equivalent
Typically offered in Spring only

ARE 420 Taxation in Agriculture, Production, and Agribusiness (3 credit hours)
Students will explore the effect of various tax obligations on farms and rural agribusinesses. Topics of discussion include income taxation, both federal and state, Social Security taxation, property taxation, sales and use taxation, and estate and gift taxation.

Prerequisites: ARE 215 or ARE 303 or ARE 304 or ARE 321
Typically offered in Spring only

ARE 425 Contracts and Organizations in Agriculture (3 credit hours)
This course deals with agricultural contracts and organizational structures in agriculture and food industries. The covered material relies on the economic theory to explain observed empirical phenomena. The approach also relies on the use case studies of different contractual arrangements observed in the U.S. agriculture. The content delivery consists of instructor's lectures, guest lectures and students' presentations. Grading is based on exams, presentations and a class project.

Prerequisite: ARE/EC 301 or equivalent or instructor's permission
Typically offered in Fall only

ARE 433 U.S. Agricultural Policy (3 credit hours)
Government economic policies and programs affecting agricultural inputs and farm products. Analysis of the rationale, objectives, and major types of agricultural programs and their effects on resource allocation and income distribution within agriculture and between agriculture and the rest of the economy.

Prerequisite: ARE(EC) 301
GEP Social Sciences
Typically offered in Fall and Spring

ARE 444 Ethics in Agribusiness (3 credit hours)
Ethical behavior is a crucial issue in American business, especially after numerous ethical lapses over the past decade, and for agribusiness given claims of marketing unhealthy foods, development of genetically-modified organisms, hiring of undocumented workers, and consolidation into industrial production facilities. Students are taught ethical theories and frameworks, used to discuss general ethical questions such as death, theft, and lying, followed by the more specific agribusiness issues mentioned above. Students will formulate their own opinions about these issues, recognize and understand the opinions of others, and be able to accurately and adequately communicate those opinions.

Typically offered in Fall and Spring

ARE 448 International Agricultural Trade (3 credit hours)
Study of the economic forces that drive international trade in agriculture, food, and natural resources. Economic principles, analytical techniques, and empirical analysis are used to explain international trade and foreign direct investment in the global marketplace.

Prerequisites: ARE 201 or EC 201 or EC 205 or equivalent.
Typically offered in Fall only

ARE 455 Agribusiness Analytics (3 credit hours)
Agribusiness Analytics provides and overview and involved application of analysis and common analytical methods in the agricultural industry. Emphasis on methods to predict, evaluate, and otherwise inform agribusiness decision makers.

Prerequisites: ST/BUS 350 or ST 311
Typically offered in Fall only

ARE 470 Agribusiness Entrepreneurship Clinical Skills Development (3 credit hours)
Agribusiness Entrepreneurship Clinical Skills Development is the third of three courses in the Agribusiness Entrepreneurship course sequence. This course teaches students the clinical skills needed to analyze questions faced by startups and other companies as they pursue opportunities in agribusiness. Students provide counseling to agribusiness developers in exchange for experience and an opportunity to build their business networks. Students will create and execute action plans with partner companies, conduct research, and develop a written analysis and recommendations for specific questions posed by the companies.

Prerequisite: ARE 270 and ARE 370
Typically offered in Fall and Spring

ARE 475 Food Policy (3 credit hours)
This course will provide students a theoretical basis and empirical tools to examine U.S. federal, state, and local food policies. Applications covered will explore contemporary food policy issues such nutrition assistance programs; regulations governing food safety, food transport and food trade; alternatives to the conventional food system (i.e. local foods, urban farming); health and nutritional labeling and claims; and the quickly evolving policy and legal environment affecting food adulteration, food fraud, and national food defense.

Prerequisites: ARE 301 or EC 301
Typically offered in Fall, Spring, and Summer

ARE 490 Career Seminar in Agriculture & Resource Economics (1 credit hours)
Planning and preparing for career choices. Resume writing, networking, interviewing, personality characteristics, and job searching. Visits with employer representatives. Employer expectations and career opportunities. Researching firms and employment opportunities. Oral and written presentations.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

ARE 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

ARE 493 Special Problems/Research Exploration (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: ARE Sophomore standing
Typically offered in Fall, Spring, and Summer

ARE 494 Agribusiness Study Abroad (1-6 credit hours)
Global trade is the largest growth area in American agribusiness, and knowledge of international agribusiness markets is a primary qualification desired from college graduates entering the workforce. This course addresses these issues by providing opportunities for students to study abroad in various locations around the world, with different destinations offered each academic year. Credit hours are variable based on length of travel and classroom instruction pre-and post-travel consistent with NCSU policies and practices. Course may be repeated for credit to visit different destinations only. Significant expenses for travel are involved. Please see the instructor for specific program details.

GEP Global Knowledge
Typically offered in Spring only

ARE 495 Special Topics in Agricultural and Resource Economics (1-6 credit hours)
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis.

ARE 590 Special Topics in ARE (1-99 credit hours)
Special Topics in ARE

Agricultural Institute (AGI)

AGI 100 Enhancing Academic Success (1 credit hours)
This course is designed to introduce students to strategies for effective learning that will help them succeed at NC State University and in their future careers. Students will have the unique opportunity to participate in a class format that focuses on building academic as well as personal skills. This course provides one-on-one and small group interaction with the instructor to help individuals identify potential obstacles to their academic performance.

Typically offered in Fall and Spring

AGI 101 Introduction to the Agricultural Institute (1 credit hours)
Introduction to the collegiate experience; academic skills of successful students; curricula of the Agricultural Institute; career opportunities of graduates; introduction to computers.

Requisite: Agricultural Institute Only
Typically offered in Fall and Spring

AGI 120 Spanish For AG Stu (3 credit hours)
This is an introductory conversational Spanish course specifically designed for agricultural students. The main goal of this course is to give students some basic grammatical and communication skills so that they will be able to interact with Spanish speaking employees in different work environments and under different situations within their specific agricultural fields. This course does not satisfy the Foreign Language Proficiency Requirement of the GEP.

Requisite: Agricultural Institute Only
Typically offered in Fall only

AGI 134 Trends and Culture of the Agricultural Workforce (3 credit hours)
This course is designed to introduce students to cultural diversity; the value it adds to the agricultural workplace; and how to increase, improve, and support cultural diversity in the workplace. This course will challenge students to get to know people of other cultures on a personal and individual level, with hopes that they will then have an increased appreciation for cultural differences. In efforts to do that, this course will include topics such as: mental health and farmers; the banana massacre; appreciating others' first languages; history of the U.S. agricultural workforce; racial history in U.S. agriculture; stopping the stigma of black farmers; migrant farm labor and how we treat farm workers; and the importance of international relationships in global trade. Students who successfully complete this course will walk away with cultural diversity skills that will increase their effectiveness as managers and business owners in the agricultural industry.

Typically offered in Spring only

AGI 160 Computer Applications for Agricultural Operations (3 credit hours)
Businesses in the agricultural industry are looking to hire employees that have knowledge of computer applications relevant to business operations. This course will introduce students to applications necessary to run a successful agricultural operation. A focus of the course will be on Excel, since its use is instrumental to the business functions of agricultural operations. Other topics covered will include online marketing tools, online meeting platforms, and the use of social media to further the business goals of an agricultural operation.

Restriction: Agricultural Institute Students Only
Typically offered in Fall only

AGI 161 Agricultural Operations (3 credit hours)
Ag Operations is a three (3) credit hour course designed to introduce students to employability skills that are desired by employers in the agricultural industry according to current research. Students will learn about what is necessary to manage people through positive organizational behavior in the 21st century through a hands-on approach that includes lectures, discussions, case studies, and experiences outside of the classroom. The course will start with a focus on self-development, understanding how to work in a team, and conclude with how to successfully lead a team in an agricultural organization. Multiple in and out of class assignments will be assigned and students will complete a handbook to take into the workforce by the end of the course.

Restriction: Agricultural Institute Students Only
Typically offered in Fall only

AGI 191 Professional Development (1 credit hours)
Professional Development is designed to introduce students to various skills (as identified by current research) that employers feel are important for prospective employers to have. This course will provide students the opportunity to develop and practice these in a variety of contexts.

Typically offered in Fall, Spring, and Summer

AGI 192 AGI External Learning Experience (1-3 credit hours)
Learning experience in one of the six majors in the Agricultural Institute that utilizes facilities and resources external to the campus. Students can choose from multiple external learning experiences. Students who complete an external learning experience will have a unique opportunity to put to practice the skills and knowledge they have learned in the classroom in an external setting.

Prerequisite: Agricultural Institute Only and AGI 191
Typically offered in Fall, Spring, and Summer

AGI 193 AGI Special Problems and On-campus Learning (1-6 credit hours)
Learning experience in one of the eight majors in the Agricultural Institute that utilizes facilities and resources on the campus. (Contact with the project supervisor must be initiated by student and approved by the faculty adviser and the Director of the Agricultural Institute prior to the experience).

Requisite: Agricultural Institute Only
Typically offered in Fall, Spring, and Summer

AGI 194 International Learning Experience in AGI (1-6 credit hours)
Course offered as needed for international learning experiences in the Agricultural Institute involving international travel and immersion in an international culture. A written report is required and student must identify a faculty member to work with them. Travel expenses may be incurred by the student. Departmental approval required.

Requisite: Agricultural Institute Only
Typically offered in Spring only

AGI 195 Special Topics in the Agricultural Institute (1-4 credit hours)
Timely topical courses or experimental course offerings in the Agricultural Institute.

Requisite: Agricultural Institute Only
Typically offered in Fall, Spring, and Summer

Agriculture and Life Sciences (ALS)

ALS 103 Freshman Transitions and Diversity in Agriculture & Life Sciences (1 credit hours)
Introduction to scope and objectives of university education. Overview of curricula, academic requirements, and career opportunities in agriculture and life sciences. Overview of campus resources and support services. Discussion of expectations for academic and career success including professionalism, diversity, and inclusiveness. Restricted to CALS majors of freshman or sophomore status. Students will not receive credit for both ALS 103 and ALS 303.

Prerequisite: CALS Majors with less than 30 Credit Hours
GEP U.S. Diversity
Typically offered in Fall and Spring

ALS 110 Academic and Career Skills Seminar (1 credit hours)
Students learn about the career decision-making process through integration of self-knowledge. Emphasis is placed on Agriculture and Life Sciences careers. Students assess interests, values, skills and personal strengths while learning about a variety of campus and career resources.

Prerequisite: Ag and Life Science Majors
Typically offered in Spring only

ALS 303 Transfer Transitions and Diversity in Agriculture & Life Sciences (1 credit hours)
Introduction to scope and objectives of university education. Overview of curricula, academic requirements, and career opportunities in agriculture and life sciences. Overview of campus resources and support services. Discussion of expectations for academic and career success including professionalism, diversity, and inclusiveness. Restricted to CALS majors with 30 or more credit hours completed. Students will not receive credit for both ALS 103 and ALS 303.

R: CALS Majors >30 credits
GEP U.S. Diversity
Typically offered in Fall and Spring

ALS 398 Agriculture and Life Sciences Honors Seminar (2 credit hours)
A seminar/discussion honors course with emphasis on a team approach to scientific research into topics that link science with issues in society; exposure to leadership skills and bioethics; requirement of detailed written or oral reports; career development in the agricultural and life sciences; required participation in on- and off-campus scholarly retreats.

Prerequisite: Enrollment by invitation for sophomores or juniors in CALS with GPA 3.35 or higher.
Typically offered in Spring only

ALS 494 International Learning Experience in Agriculture and Life Sciences (1-6 credit hours)
Course offered as needed for international learning experiences in agriculture and life sciences involving international travel and immersion in an international culture. Travel expenses may be incurred by the student. Departmental Approval Required. Students will need to complete a program application through the NC State Study Abroad Office. Students enrolled in the summer will be required to take a one credit hour lecture section of ALS 494 in the spring of the same year. Department approval required, enroll with instructor's permission.

GEP Global Knowledge
Typically offered in Fall, Spring, and Summer

ALS 495 Special Topics in Agriculture and Life Sciences (1-3 credit hours)
Offered as needed to present material not normally available in regular departmental course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

ALS 496 International Research Experience (3 credit hours)
This summer research experience will provide students with the opportunity to sharpen their research skills while working side-by-side with scientists at international research stations. Students will conduct lab and/or field research depending on their international location. Students will experience full-cultural immersion during the research experience and will develop a strong understanding of the local culture. Some basic local language knowledge may be necessary depending on the location and research.

Typically offered in Fall, Spring, and Summer

ALS 498 Honors Research or Teaching I (1-3 credit hours)
Honors research or teaching for students in Agriculture and Life Sciences. First of a two-course sequence. Identification of a project and development of a proposal; literature search, planning, and work initiation. A maximum of 6 credits for ALS 498 & ALS 499 combined. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: ALS 398, GPA 3.35 or higher
Typically offered in Fall, Spring, and Summer

ALS 499 Honors Research or Teaching II (1-4 credit hours)
Honors research or teaching for students in Agriculture and Life Sciences. Completion of work initiated in ALS 498. Analysis of results. Preparation and presentation of written and oral reports. A maximum of 6 credits for ALS 498 and ALS 499 combined. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: ALS 498, GPA 3.35 or higher
Typically offered in Fall, Spring, and Summer

ALS 602 Preparing for a Career in Agriculture and the Life Sciences (1 credit hours)
This course provides graduate students with techniques, strategies, and opportunities to practice and develop skills beneficial to their professional development and transition from school to career. The course focuses on six competencies known to contribute to success in the workforce: teamwork and collaboration; oral communication; career management and self-development; giving and accepting feedback; global/intercultural fluency; and organizing, prioritizing, and delegating work. Students will examine their life trajectory to date and create a 5-year plan for personal and professional success; and be equipped with an understanding of the steps necessary to accomplish their professional goals.

Typically offered in Spring only

Animal Science (ANS)

ANS 101 Introduction to Livestock and Poultry Industries (3 credit hours)
General introduction to nutrition, reproduction, breeding, management and description of marketing channels of animals and poultry. Equates live animal and carcass characteristics with market specifications. Factors of pre- and post-slaughter treatment are related to the shelf life of fresh and processed meats. MCCRAW/GREGORY

Requisite: Agricultural Institute Only
Typically offered in Fall only

ANS 102 Animal Feeds and Nutrition (3 credit hours)
Basics of animal nutrition and feeding. Identification and classification of common feedstuffs, including relative nutritional value for livestock and poultry. General nutrition and changes in requirements as influenced by production and the animal's life cycle. Applied aspects of feeding and nutrition of livestock and poultry. Agricultural Institute Students Only (Class= 01 or 02).

Requisite: Agricultural Institute Only
Typically offered in Fall only

ANS 103 Beef Production (3 credit hours)
Genetics, reproduction, nutrition, animal health, forage management and marketing channels as related to beef cattle enterprises.

Requisite: Agricultural Institute Only
Typically offered in Fall only

ANS 104 Swine Production (4 credit hours)
Management principles associated with swine production. Primary emphasis on interactions of health, equipment, nutrition, reproduction and genetics during nursery, finishing, farrowing and breeding phases of production. Management of farrowing, finishing and farrow to finish operations. Emphasis on management kills, computer applications and economics.

Requisite: Agricultural Institute Only
Typically offered in Spring only

ANS 105 Introduction to Companion Animal Science (3 credit hours)
Companion animals are often considered family members. This course surveys the variation available in companion animals (dog breeds, cat breeds, fish, reptiles, amphibians, rabbits, pet pigs, ferrets, hamsters, gerbils, mice, rats, birds & newer pets such as hedgehogs, prairie dogs & sugar gliders) and then examines related human and animal issues in more depth. Biological explanations are stressed for understanding disease states and normal behaviors of companion animals. These explanations are discussed from the point of view of problem behaviors in the average home housing these animals. This course will help educate the students about companion animals so that both the animals and their human families will be happier and more productive members of society. ANS 105 will enable students to pick the pet or specific breed that is best for them so that pets and owners stay together. Restricted to Freshmen and Sophomores.

Restriction: Freshmen & Sophomores only
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

ANS 110 Introduction to Equine Science (3 credit hours)
Introduction to Equine Science is a course designed for Freshmen and Sophomores of any major. There are no pre-requisites for this course. We will discuss terminology, impact of horses on history and society, breeds, uses, management, genetics, reproduction, health, nutrition, behavior, and business aspects of the horse industry. Restricted to Freshmen and Sophomores.

Prerequisite: Freshman standing or Sophomore standing
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

ANS 150 Introduction to Animal Science (3 credit hours)
Introduction to the principles and physiology of animal management, the contributions of animals and animal products to humanity, the application of science to to animal production, and issues regarding animal production. The course includes biological aspects of animal science such as animal behavior, anatomical and physiological aspects of reproduction and nutrition, animal breeding and genetics, and human/animal interactions. Normal management and production techniques [including proper terminology] as well as social issues and current events related to livestock, equines, and companion mammals are discussed. Prerequisite: None. Course is 3 credits. Class meets Monday, Wednesday, and Friday 8:30 to 9:20 am in Fall and Spring, Internet only during the Summer. Fall semesters are restricted to new incoming Animal Science Freshmen. Open to all students in Spring and Summer.

Typically offered in Fall, Spring, and Summer

ANS 151 Introduction to Animal Science Lab (1 credit hours)
Hands-on experience and demonstrations with livestock and horses; identification of common management equipment and knowledge of proper use; animal tracts, organs, skulls, feeds, breeds, and other animal-related items or topics. The lecture (ANS 150) must be taken concurrently or have been passed previously with a C-minus or higher. This lab course is restricted to the following majors: Animal Science, Ag Extension, Ag Science, and Ag Education. Transportation is provided to the off-campus labs, and students will be returned to campus prior to the end of the scheduled lab period.

Corequisite: ANS 150; R: Animal Science or Ag Extension or Ag Science or Ag Education majors
Typically offered in Fall and Spring

ANS 201 Techniques of Animal Care (2 credit hours)
A laboratory course in the applied management of beef cattle, dairy cattle, equine, swine and small ruminants with required participatory assignments of common techniques utilized in livestock production. These techniques include but are not limited to castration, animal ID, and hoof trimming. Most of course will be held at the various Teaching Educational Units and will be held outdoors. Therefore, students should arrive for the course dressed appropriately for the lab activities and weather conditions of each day. Students will be working with animals, which comes with an inherent risk of injury. Students will be instructed on safety measures at the beginning of the semester and before each lab. Transportation will be provided to the scheduled course meetings but students will be required to provide their own transportation to the Teaching Educational Units for required assignments outside of class time.

Prerequisite: ANS 150 and ANS 151 (all ANS Majors) or ANS 101 (Ag Institute Livestock, Poultry Mgmt Program; Restriction: Junior or Senior Animal Science majors
Typically offered in Fall and Spring

ANS 205 Physiology of Domestic Animals (3 credit hours)
This course is designed to introduce students to mammalian physiology (structure and function) with emphasis on livestock species. Students will gain a basic understanding of body systems including circulatory, muscular, skeletal, digestive, and reproductive systems and functions of those systems with relevance to the whole animal and maintenance of homeostasis.

Prerequisite: (BIO 181 or BIO 183) and Sophomore standing
Typically offered in Fall, Spring, and Summer

ANS 206 Anatomy of Domestic Animals Lab (1 credit hours)
This lab course is designed for Animal Science majors to take with the ANS 205 lectures (Physiology of Domestic Animals). Students will learn to identify major anatomical and cellular structures from domestic animal (livestock) specimens through examination of gross and microscopic anatomy. SAS and IAS majors only.

Corequisite: ANS 205
Typically offered in Fall and Spring

ANS 208/PB 208/AEE 208 Agricultural Biotechnology: Issues and Implications (3 credit hours)
Trends and issues of agricultural biotechnology in today's society are addressed while covering the basic biological science behind the technology. Applications of and policy issues associated with plant, animal, and environmental biotechnology used in the agricultural industry are examined from an interdisciplinary approach.

Prerequisite: (BIO 105 or BIO 115 or BIO 181 or BIO 183)
GEP Interdisciplinary Perspectives
Typically offered in Spring and Summer

ANS 215/HS 215 Agricultural Genetics (3 credit hours)
To provide an introduction to the science of genetics as applied to agriculture. Emphasis is given to qualitative and quantitative genetics. By the end of this course, students should be able to apply genetic concepts to efficiently solve problems and make predictions necessary for "real-life" agricultural situations.

Prerequisite: BIO 183 or equivalent or instructor's consent
GEP Natural Sciences
Typically offered in Fall only

ANS 220 Reproductive Physiology (3 credit hours)
Biological processes in reproduction and lactation with emphasis on domestic mammals such as cattle, sheep, goats, horses, swine, dogs, cand cats. Environmental and genetic factors that affect these processes. Identification, evaluation and solutions of problems in these physiological areas.

Prerequisite: ANS 205 or BIO 250 or ZO 250
Typically offered in Fall and Spring

ANS 221 Reproductive Physiology Lab (1 credit hours)
ANS 221 is a laboratory course that introduces students to the application of principles of reproduction and lactation in domestic mammals. Students must have either completed or concurrently be enrolled in ANS 220. This course is restricted to Animal Science majors (SAS, IAS).

Corequisite of ANS 220
Typically offered in Fall and Spring

ANS 225 Principles of Animal Nutrition (3 credit hours)
This online Principles of Animal Nutrition course is designed for non-Animal Science majors and off-campus students. It includes: feed classification, gastrointestinal tract anatomy of domestic mammals, nutrients and their functions, digestion and metabolism, feed regulations, and feeding/nutrition of cattle, small ruminants, horses, swine, poultry, dogs, cats, and rabbits. For on-campus students, ANS 225 counts toward the Animal Science minor but only counts as a Free Elective for Animal Science majors.

Typically offered in Summer only

ANS 230 Animal Nutrition (3 credit hours)
Introduction to nutrition, digestion, and absorption in domestic mammals. Major nutrient classes and their functions in the body, feed classification and chemical analysis, feed processing, and nutrient requirements.

Prerequisite: ANS 150 or BIO 183; ANS 205 is also recommended.
Typically offered in Fall and Spring

ANS 231 Animal Nutrition Lab (1 credit hours)
ANS 231 is a laboratory course that introduces students to the application of principles of nutrition and applied feeding of domestic mammals. Students must have either completed or concurrently be enrolled in ANS 230. This course is restricted to Animal Science Majors (SAS, IAS).

Corequisite: ANS 230
Typically offered in Fall and Spring

ANS 240/ANS 240A Livestock Merchandising (3 credit hours)
This course is designed to acquaint students with different methods for merchandising livestock and with strategies for adding value to products produced from livestock. Students will learn new ways to promote a farming operation. Required visits to Animal Educational Units outside of normal class time and student must provide own transportation. Required visits to Animal Educational Units outside of normal class time and student must provide own transportation. There are two required mandatory Saturday events. The animal auction held on the 3rd Saturday of April (2nd Saturday if Easter occurs on the 3rd weekend) and the Open House held either one or two Saturdays (varies depending on the Easter date) prior to the animal auction.

Prerequisite: ANS 150; Restrictive Statement: Students must be Juniors or Seniors
Typically offered in Spring only

ANS 240A/ANS 240 Livestock Merchandising (3 credit hours)
This course is designed to acquaint students with different methods for merchandising livestock and with strategies for adding value to products produced from livestock. Students will learn new ways to promote a farming operation. Required visits to Animal Educational Units outside of normal class time and student must provide own transportation. Required visits to Animal Educational Units outside of normal class time and student must provide own transportation. There are two required mandatory Saturday events. The animal auction held on the 3rd Saturday of April (2nd Saturday if Easter occurs on the 3rd weekend) and the Open House held either one or two Saturdays (varies depending on the Easter date) prior to the animal auction.

Prerequisite: ANS 150; Restrictive Statement: Students must be Juniors or Seniors
Typically offered in Spring only

ANS 260 Basic Swine Science (2 credit hours)
Basic disciplines and concepts involved in swine production including: industry structure, trends and statistics; production phases and buildings; genetic improvement; reproduction; nutrition; health and biosecurity; nutrient management; marketing, meat quality, and career opportunities in the swine industry.

Restriction: Non-ANS (Animal Science) students only. ANS students cannot take this course for credit.
Typically offered in Spring only

ANS 261 Swine Health and Biosecurity (1 credit hours)
Introduction and basic overview of the immune system, swine disease transmission and pathobiology, standard biosecurity protocols, identification of disease in pigs, basic treatment administration, and disease prevention.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring only

ANS 262 Swine Breeding and Gestation Management (1 credit hours)
Management principles associated with breeding and gestation in swine. Emphasis on reproductive anatomy and physiology of boars and sows, development of replacement animals, semen production and evaluation, artificial insemination, and use of reproductive records. Extensive use of reproductive case studies.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring only

ANS 263 Farrowing Management (1 credit hours)
Advanced integration and application of factors important in the proper care and management of swine during farrowing and lactation.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring and Summer

ANS 264 Swine Nursery and Finishing Management (1 credit hours)
Overview of the critical management, housing, and financial considerations relevant to the successful operation of a swine nursery, grow-finish, or wean to finish enterprise.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring and Summer

ANS 265 Contemporary Issues in the Swine Industry (1 credit hours)
Overview of current issues affecting pork production in the United States, including, but not limited to: environment, Swine welfare and profitability/ market issues. Development of skills to promote animal agriculture when dealing with the media and general public.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring only

ANS 266 Swine Environment Management (1 credit hours)
Course includes response of swine to thermal environment ventilation system design and analysis, heating and cooling, systems and examples of various designs for all phases of production. Troubleshooting and energy analysis will be included as well.

Prerequisite: ANS 150 or equivalent
Typically offered in Fall only

ANS 267 Swine Manure and Nutrient Management (1 credit hours)
Course includes manure production rates, manure handling systems, storage and manure management planning for land applications. Some odor mitigation technologies will be covered.

Prerequisite: ANS 150 or equivalent
Typically offered in Spring only

ANS 268 Employee Management for the Swine Industry (1 credit hours)
Effective employee management in swine production units. Principles, policies, and practices related to hiring, development and retention of employees, as well as fundamental organizational management.

Prerequisite: ANS 150 or equivalent
Typically offered in Fall only

ANS 269 Internship in the Swine Industry (1 credit hours)
Experiential learning in the swine industry through opportunities that provide hands-on experience and exposure to the scope of pork enterprises. Students can expect to apply principles and practices already learned, and add practical experience to their skill sets and knowledge base. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: ANS 150 or equivalent
Typically offered in Summer only

ANS 270 Pork Export Markets from a Swine Production Perspective (1 credit hours)
Introduction to global markets; cultural preferences and customs associated with the global swine industry. International trade regulations and potential impact of foreign animal diseases and bioterrorism affecting the U.S. swine industry.

Prerequisite: ANS 150 or equivalent
Typically offered in Summer only

ANS 271 Swine Nutrition (1 credit hours)
Principles involved with developing and implementing a swine feeding program, including fundamentals of feeding pigs, understanding nutrients used in pig diets, factors affecting nutrient recommendations, feeding systems for pigs, feed ingredients, and formulation of swine diets.

Prerequisite: ANS 150 or ANS 260 or Equivalent Restriction: Restricted to non-ANS (Animal Science) students. ANS students cannot take the course for credit.
Typically offered in Fall only

ANS 281 Professional Development of PreVeterinary Track Students (1 credit hours)
This course introduces PreVeterinary track students to the scope of the veterinary profession and to current issues affecting veterinary professionals. The course will help students gain an understanding of the professional requirement of the veterinary school applications. Students will be expected to discuss current animal and public health issues as well as areas of national shortage in the veterinary profession. One Saturday at the NCSU vet school Open House is required (first Saturday in April).

Prerequisite: ZO 160 or BIO 125 or BIO 181 or BIO 183
Typically offered in Spring only

ANS 290 Professional Development for Animal Science Careers (2 credit hours)
This course will teach students how to navigate the career decision-making process to make an informed decision and discuss career options in the field of Animal Science. The course will also help students evaluate and develop their professional competencies and skills.

Animal Science Majors Only
Typically offered in Fall and Spring

ANS 303 Principles of Equine Evaluation (2 credit hours)
Students will learn about and apply methods for evaluating conformation and function of performance and halter horses, soundness, breed standards, rules and regulations for evaluation, selection, and performance. Guest lecturers and field trips.

Prerequisite: ANS 150 or ANS 110
Typically offered in Spring only

ANS 304 Dairy Cattle Evaluation (2 credit hours)
The first half of this course covers basic aspects of dairy cattle breeds, dairy character, form and function including type traits and linear scoring of dairy cattle, interpreting and using judging scorecards, comparing/evaluating dairy cattle, andplacing animals in a class. The second half of the course develops the student's ability to correctly evaluate dairy cattle classes, but more importantly to support their opinions through oral communication.

Prerequisite: ANS 150
Typically offered in Spring only

ANS 309 Livestock Evaluation (3 credit hours)
Students will be exposed to basic concepts associated with growth, development and value determination of livestock. Familiarization with official USDA grading standards for cattle, sheep, swine and goats is emphasized. Introduction to judging terminology, placing classes of livestock and justification through oral reasons.

Prerequisite: ANS 150
Typically offered in Spring only

ANS 322/FS 322/PO 322 Muscle Foods and Eggs (3 credit hours)
Processing and preserving fresh poultry, red meats, seafood, and eggs. Ante- and post-mortem events as they affect quality, yield, and compositional characteristics of muscle foods. Principles and procedures involved in the production of processedmeat items.

Prerequisite: ZO 160, BIO 181 or BIO 183
Typically offered in Fall only

ANS 324/FS 324 Milk and Dairy Products (3 credit hours)
Introduction to the manufacture of dairy products. Dairy processing procedures from the farm, through the dairy plant, and to the consumer are studied. The course consists of 15 learning modules, three exams, and a project.

Prerequisite: BIO 181 or 183, CH 101
Typically offered in Fall only

ANS 330 Laboratory Animal Science (3 credit hours)
A sophomore to senior level course designed to cover the basics of laboratory animal science, a specialty dealing with the use of vertebrate animal species in intensive research. Some topics to be covered are: husbandry, facility management, animalhealth and welfare, diagnostics, surgical area management, research methods and administrative duties. Students will use the material for studying for the certification as a Laboratory Animal Technician via the American Association For Laboratory Animal Science (AALAS). A separate fee is required for certification; this fee is not covered by tuition for ANS 330. Must hold sophomore standing or higher.

Typically offered in Spring only

ANS 395 Animal Science Study Abroad (1-6 credit hours)
This course provides an international perspective on animal management, conservation and various animal-related industries by allowing students to study abroad in various locations around the world, with different destinations offered each academic year. Credit hours are variable based on length of travel and classroom instruction pre- and post-travel consistent with NCSU policies and practices. Course may be repeated for credit to visit different destinations only. Significant expenses for travel are involved. Please consult with the instructor or the Study Abroad Office for specific program details.

GEP Global Knowledge
Typically offered in Fall, Spring, and Summer

ANS 400 Companion Animal Management (3 credit hours)
Anatomy, physiology, nutrition, genetics, and health of companion animals including cats, dogs, rabbits, rats, mice, reptiles, amphibians, and fish. Problem solving and enterprise management skills in laboratories.

Prerequisite: ANS 105 and Junior standing
Typically offered in Spring only

ANS 402 Beef Cattle Management (3 credit hours)
ANS 402 integrates technical information from nutrition, reproduction, genetics, physiology, and animal welfare into management decisions that will enhance a beef cattle operation. Students will engage in beef cattle and environmental management and varied communication formats to explore relationships between sectors of the beef industry from cow-calf to the consumer.

Prerequisite: ANS 150, Junior standing
Typically offered in Spring only

ANS 403 Swine Management (3 credit hours)
Management principles associated with swine production. Emphasis on interactions of health, equipment, nutrition, reproduction and genetics during nursery, finishing, farrowing and breeding phases of production. Waste management practices and alternatives, development of marketing strategies and economic evaluation of management practices.

Prerequisite: ANS 150; Restrictive Statement: Students must be Juniors or Seniors
Typically offered in Fall only

ANS 404 Dairy Cattle Management (3 credit hours)
In ANS 404, students will develop a better understanding of dairy cattle management with an emphasis on the impact of decisions on productivity, health, profitability, and the future of the dairy enterprise.

Prerequisite: ANS 150, Junior standing
Typically offered in Spring only

ANS 407 Livestock Grazing Management (3 credit hours)
This course is an overview of scientific principles applied in managing grazing livestock species (e.g., beef cattle, horses, sheep and goats) with an emphasis on promoting animal health, plant health and production efficiency. Topics include grazing behavior of livestock, nutritional aspects of pasture, effect of grazing on plant and soil health, plant identification, pasture allocation, pasture systems for each livestock species (beef cattle, horse, sheep and goats), multi-species grazing systems, watering systems, fencing, and economics of grazing. The course will be conducted as hybrid using asynchronous online lectures and one three-hour lab per week. Students will be required to provide their own transportation to lab. Non-scheduled class time for field trips or out-of-class activities is NOT required for this class.

P: ANS 150 and ANS 151 and ANS 230
Typically offered in Fall only

ANS 408 Small Ruminant Management (3 credit hours)
Principles and practices of production, management, and marketing of sheep and goats. Role of genetics, nutrition, reproduction and animal health. Hands-on experience and field trips during labs.

Prerequisite: ANS 150, Junior standing
Typically offered in Fall and Spring

ANS 410 Equine Breeding Farm Management (3 credit hours)
Equine anatomy, physiology, nutrition, genetics and health. Laboratory emphasis on reproductive management, breeding, problem solving, and management skills. Field trips required.

Prerequisite: ANS 110 and Junior standing
Typically offered in Spring only

ANS 411 Management of Growing and Performance Horses (3 credit hours)
This course is an overview of scientific applications used in management of growing and performance horses. Topics include: nutrition and feeding, disease prevention, exercise conditioning, and methods of evaluation and selection. Students required to provide their own transportation to labs. Must hold junior or senior standing.

Prerequisite: ANS 110
Typically offered in Fall only

ANS 415/NTR 415/PO 415/PO 515/NTR 515/ANS 515 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

ANS 425/FM 425/PO 425/NTR 525/FM 525/ANS 525/PO 525/ NTR 425 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall, Spring, and Summer

ANS 435/ANS 535 Stress Physiology in Animals (3 credit hours)
Stress Physiology in Animals is a course focusing on the mechanism whereby stress impacts multiple physiological systems throughout the body in animals (human and non-human models). Physiological systems discussed will include the hypothalamic-pituitary-adrenal axis, the nervous system, the cardiovascular system, the respiratory system, the immune system, the metabolic system, and the reproduction system.

Prerequisite: ANS 205 or ZO 250
Typically offered in Spring only

ANS 440/ANS 540 Animal Genetic Improvement (3 credit hours)
Modern evaluation and selection procedures for domestic animals; selection goals, estimation of breeding values and performance testing; their impact on genetic changes.

Prerequisite: (ANS/HS 215 or GN 311) and (ST 311 or ST/BUS 350) and Junior standing
Typically offered in Fall and Summer

ANS 452/ANS 552/PHY 552/PHY 452 Comparative Reproductive Physiology and Biotechnology (3 credit hours)
Comparative approach to examining aspects of reproductive physiology in selected vertebrate species. Detailed examination of current reproductive biotechnologies and ethical issues associated with the application of reproductive biotechnologies. Credit will not be given for both ANS 452 and ANS (PHY) 552.

Prerequisite: ANS 220
Typically offered in Fall only

ANS 453/ANS 553 Physiology and Genetics of Growth and Development (3 credit hours)
Introduction to the basic concepts of growth with emphasis on domestic mammals. Growth of the major classes of animal tissues and regulation by endogenous and exogenous factors. Relationship to efficiency of animal production. Credit will not be given for both ANS 453 and 553.

Typically offered in Fall only

ANS 454/NTR 454/ANS 554 Lactation, Milk and Nutrition (3 credit hours)
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421
Typically offered in Spring only

ANS 480 Judging Team (1 credit hours)
Students practice judging techniques for livestock, horses, or dairy animals, including ranking animals and providing oral reasons to defend the rankings. Students meet weekly with a coach to practice locally and will also travel to compete in one or two regional or national competitions. Each team (livestock, horse, dairy) is expected to raise funds to finance the trips. Students earn 1 credit for being on a team, and can earn up to 3 credits of Free Elective for ANS 480 by serving on the judging team for different species. Field trips that last several days are required. Departmental Approval Required. Course may be taken up to 3 times (once per species).

Prerequisite: ANS 303 or ANS 304 or ANS 309
Typically offered in Fall only

ANS 492 Professional Internship Experience in the Animal Sciences (1-3 credit hours)
This course provides an opportunity for students to gain real-world experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Department of Animal Science prior to the start of the experience. To gain approval, a student must submit the completed ANS 492 contract and have it approved by his/her experience supervisor, academic advisor and the ANS 492 coordinator. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

ANS 493 Research Experience in the Animal Sciences (1-3 credit hours)
This course provides an opportunity for students to gain real-world experience in a scientific research program. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Department of Animal Science prior to the start of the experience. To gain approval, a student must submit the completed ANS 493 contract and have it approved by his/her research supervisor, academic advisor and the ANS 493 coordinator. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

ANS 494 Teaching Experience in the Animal Sciences (1-3 credit hours)
This course provides an opportunity for students to gain experience with some aspect of teaching, including: leading or facilitating lessons, producing educational resources, or education research. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Animal Science Department prior to the start of the experience. To gain approval, a student must submit the completed ANS 494 contract and have it approved by his/her research supervisor, academic advisor and the ANS 494 coordinator. If the experience involves education research, the research mentor is encouraged to require a research paper or poster presentation as part of the work expectations when appropriate. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

ANS 495 Special Topics in Animal Science (1-3 credit hours)
Offered as needed to present material not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

ANS 515/ANS 415/NTR 415/PO 415/PO 515/NTR 515 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

ANS 525/PO 525/NTR 425/ANS 425/FM 425/PO 425/NTR 525/ FM 525 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall, Spring, and Summer

ANS 535/ANS 435 Stress Physiology in Animals (3 credit hours)
Stress Physiology in Animals is a course focusing on the mechanism whereby stress impacts multiple physiological systems throughout the body in animals (human and non-human models). Physiological systems discussed will include the hypothalamic-pituitary-adrenal axis, the nervous system, the cardiovascular system, the respiratory system, the immune system, the metabolic system, and the reproduction system.

Prerequisite: ANS 205 or ZO 250
Typically offered in Spring only

ANS 540/ANS 440 Animal Genetic Improvement (3 credit hours)
Modern evaluation and selection procedures for domestic animals; selection goals, estimation of breeding values and performance testing; their impact on genetic changes.

Prerequisite: (ANS/HS 215 or GN 311) and (ST 311 or ST/BUS 350) and Junior standing
Typically offered in Fall and Summer

ANS 550/NTR 550 Applied Ruminant Nutrition (3 credit hours)
Applied concepts in ruminant nutrition for the practicing agricultural professional. Protein, energy, vitamin and mineral nutrition in relation to the nutritional needs and practical feeding of beef cattle, dairy cattle, sheep, and goats. New developments in feeding systems, feed additives and the prevention and treatment of metabolic disorders. Emphasis on solving problems in case studies. Permission given to undergraduates

Prerequisite: ANS 230 or ANS(NTR,PO) 415. Permission given to undergraduates
Typically offered in Fall only

ANS 552/PHY 552/PHY 452/ANS 452 Comparative Reproductive Physiology and Biotechnology (3 credit hours)
Comparative approach to examining aspects of reproductive physiology in selected vertebrate species. Detailed examination of current reproductive biotechnologies and ethical issues associated with the application of reproductive biotechnologies. Credit will not be given for both ANS 452 and ANS (PHY) 552.

Prerequisite: ANS 220
Typically offered in Fall only

ANS 553/ANS 453 Physiology and Genetics of Growth and Development (3 credit hours)
Introduction to the basic concepts of growth with emphasis on domestic mammals. Growth of the major classes of animal tissues and regulation by endogenous and exogenous factors. Relationship to efficiency of animal production. Credit will not be given for both ANS 453 and 553.

Typically offered in Fall only

ANS 554/ANS 454/NTR 454 Lactation, Milk and Nutrition (3 credit hours)
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421
Typically offered in Spring only

ANS 561/NTR 561 Equine Nutrition (3 credit hours)
This course explores concepts in equine nutrition including digestive physiology of horses, nutrient requirements for different classes of horses and feed management. Ration evaluation and balancing, as well as problem solving will be a core component to this course.

Prerequisite:NTR 500 or NTR/FS 501 or NTR/PO 515
Typically offered in Spring only

ANS 565/NTR 565 Advanced Canine and Feline Nutrition (3 credit hours)
This course is about the advanced principles of nutrition within canines and felines. The course focuses on the unique gastro- intestinal tracts for the two species as well as their specific nutrient requirements and how the animal industry addresses these needs.

Restriction: Graduate Student or Senior with 3.35 GPA; Prerequisite: 400-level Nutrition Course
Typically offered in Fall only

ANS 571/BCH 571 Regulation of Metabolism (3 credit hours)
Study of hormonal, enzymatic and molecular-genetic regulation of carbohydrate and lipid metabolism; emphasis on mammalian species.

Prerequisite: BCH 451, GN 311, a course in physiology, cell biology
Typically offered in Fall only

ANS 590 Topical Problems in Animal Science (1-3 credit hours)
Selection or assignment of special problems in various phases of animal science.

Typically offered in Fall and Spring

ANS 591 Special Topics in Animal Science through AG Idea (1-3 credit hours)
Special topics in various aspects of animal science offered via Great Plains AG Idea.

Typically offered in Fall, Spring, and Summer

ANS 600 Professional Development for Graduate Students (1 credit hours)
This course is designed to assist graduate students with the preparation of professional information that they may be required to provide as they seek opportunities following graduate school. Course topics will include preparation of personal statements, resumes or curriculum vitae, investigation of the types of careers available to Animal Science graduates, and preparation of multimedia presentations that may be used in formal interviews.

Restriction: Graduate Standing
Typically offered in Spring only

ANS 601 Animal Science Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

ANS 603 Reproductive Physiology Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Spring only

ANS 604 Animal Breeding and Genetics Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

ANS 610 Topical Problems in Animal Science (1-6 credit hours)
Selection or assignment of special problems in various phases of animal science.

Typically offered in Fall, Spring, and Summer

ANS 641 Practicum in Animal Science (1-3 credit hours)
Typically offered in Fall and Spring

ANS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

ANS 690 Master's Exam (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ANS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ANS 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ANS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ANS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ANS 701/NTR 701 Protein and Amino Acid Metabolism (3 credit hours)
Study of protein and amino acid metabolism, regulation, dietary requirements and techniques for their investigation in human and other animals.

Prerequisite: BCH 453, ZO 421, a 400-level nutrition course
Typically offered in Spring only

ANS 702/PHY 702 Reproductive Physiology of Mammals (3 credit hours)
Survey of reproductive strategies among vertebrates; in-depth coverage of mammalian reproductive physiology; gametogenesis, fertilization, embryonic and fetal development, parturition, puberty, neuroendrocrine control mechanisms in male and female mammals.

Prerequisite: ZO 421
Typically offered in Fall and Spring

ANS 713/GN 713 Quantitative Genetics and Breeding (3 credit hours)
Quantitative and population genetic theory of breeding problems; partitioning of genetic variance, maternal effects, genotype by environment interaction and genetic correlation; selection indexes; design and analysis of selection experiments; marker-assisted selection.

Prerequisite: GN 509, ST 512
Typically offered in Spring only

ANS 726/FOR 726/CS 726 Advanced Topics In Quantitative Genetics and Breeding (3 credit hours)
Advanced topics in quantitative genetics pertinent to population improvement for quantitative and categorical traits with special applications to plant and animal breeding. DNA markers - phenotype associations. The theory and application of linear mixed models, BLUP and genomic selection using maximum likelihood and Bayesian approaches. Pedigree and construction of genomic relationships matrices from DNA markers and application in breeding.

Prerequisite: ST 511, Corequisite: ST 512
Typically offered in Spring only

ANS 780/PHY 780 Mammalian Endocrinology (3 credit hours)
Mammalian endocrine system with emphasis on ontogeny and anatomy of key organs; synthesis and action of hormones. Role of hormones in regulation of physiological processes such as metabolism, exocrine function, digestion, ion balance, behavior, lactation, growth and reproduction.

Prerequisite: BCH 451, ZO 421

ANS 790 Advanced Special Topics in Animal Science (1-6 credit hours)
Selection or assignment of advanced special problems in various disciplines of animal science.

Prerequisite: Graduate Standing
Typically offered in Fall and Spring

ANS 803 Reproductive Physiology Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Spring only

ANS 804 Animal Breeding and Genetics Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

ANS 810 Topical Problems in Animal Science (1-6 credit hours)
Selection or assignment of special problems in various phases of animal science.

Typically offered in Fall, Spring, and Summer

ANS 811 Safety and Ethics in Animal Science (1 credit hours)
ANS 811 is 1 credit hour course focused on safety and ethics in the Department of Animal Science.

P: Graduate Standing
Typically offered in Fall only

ANS 841 Practicum in Animal Science (1-3 credit hours)
Typically offered in Fall and Spring

ANS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment

Prerequisite: Doctoral student
Typically offered in Fall and Spring

ANS 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ANS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ANS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ANS 896 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ANS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Anthropology (ANT)

ANT 251 Physical Anthropology (3 credit hours)
Study of human evolution. Processes of evolution, human variation and race, behavior and morphology of nonhuman primates, and the fossil record. Emphasis on the study of human biosocial adaptation, past and present, and on humans as culture-bearing primates.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ANT 252 Cultural Anthropology (3 credit hours)
Comparative study of contemporary human culture, social institutions and processes that influence behavior. The range of human cultural variation shown throughout the world, including the student's own cultural system.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ANT 253 Unearthing the Past: Introduction to World Archaeology (3 credit hours)
World-wide survey of origins of human society, technology and culture in Old Stone Age, and origins of agriculture, cities, and civilizations of the Bronze and Iron Age in Europe, Asia, Africa, and pre-Columbian Middle and South America.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall and Spring

ANT 254 Language and Culture (3 credit hours)
Focus among the aspects of human language and between aspects of language and culture. Topics such as: descriptive and comparative linguistics, structuralism, language and thought, sociolinguistics, bilingualism, culture change and linguistic changes.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

ANT 261/SOC 261 Technology in Society and Culture (3 credit hours)
Processes of social and cultural change with a focus on role of technological innovation. Cross-cultural emphasis. Workplace changes and societal risks in U.S. and non-U.S. societies associated with technological innovations. Special attention to the role of scientists and engineers in socio-cultural change. Topical case studies apply course concepts and principles. Core sociological and anthropological concepts, methods, theories.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

ANT 295 Special Topics in Anthropology (1-3 credit hours)
Offered as needed to present 200-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

ANT 310 Native Peoples and Cultures of North America (3 credit hours)
Native North American peoples and cultures including Eskimos and Aleuts. Theories of origin and selected prehistoric cultural manifestations. People and cultures at the time of European contact and post-contact cultural change. Contemporary problems and prospects.

Prerequisite: ANT 252 or HI 365
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Summer

ANT 315 The Aztecs, Maya, and Their Predecessors: Archaeology of Mesoamerica (3 credit hours)
This course introduces the peoples and cultures of Mesoamerica from prehistoric times to the Colonial period. Themes include the peopling of the New World, the development of agriculture and social inequity, and the rise of states and empires. Covers the cultures of the Olmec, Maya, Zapotec, and Aztec as well as the ongoing importance of these cultures for the people of Mexico and Central America. Introduces primary archaeological and ethnohistoric sources and the anthropological approach to understanding people and cultures through their material remains.

Prerequisite: 3 credits of 200-level Anthropology, or HI 215, or HI 216
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

ANT 325 Andean South America (3 credit hours)
The societies, cultures, politics, economics and ecology of the Andean countries of South America (Peru, Bolivia, Ecuador, Chile, Colombia). Special attention is paid to the development of pre-Columbian Andean societies.

Prerequisite: ANT 252 or HI 215 or HI 216
GEP Global Knowledge, GEP Social Sciences
Typically offered in Spring only

ANT 330 People and Cultures of Africa (3 credit hours)
Course offers an introduction to the anthropological study of Africa. Focus is on African people and cultures, especially in sub-Saharan Africa, including past and present social patterns of indigenous African populations from a cross-cultural perspective.

P: ANT 252 or HI 275 or HI 276
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

ANT 345 Anthropology of the Middle East (3 credit hours)
An introduction to the anthropology of Middle Eastern societies. Themes include religion and secularism, gender and sexuality, national identity and the state, memory and commemoration, violence and conflict, youth culture, and popular uprisings.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Spring only

ANT 346 Peoples and Cultures of Southeast Asia (3 credit hours)
Southeast Asian peoples and cultures; past and present social patterns of selected mainland and insular Southeast Asian peoples; culture change; relations between minorities and dominant ethnic groups; development of nationalism.

Prerequisite: ANT 252
Typically offered in Fall only

ANT 351/FLJ 351 Contemporary Culture in Japan (3 credit hours)
Introduction to basic aspects of cultural practices in Japanese society, including education, work life, family relationships, everyday religious practices, aesthetic traditions, national identity, and gender. Students will develop an understanding of the interrelationships between language and culture.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ANT 354 Peoples and Cultures of the Pacific (3 credit hours)
The Pacific Ocean contains thousands of inhabited islands. This course examines the millions of people and thousands of societies that live in the Pacific and its three subregional areas Melanesia, Micronesia and Polynesia. Course topics include the Pacific environment, peopling of the Pacific, regional cultural variation, social organization, Exchange systems, politics, conflict, modernization, globalization and global warming in the Pacific region.

Prerequisite: ANT 252
Typically offered in Spring only

ANT 370 Introduction to Forensic Anthropology (3 credit hours)
Provides a broad overview of forensic anthropology, an applied field of biological anthropology. Students will apply the science of biological anthropology to the legal process and humanitarian arena. Students will identify skeletal remains to determine age, sex, ancestry, stature, and unique features of a decedent. Course will address general identification techniques, but proficiency is not expected.

GEP Social Sciences
Typically offered in Fall and Spring

ANT 371 Human Variation (3 credit hours)
Survey of basic principles of population genetics with emphasis on mechanisms that shape human biological variation. Geographic variation. Analysis of laws of heredity exhibited in modern human populations via microevolution and adaptation. Historical development of concepts with specific application to physical and forensic anthropology. Discussion of most current research.

Prerequisite: ANT 251
GEP Global Knowledge
Typically offered in Fall only

ANT 374 Disease and Society (3 credit hours)
Survey of diseases that affect human beings and human societies past and present. Analysis of how diseases affect societies with different economies (gathering/hunting, pastoral, agricultural, industrial) and of different social complexity. Impactof diseases on human evolution.

Prerequisite: ANT 251 or ANT 252

ANT 389 Fundamentals of Archaeological Research (3 credit hours)
Overview of the objectives, field strategies, basics of laboratory analysis, and interpretative approaches to the archaeological record. Analysis and classification of lithics, shell, bone, ceramics, metal, soils, and perishable materials.

Prerequisite: ANT 253 or Instructor Permission
Typically offered in Summer only

ANT 395 Special Topics in Anthropology (1-3 credit hours)
Offered as needed to present 300-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

Prerequisite: 3 credits of 200-level Anthropology
Typically offered in Fall, Spring, and Summer

ANT 411/ANT 511 Overview of Anthropological Theory (3 credit hours)
A detailed introduction to anthropological theory, interpretive styles and research techniques of major nineteenth and twentieth century anthropologists working within the analytic frameworks of their times, positions espoused by anthropologists in contemporary debates concerning the discipline's future. Students cannot receive credit for both ANT 411 and ANT 511.

Prerequisite: ANT 252 and ANT 310 or ANT 325 or ANT 330 or ANT 345 or ANT 346 or ANT 354
Typically offered in Spring only

ANT 412/ANT 512 Applied Anthropology (3 credit hours)
History, aims, methods and ethics of applied anthropology. Anthropological practice in government, industry, community development, education, and medicine. Analysis of consequences of development programs for culture change. Credit cannot be given for both 412 and 512.

Typically offered in Spring only

ANT 416/ANT 516 Research Methods in Cultural Anthropology (3 credit hours)
A systematic overview of cultural anthropological research methods including designing research projects, research techniques, field work methods, and cross-cultural comparison. Reviews relevant ethical questions and anthropologists' reports of their own field work.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330, 345, 346, 351, or 354
Typically offered in Fall only

ANT 419 Ethnographic Field Methods (3 credit hours)
Ethnographic research methods as part of a summer field school abroad. Topics: research design, participant observation, field note writing, interviewing, sampling, coding, computers in ethnographic research, analysis and ethics.

Prerequisite: Six hours of cultural anthropology
Typically offered in Summer only

ANT 421/ANT 521 Human Osteology (3 credit hours)
Survey of all the bones of the human skeleton from an anthropological perspective, including their names, important features useful in recognizing fragmentary specimens from an archaeological context, and techniques for determining the side of the body they come from. Skeletal development and its relationship to skeletal abnormalities. Issues relating to the study of archaeological skeletons.

Prerequisite: ANT 251 and any ANT 300 Level
Typically offered in Fall only

ANT 424/ANT 524 Bioarchaeology (3 credit hours)
Survey of approaches used by bioarchaeologists to understand past lifeways through the study of excavated human remains, and the theories that inform those approaches. Analysis and critique of the ways in which bioarchaeologists use skeletal and mortuary data to reconstruct health and disease patterns, mortality rates, diet, degree of interpersonal violence, and social structure among humans from the distant past.

Prerequisite: ANT 421
Typically offered in Spring only

ANT 427 Bioarchaeological Fieldwork (3 credit hours)
An introduction to the bioarchaeology of the local region, and an overview of the objectives, field strategies, ad laboratory methods used by bioarchaeologists to prepare and study human remains from archaeological cemeteries. Includes laboratory work on field osteology and processing of skeletal remains. Provides an understanding of how bioarchaeologists proceed from excavation of osteological remains to preparation and analysis. Course is offered as part of an NCSU Study Abroad Program. All costs associated with the course, except for textbooks, are paid via the Study Abroad Program fee.

Prerequisite: ANT 421
Typically offered in Summer only

ANT 428/ANT 528 Human Paleopathology (3 credit hours)
Survey of diseases that manifest on the human skeleton. Analysis and identification of these diseases from a clinical perspective through all life stages from radiographic analysis, macroscopic analysis, and photographic analysis.

Prerequisite: ANT 251
Typically offered in Spring only

ANT 431/ANT 531 Tourism, Culture and Anthropology (3 credit hours)
Anthropological approach to tourism studies with emphasis on cross-cultural aspects of international tourism. Attention to impact of mass tourism as compared to alternative tourism; environmental and economic impact of tourism; impact of international tourists and tourism on local communities. Principal theories of leisure in relation to tourism. Theories of culture change in relation to travel and tourism. Credit not given for both ANT 431 and ANT 531.

Prerequisite: Three hours of cultural anthropology
Typically offered in Fall and Summer

ANT 433/ANT 533 Anthropology of Ecotourism and Heritage Conservation (3 credit hours)
Introduction to how cultures and societies view, utilize, interpret, manage and conserve environmental and cultural heritage resources; includes examination of theory and concepts of place, identity, sacred heritage, ecotourism, wildlife management as well as the cultural politics and practices of environmentalist and heritage management. Some limited travel to NC heritage sites required at student expense.

Prerequisite: ANT 252
Typically offered in Spring only

ANT 444/WGS 444/ANT 544/WGS 544 Cross-Cultural Perspectives on Women (3 credit hours)
Comparison of women in a variety of societies: western and non-western; hunting and gathering to industrialized. Cross-cultural perspective on the similarity and diversity of women's statuses and roles. Effect of gender on social position

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

ANT 450/ANT 550 Culture, Ecology, and Sustainable Living (3 credit hours)
Examines the myriad ways that culture serves to mediate the human-environmental equation. Focus is given to different belief systems, subsistence strategies, technological achievements, and policy formulations. Topics covered include cultural ecology, gender and the environment, land tenure, development, ethnoscience and cognitive ecology, subsistence and social organization, historical and political ecology, environmentalism, and environmental policy issues.

Prerequisite: One of the following: ANT 310,325,330 or 346

ANT 460/ANT 560 Urban Anthropology (3 credit hours)
Anthropological study of cities. Examination of cross-cultural patterns of behavior in urban areas and adaptive strategies that urban dwellers employ. Introduction to major theoretical and methodological approaches relevant to an understanding of contemporary urbanization.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Fall only

ANT 461/ANT 561 Wealth, Poverty and International Aid (3 credit hours)
Examines notions of wealth and poverty in a variety of cultural settings, as well as ideas of whether and how people categorized as poor or rich might alter their status. These findings are applied to case studies of current international aid organizations that carry out poverty relief.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

ANT 464/ANT 564 Anthropology of Religion (3 credit hours)
Examination of various anthropological perspectives on the role of religion in social life, and discussion of theoretical and methodological issues pertaining to the study of ritual and belief.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

ANT 471/IS 471/ANT 571 Understanding Latino Migration (3 credit hours)
This collaborative, hands-on class examines what ultimately drives migration and how families, communities, and policy-makers respond to migration in ways that can keep the process going. Focusing on emigration from Mexico, Guatemala, Honduras, and El Salvador, the course reviews the historical foundation for today's migration with attention to migration to North Carolina.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Summer only

ANT 475/ANT 575 Environmental Archaeology (3 credit hours)
Archaeological investigation of human-environmental interactions and human impacts on ancient environments. Focuses on the causes of environmental change (climate, human activity) and the implications for understanding human nature, predicting future problems, and addressing current crises. Topics include reconstructing paleoclimate, the extinction of megafuana, anthropogenic landscapes, environmental degradation and the collapse of ancient states, sustainability and the Anthropocene.

Prerequisites:ANT 253 and one 300-level anthropology course
Typically offered in Fall and Spring

ANT 481/ANT 581 Zooarchaeology (3 credit hours)
Survey of approaches used by archaeologists to understand the human past through the study of excavated animal remains, and the theories that inform those approaches. Analysis and critique of the ways in which archaeologists use animal remains to reconstruct past human economic systems, social identities, environments, hunting practices, domestication, and foodways. Includes analysis and identification of animal remains; zooarchaeological sampling, measurement, and quantification; and computer analysis of animal bone data to address archaeological questions.

Prerequisite: ANT 253
GEP Social Sciences
Typically offered in Spring only

ANT 483/ANT 583 Theories of Archaeological Research (3 credit hours)
Covers the theories that inform archaeological research in the effort to locate and interpret material evidence about past human activities. Topics include the history of archaeology, theories of archaeological practice and interpretation, ethics, and working with stakeholders. Relies on case studies and major syntheses and critiques of current theoretical debates. Cases focus on the origins of social complexity, human-environmental interactions, and critical perspectives on inequality, race, class, gender, and ethnicity. Students may not receive credit for both ANT 483 and ANT 583.

Typically offered in Fall only

ANT 495 Special Topics in Anthropology (3 credit hours)
Detailed investigation of a topic in anthropology. Topic and mode of study determined by faculty member(s).

ANT 496 Anthropology Internship (6 credit hours)
Supervised observation and experience in work settings appropriate to anthropological perspectives. Study of the relationships between internship setting and relevant anthropological theory, methods and research. Weekly seminars, individual conferences and an integrative report. Students are responsible for arranging their own transportation to internship sites. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: ANT 412, ANT 416; Senior standing in Anthropology (B.A.)
Typically offered in Fall and Spring

ANT 498 Independent Study in Anthropology (1-6 credit hours)
Independent study of a topic in anthropology. Topic and mode of study determined by faculty member(s) and student(s). Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Six hours of ANT
Typically offered in Fall, Spring, and Summer

ANT 501 Proseminar: Introduction to Graduate Studies in Anthropology (3 credit hours)
Introduction to anthropological research process; introduction to anthropology faculty; research proposal design; career planning; professional development; campus resources.

R: Anthropology Graduate students
Typically offered in Fall only

ANT 511/ANT 411 Overview of Anthropological Theory (3 credit hours)
A detailed introduction to anthropological theory, interpretive styles and research techniques of major nineteenth and twentieth century anthropologists working within the analytic frameworks of their times, positions espoused by anthropologists in contemporary debates concerning the discipline's future. Students cannot receive credit for both ANT 411 and ANT 511.

Prerequisite: ANT 252 and ANT 310 or ANT 325 or ANT 330 or ANT 345 or ANT 346 or ANT 354
Typically offered in Spring only

ANT 512/ANT 412 Applied Anthropology (3 credit hours)
History, aims, methods and ethics of applied anthropology. Anthropological practice in government, industry, community development, education, and medicine. Analysis of consequences of development programs for culture change. Credit cannot be given for both 412 and 512.

Typically offered in Spring only

ANT 516/ANT 416 Research Methods in Cultural Anthropology (3 credit hours)
A systematic overview of cultural anthropological research methods including designing research projects, research techniques, field work methods, and cross-cultural comparison. Reviews relevant ethical questions and anthropologists' reports of their own field work.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330, 345, 346, 351, or 354
Typically offered in Fall only

ANT 521/ANT 421 Human Osteology (3 credit hours)
Survey of all the bones of the human skeleton from an anthropological perspective, including their names, important features useful in recognizing fragmentary specimens from an archaeological context, and techniques for determining the side of the body they come from. Skeletal development and its relationship to skeletal abnormalities. Issues relating to the study of archaeological skeletons.

Prerequisite: ANT 251 and any ANT 300 Level
Typically offered in Fall only

ANT 524/ANT 424 Bioarchaeology (3 credit hours)
Survey of approaches used by bioarchaeologists to understand past lifeways through the study of excavated human remains, and the theories that inform those approaches. Analysis and critique of the ways in which bioarchaeologists use skeletal and mortuary data to reconstruct health and disease patterns, mortality rates, diet, degree of interpersonal violence, and social structure among humans from the distant past.

Prerequisite: ANT 421
Typically offered in Spring only

ANT 528/ANT 428 Human Paleopathology (3 credit hours)
Survey of diseases that manifest on the human skeleton. Analysis and identification of these diseases from a clinical perspective through all life stages from radiographic analysis, macroscopic analysis, and photographic analysis.

Prerequisite: ANT 251
Typically offered in Spring only

ANT 529 Advanced Methods in Forensic Anthropology (4 credit hours)
Advanced methods in forensic anthropology-an applied field of biological anthropology. Application of the science of biological anthropology to the medicolegal process. Identification of skeletal remains to determine age, sex, ancestry, stature, andunique features of a decedent. Analysis of human skeletal remains. Identification techniques addressed and proficiency expected. Students must provide their own transportation to the laboratory site.

Prerequisite: Graduate Standing
Typically offered in Spring only

ANT 531/ANT 431 Tourism, Culture and Anthropology (3 credit hours)
Anthropological approach to tourism studies with emphasis on cross-cultural aspects of international tourism. Attention to impact of mass tourism as compared to alternative tourism; environmental and economic impact of tourism; impact of international tourists and tourism on local communities. Principal theories of leisure in relation to tourism. Theories of culture change in relation to travel and tourism. Credit not given for both ANT 431 and ANT 531.

Prerequisite: Three hours of cultural anthropology
Typically offered in Fall and Summer

ANT 533/ANT 433 Anthropology of Ecotourism and Heritage Conservation (3 credit hours)
Introduction to how cultures and societies view, utilize, interpret, manage and conserve environmental and cultural heritage resources; includes examination of theory and concepts of place, identity, sacred heritage, ecotourism, wildlife management as well as the cultural politics and practices of environmentalist and heritage management. Some limited travel to NC heritage sites required at student expense.

Prerequisite: ANT 252
Typically offered in Spring only

ANT 544/WGS 544/ANT 444/WGS 444 Cross-Cultural Perspectives on Women (3 credit hours)
Comparison of women in a variety of societies: western and non-western; hunting and gathering to industrialized. Cross-cultural perspective on the similarity and diversity of women's statuses and roles. Effect of gender on social position

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

ANT 550/ANT 450 Culture, Ecology, and Sustainable Living (3 credit hours)
Examines the myriad ways that culture serves to mediate the human-environmental equation. Focus is given to different belief systems, subsistence strategies, technological achievements, and policy formulations. Topics covered include cultural ecology, gender and the environment, land tenure, development, ethnoscience and cognitive ecology, subsistence and social organization, historical and political ecology, environmentalism, and environmental policy issues.

Prerequisite: One of the following: ANT 310,325,330 or 346

ANT 560/ANT 460 Urban Anthropology (3 credit hours)
Anthropological study of cities. Examination of cross-cultural patterns of behavior in urban areas and adaptive strategies that urban dwellers employ. Introduction to major theoretical and methodological approaches relevant to an understanding of contemporary urbanization.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Fall only

ANT 561/ANT 461 Wealth, Poverty and International Aid (3 credit hours)
Examines notions of wealth and poverty in a variety of cultural settings, as well as ideas of whether and how people categorized as poor or rich might alter their status. These findings are applied to case studies of current international aid organizations that carry out poverty relief.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

ANT 564/ANT 464 Anthropology of Religion (3 credit hours)
Examination of various anthropological perspectives on the role of religion in social life, and discussion of theoretical and methodological issues pertaining to the study of ritual and belief.

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

ANT 571/ANT 471/IS 471 Understanding Latino Migration (3 credit hours)
This collaborative, hands-on class examines what ultimately drives migration and how families, communities, and policy-makers respond to migration in ways that can keep the process going. Focusing on emigration from Mexico, Guatemala, Honduras, and El Salvador, the course reviews the historical foundation for today's migration with attention to migration to North Carolina.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Summer only

ANT 575/ANT 475 Environmental Archaeology (3 credit hours)
Archaeological investigation of human-environmental interactions and human impacts on ancient environments. Focuses on the causes of environmental change (climate, human activity) and the implications for understanding human nature, predicting future problems, and addressing current crises. Topics include reconstructing paleoclimate, the extinction of megafuana, anthropogenic landscapes, environmental degradation and the collapse of ancient states, sustainability and the Anthropocene.

Prerequisites:ANT 253 and one 300-level anthropology course
Typically offered in Fall and Spring

ANT 581/ANT 481 Zooarchaeology (3 credit hours)
Survey of approaches used by archaeologists to understand the human past through the study of excavated animal remains, and the theories that inform those approaches. Analysis and critique of the ways in which archaeologists use animal remains to reconstruct past human economic systems, social identities, environments, hunting practices, domestication, and foodways. Includes analysis and identification of animal remains; zooarchaeological sampling, measurement, and quantification; and computer analysis of animal bone data to address archaeological questions.

Prerequisite: ANT 253
GEP Social Sciences
Typically offered in Spring only

ANT 583/ANT 483 Theories of Archaeological Research (3 credit hours)
Covers the theories that inform archaeological research in the effort to locate and interpret material evidence about past human activities. Topics include the history of archaeology, theories of archaeological practice and interpretation, ethics, and working with stakeholders. Relies on case studies and major syntheses and critiques of current theoretical debates. Cases focus on the origins of social complexity, human-environmental interactions, and critical perspectives on inequality, race, class, gender, and ethnicity. Students may not receive credit for both ANT 483 and ANT 583.

Typically offered in Fall only

ANT 585 Skeletal Biology in Anthropology (3 credit hours)
Skeletal biology is the study of human skeletal remains; understanding past populations' demographics, health and disease, physical activity, diet, and biological relatedness to other groups, past and present. Must hold graduate standing.

ANT 587/HI 587 Cultural Resource Management (3 credit hours)
Theoretical and practical overview of U.S. federal and state laws, institutions, and practices related to the inventory, evaluation, preservation, protection, and overall management of cultural resources; history and philosophical bases of Cultural Resource Management (CRM); professional ethics; indigenous and other stakeholder interests in CRM; and comparative national regulations outside the U.S. and the international heritage management and organizations. Graduate standing in history required.

Typically offered in Spring only

ANT 595 Special Topics in Anthropology (1-6 credit hours)
In depth exploration of specialized topics in Anthropology. Also used to test and develop new courses.

Prerequisite: Graduate Standing

ANT 598 Independent Study in ANT (1-3 credit hours)
Independent study of a topic in anthropology. Topic and mode of study determined by faculty member(s) and student(s).

Typically offered in Fall, Spring, and Summer

ANT 610 Special Topics in Anthropology (1-6 credit hours)
Provision for in-depth investigation of some particular topic in anthropology. Reflection of current student needs and interests through variations in course content and mode of study. Determination of topics by faculty member(s) and student.

ANT 693 Masters Supervised Research (1-9 credit hours)
Instruction in research, and research under the mentorship of a member of the Graduate Faculty. Restricted to Masters Students in Anthropology.

Prerequisite: Graduate Standing
Typically offered in Fall, Spring, and Summer

ANT 695 Masters Research (1-9 credit hours)
Thesis research conducted under the supervision of student's thesis committee chair or other graduate faculty member. Restricted to Masters Students in Anthropology.

Prerequisite: Graduate Standing
Typically offered in Fall, Spring, and Summer

ANT 696 Summer Thesis Res (1 credit hours)
Typically offered in Summer only

ANT 699 Masters Thesis Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, and other requirements for the masters degree, and are writing and defending their thesis. Restricted to Masters Students in Anthropology.

Prerequisite: Graduate Standing
Typically offered in Fall, Spring, and Summer

ANT 810 Special Topics in Anthropology (1-6 credit hours)
Provision for in-depth investigation of some particular topic in anthropology. Reflection of current student needs and interests through variations in course content and mode of study. Determination of topics by faculty member(s) and student.

Typically offered in Fall, Spring, and Summer

Applied Ecology (AEC)

AEC 114 Wicked Problems, Wolfpack Solutions: Global Change (2 credit hours)
Wicked Problems, Wolfpack Solutions is a shared academic experience designed for all students new to NC State. Each year, this course focuses on a current wicked problem, defined as a highly complex problem that can only be addressed through collaborative, multidisciplinary efforts. This course explores a wicked problem and possible solutions through the perspectives of NC State scholars representing many different areas of study and reflects NC State's commitment to inclusion of individuals and ideas from a broad diversity of backgrounds and experiences. AEC 114 focuses on the wicked problem of Global Change.

R: New First-Year Students and New Transfer Students
GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

AEC 203 An Introduction to the Honey Bee and Beekeeping (3 credit hours)
Introduction to honey bee biology and a fundamental understanding of beekeeping management including crop pollination by bees. Examination of the relationships between honey bees and humans from prehistoric through modern times and the behavior and social system of one of the animal world's most complex and highly organized non-human societies.

GEP Natural Sciences
Typically offered in Fall only

AEC 245 Global Conservation Ecology (3 credit hours)
This course provides an introduction to the scientific principles and concepts that are the foundation of conservation biology. A diversity of topics will be covered, including 1) causes of extinction, 2) the impacts of habitat fragmentation, small population sizes, and exotic species, 3) evidence based nature preserve and corridor design, and strategies for protecting and restoring endangered species and ecosystems. Students will build on their conceptual and analytical skills and gain real-world decision making through collaborative research projects, in which they will gather data and apply their findings to develop climate-smart conservation approaches.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Spring only

AEC 295 Special Topics in Applied Ecology (1-3 credit hours)
Special topics and experimental offerings in Applied Ecology including developmental courses offered on a trial basis. Intended for students at an intermediate level of training in Biological Sciences.

Prerequisite: BIO 181
Typically offered in Fall, Spring, and Summer

AEC 360/PB 360 Ecology (4 credit hours)
The science of ecology, including factors which control distribution and population dynamics of organisms, structure and function of biological communities, and energy flow and nutrient cycling in ecosystems; contrasts among the major biomes; and principles governing ecological responses to global climatic and other environmental changes.

Prerequisite: C- or better in BIO 181
Typically offered in Spring only

AEC 380 Water Resources: Global Issues in Ecology, Policy, Management, and Advocacy (3 credit hours)
This course will take a broad look at global issues associated with water resources, including the ways that people interact with water (how we use, degrade, conserve, and advocate for water and water rights). And how these interactions shape our lives. Woven throughout the course is the fact that science (ecology), policy (resource management), and cultural perspectives interact (sometimes in cooperation and sometimes in conflict) on many topics related to water. Students will explore water resource issues from the perspectives of ecology, natural resource management, and different cultures. The course is appropriate for students with interests in the life and social sciences.

Prerequisite: BIO 181
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Summer only

AEC 384 Tropical Ecology in a Changing World (3 credit hours)
The tropics have attracted the attention of scientist for a long time and tropical studies have help advance our understanding of ecology and ecological theories. This course will focus on understanding tropical ecosystems, their biodiversity, and complexity. Students will learn about major ecosystem types and their characteristics. We will discuss major tropical contributions to ecology and ecological theories. In addition, we will study how global change is affecting the tropics and the potential consequences. Students will gain a general understanding of tropical ecology in a changing world.

P: AEC 360 / PB 360 or equivalent
Typically offered in Spring only

AEC 390 Community Ecology (3 credit hours)
This course explores the various mechanisms structuring ecological communities. The course builds on community ecology topics introduced in other courses, by providing an advanced understanding of the theoretical and quantitative nature of community ecology. Topics covered include two-species interactions (e.g. predation, competition, parasitism, mutualisms), multispecies interactions, food webs and ecological networks, biodiversity and ecosystem functioning, estimation of and regulation of species diversity at ecological and evolutionary time scales, higher order interactions, community succession, and biogeography. Emphasis will be on concepts and theory, quantitative and mathematical models, experimental and other empirical approaches, and hands-on use of data and computer software to address basic and applied questions in community ecology.

Prerequisites: (ENV 101 or AEC 360 or PB 360 or FOR 260) and (MA 121 or MA 131 or MA 141 or ST 311)
Typically offered in Spring only

AEC 400 Applied Ecology (3 credit hours)
Global climate change, over-fishing, habitat loss, altered nutrient cycles, and the spread of invasive species are among the world's pressing global environmental issues. Solutions to these problems are complex, but firmly rooted in the fundamental tenets of ecological theory. The field of applied ecology is premised on using these fundamental ecological principles to help solve the environmental challenges we face. This course will provide an overview of the field of applied ecology, based on a series of case studies. Working from the individual to global level, the course will provide a broad perspective on the field of applied ecology.

Prerequisite: AEC/PB 360
Typically offered in Fall only

AEC 409/AEC 509 Ecology and Conservation of Freshwater Invertebrates (3 credit hours)
This course will introduce the student to the identification and ecology of freshwater invertebrates, with an emphasis on their life histories and adaptation to diverse freshwater habitats, significance to higher trophic levels, such as fish, ecosystem functioning, as a major source of freshwater animal diversity, conservation of threatened species, and application to bioassessment of water quality.

Typically offered in Spring only

AEC 419/AEC 519 Freshwater Ecology (4 credit hours)
The course explores the structure and function of streams, lakes, and wetlands, including physical, chemical and biological controls of productivity and species composition of aquatic plants and animals and effects of pollution on organisms and water quality. The laboratory emphasizes modern, hands-on techniques for answering fundamental and applied questions. One local weekend field trip required. Credit in both AEC 419 and AEC 519 is not allowed.

Prerequisite: C- or better in BIO/PB 360
Typically offered in Fall only

AEC 420 Introduction to Fisheries Science (3 credit hours)
Role of fish in aquatic ecosystems, fish biology, fish ecology, fisheries management and conservation. Emphasis on aquatic ecosystems and food webs, life history and ecology of important sport and commercial fishes, population and community dynamics, and theory and practice of fisheries management and conservation. Case studies from freshwater, estuarine and marine systems.

Prerequisite: C- or better in BIO/PB 360
Typically offered in Spring only

AEC 423 Introduction to Fisheries Sciences Laboratory (1 credit hours)
General anatomy and identification of common freshwater, estuarine and marine fish, functional morphology, age and growth analyses, fish health and diets. Computer analyses of bioenergetic and population dynamics.

Corequisite: FW/BIO 420
Typically offered in Spring only

AEC 424 Marine Fisheries Ecology (3 credit hours)
This course covers the life history, stock concept, fishing gears, stock assessment approaches, fish-habitat relationships, socio-economics, and management of marine fishes. Several field trips to state and federal agency laboratories and fish houses/docks are used to emphasize fish sampling, biological sample processing, and gear design. This course is part of the semester at CMAST program and requires students to be on site in Morehead City, NC.

Prerequisite: BIO 181
Typically offered in Spring only

AEC 441 Biology of Fishes (3 credit hours)
Behavior, evolution, physiology and ecology of fishes, emphasizing their adaptations for life in streams, lakes, and oceans.

Prerequisite: C- or better in BIO/PB 360 Corequisite: AEC 442 Biology of Fishes Laboratory
Typically offered in Fall only

AEC 442 Biology of Fishes Laboratory (1 credit hours)
Field and laboratory exercises with the common fish species and communities of North Carolina. Field trips to local streams and lakes plus weekend trips to coastal, estuarine, and mountain habitats.

Corequisite: AEC 441
Typically offered in Fall only

AEC 460 Field Ecology and Methods (4 credit hours)
Field Ecology and Methods will expose senior students with interests in Ecology and Evolution to the diverse field approaches used to address ecological questions. The course considers and implements a variety of field approaches ranging from microcosm experiments to global studies of patterns and diversity. Course is restricted to seniors.

Prerequisite: C- or better in ST 311 and BIO 360
Typically offered in Fall only

AEC 470/AEC 570 Urban Ecology (3 credit hours)
Developing design, conservation, and management strategies to serve humans and biodiversity in urban areas is an ongoing challenge. This course examines cities as unique physical environments and as social-ecological systems: How urban factors drive physiology, abundance and distribution of plants and animals, with consequences for biodiversity, ecosystem function, and human well-being. We will discuss the role of ecology in urban design and management, and emphasize the question of whether urban systems, and the role of humans therein, are adequately described by existing ecological principles.

P: AEC360 / PB360 or equivalent
Typically offered in Fall only

AEC 492 External Learning Experience in Applied Ecology (1-3 credit hours)
Learning experience in applied ecology within an academic framework with facilities and resources on or off campus. Contact and arrangements with prospective supervisors must be done by the student. Prior approval by faculty advisor and minor coordinator in department of applied ecology is required. Students are responsible for risk and safety assessment at off campus locations. Students are responsible for transportation. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: BIO 181 (Variable, depending on instructor)
Typically offered in Fall, Spring, and Summer

AEC 493 Internal Learning Experience in Applied Ecology (1-3 credit hours)
Internal learning experience in applied ecology within an academic framework with facilities and resources on campus. Contact and arrangements with prospective supervisors must be done by the student. Prior approval by faculty advisor and minor coordinator in department of applied ecology is required. Students are responsible for risk and safety assessment at off campus locations. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: BIO 181 (Variable, depending on instructor)
Typically offered in Fall and Spring

AEC 495 Advanced Special Topics in Applied Ecology (1-4 credit hours)
Special topics and experimental offerings in Applied Ecology including developmental courses offered on a trial basis. Intended for students at an advanced level of training in Biological Sciences.

Typically offered in Fall, Spring, and Summer

AEC 501 Ornithology (4 credit hours)
The biology of birds. Lecture topics include evolution, functional morphology, physiology, ecology and behavior. Field and museum laboratories emphasize particular aspects of morphology, ecology and behavior, as well as taxonomy and identification.One coastal weekend field trip required.

Prerequisite: BIO 181, BIO 183, and (BIO 250 or BIO/PB 360)
Typically offered in Fall only

AEC 502 Introduction to Biological Research (2 credit hours)
The main objectives of this course are to introduce and develop the tools and skills useful for excelling in graduate programs in Biology. Topics range from practical skills, such as selecting a committee, communication, data management, generating a thesis topic, and formulating hypotheses, to those that are more philosophical. There is a focus on scientific writing, especially grant proposals, and other professional skills, such as oral discussions of topics related to diversity and inclusivity, collaboration, publishing and reviewing, and developing professional skills and relationships that will be important throughout the graduate tenure of the students.

Typically offered in Fall only

AEC 503 Foundations of Ecology (2 credit hours)
This course covers major concepts, themes, and theories in ecology, including population, community and ecosystem ecology, and evolutionary ecology. Students are introduced to the core skill of critically evaluating scientific papers. The format of the course is readings from the primary literature and student-lead discussions. This course is focused toward first- and second-year graduate students, especially those in preparation for their preliminary exam.

Prerequisite: Graduate standing
Typically offered in Spring only

AEC 509/AEC 409 Ecology and Conservation of Freshwater Invertebrates (3 credit hours)
This course will introduce the student to the identification and ecology of freshwater invertebrates, with an emphasis on their life histories and adaptation to diverse freshwater habitats, significance to higher trophic levels, such as fish, ecosystem functioning, as a major source of freshwater animal diversity, conservation of threatened species, and application to bioassessment of water quality.

Typically offered in Spring only

AEC 510 Machine Learning Approaches in Biological Sciences (2 credit hours)
A wide range of high-throughput technologies are now being used to generate data to answer an ever-increasingly diverse set of questions about biological systems. The next great challenge is integrating data analysis in a systems biology approach that utilizes novel supervised machine learning methods, which accommodate heterogeneity of data, are robust to biological variation, and provide mechanistic insight. The course will not focus on detailed mathematical models, but instead on how these machine learning tools may be used to analyze biological data, in particular gene and protein expression.

Restriction: Graduate standing; Senior Undergraduates with permission from instructor
Typically offered in Fall only

AEC 515/FW 515 Fish Physiology (3 credit hours)
The biology of fishes: physiology, anatomy, endocrinology, behavior and genetics. Designed especially for graduate students in fisheries. Several trips to research laboratories taken.

Typically offered in Fall only

AEC 519/AEC 419 Freshwater Ecology (4 credit hours)
The course explores the structure and function of streams, lakes, and wetlands, including physical, chemical and biological controls of productivity and species composition of aquatic plants and animals and effects of pollution on organisms and water quality. The laboratory emphasizes modern, hands-on techniques for answering fundamental and applied questions. One local weekend field trip required. Credit in both AEC 419 and AEC 519 is not allowed.

Prerequisite: C- or better in BIO/PB 360
Typically offered in Fall only

AEC 570/AEC 470 Urban Ecology (3 credit hours)
Developing design, conservation, and management strategies to serve humans and biodiversity in urban areas is an ongoing challenge. This course examines cities as unique physical environments and as social-ecological systems: How urban factors drive physiology, abundance and distribution of plants and animals, with consequences for biodiversity, ecosystem function, and human well-being. We will discuss the role of ecology in urban design and management, and emphasize the question of whether urban systems, and the role of humans therein, are adequately described by existing ecological principles.

P: AEC360 / PB360 or equivalent
Typically offered in Fall only

AEC 586/FW 586 Aquaculture (3 credit hours)
Biological and general principles of aquaculture. Emphasis on the present status of aquaculture, species involved, techniques employed, and problems encountered. Discussion of recent advances in research and development and identification of areas of future research and development.

Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing
Typically offered in Spring only

AEC 587/FW 587 Aquaculture Laboratory (1 credit hours)
Methods and techniques of cultivating aquatic organisms. Field trips and reports on local hatcheries and facilities required. (Three to four overnight field trips taken on week days to coastal areas, state hatcheries, and private hatcheries; students responsible for shared room costs and their meals. Four field trips also taken on laboratory day within driving range of Raleigh.)

Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing, Corequisite: ZO 586
Typically offered in Spring only

AEC 592 Special Topics in Applied Ecology (1-6 credit hours)
Special Topics in Applied Ecology. Topics will vary.

Typically offered in Fall, Spring, and Summer

AEC 624 Advanced Fisheries Science (2 credit hours)
This is a seminar style course where students and faculty discuss readings in advanced fisheries science. The course is offered to students at CMAST (live) and on main campus (using Zoom or related online meeting software). Transportation is not required.

Typically offered in Fall only

AEC 630 Special Topics in AEC (1-6 credit hours)
Special Topics in AEC

Typically offered in Fall, Spring, and Summer

AEC 710 Sampling Animal Populations (3 credit hours)
Statistical methods applicable to sampling of wildlife populations, including capture-recapture, removal, change in ratio, quadrant and line transect sampling. Emphasis on model assumptions and study design.

Prerequisite: ST 512
Typically offered in Fall only

AEC 718 Community Ecology (3 credit hours)
Animal community structure and function. Effects of competition, predation, coevolution and disturbance on community composition. Emphasis on ecological and evolutionary controversies from empirical and theoretical approaches.

Prerequisite: BO 360 or ZO 260, BO(ZO) 760; BO(ZO) 365
Typically offered in Spring only

AEC 726/FW 726 Quantitative Fisheries Management (3 credit hours)
Current methods for assessment and management of exploited fish populations, including sampling methods, data analysis and modeling. A required research paper or project.

Typically offered in Fall only

AEC 756 Ecology Of Fishes (3 credit hours)
Physiological ecology of fishes emphasizing energetics, production and adaptations to aquatic mediums. Ecological classification of fishes and theory of resource partitioning in freshwater, estuarine and marine realms.

Typically offered in Fall only

AEC 761 Conservation and Climate Science (3 credit hours)
Conservation Science applies principles from ecology, genetics, and other biological disciplines and social sciences to the conservation of biological diversity. This course will train students in techniques in population ecology such as population viability analysis; community ecology and theories of biodiversity; and reserve selection algorithms. The course will also expose and trains students to understand climate science and using climate data for ecological studies. The class will examine threats to biodiversity such as habitat fragmentation and loss, climate change, and invasion by exotic species. These issues will be considered within the context of economic, social, and legal constraints. Graduate status or permission of instructor.

Typically offered in Fall only

AEC 770 Advanced Topics In Ecology I (3 credit hours)
Development of subject matter in major fields of ecology through seminars and lectures and principles illustrated by laboratory exercises and field trips. Microenvironment, population biology, community ecology, ecosystems and nutrient cycling.

Typically offered in Spring only

Architecture (ARC)

ARC 140 Experiencing Architecture (3 credit hours)
An introductory course intended to provide non-majors with a foundation in the basic concepts of architecture. Provides a general understanding of contemporary issues and theory in architecture, concerns about green architecture and sustainability, architecture practice and the role architecture plays in the design of cities.

GEP Visual and Performing Arts
Typically offered in Spring and Summer

ARC 141 Introduction to Architectural History (3 credit hours)
World architectural history of sacred and secular buildings and buildings with emphasis before the modern era. For non-Architecture majors only. Does not count toward Architecture degrees.

R: For non-Architecture majors only.
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

ARC 162 An Introduction to Architecture (3 credit hours)
The purpose of architecture examined through its practices, theories and key principles. Lectures, projects, and readings expose students to the diverse world of ideas, creative work and practical considerations which make up the discipline of architecture.

Prerequisite: D 104 and BED-A students; Corequisite: D 105
Typically offered in Spring only

ARC 201 Architectural Design: Environment (6 credit hours)
Investigation of the relationships between environment and built form. Solar orientation, topography, vegetation, and constructed context in relationship to user needs as parameters for justifying design proposals. Particular emphasis on architectural conventions of communication.

Prerequisite: D 105; BED-A students only; Corequisite: ARC 211
Typically offered in Fall only

ARC 202 Architectural Design: Form (6 credit hours)
Investigation of relationships between idea and form. Composition and precedent as parameters for generating, developing, and justifying architectural form. Particular emphasis on electronic media in drawing and modeling.

Prerequisite: ARC 201 and BED-A students
Typically offered in Spring only

ARC 211 Natural Systems and Architecture (3 credit hours)
Restricted to students in BEDA Program. Relationship between natural and architectural systems. Exploration of the implications of natural forces - sun, wind and daylight- on architecture. Energy-conscious architectural design and site planning strategies to fulfill thermal comfort requirements of people in designed environments.

Prerequisite: D 105
Typically offered in Fall only

ARC 232 Structures and Materials (3 credit hours)
An introduction to construction materials and building structures. Explorations of materials' properties, aesthetics, environmental impact, and performance. Quantitative and qualitative analysis of structural building elements. Course integrates lecture and laboratory. Off-campus field trips are included (students may need to coordinate transportation).

Typically offered in Spring only

ARC 241 History of World Architecture (3 credit hours)
History of the built environment (buildings, urban planning, and associated arts) in western and non-western cultures, ranging from dawn of civilization to dawn of modern era, including high-style architecture, vernacular buildings, and traditional forms.

Typically offered in Fall only

ARC 242 History of Western Architecture (3 credit hours)
History of western architecture (including some landscape architecture and city planning) from the beginnings of the Renaissance in early 15th century to late 19th century in the United States.

Prerequisite: ARC 241 or Consent of Instructor
Typically offered in Spring only

ARC 250 Fundamentals of Architectural Visualization (3 credit hours)
Drawing is a skill fundamental to the discipline of architecture. Drawing allows us to record the world around us. In doing so, we learn and observe the built environment and invigorate our observation skills, an ability essential to architects. Drawing enables us to visualize imaged environments. Drawings allow us to communicate our ideas with others, and most importantly, with ourselves. This dialogue, namely visual thinking, enables us to transform the initial blurry images of imagined environments into defined (and refined) ideas. This course will introduce drawing skills, techniques, and concepts necessary to visualize and understand architectural design ideas.

Prerequisite: Architecture Majors Only
Typically offered in Fall only

ARC 251 Digital Representation (3 credit hours)
Project based methodological investigation of digital representation in architecture including: two- three- and four-dimensional media. Purchase of laptop and necessary software required.

Prerequisite: BED-A students or Master of Arch, Track 3 students
Typically offered in Spring only

ARC 289 Architectural Travel Study I (3 credit hours)
The study of cities, architectural sites, buildings, building complexes, and architectural elements conducted independently by students as part of a planned travel-study tour. Includes advance research and approval of proposed study topic and itinerary. Students will document study through sketches, analytical notations, and a summary paper. Departmental Approval Required

Prerequisite: ARC 141 and ARC 142
Typically offered in Fall and Spring

ARC 292 Special Topics in Architecture (1-3 credit hours)
Topics of current interest in Architecture. Normally used to develop new courses.

Typically offered in Fall, Spring, and Summer

ARC 301 Architectural Design: Tectonics (6 credit hours)
An introduction to the fundamentals of building systems on architectural design. Emphases on building assemblages, vertical-load structural systems, circulation, and passive heating, cooling, and ventilation. Particular emphasis on physical models. Limited to BED-A Students. Junior Standing. Students are required to purchase project materials.

Prerequisite: ARC 202 and ARC 211 and ARC 232; Corequisite: ARC 331 and ARC 432
Typically offered in Fall only

ARC 302 Architectural Design: Technology (6 credit hours)
An investigation of building technical systems as fundamental elements of the design process with emphasis on lateral load resisting structural strategies, environmental control/energy, enclosure assembly detail, and their architectural implications. Particular emphasis on physical models. Restricted to BED-A students, Junior standing. Students are required to purchase materials for projects.

Prerequisite: ARC 301 and ARC 331 and ARC 432
Typically offered in Spring only

ARC 331 Architectural Structures I (3 credit hours)
Structural design process. Combined role of imposed loads and architectural function in shaping the form of the building. Interaction of elements in structural systems containing beams, columns, trusses, space frames, slabs, arches, vaults, domes,cables, cable networks, fabrics and diaphrams. Case studies emphasized.

Prerequisite: ARC 232
Typically offered in Fall only

ARC 332 Architectural Structures II (3 credit hours)
Structural systems explored through case studies and design projects. Emphasis on interaction of structural elements. Tracing of loads in structural systems. Sizing of tensile elements, columns, trusses, and flexural elements. Design and sizing of joints.

Prerequisite: ARC 331
Typically offered in Spring only

ARC 401 Architectural Design: Urban (6 credit hours)
An architectural design studio intended to explore and integrate design issues of all types within an urban environment. Emphasis will be placed on both formal and technical issues of urban sites including transportation and land use planning, phasing of projects over time, relationships to other structures, and the application of development codes, regulations, and urban design principles to the fabric of the city.

Prerequisite: ARC 302 and BED-A student
Typically offered in Fall only

ARC 402 Architectural Design: Advanced (6 credit hours)
Advanced architectural design studios in which projects of many types and scales are employed to investigate a range of educational, theoretical and professional studies. Particular emphasis on independent research and exploration of design issues and their implications as defined by faculty.

Prerequisite: ARC 401 and BED-A students
Typically offered in Spring and Summer

ARC 403 Architectural Design Fundamentals: Environment (6 credit hours)
An introductory architectural design studio for M. Arch, Track 3 students investigating the relationship between environment and built form. Solar orientation, climate, topography, vegetation, and constructed context in relationship to user needs as parameters for design proposals. Particular emphasis on design fundamentals and conventions of architectural communication.

Prerequisite: Masters of Architecture students; Co-requisite: ARC 211
Typically offered in Fall only

ARC 404 Architectural Design Fundamentals: Form (6 credit hours)
An introductory architectural design studio for M. Arch. Track 3 students investigating relationships between idea and form. Composition and precedent as parameters for generating, developing, and justifying architectural form. Particular emphasison electronic media in drawing and modeling.

Prerequisite: Masters of Architecture Track 3 students; ARC 403; Co-requisite: ARC 251
Typically offered in Spring only

ARC 405 Architectural Design Fundamentals: Technology (6 credit hours)
An introductory architectural design studio for M. Arch. Track 3 students in which the technical systems of building - structure, environmental control/energy, materials, enclosure, and circulation; their fabrication and assembly; and their capacityto affect form and tectonic expression - are explored as fundamental elements of the design process. Particular emphasis on physical models.

Prerequisite: Master of Architecture students; ARC 404; Co-requisite: ARC 331 and ARC 432
Typically offered in Fall only

ARC 414 Environmental Control Systems (3 credit hours)
Studies in light, heat, moisture, air motion, and sound in architectural environments. Mechanical, electrical and/or electronic equipment for illumination, heating, cooling, ventilation, vertical transportation and communication in buildings. Water and waste, fire protection and safety, and acoustic systems in architecture.

Prerequisite: ARC 211
Typically offered in Spring only

ARC 432 Architectural Construction Systems (3 credit hours)
Building construction systems related to architectural design. Historical and current building practices. Implications for design and systems selection. Case studies. Field trips are required.

Prerequisite: ARC 232
Typically offered in Fall only

ARC 441 History of Contemporary Architecture (3 credit hours)
A survey and critical examination of modern architecture from its origins in 19th-century philosophy and technology to the most recent developments in world architecture.

Prerequisite: ARC 241, ARC 242; BED-A students, Bachelor of Architecture students, or Masters of Architecture students
Typically offered in Fall only

ARC 442 History of NC Architecture (3 credit hours)
Survey of NC Architecture from 17th-century settlement to World War II. Coverage of a wide range of building types and development patterns.

Prerequisite: ARC 241, ARC 242

ARC 450 Architectural Drawing (3 credit hours)
Introduction to hand drawing skills, techniques, and concepts necessary to use drawing for visual thinking (and visual communication) particularly in the development of design ideas and understanding of architecture. Restricted to Masters of Architecture Track III students.

Corequisite: ARC 451
Typically offered in Summer only

ARC 451 Digital Drawing and Modeling (3 credit hours)
Introductory course to digital communication tools as an integral part of the architectural design process. This course challenges students to develop diverse two and three-dimensional drawing and modeling skills through project-based exercises that engage various digital visualization and layout software. Purchase of laptop and necessary software required. Summer 5 week course. Restricted to Master of Architecture, Track III students.

Co-requisite: ARC 450
Typically offered in Spring only

ARC 490 Architecture International Studio (6 credit hours)
Exploration of architectural problems and development of design solutions in an international setting. Studio projects focused on current conditions found in the host culture, profession, and community.

Prerequisite: ARC 302, Participation in off-campus program.
Typically offered in Fall only

ARC 492 Special Topics in Architecture (1-3 credit hours)
Topics of current interest in Architecture. Normally used to develop new courses.

Typically offered in Fall, Spring, and Summer

ARC 495 Independent Study in Architecture (1-3 credit hours)
Special projects in architecture developed under the direction of a faculty member on a tutorial basis. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: BED-A students with Junior standing and a GPA greater than or equal to 3.0.
Typically offered in Fall, Spring, and Summer

ARC 500 Architectural Design: Professional Studio (6 credit hours)
A comprehensive and integrative architectural design studio for M.Arch students involving the execution of a project in sufficient depth to understand the opportunities and discipline resulting from the inclusion of building.

Prerequisite: M.Arch Track 1 and Track 3 student, ARC 405 or BEDA Degree (or equivalent)
Typically offered in Fall and Spring

ARC 501 Professional Architecture Studio I (6 credit hours)
Design studio investigations aimed at the development of an understanding of the major issues confronting the contemporary architect and at the expanding of problem solving abilities in architectural design.

Prerequisite: BEDA degree
Typically offered in Fall only

ARC 502 Professional Architecture Studio II (6 credit hours)
Design investigation aimed at the development of an understanding of the major issues confronting the contemporary architect and at the expanding of problem solving abilities in architectural design. This is an individualized, final project studio.

Prerequisite: ARC 501
Typically offered in Spring only

ARC 503 Advanced Architectural Design (Series) (6 credit hours)
Advanced studies in architectural design. Projects concerning various aspects of building design, urban design and community design in comprehensive and integrative manner.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ARC 520 Sustainable Architecture (3 credit hours)
This survey course provides students with a solid knowledge base in the numerous aspects of sustainable design touching not only upon strategies, but also various philosophies behind sustainability and the green building movement. This course examines the impact of the built environment on natural systems and questions what it truly means to build responsibly. Lectures, discussions, guest speakers, and field trips create a critical foundation for green building considerations to be references in design at a variety of scales. Restricted to M. Arch, B. Arch, and BEDA seniors. Non-architecture majors by instructor's permission.

Architecture or Environmental Design in Architecture Majors Only
Typically offered in Summer only

ARC 521 Daylighting and Passive Energy Systems for Architecture (3 credit hours)
An investigation of building energy systems and simulation techniques with emphases on thermal envelope, solar geometry, daylighting, passive heating & cooling, and building systems integration. The theoretical considerations will be accompanied by hands-on exercises using various simulation tools. Restricted to M.Arch, B.Arch, and BEDA Senior Students. Non-Architecture majors by instructor's permission.

Typically offered in Fall only

ARC 522 Building Energy Efficiency & Renewable Energy (3 credit hours)
This course will discuss and develop strategies for the design of sustainable buildings. The two primary topics addressed are: 1) energy efficiency and 2) renewable energy. The students will learn and discuss ways to improve energy efficiency in buildings. The renewable energy technologies, such as solar and geothermal, are explored to discuss the applicability of those in the building design.

Typically offered in Fall only

ARC 523 Building Energy Modeling and Simulation (3 credit hours)
This course deals with the fundamentals of building sciences in terms of energy systems. Energy modeling and simulation technologies are used to predict and analyze the energy performance of buildings. The students calculate the energy consumption of heating, cooling, lighting, and equipment by hand to understand the energy & thermal behavior of buildings and then compare and analyze them with those calculated by energy modeling and simulation programs.

Prerequisite: ARC 414
Typically offered in Fall only

ARC 524 Building Energy Optimization (3 credit hours)
This course introduces energy optimization technologies in buildings using computer simulation. The EnergyPlus program, a whole-building computational energy simulation tool developed by USDOE, is used. The maximum energy savings potential of Energy Efficience Measures (EEMs) are identified and implemented for the energy optimization process. Students obtain a great deal of information about a building's potential for energy savings, well before the first brick is even laid.

Prerequisite: ARC 523
Typically offered in Spring only

ARC 525 Sustainability Over the Life of a Building (3 credit hours)
Focuses on strategies and metrics for "greening" existing buildings. Sustainability over the Life of a Building will explore the criteria and documentation needed to certify a building at NC State in the LEED for Existing Buildings: Operations and Maintenance (EBOM) rating system. This course will emphasize the importance of interdisciplinary work while working toward sustainability goals. Over the course of the semester, students will research various criteria and thresholds for the LEED EBOM system. Through this in-depth process, students will synthesize core knowledge about LEED credits to better understand opportunities for strategies in green buildings. Over the course of the semester, students will research various criteria in-depth which are needed for LEED Existing Building Certification, not only becoming familiar with the rating system itself, but also the foundation for each of the addressed LEED credits, as well as context for decisions made in the realm of green buildings.

This is a graduate-level seminar open to all NCSU master's degree students but can be open to advanced standing undergraduate students with instructors' approval. No prerequisites.
Typically offered in Fall only

ARC 526 Health and Sustainability in the Built Environment (3 credit hours)
Explores opportunities in the design and aligned fields for facilitating higher sustainability and health targets, associated thresholds, and certification achievements in the built environment. Building rating systems are reviewed that address categories such as social equity, carbon neutrality, material toxicity, nourishment, fitness, mind, justness, and more. Reaching beyond the standards of current green building practice and public policy, the class will explore methods and case studies using cutting-edge building certification frameworks to target carbon neutral, net-zero, and health-promotive design. Student teams will be working on specific projects with professional firms for their final projects.

This is a graduate-level seminar open to all NCSU master's degree students but can be open to advanced standing undergraduate students with instructors' approval. No prerequisites.
Typically offered in Spring only

ARC 530 Tectonics and Craft (3 credit hours)
Studies of construction and material form in architecture. Case studies of select examples of contemporary architecture that exemplify the technique and craft of modern construction. Analysis of functional, tectonic, and experiential aspects of building methods within the context of economics and culture. Examination of assembly as a determinant of building form.

Prerequisite: Architecture Majors, ARC 432
Typically offered in Fall only

ARC 534 Design of Architectural Details (3 credit hours)
Using detail patterns based on function, constructability, and aesthetics, students analyze existing successful building details, diagnose problems in existing buildings, and design details for their own projects. Restricted to Bachelors and Masters students in Architecture.

Typically offered in Spring only

ARC 535 Experiments in Architecture Prototypes (3 credit hours)
Examination of significant architecture prototypes of the Modern Movement. Seminar will investigate the effectiveness of prototypes in proposing solutions to technological, social, and environmental issues such as housing, education, and sustainability. Students will explore the possibilities of prototype design and construction in contemporary practice. Field trips required.

Prerequisite:ARC 232 or equivalent
Typically offered in Summer only

ARC 536 Materials for Design (3 credit hours)
Contemporary buildings that have insightfully integrated design intention and materials are analyzed using the case study method. Each student uses an iterative analytical process to probe deeply and specifically to find each building's key lessons regarding materials. Key drawings and photographs will be graphically presented, with a narrative summarizing findings regarding the project's general design intentions and its technical embodiment. Restricted to M. Arch or B. Arch Students.

P:
Typically offered in Fall only

ARC 537 Digital Materials Translations (3 credit hours)
This seminar combines architectural material research with instruction in advanced digital design software. Students will examine specific materials to determine attributes, and then use parametric, NURBS-based software, and CNC machinery to propose new material applications. The course is limited to College of Design students unless instructors grant permission.

Prerequisite: (ARC 251 or ARC 451 or equivalent) and (ARC 232 or equivalent)
Typically offered in Fall only

ARC 538 Manufacturing Architecture (3 credit hours)
Focuses on customized repetitive manufacturing for architecture components. Specifically includes repetitive processes that make repeated uses of tooling (e.g. molds, patterns, or jigs) to form components. We will investigate repetitive manufacturing processes and architectural case studies. Limited to MArch, BArch, and BED-A students, senior standing.

Prerequisite: Architecture Majors, ARC 432
Typically offered in Fall only

ARC 540 Architectural Theory (3 credit hours)
This course provides an introduction to the major themes and associated figures of architectural theory. It focuses on 20th and 21st century texts with a particular emphasis on historicism, phenomenology, structuralism and post-structuralism. Each week there is assigned reading from a range of texts, including extra-disciplinary writers. Lectures and discussions serve to identify principal themes, connect to contemporary issues, and establish relevancy to architectural design. Restricted to M. Arch, B. Arch, and BEDA Seniors. Non-architecture majors by instructor's permission.

Typically offered in Spring only

ARC 541 Architecture, Culture, and Meaning (3 credit hours)
This course focuses on architecture as a cultural artifact and provides an overview of the interrelationship of architectural form, organization, symbolism, use and meaning. A broad range of examples from a variety of cultures, religions, and historical periods are covered (including "non-Western"), illustrated by detailed case studies. Syncretic, holistic and homological approaches to understanding the meaning and significance of architecture are emphasized. Phenomenological and hermeneutical methods of interpretation are introduced and pertinent philosophical traditions discussed. Restricted to M.Arch., B.Arch., and BEDA seniors. Non-architecture majors by instructor's permission.

Typically offered in Fall only

ARC 542 Sacred Architecture (3 credit hours)
This course focuses on the meaning and cultural significance of sacred architecture, including its environmental and socio-political contexts, and doctrinal and liturgical influences. The course is structured according to the world's principal faiths and presented comparatively and holistically. There is a particular emphasis on the communicative roles of architecture and the symbolism and ritual use of sacred places. Contemporary theoretical methodologies are introduced and applied as means establish relevancy to contemporary issues and architectural design. Restricted to graduate students.

Typically offered in Fall only

ARC 543 Analysis of Precedent (3 credit hours)
Investigation of architectural elements, relationships and ordering ideas through comparative graphic analysis of buildings designed by architects. Emphasis on buildings as physical artifacts.

Prerequisite: Grad. standing
Typically offered in Spring only

ARC 544 American City Planning History (3 credit hours)
An examination of the history of American cities, their founding, plans, and development with emphasis on the colonial era to the late 19th century. Broad study of the larger historical trends in city planning balanced by readings focused on major cities (New York, Chicago, Los Angeles) and smaller ones (Savannah, New Orleans). Major issues include street patterns, parks,and public buildings and spaces; and the roles of government and private citizen groups. Restricted to graduate students in the MArch, seniors in the BArch, and seniors in the BEDA programs; or by permission of theinstructor.

Prerequisite: ARC 241 and ARC 242 and ARC 441 or permission of instructor.
Typically offered in Spring only

ARC 545 Methods of Interpretation in Architectural History (3 credit hours)
This seminar surveys the materials, methods, and texts of architectural history as an analytical discipline of the built environment. A broad selection of readings will trace the evolution of the discipline and will position architectural history in relation to such fields as architecture, art history, urban and social history, anthropology, literature, cultural studies, urban planning, and architectural theory. The course is restricted to graduate students and serves as one of the alternate required courses for the Concentration in the History and Theory of Architecture.

P: ARC 241 and ARC 242 and ARC
Typically offered in Fall only

ARC 546 Theory of Building Types (3 credit hours)
Theoretical implications and practical applications of typology in architecture. Analysis and documentation of selected building types in their historical evolution. Graphic identification of type characteristics.

Prerequisite: Two ARC studios
Typically offered in Fall only

ARC 548 Vernacular Architecture (3 credit hours)
Readings in theories of vernacular architecture. Case studies of selected examples of vernacular architecture of the world: architectural analysis of utilitarian, tectonic, and perceptual aspects of buildings and urban fabrics against the background of place and culture. Examination of influences of various vernacular traditions on contemporary practice.

Prerequisite: M.Arch student without an undergraduate degree in architecture must have completed ARC 211,ARC 241,ARC 232
Typically offered in Spring only

ARC 561 The Practice of Architecture (3 credit hours)
A lecture course examination of the practice of architecture through a lecture course, with emphasis upon both normative and emerging procedures in the private architectural firm. Special attention upon the role and function of the practicing architect, legal and regulatory conditions, the nature of professional services, office management and project management processes.

Typically offered in Fall and Spring

ARC 562 Legal Issues in Architecture (3 credit hours)
The main principles of law affecting the profession of architecture as it is influenced by contracts, torts, agency, property, and environmental restrictions.

Prerequisite: Architecture Majors, ARC 561
Typically offered in Fall only

ARC 563 Public Interest Design Seminar: Case Studies and Current Issues (3 credit hours)
This course evaluates and appraises design in the public interest as a critical and growing element of design disciplines. We explore how design can positively contribute to the social, economic, and environmental well-being of US and global communities. We study current innovations and review successful examples of projects and practice. In addition to lectures by the professor, presentations are made by professionals and experts in public interest design.

The class is open to Architecture Graduate Students in the College of Design. Other NCSU students may enroll by permission of Instructor.
Typically offered in Spring only

ARC 570 Anatomy of the City (3 credit hours)
A morphological investigation of cities throughout urban history, with emphasis on formal principles of spatial organization. Part one: examination of the descriptive properties of cities in terms of interdisciplinary concepts and principles. Part two: examination of the organizational characteristics of urban space.

Typically offered in Fall only

ARC 571 Urban House (3 credit hours)
This seminar is intended to investigate the interrelationships between the form of housing and the demands of a rapidly changing society. Reference is made to the physical, economic, social, cultural, and economic factors that influence housing design.

Prerequisite: Graduate standing
Typically offered in Spring only

ARC 572 Regional Infrastructures (3 credit hours)
This seminar provides students with a solid knowledge base about current urban issues and design theory surrounding the contemporary networked metropolis. Through lectures, discussions, and workshops the course examines how infrastructural systems might be expanded in order to catalyze additional environmental, social, and economic processes. Students research specific infrastructural systems (conducting food, water, or energy) at a systems-defined regional scale to better understand the characteristics of 21st century American cities and speculate on new opportunities for architects and landscape architects to practice. Restricted to M. Arch, B. Arch, BEDA seniors, and M. LArch.

Restricted to: M. Arch, B. Arch, BEDA seniors, and M. LArch
Typically offered in Spring only

ARC 574 Place and Place Making (3 credit hours)
Examination of the definitions, concepts and emergent research findings useful in explaining the human sense of place through seminar-lecture course. Particular emphasis upon those physical aspects and relationships influencing this sense of place and affording some designer control.

Prerequisite: Graduate standing
Typically offered in Fall only

ARC 576 Community Design (3 credit hours)
Processes through which citizens shape and manage built environment. Strategic planning, visioning process, community action, and mediation will be discussed and illustrated with case study examples from architecture, landscape architecture and planning. Analysis and assessment from case studies of participation techniques such as charrette, study circles, and visual appraisal.

Typically offered in Fall only

ARC 577 Sustainable Communities (3 credit hours)
Historical precedents of sustainable communities. Examination of the Garden City, the New Towns Movement, and the New Urbanism. Comparison of sustainable communities to urban visions of Wright, Corbusier, Soleri and others. Virtual cities and digital communities.

Typically offered in Spring only

ARC 581 Project Preparation Seminar (3 credit hours)
Quantitative and qualitative conditions, considerations and determinants as preparation for architectural design. Emphasis on research methods, data collection and interpretation, theoretical discourse, site analysis, programming and architectural precedent. Required enrollment in B.Arch.

Typically offered in Fall only

ARC 589 Architectural Travel Study II (3 credit hours)
Independent study while traveling. Submission of sketchbook/journal and paper upon return. Research on topic of concentration and approval of itinerary in advance required. Graphic documentation and critical evaluation of buildings and urban spaces.Required of all participants in Dept. of Architecture Foreign Exchange and Summer Abroad Programs. Restricted to departmental approval.

Typically offered in Fall, Spring, and Summer

ARC 590 Special Topics in Architecture (1-6 credit hours)
Topics of current interest by faculty in the Department of Architecture. Subjects under this number normally to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ARC 598 Final Project Studio In Architecture (6 credit hours)
Final project for graduate students supervised by members of their graduate advisory committee. Requires department approval.

Prerequisite: 18 hrs. of ARC 503 and ARC 697
Typically offered in Fall and Spring

ARC 610 Special Topics in Architecture (1-6 credit hours)
Special Topics in Architecture

ARC 630 Independent Study (1-3 credit hours)
Development of research and projects in various aspects of architecture under the direction of architecture faculty member on tutorial basis. Requires a faculty sponsor and departmental approval.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ARC 682 Directed Research (3 credit hours)
Students work directly with their advisor in areas of research as defined by advisor. Includes research methods. Restricted to students enrolled in the Master of Advanced Architectural Studies program.

Restricted to students enrolled in the Master of Advanced Architectural Studies program.
Typically offered in Fall, Spring, and Summer

ARC 685 Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Spring only

ARC 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

ARC 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

ARC 696 Summer Thesis Res (1 credit hours)

ARC 697 Final Project Research in Architecture (1-6 credit hours)
Investigation of selected problems and projects in architecture of particular interest to graduate students under the direction of a faculty member on a tutorial basis. Credits and content vary to meet the scope of the project proposal.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ARC 698 Advanced Architectural Studies Project (3-9 credit hours)
Investigation of specific topic and subjects, as defined by student in consultation with student's advisor, and approved and supervised by advisor. Includes research methods. Restricted to students enrolled in the Master of Advanced Architectural Studies program.

Restricted to students enrolled in the Master of Advanced Architectural Studies program.
Typically offered in Fall, Spring, and Summer

ARC 896 Summer Dissert Res (1 credit hours)

Art and Design (ADN)

ADN 111 Introduction to Two-Dimensional Design (3 credit hours)
An introduction to the fundamentals of design studies through two dimensional problems. The basic elements and concepts of design explored as abstract and applied problems through design issues. Provides non-design students an introduction to design principles and a language of design.

Typically offered in Fall, Spring, and Summer

ADN 112 Introduction to Three-Dimensional Design (3 credit hours)
An introduction to the fundamentals of design studies through three-dimensional problems. The basic elements and concepts of design explored as abstract and applied problems through the design issue. Provides non-design students a working knowledge of design principles and a language of design.

Typically offered in Fall and Spring

ADN 200/DS 200 A Survey of Design Studies (3 credit hours)
This course will introduce students to a variety of perspectives and lenses through which to examine and evaluate design in the world. Students will consider design studies through theory and criticism of design, as well as applied to business administration, museum studies, and environmental studies. In addition, students will be encouraged to find evidence of and define design studies in areas that are uniquely suited to their individual areas of interest. As an advised elective, this course is required for Design Studies majors who are sophomores in their major.

Typically offered in Fall only

ADN 202 Design Studio: Art & Design in Context (6 credit hours)
Emphasis on fundamental Art & Design visual language through investigative problem solving.

Prerequisite: D 104, D 105, or permission of department, ADN majors only
Typically offered in Spring only

ADN 203 Art + Design Sophomore Studio II (3 credit hours)
The Art + Design Sophomore Studio series includes four required courses of three-credit hours each to be completed in the sophomore year. ADN 202 and ADN 203 are offered in the fall semester. ADN 204 and ADN 205 are offered in the spring semester. The Art + Design Sophomore Studio Series focuses on the creative disciplines foundations taught at the intermediate and advance level Art + Design electives and studios. The Sophomore Studio Series courses include: Visual Composition (ADN 202); Sequential Imaging (ADN 203); Applied Creative Processes (ADN 204); and Interactive Media (ADN 205).

Prerequisite: ADN 201, or permission of department, ADN majors only
Typically offered in Fall only

ADN 204 Art + Design Sophomore Studio Spring (6 credit hours)
The Art + Design Sophomore Studio series includes two required courses of six-credit hours each to be completed in the sophomore year. ADN 202 is offered in the fall semester. ADN 204 is offered in the spring semester. The Art + Design Sophomore Studio Series focuses on the creative disciplines foundations taught at the intermediate and advance level Art + Design electives and studios.

Typically offered in Spring only

ADN 212 Photography I (3 credit hours)
Introduction to the processes and visual skills necessary for the beginning photographer. Darkroom experimentation, pinhole camera, basic rudiments of camera use, film development and printing. Exploration of issues related to the quality of visual communication.

Typically offered in Fall and Spring

ADN 219 Digital Imaging I (3 credit hours)
Introduction to exploring, creating, and modifying images through the use of computers. Emphasis is on creativity, experimentation, and intuitive image-making using various computer techniques.

Prerequisite: D104 or ADN 111
Typically offered in Fall, Spring, and Summer

ADN 220 Digital Illustration I (3 credit hours)
Hands-on exploration of digital drawing, painting, and image editing techniques with the use of pressure sensitive digital drawing tablets and image editing software; Development of ability to design and communicate convincing 3-dimensional forms and environments using 2D digital techniques with an emphasis on gesture, shape, volume, intuitive perspective, color, and light; Application of design process and research to generate images for visual concept development; Examination of relationships between historic and contemporary conventions for traditional and digital image-making.

Typically offered in Fall and Spring

ADN 221 Digital Illustration II (3 credit hours)
Hands-on exploration of digital drawings, painting, and image editing techniques with the use of pressure sensitive digital drawing tablets and image editing software; Development of ability to integrate multiple visual elements to illustrate narratives and create illusionistic environments. Emphasis shot design, linear perspective, light, color, texture, and atmosphere; Application of design process and research to generate images for visual concept development and mood; Examination of relationship between historic and contemporary illustration, compositing, and matte painting techniques.

Prerequisite: ADN 220
Typically offered in Fall and Spring

ADN 224 Digital Motion (3 credit hours)
Hands-on exploration of motion, animation principles, and keyframing strategies; Development of animated experiments and sequences that focus on convincing and exaggerated movement, physics, and acting; Introduction to range of key animation software and techniques. Restricted to Art and Design Majors Only

Typically offered in Spring only

ADN 226 Sequential Imaging (3 credit hours)
Hands-on development of story-boards, story-reels, and animatics to plan and examine visual sequences; Development of freehand sketching techniques; Exploration of drawing and image-making as a tool for visual and conceptual development; Examination of traditional and contemporary visual storytelling techniques and conventions; Exploration of common strategies for developing narrative structure. Restricted to Art and Design Majors Only.

Typically offered in Fall only

ADN 272 Introduction to Printing and Surface Design (3 credit hours)
Design and production of screen printed, painted and pattern-dyed fabrics. Development of design abilities (color use, pattern generation) and technical skills (screen printing, painting, use of fabric dyes). Production of fabric samples, studies, yardage, and/or end products. Awareness of industrial processes.

Prerequisite: C- or better in D104, ADN 111, or ADN 112
Typically offered in Fall and Spring

ADN 273 Fibers Materials and Processes (3 credit hours)
Introduction to historical and contemporary hand processes used by the textile designer. Students will learn a variety of textile techniques utilizing traditional and experimental methods. Emphasis will be on technical exploration and development.

Prerequisite: ADN 111 or ADN 112 or D 105
Typically offered in Fall and Spring

ADN 274 Basic Woven and Constructed Textiles (3 credit hours)
Hands-on introduction to structures and techniques of hand weaving and related off-loom textile structures. Focus on basic hand weaving structures, including plain weave, twills and satins, acquired through threading the loom and weaving with a variety of materials. Off-loom techniques explore a variety of structures made with simple hand tools. Projects focus on materials choice; color experimentation and control; pattern manipulations; scale and balance; and the design process as applied to hand constructed textile artifacts.

Typically offered in Fall only

ADN 275 Survey of Fibers in Art and Design (3 credit hours)
This course introduces the student to the vast world of fibers within the Art+Design community and industry. Students will learn the basics of fiber construction and terminology and explore the specialties within the fibers world (including costume design, fashion, fiber art, textile design, etc.). College of Design students only.

Design Students Only
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

ADN 276 Soft Construction I: Sewing (3 credit hours)
Students will gain a fundamental understanding of traditional sewing and construction techniques using both hand and machine methods. Students may incur additional costs for project supplies. Please note that seats in this course are reserved for College of Design or Art + Design Minor (v) students only due to to limited size of labs and class demand. Students who elect to take this course a second time are expected to build upon their experience and/or to approach these concepts from a different perspective.

Prerequisite: Design Majors
Typically offered in Fall only

ADN 281 Drawing I (3 credit hours)
A beginning descriptive drawing experience which teaches students to see, analyze, and transcribe observed subject matters. The transcription incorporates formal drawing issues (line, form, texture) with traditional and contemporary material space exploration.

Prerequisite: Design Majors and Design Minors
Typically offered in Fall and Spring

ADN 288 History of Art + Design: 1918 to the Contemporary World (3 credit hours)
A survey of the History of Art and Design, 1918 to the present, focused on innovative work done in the areas of advertising, animation, comic books & graphic novels, fine arts, and emerging practices in the 21st Century, including Virtual Reality and User Experience design. Attention is paid to evolving definitions of visual culture and their critiques utilizing art historical frameworks to introduce students to methodological approaches in the field.

Typically offered in Spring only

ADN 292 Special Topics in Art + Design (1-3 credit hours)
Topics of current interest in the School of Design. Used to develop new courses.

Typically offered in Fall and Spring

ADN 311 Art + Design Laboratory I (3 credit hours)
Study of creative and contextual skills that relate to Art & Design areas of focus.

Prerequisite: ADN 111, ADN 112
Typically offered in Fall and Spring

ADN 312 Photography II (3 credit hours)
Continuation of an advanced level of the skills and techniques developed in Basic Photography. Purpose is to develop use of camera as a perceptual tool to increase awareness and sensitivity of visual imagery.

Prerequisite: ADN 212
Typically offered in Fall and Spring

ADN 319 Animation I (3 credit hours)
An intensive introduction to animation which integrates traditional hand generated animation, digital techniques and technology. Students will explore animation's fundamental principles of linear formats, sequenced movement and time-based imaging.

Prerequisite: ADN 219
Typically offered in Fall and Spring

ADN 371 Soft Construction II: Sculptural Geometry (3 credit hours)
Students will learn advanced problem solving skills through the creation of the basic set of fashion patterns and the integration of design details. Students may incur additional costs for project related supplies. This course requires field trips as possible. They are scheduled within class time and usually do not require additional cost to student. An example of previous field trips is a research trip to the Gregg. Please note College of Design or Minor of Art + Design (12DMN) Students ONLY due to to limited size of labs and class demand.

Prerequisite: Design Majors and Design Minors
Typically offered in Fall and Spring

ADN 372 Surface Embellishment (3 credit hours)
Hands-on experimentation with classic hand, machine, and digital stitching techniques on fabric; personal exploration of non-traditional materials and applications at different scales; and examination of historic and contemporary stitching through visits to the Gregg Museum and directed library and internet research.

Typically offered in Fall and Spring

ADN 373 Survey of the Fashion Industry and Design (3 credit hours)
Students will be introduced to the fashion industry, fashion history, creative process, behind the scenes, and presentation skills. Please note that 50% of seats are reserved for College of Design or Art + Design Minor (v) students only.

Typically offered in Spring only

ADN 384 Painting I (3 credit hours)
Introduction to the principles of painting through class projects that expose students to different painting materials and techniques. Students learn to build a stretcher, size and prime a canvas as well as other rigid painting surfaces. Acrylic and oil paint used; projects assigned and open themes.

Prerequisite: D 104 or both ADN 111 and ADN 112.
Typically offered in Fall only

ADN 386 Sculpture I (3 credit hours)
Studio course introducing basic concepts, materials, and processes of sculpture. Instruction incorporates both traditional and contemporary form generation with emphasis on developing formal perception and projection.

Prerequisite: D 104 or ADN 112.
Typically offered in Fall only

ADN 400 Design Studio (6 credit hours)
Studio offering Art & Design undergraduates the opportunity to intensively study general design issues (form, color, structure, proportions, scale, etc..) as applies to the study of Art + Design.

Prerequisite: ADN majors only.
Typically offered in Fall and Spring

ADN 402 Senior Art + Design Studio (6 credit hours)
Advanced Design studio emphasizing the exploration of past, current and potential future technologies within Art + Design Department content areas. Students are expected to work independently, develop their own problem statements.

Prerequisite: Seven studios and ADN 219
Typically offered in Fall and Spring

ADN 411 Art + Design Laboratory II (3 credit hours)
Study of intermediate visual communication skills that relate to Art & Design areas of focus.

Prerequisite: D 105 or ADN 111 or ADN 112 or ADN 281
Typically offered in Fall and Spring

ADN 414 Color and Light (3 credit hours)
Physical and perceptual nature of color, color awareness, sensitivity and skills in visual communication with color as a designer's tool.

Typically offered in Fall and Spring

ADN 415 Visualizing Narrative (3 credit hours)
This course will build upon previous knowledge in Art and Design through a focus on the basic historic, stylistic and compositional attributes of type to enhance storytelling in their work. Â¬Main topics addressed in the course will cover the relationship between form and content to support pacing, transition, structure, voice, action and resolution for richer visual narratives. We will use both found text as well as stories that students create in the class to explore the many ways that type can enunciate the meaning, tone and spirit of a story. There are printing fees estimated at $100 associated with this

Prerequisites: (ADN 111 (2D) and ADN 219) OR PERMISSION OF THE INSTRUCTOR. Restricted to: JUNIOR AND ABOVE STANDING IN THE MAJOR, COLLEGE OF DESIGN STUDENTS ONLY
Typically offered in Fall and Spring

ADN 418 Contemporary Issues in Art and Design (3 credit hours)
Explore a range of issues about contemporary art and design ideologies. Concentration on selected readings which provide a platform for discussion of various ideas, approaches, perspectives and practices in the contemporary fields of art and design.

Prerequisite: DS 100 and DS 200 and ADN 202 and ADN 400; Requisite: Junior Standing in ADN or Design Studies
Typically offered in Fall and Spring

ADN 419 Creative Technology Studio I (3 credit hours)
Intensive hands-on investigation of the tools, techniques, and processes for the development of interactive multi-media projects. Media teams will emphasize shaping an idea into a well thought-out design that works as an interactive experience.

Prerequisite: D 105, ADN 219
Typically offered in Fall and Spring

ADN 423 Digital Modeling (3 credit hours)
Hands on introduction to 3D digital modeling tools and techniques for artists and designers who want to expand their skill sets to include 3D practices. The course has applications in several disciplines including; animation, illustration, surface design, and concept development. Explores the use of surface textures, lighting, and compositing. Examines strategies for using 3D tools to create prototypes for physical objects, integrate 3D elements into 2D images, and create models for animation. Restricted to Art and Design Majors Only.

Typically offered in Fall only

ADN 428 Art and Design: Theory and Practice (3 credit hours)
Conceptual basis for developing a personal philosophy regarding the practice of art and design. Theory based history of diverse cultures and forces of change: political, economic, religious, social, intellectual and philosophical as they affect the fields of art and design.

Prerequisite: Senior Level (6 studios), Art and Design Major
Typically offered in Fall only

ADN 460 Creative Technology Studio II (6 credit hours)
An intensive study of advanced image-making processes, software, and various computer platforms used in the creation of multimedia. In a studio mode, students will place emphasis on creating interactive interface systems with audio and special effects.

Prerequisite: ADN 219 and ADN 400
Typically offered in Fall and Summer

ADN 470 Fibers and Surface Design Studio (6 credit hours)
Practice of widely varying textile techniques with the solving of practical and conceptual design problems. Textile end products are designed and produced at full scale in appropriate materials. Focus includes weaving, knitting, printing and dyeing of fabrics, and a wide variety of fabric construction and embellishment processes. Textile history is an ongoing part of the study. Emphasis on synthesis of techniques and ideas.

Prerequisite: Grade of C- or better in (ADN 400 or ARC 202 or ID 202 or GD 202)
Typically offered in Fall and Spring

ADN 472 Advanced Surface Design (3 credit hours)
Advanced problems in the design and production of hand-printed and pattern-dyed fabrics. Experimentation with advanced color application techniques. Exploration of pattern and image production on fabric and development of design abilities in textilemedia. Specific focus changes each semester.

Prerequisite: D 104, ADN 272
Typically offered in Fall and Spring

ADN 473 Advanced Three-Dimensional Fibers Forms and Structures (3 credit hours)
Advanced explorations of three-dimensional textiles forms and structures including works small and large scale installations and sculptures, planar structures in space, and textiles that interact with interior or exterior architecture, the body, or public or site-specific spaces. Technical focus on construction, joining mixed materials, armatures, integration of found materials, and both traditional and experimental structures and applications. Use of hand and power tools.

Prerequisite: ADN 273 or equivalent
Typically offered in Fall and Spring

ADN 474 Advanced Digital Hand Weaving (3 credit hours)
Introduction to use of the computer as a tool for designing, drafting, and hand weaving, using simple software packages. Hand weaving on 24-harness computer assisted looms, 8 harness hand looms, and TC-1 digital hand jacquard loom. 4 to 24 harness woven structures including twill, satin, shadow weave, double weave, woven shibori, dyed warps, and other weave structures. Focus on designing, technical skills, and solving technical problems.

Typically offered in Fall and Spring

ADN 475/ADN 575 Pre-Industrial World Textiles (3 credit hours)
Research on and discussion of hand-made textiles of the world, introducing major textile traditions from Africa, Asia, Europe, North and South America. Focus on geographic and cultural contexts, developments in making, and design characteristics, including impact of 20th century fiber art movements. Seminar format.

Prerequisite: Sophomore standing
Typically offered in Spring only

ADN 480 Intermediate Studio (6 credit hours)
Studio format offering upper level undergraduates the opportunity to intensively study general design issues (form, color, structure, proportions, scale, etc.) through individual study in drawing, painting, sculpture, photography, or printmaking.

Prerequisite: Grade of C- or better in (ADN 400 or ARC 202 or ID 202 or GD 202)

ADN 481 Drawing II (3 credit hours)
An intermediate-level drawing course that further develops the designer's graphic, analytic, observational, and conceptual skills.

Prerequisite: ADN 281
Typically offered in Fall and Spring

ADN 484 Painting II (3 credit hours)
An intermediate-level painting course that through slide lectures, class projects, and assigned readings exposes students to contemporary painting art movements. Special emphasis given to the formal and interpretative analysis of a painting. Acrylic and oil paint are used; Projects have assigned and open themes.

Prerequisite: D 105 or both ADN 111 and ADN 112.
Typically offered in Fall and Spring

ADN 486 Sculpture II (3 credit hours)
An intermediate-level sculpture course that further develops the designer's analytic, observational, and conceptual skills.

Prerequisite: ADN 386
Typically offered in Fall only

ADN 490 Art and Design International Studio (6 credit hours)
Define Art and Design problems and develop design solutions in an international setting. Studio projects related to design, culture, and traditional and contemporary art forms. Focus on artifact making through direct studies. Taught off campus.

Prerequisite: Junior standing, Design Majors, Approval Study Abroad Office
Typically offered in Fall, Spring, and Summer

ADN 491 Special Seminar in Art + Design (1-3 credit hours)
Seminars on subjects of current interest in art + design.

Typically offered in Fall and Spring

ADN 492 Special Topics in Art + Design (1-3 credit hours)
Topics of current interest in Design & Technology. Used to develop new courses.

Typically offered in Fall and Spring

ADN 493 Art and Design Senior Lecture (3 credit hours)
ADN 493 is a capstone course for seniors in Art and Design. The course prepares and equips students with the necessary tools and communication skills to present themselves professionally as competent practitioners. Students are required to integrate their work from previous Art and Design courses into a comprehensive portfolio and personal website. Students are required to participate in the Art and Design Senior Exhibition and provide their own transportation to the exhibition.

Prerequisite: ADN 219, ADN 281, completion of a 400 level studio; Corequisite: ADN 202 or ADN 400 or ADN 460 or ADN 470, or ADN 480
Typically offered in Spring only

ADN 494 Internship in Art + Design (1-6 credit hours)
Supervised field experience in design offices, galleries, museums and other organizations. Maximum of 6 credit hours. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing; 3.0 GPA or better
Typically offered in Fall, Spring, and Summer

ADN 495 Independent Study in Art + Design (1-6 credit hours)
Special projects in art and design developed under the direction of a faculty member on a tutorial basis. Maximum 6 credit hours. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in Design with 3.0 in Design or better
Typically offered in Fall and Spring

ADN 496 The Business of Art and Design (3 credit hours)
A distance education elective course (ADN & DS) that introduces students to the mechanics of gainfully applying their fine and applied arts and/or design education. The course is not discipline specific. The business of design, principles of branding, project management, entrepreneurship and business development are explored through case studies, virtual class forums, independent and group assignments, and assigned readings. The course engages students in the development and management of design business planning, models, and philosophies with emphasis on social responsibility. Through coursework, students foster interpersonal, group, and leadership competencies.

Typically offered in Spring only

ADN 500 Graduate Seminar I: Software, Platforms + Environments (3 credit hours)
This course will introduce first semester Art + Design graduate students to historical and foundational theories of design and media studies-specifically related to platforms, environments and networks-to better understand the myriad ways these ideas have impacted artistic and design-based practice.

Restriction: Art + Design Graduate Students Only. Non-majors by permission of the instructor
Typically offered in Fall only

ADN 501 Graduate Seminar II: Art + Design as Future Making (3 credit hours)
This graduate-level Art +Design seminar looks at theories and methods impacting experimental media art in contemporary practice, as well as how these contemporary practices might inform future art and design-making practices. Topics in the course expose students to a wide breadth of ideas, with the opportunity to dive more deeply into concepts that are personally and professionally intriguing. Topics include: speculative and participatory art + design; biomimicry; artificial intelligence; and technology and ethics. Methods include examining idea sources, process, documentation, critiquing, speaking, and writing about visual concepts.

Restriction: Master of Art + Design Students Pre-requisite: ADN500; Co-Requisite: ADN561. This course is open to undergraduate students and Masters students outside of Art + Design by permission of the instructor.
Typically offered in Fall and Spring

ADN 502 Advanced Visual Laboratory (3 credit hours)
ADN 502 is a general title of Advanced Visual Laboratories under the supervision of an Art and Design faculty member to provide intensive experimental work in various phenomena and disciplines related to design.

Typically offered in Fall and Spring

ADN 510 Graduate Seminar III: Final Project Research (3 credit hours)
Directed research to prepare background documentation for the final project, including historical and contemporary context, theoretical frameworks and references, formation of project parameters, statement of goals, and documentation/project outline.

Prerequisites: ADN500 and ADN501 or permission of the instructor. Restricted to graduate students in Art + Design or permission of the instructor.
Typically offered in Fall and Spring

ADN 511 Graduate Seminar IV: Final Project Documentation (3 credit hours)
This graduate seminar in Art + Design supports students in the development of their final project documentation paper. More specifically, the course gives the direction to revise the historical and contemporary influences of the final project, theoretical framework, and related disciplines. Students will also develop their final project description, analysis and next steps for the project.

Prerequisite: ADN510, ADN570 or permission of the instructor. Co-Requisite: ADN571 or Permission of the Instructor. Open to Master of Design students only.
Typically offered in Fall and Spring

ADN 560 Graduate Studio I: Immersive and Experimental Narratives (6 credit hours)
Graduate Studio in Art and Design that introduces students to multiple modes of creating immersive and experiential narratives through platforms and methods such as animation and motion design, augmented reality, virtual reality, mixed reality and computational art and design.

Restriction: Art + Design Graduate Student or permission of the instructor
Typically offered in Fall only

ADN 561 Graduate Studio II: Exploring the HyperReal: Materiality, Reality and Speculation (6 credit hours)
This graduate studio will explore elements of Speculative Design that use design fiction, future casting and critical design principles to examine the past, present and future of experimental design and media experiences. Students will explore different elements of materiality and how experiences are shaped by the tangible, haptic and immersive nature of technology and media.

Typically offered in Spring only

ADN 570 Graduate Studio III: Final Project Definition (6 credit hours)
This course will provide structure to the final project development for Master of Art + Design Students. Throughout the course, students will be working independently, with instructor guidance and mentorship to develop unique, novel projects that explore new forms of immersive narrative and interactive experiences and push technical boundaries and platforms. Guest lectures and workshops may be brought into the studio throughout the semester.

Restriction: Art + Design Graduate Student or permission of the instructor
Typically offered in Fall and Spring

ADN 571 Graduate Studio IV: Final Project Development (9 credit hours)
This course will provide structure to the final project development for Master of Art + Design Students. Throughout the course, students will be working independently, with guided instruction from the Director of Graduate Programs in Art + Design, their committee chair and committee members. Guest lectures and workshops may be brought into the studio throughout the semester.

Pre-requisite: ADN570 or permission of the Instructor. Master of Art + Design Graduate Students or permission of the instructor.
Typically offered in Fall and Spring

ADN 575/ADN 475 Pre-Industrial World Textiles (3 credit hours)
Research on and discussion of hand-made textiles of the world, introducing major textile traditions from Africa, Asia, Europe, North and South America. Focus on geographic and cultural contexts, developments in making, and design characteristics, including impact of 20th century fiber art movements. Seminar format.

Prerequisite: Sophomore standing
Typically offered in Spring only

ADN 588 Final Project Studio (6 credit hours)
Final studio project for graduate students in Art & Design, under the supervision of graduate advisory committee members.

Prerequisite: ADN 570(18cr) and ADN 581. Student in last semester of graduate enrollment
Typically offered in Fall and Spring

ADN 592 Graduate Art + Design Special Topics (1-6 credit hours)
Topics of current interest to the program or concentration offered by faculty in the department of Art and Design. Subjects offered under this number are normally used to test and develop new courses.

Typically offered in Fall, Spring, and Summer

ADN 630 Independent Study in Art & Design (1-3 credit hours)
Independent study in art and design under the supervision of a specific Art & Design faculty member. Restricted to graduate students in Art & Design with consent of the supervising faculty. May not be taken in the first semester of graduate study

Prerequisite: ADN 503; and ADN 570
Typically offered in Fall, Spring, and Summer

ADN 685 Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Spring only

ADN 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Summer

ADN 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall and Spring

Arts Studies (ARS)

ARS 251 The Arts of a World Capital: London (3 credit hours)
Multidisciplinary course introducing students to the architecture and museums and the musical, dance, and theatrical performances of London. Historical and social context of these works of art. The infrastructure in London that makes its unusual artistic vitality and quality possible. Taught in London.

GEP Global Knowledge, GEP Humanities, GEP Visual and Performing Arts
Typically offered in Summer only

ARS 252 The Arts of Vienna 1900 (3 credit hours)
Interdisciplinary study of art, architecture, music and theater in turn-of-the-century Vienna and of the political and scientific thinking that surrounded these arts. Taught in Vienna.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Summer only

ARS 257/STS 257 Technology in the Arts (3 credit hours)
The interaction between technology and the arts with an emphasis on developments in Western art of the twentieth century. Historical and emerging issues include: sound and film recordings, the addition of sound to films, the impact of films and television on theater, the impact of radio, computer applications to music, the visual arts, and literature.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

ARS 258 Mathematics and Models in Music (3 credit hours)
Use of mathematics and models in the composition of western music of various time periods with an emphasis on the twentieth century. Critical analysis of trivial and non-trivial uses of mathematics; differentiation between mathematics as an analytical tool and mathematics as a compositional tool. Survey of models including geographical, grammatical, and graphic.

Typically offered in Spring only

ARS 259 The Arts and Politics (3 credit hours)
Interactions between the arts and politics. Specific instances and types of political art from the past and the present. Patronage, censorship, propaganda, art in times of war, the artist's options and powers, aesthetics and criticism.

GEP Visual and Performing Arts
Typically offered in Fall only

ARS 306/MUS 306 Music Composition with Computers (3 credit hours)
Survey of the theory and history of computer music, compositional algorithms, digital synthesis techniques, composition of at least one computer music work -- a computer-assisted composition for traditional instruments, a piece for computer music on tape, a real-time piece, or a piece that combines tape and instrument(s).

Prerequisite: Some knowledge of music or computer science (e.g. CSC 200)
GEP Visual and Performing Arts
Typically offered in Fall and Spring

ARS 346/AFS 346 Black Popular Culture (3 credit hours)
A multidisciplinary examination of contemporary black cultural expression in film, music, art, and the media. Emphasis on race, class, gender, and political discourse. This class may be scheduled with a small percentage of seats held for IDS Students Only.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

ARS 351 Arts, Ideas and Values (3 credit hours)
An examination of the way works of art embody a particular understanding of what is real and what is worthwhile and shape their viewers' ideas and values. Case studies approach.

GEP Visual and Performing Arts
Typically offered in Spring only

ARS 353 Arts and Cross-Cultural Contacts (3 credit hours)
Study of works of art that allude to or combine two or more traditions. Examples from film, dance, music, theater and visual arts. Analysis of the role of the exotic in art. The role of arts of multiple traditions in inaugurating new artistic movements, such as Ming landscape painting. Impact of electronic media on contemporary multicultural arts, such as Nepali pop.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

ARS 354 The Arts and the Sacred (3 credit hours)
The support and critique of religion through the arts. Study of religious symbolism embodied in works of art from a number of traditions and genres. The interrelationship between art and religion, history, culture, spirituality, and ritual.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

ARS 410 Art and History of World Puppetry (3 credit hours)
Development of puppet and object performance as a major art form and network of global intercultural traditions. Study of styles and forms, technologies employed, cultural influences and movements, and the influence of traditional forms on contemporary puppetry forms. Analysis of theoretical perspectives, aesthetics, creative process, and practitioner's perspectives. Making of a puppet and a short script. Course requires students to complete a field trip off-campus outside of class times.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

ARS 414 Interdisciplinary Arts Seminar (3 credit hours)
Creation and presentation of new interdisciplinary works of art. Theory and history of such works including discussion of mixed media, multimedia and intermedia. In-class presentations and critiques. Eventual presentation of finished works in appropriate venues. Additional expenses will be incurred for Arts Now Series events

Typically offered in Fall only

ARS 494 Topics in Arts Studies (3 credit hours)
Multi-arts course focusing on selected works of art in various media, related by theme, place or date. Capstone course for students with an extensive background in one of the arts. Topics may vary.

Prerequisite: Junior standing and 15 hours in either dance, design, film studies, music, theater, or visual arts.
Typically offered in Fall and Spring

ARS 498 Independent Study in Arts Studies (1-3 credit hours)
Independent study or project directed by a faculty member in the student's area of interest. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Nine hours of course work in Arts Studies
Typically offered in Fall, Spring, and Summer

Arts Village (AVS)

AVS 100 Arts Village Forum (1 credit hours)
Direct experience with multiple arts events at the university and across the Triangle area. Through pre- and post-event presentations, discussions, and written responses, students will gain a deepened awareness of a wide variety of artistic structures, meaning, interpretation, and values. Transportation to off-campus arts events will be provided. For Arts Village Students only.

Typically offered in Fall and Spring

Biochemistry (BCH)

BCH 101/MB 101 Introduction to Microbiology and Biochemistry Laboratory Practices (3 credit hours)
Curricular bridge between high school and college for high school and transitional students. A "hands on" introduction to fundamentals in Microbiology and Biochemistry. Bacterial isolation, identification and growth using aseptic technique, microscopy, and metabolic analysis. Experiments with DNA isolation and analysis, protein isolation, and purification, and enzyme kinetics. Lectures and readings on background, theory and applications of these techniques. Field trips to university and industry research laboratories. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS) as well as other pre-college, transitional and early-college programs and is offered as 4 week intensive course. Applicants should have completed high school courses in biology and chemistry. Students must have completed no more than 30 credit hours. Departmental approval is required for current NCSU students.

Typically offered in Summer only

BCH 103 Introduction to Biochemistry (1 credit hours)
Introduction to curriculum and career requirements for biochemistry and being a successful student at NCSU. Emphasis is placed on curricular requirements, interactions with faculty and students in the Department of Molecular and Structural Biochemistry, introduction to key resource programs on campus, exposure to research opportunities and ongoing career planning. Enrollment is limited to new or transfer Biochemistry majors with less than 45 hours.

Typically offered in Fall only

BCH 220 Role of Biotechnology in Society (3 credit hours)
Role of Biotechnology in Society is an introductory science course that takes a semi-technical look at the emerging role of biotechnology in human society. Expectations are that students will gain an appreciation for biotechnology and gain the ability to understand how biotechnology works. Offered only in Poland through Study Abroad Program (4-week course).

Prerequisite: BIO 181, CH 101
GEP Interdisciplinary Perspectives
Typically offered in Summer only

BCH 330 Physical Biochemistry (3 credit hours)
This course provides a descriptive survey of the concepts of physical chemistry with emphasis on their use in applications designed to characterize and manipulate biological molecules and systems. Topics are drawn from thermodynamics (bonding, protein folding energies, linkage, specostropic and differential scanning calorimetric binding measurements), kinetics (enzymatic catalysis, perturbation techniques), statistical mechanics (distributions, ensembles, molecular mechanical & dynamics calculations), electrochemistry, hydrodynamics (diffusion, friction, electrophoresis, viscosity, sedimentation, organism size and shape), quantum mechanics (wave functions operators, uncertainty principle, dipoles, orbitals and resonance energy coupling), and spectroscopy (absorbance and light scattering, fluorescence, nuclear and electronic paramagnetic resonance, MR imaging and x-ray diffraction).

P: (CH 201 or CH 203) and (BCH 351 or BCH 451) and (MA 231 or MA 242) and (PY 208 or PY 212)
Typically offered in Spring only

BCH 351 General Biochemistry (3 credit hours)
This course is an introduction to the basic principles of biochemistry. It emphasizes biochemical structures, properties, and functions, including enzyme kinetics and major metabolic processes. It can serve as a prerequisite for BCH 452 with permission of the department. This course is designed for those students who are not majoring in Biochemistry and do not require a more comprehensive introduction to biochemistry. It is not intended for graduate students. Credit is not allowed for both BCH 351 and BCH 451. Prerequisites CH 223 (or CH 227) and BIO 183 are required. CH 201 (or CH 203) is strongly recommended, but not required.

Prerequisite: CH 223 (or CH 227), BIO 183
Typically offered in Fall, Spring, and Summer

BCH 451 Principles of Biochemistry (4 credit hours)
Introduction to and survey of the fundamental principles of biochemistry, emphasizing the chemistry of living organisms, chemical structures, and interactions of and between biomolecules.

Prerequisite: CH 101 (or CH 103), CH 102 (or CH 104), CH 201 (or CH 203), CH 202 (or CH 204), CH 221 (or CH 225), CH 222 (or CH 226), CH 223 (or CH 227), CH 224 (or CH 228), and BIO 183
Typically offered in Fall, Spring, and Summer

BCH 452 Introductory Biochemistry Laboratory (2 credit hours)
Laboratory experiences in this course are designed to compliment the first semester undergraduate biochemistry course, BCH 451. Basic skills to be mastered include the use of volumetric equipment, spectrophotometers, chromatography, and electrophoresis. You will also learn to assay small quantities of biological materials and analyze lab data. You will learn to manipulate biochemical materials from three of the four major subgroups: proteins, nucleic acids and carbohydrates. You will determine structural elements at a number of analytical levels and learn how to think about their functional capabilities. We will emphasize theoretical information, while discussing how the techniques work. The explanations discuss how the techniques work. We focus on how consecutive methods are interconnected to form process chains.

P: CH 101 (or CH 103), CH 102 (or CH 104), CH 201 (or CH 203), CH 202 (or CH 204), CH 221 Organic Chemistry I (or CH 225), CH 222 (or CH 226), CH 223 (or CH 227), CH 224 (or CH 228), BIO 183 and BCH 451 (may serve as corequisite or prerequisite).
Typically offered in Fall and Spring

BCH 453/BCH 553 Biochemistry of Gene Expression (3 credit hours)
Structure and function of nucleic acids and proteins. Synthesis of DNA, RNA, and proteins. Gene expression and Regulation. Methodologies of recombinant DNA research. Credit is not allowed for both BCH 453 and BCH 553.

Prerequisite: BCH 451, Corequisite: GN 311, MB 351
Typically offered in Fall, Spring, and Summer

BCH 454 Advanced Biochemistry Laboratory (4 credit hours)
Hands on experience with the techniques of molecular biology and protein purification. Cloning and expression of a eukaryotic gene in bacteria will be performed followed by purification of the eukaryotic gene product. Microanalysis of DNA, RNA and protein.

Prerequisite: BCH 451 & BCH 452; Corequisite: BCH 453
Typically offered in Fall and Spring

BCH 455/BCH 555 Proteins and Molecular Mechanisms (3 credit hours)
Principles of protein structure and function, protein folding, enzymology, ligand binding, protein transport, and metabolic pathways.

Prerequisite: BCH 451, BCH 453/553
Typically offered in Fall and Spring

BCH 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

BCH 493 Special Problems in Biochemistry (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

BCH 495 Special Topics in Biochemistry (1-5 credit hours)
Offered as needed to present materials not normally available in regular BCH departmental courses or for new BCH courses on a trial basis.

Prerequisite: Junior standing.
Typically offered in Fall, Spring, and Summer

BCH 552 Experimental Biochemistry (3 credit hours)
An advanced laboratory to give students practical experiences in purification and quantitative characterization of enzymes and nucleic acids. Studies with carbohydrates and membrane lipids. Credit may be applied toward biotechnology minor.

Prerequisite: BCH 452;BCH 453
Typically offered in Fall and Spring

BCH 553/BCH 453 Biochemistry of Gene Expression (3 credit hours)
Structure and function of nucleic acids and proteins. Synthesis of DNA, RNA, and proteins. Gene expression and Regulation. Methodologies of recombinant DNA research. Credit is not allowed for both BCH 453 and BCH 553.

Prerequisite: BCH 451, Corequisite: GN 311, MB 351
Typically offered in Fall, Spring, and Summer

BCH 555/BCH 455 Proteins and Molecular Mechanisms (3 credit hours)
Principles of protein structure and function, protein folding, enzymology, ligand binding, protein transport, and metabolic pathways.

Prerequisite: BCH 451, BCH 453/553
Typically offered in Fall and Spring

BCH 560 Molecular Biology for Teachers (3 credit hours)
Introduction to molecular biology for teachers. Emphasis will be on developing basic laboratory skills applicable to middle or high school biology classes. Teachers will develop their own labs during the last week of class. This is an intensive three-week class, five hours per day. Students should have at least one biotechnology course before enrolling in this course. Prior secondary school teaching experience preferred.

Typically offered in Summer only

BCH 571/ANS 571 Regulation of Metabolism (3 credit hours)
Study of hormonal, enzymatic and molecular-genetic regulation of carbohydrate and lipid metabolism; emphasis on mammalian species.

Prerequisite: BCH 451, GN 311, a course in physiology, cell biology
Typically offered in Fall only

BCH 590 Special Topics in Biochemistry (1-6 credit hours)
The study of topics of special interest by small groups of students instructed by members of the faculty.

Prerequisite: BCH 451
Typically offered in Fall, Spring, and Summer

BCH 601 Macromolecular Structure (1 credit hours)
Introduction to the current understanding and methods used for the study of structures, thermodynamics and conformational dynamics of proteins, nucleic acids and membranes.

Prerequisite: BCH 453 or BCH 553; a course in physical chemistry highly recommended
Typically offered in Fall only

BCH 610 Special Topics (1-6 credit hours)
The study of topics of special interest by small groups of students instructed by members of the faculty.

Prerequisite: BCH 451
Typically offered in Fall, Spring, and Summer

BCH 615 Special Topics In Biochemistry (1-6 credit hours)
Critical study of special problems and selected topics of current interest in biochemistry and related fields.

Prerequisite: Graduate standing in BCH
Typically offered in Fall, Spring, and Summer

BCH 670 Laboratory Rotations (1 credit hours)
Performance of highly directed research by biochemistry students in one or more laboratories of student's choice prior to beginning thesis research. Each laboratory experience lasts 5 weeks and given 1 hr. of credit. No more than 4 credits earned inBCH 692.

Prerequisite: BCH 451
Typically offered in Fall and Spring

BCH 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

BCH 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirement of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring only

BCH 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BCH 695 Master's Thesis Research (1-9 credit hours)
Thesis research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BCH 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

BCH 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BCH 701 Macromolecular Structure (3 credit hours)
Introduction to the current understanding and methods used for the study of structures, thermodynamics and conformational dynamics of proteins, nucleic acids and membranes.

Prerequisite: BCH 453 or BCH 553; a course in physical chemistry highly recommended
Typically offered in Fall only

BCH 703 Macromolecular Synthesis and Regulation (3 credit hours)
Biochemistry of DNA replication, transcription, RNA processing and translation. Development of key concepts, techniques and applications relating to mechanisms and regulation of these processes by analysis of primary literature.

Prerequisite: BCH 453 or BCH 553
Typically offered in Spring only

BCH 705 Molecular Biology Of the Cell (3 credit hours)
Regulation of cellular processes, membrane structure and function, signal transduction, protein trafficking/sorting, secretion, photosynthesis and nitrogen fixation.

Prerequisite: BCH 701 or BCH 703
Typically offered in Spring only

BCH 710 Biological Scanning Electron Microscopy (2 credit hours)
On demand. Theory and application of scanning electron microscopy, including specimen preparation, microscope alignment and operation, performance evaluation, interpretation of problems and darkroom technique. (Limited to 8 students with prior approval of instructor.)

Prerequisite: Graduate standing with some biological background
Typically offered in Spring only

BCH 751 Biophysical Chemistry (3 credit hours)
Fundamental and practical aspects of biological macromolecular structure, thermodynamics, hydrodynamics, kinetics and spectroscopy with emphasis on mechanisms in functionally important structural transformations.

Prerequisite: BCH 451; one sem. of physical chemistry
Typically offered in Fall only

BCH 760 Protein Crystallography and Macromolecular Modeling (3 credit hours)
Basic principles and practice of protein crystallography and the application of molecular dynamics to evaluate structural models. The computer lab provides hands-on experience in structure determination, refinement, model building, and molecular dynamics using CHARMM.

Prerequisite: BCH 455 or BCH 555 or equivalent
Typically offered in Fall only

BCH 761/GN 761/PB 761 Advanced Molecular Biology Of the Cell (3 credit hours)
An advanced graduate class involving integrated approaches to complex biological questions at the molecular level, encompassing biochemistry, cell biology and molecular genetics. The course will focus on an important, current area of research in eukaryotic biology using the primary scientific literature, and will involve class discussions, oral presentations, and a written research proposal.

Typically offered in Spring only

BCH 763 Biochemistry Of Hormone Action (3 credit hours)
Study of well-defined models of steroid and protein hormone action via lectures, assigned readings and discussions. Students add breadth to the course and depth to their own understanding by searching the literature and writing or lecturing about a particular hormone of their own choosing.

Prerequisite: BCH 705 or GN 757
Typically offered in Spring only

BCH 768/GN 768 Nucleic Acids: Structure and Function (3 credit hours)
An advanced treatment involving integrated approaches to biological problems at the molecular level, encompassing biochemistry, cell biology and molecular genetics. Broad, multidisciplinary approaches to solving research problems in biology and thecritical study of primary scientific literature, the development of a research proposal, oral presentations and class discussions.

Prerequisite: BCH 701 and 703
Typically offered in Spring only

BCH 770 Enzyme Kinetics and Mechanisms (3 credit hours)
An advanced course in enzyme kinetics and mechanisms with particular emphasis on experimental design and interpretation. The first half of the course covers the derivation and application of single and multisubstrate kinetic equations, inhibition and pre-steady state kinetics. The second half of the course covers fundamental chemical and physical principles of enzyme catalysis and specificity.

Prerequisite: BCH 451 and BCH 455/555 or equivalent.
Typically offered in Spring only

BCH 801 Seminar In Biochemistry (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

BCH 810 Special Topics (1-6 credit hours)
The study of topics of special interest by small groups of students instructed by members of the faculty.

Prerequisite: BCH 451
Typically offered in Fall, Spring, and Summer

BCH 815 Advanced Special Topics (1-6 credit hours)
Critical study of special problems and selected topics of current interest in biochemistry and related fields.

Prerequisite: Graduate standing in BCH
Typically offered in Spring only

BCH 870 Laboratory Rotations (1 credit hours)
Performance of highly directed research by biochemistry students in one or more laboratories of student's choice prior to beginning thesis research. Each laboratory experience lasts 5 weeks and given 1 hr. of credit. No more than 4 credits earned inBCH 692.

Prerequisite: BCH 451
Typically offered in Fall and Spring

BCH 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BCH 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BCH 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BCH 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BCH 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

BCH 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Biological and Agricultural Engineering (BAE)

BAE 100 Introduction to Biological Engineering (1 credit hours)
Technical topics and career options in Biological Engineering with concentrations in Agricultural, Bioprocess, and Environmental Engineering are introduced. Information is provided about career services, internships, and study abroad and co-op opportunities in these areas. Students develop a plan of work.

Typically offered in Spring only

BAE 123 Light Equipment Technology (3 credit hours)
Principles of operation and maintenance of powered turf, garden, and landscape equipment. Small engines, power transmission systems, equipment maintenance, and operator safety.

Requisite: Agricultural Institute Only
Typically offered in Spring only

BAE 133 Agricultural Tractors and Machinery (4 credit hours)
Principles of tractor engines, power trains, and hydraulics. Tractor operation, service and testing. Machinery management involving tractor and implement selection based on power and field requirements and on economics of ownership and operation. Implements for crop production to include tillage, planting, chemicals and harvesting. Set-up, operation and maintenance of implements. Calibration of planting and chemical equipment. Tractor and machinery safety. VEAL

Requisite: Agricultural Institute Only
Typically offered in Spring only

BAE 200 Computer Methods in Biological Engineering (2 credit hours)
Students develop computer-based problem solving techniques to solve introductory problems in Biological Engineering. Emphasis is on developing solution algorithms and implementing these with spreadsheets and computer programming.

Prerequisite: Grade of C or better in MA 141 and Corequisite: E 115
Typically offered in Fall and Summer

BAE 202 Introduction to Biological and Agricultural Engineering Methods (4 credit hours)
Introduction to experimental design methodology, basic engineering design and problem solving methodology for Biological Engineering. Visualization skills, computer-aided 3-D solid modeling of parts, 3-D assembly of solid part geometries, computation of mass properties, 2-D engineering drawings, engineering design process, safety, tools and fabrication processes and design, and hands-on shop fabrication of semester project.

Prerequisite: E 115
Typically offered in Spring only

BAE 203 Introduction to AutoCAD Civil 3D for Environmental & Ecological Engineers (2 credit hours)
Introduction to the use of AutoCAD Civil 3D for Environmental & Ecological Engineering applications. Basic drawing, managing survey data, surfaces, alignments, profiles, corridors, grading, pipe networks, plan production, GIS interface, GIS data types and sources, importing data, creation and export of objects in GIS formats. BE majors will be given priority in enrollment.

Prerequisite: BAE 200
Typically offered in Spring only

BAE 204 Introduction to Environmental and Ecological Engineering (2 credit hours)
Introduction to the principles and applications related to environmental and ecological engineering. Topics include watershed hydrology, nutrient cycling, sources of environmental pollution, and the impact to ecosystems. An overview of different methods employed in these two disciplines to remediate and protect natural resources. Special emphasis on how soil, water, microbial, and plant interactions occur in ecosystems and how they are used to develop treatment technologies.

Prerequisite: BAE 200 and (BIO 181 or BIO 183); Corequisite: BAE 203 and SSC 200
Typically offered in Spring only

BAE 302 Transport Phenomena (3 credit hours)
Theory and application of heat and mass transfer in biological, food, and agricultural systems. Topics include fluid flow, conduction, convection, radiation, psychrometrics, and refrigeration.

Prerequisite: MAE 201 and MA 341 and Corequisite: BAE 200 and MAE 208 and CE 282 or MAE 308
Typically offered in Fall only

BAE 305 Biological Engineering Circuits (4 credit hours)
Fundamentals of analog and digital circuit analysis and design as applied to biological engineering instrumentation systems. Analysis and design of AC and DC circuits using Ohms and Kirchhoff's laws, the node voltage method, ThÃ©venin and Norton's theorem, Laplace Transforms, resistance, capacitance, inductance, operational amplifiers, and frequency response, analog filter design, diode, transistors, biological signal acquisition, binary math and logical operators, digital circuit design, circuit simulation tools and techniques. Laboratory exercises supplement the topics presented in class lectures.

Prerequisite: MA 242, PY 208
Typically offered in Fall only

BAE 321 Bioprocessing Engineering Fundamentals (3 credit hours)
For Engineering and non-Engineering students interested in processing, biotechnology and related disciplines, it is important to have an understanding of the basic principles behind process analysis, design and scale up. This course will provide an introduction to the interdisciplinary approach and engineering concepts behind the development of useful food, chemical, energy, nutraceutical and pharmaceutical products through transformation of biological materials (bioprocessing). Some of the relevant topics covered include the fundamentals behind units, dimensions and engineering properties, stoichiometry, data analysis and statistics, mass and energy balances, rheology, mixing, heat and mass transfer, reaction kinetics and unit operations.

Prerequisite: BIO 181 or BIO 183; Corequisite: MAE 201
Typically offered in Fall only

BAE 322 Introduction to Food Process Engineering (3 credit hours)
Introductory principles and practices of handling and preserving food products. Coverage includes the design and analysis of handling systems for discrete and continuous flow material handling systems, the selection and specification of automatic controls, food preservation principles and considerations relevant to the design of food handling systems, and the principles and practices of drying and storing grain.

Prerequisite: BAE 302; MAE 308 or CE 282; MAE 301 or CHE 315
Typically offered in Spring only

BAE 325 Introductory Geomatics (3 credit hours)
Theory and practice of plane and satellite-based surveying. Includes distance measurement, differential leveling, profile leveling, topographic surveying, and record keeping. Introduction to tapes, levels, total stations, surveying software, the global positioning system, GPS receivers and methods (stand-alone, DGPS, RTK), data collection, data processing, and applications.

Prerequisite: Junior standing
Typically offered in Fall only

BAE 361 Analytical Methods in Engineering Design (3 credit hours)
Engineering problem solving through studies of topics in engineering design. Analysis of linkages, analysis and design of machine structures and components, analysis and design of power transmission components, three-dimensional modeling, and finite element analysis.

Prerequisite: BAE 202 and MAE 208 and MA 341 and Corequisite: CE 225 or MAE 214
Typically offered in Spring only

BAE 371 Fundamentals of Hydrology for Engineers (3 credit hours)
Hydrology and erosion principles. Designing structures and selecting practices to control land runoff, erosion, sediment pollution and flooding.

Prerequisite: BAE 200 and BAE 203; Corequisite: SSC 200 and CE 282 or MAE 308
Typically offered in Fall only

BAE 376 Watershed Assessment and Water Quality Protection (3 credit hours)
Application of methods to describe and protect quality. Identification of water quality problems based on physical, chemical, and biological species and intended use. Water quality sampling equipment, and sample collection strategies and methods. Macroinvertebrate sampling and interpretation. Presentation of water quality data and information. Identification of structural and non-structural best management practices (BMPs) to mitigate degradation of watersheds and ecological systems.

Prerequisite: BAE 371 Corequisite: ST 370
Typically offered in Spring only

BAE 401/BAE 501 Sensors and Controls (3 credit hours)
Basic concepts of sensors and controls for biological systems. Study of transducers and circuits utilized in biological and agricultural engineering applications. Demonstration of concepts of error, accuracy and precision, linearity and other instrument characteristics by electronic models. Provision of hands-on experience for reinforcing lecture concepts in laboratories. Credit will not be given for both BAE 401 and BAE 501.

Prerequisite: BAE 305
Typically offered in Spring only

BAE 425/BAE 525 Industrial Microbiology and Bioprocessing (3 credit hours)
Introduction to the structure and functions of microbial cells and their cultivation and utilization in Biological engineering processes. Topics covered include Fermentation systems and downstream processing methods. Enzyme kinetics, production and application. Biomanufacturing of fuels, industrial chemicals, food additives and food products such as beer, wine, cheese and yogurt, Microbial biomass production, Introduction to environmental biotechnology including wastewater treatment and bioremediation. Field trip is an essential educational component of the course and is are required. Credit will not be given for both BAE 425 and BAE 525.

Prerequisite: Junior or higher standing in CALS or COE; MB 351
Typically offered in Spring only

BAE 435/BAE 535 Precision Agriculture Technology (3 credit hours)
Overview of technology available for implementation of a comprehensive precision agriculture program. Topics include computers, GPS, sensors, mechanized soil sampling, variable rate control system, yield monitors, and postharvest processing controls. Applications of precision agriculture in crop planning, tillage, planting, chemical applications, harvesting and postharvest processing. Credit may not be received for BAE 435 and BAE 535.

Prerequisite: Junior standing or Senior standing
Typically offered in Spring only

BAE 451 Engineering Design I (2 credit hours)
Design concepts of engineering problems are reviewed, including objectives, specifications, manufacturing, prior art and analysis. Reverse engineering, national and international standards, quality control, intellectual law and engineering ethics are covered. Team projects from agricultural, bio-processing and environmental/ecological engineering are executed through problem definition. proposal development, design, and testing. Field trips are required.

Prerequisite: (CE 225 or MAE 214) and (BAE 202 or BAE 203) and BAE 302 and BAE 401 and either (BAE 321 or BAE 322 or BAE 361 or BAE 371) Restrictive Statement: Must be within 36 credit hours of completing the BE degree.
Typically offered in Fall only

BAE 452 Engineering Design II (2 credit hours)
Continuation of BAE 451; Project analysis, design, scheduling, construction, tests, presentations and reports. Teamwork development, soft skills and the function of engineering design in society are covered. Field trips are required.

Prerequisite: BAE 451; Restrictive Statement: Must be within 36 hours of completing the BE degree.
Typically offered in Spring only

BAE 455/BAE 555 R Coding for Data Management and Analysis (3 credit hours)
This course provides students with foundational coding skills in R, an open-source statistical software environment, as well as instruction on best practices for tidying, managing, and analyzing environmental and agricultural data, including geospatial, tabular, and time series observations. As this is an introductory course, prior programming experience is not required or expected. Coding approaches taught in the course will be targeted towards developing skills needed for summarizing data, creating data visualizations, and applying simple statistical models for analysis of environmental and agricultural data.

P: ST 311, or ST 370, or ST 512, or ST 515
Typically offered in Fall only

BAE 462 Machinery Design and Applications (3 credit hours)
Machinery design for effective use of energy and labor in agricultural production. Engine cycles, power transmission, hydraulics, traction, combined stresses, finite element analysis, computer-aided-engineering, and engineering economics. Machinerydesign of agricultural field equipment and other agricultural machinery systems.

Prerequisite: BAE 361
Typically offered in Fall only

BAE 472/BAE 572 Irrigation and Drainage (3 credit hours)
Design, management and evaluation of irrigation and drainage systems; concepts and processes of system design. Credit will not be given for both BAE 472 and BAE 572.

Prerequisite: BAE 371
Typically offered in Spring only

BAE 473/BAE 573/SSC 573/SSC 473 Introduction to Hydrologic and Water Quality Modeling (3 credit hours)
Concepts in basic hydrologic, erosion and chemical transport used in modeling. Evaluation of typical hydrologic and water quality models on watershed systems. Project examples using state-of-the-art models. Credit will not be given for both BAE 473 and BAE 573.

Prerequisite: BAE 371
Typically offered in Fall only

BAE 474 Principles and Applications of Ecological Engineering (3 credit hours)
Governing principles of ecological engineering and the advanced biological, chemical, and physical conditions that determine the design of biological systems. Emphasis on 1) stream and wetland ecosystem restoration and 2) natural treatment systems for groundwater, stormwater, and wastewater such as riparian buffers, bioretention cells, and stormwater wetlands. A class field trip is required during non-scheduled time.

Prerequisite: BAE 203 and BAE 204 and BAE 371 and at least one of the following, MB 351 or PB 321 or PB 360 or SSC 332; Corequisite: BAE 451
Typically offered in Spring only

BAE 478/BAE 578 Agricultural Waste Management (3 credit hours)
This course covers principles of managing, handling, treating and applying animal and poultry manures and organic byproducts from an engineering perspective. Topics include waste characterization, descriptions of systems and technology, land application principles, preparation of waste management plans, biochemical/biological processes, and potential impacts to the environment. Assignments include homework, quizzes, projects, and discussion that emphasize problem solving and analysis.

Prerequisite: AEC/PB 360 or PB 321 or SSC 332 or MB 351
Typically offered in Fall only

BAE 481 Structures & Environment (3 credit hours)
Principles of environmental control and structural analysis are combined with biological principles for the design of structures. Topics include structural analysis, load estimation, material selection, fasteners, physiological reactions of animalsand plants to their environment, applications of heat transfer and psychrometrics in calculating ventilation requirements, heating or cooling loads.

Prerequisite: BAE 302; CE 225 or MAE 314
Typically offered in Spring only

BAE 486/BAE 586 Aquacultural Engineering (3 credit hours)
This course starts with a general background of aquaculture, both theoretical and practical. Based on this, engineering applications for both extensive (e.g. pond based) and intensive (e.g. recirculating aquaculture systems) culture systems are studied. Unit operations including biofiltration, aeration, degassing, sedimentation, pumps, piping and related topics, as well as mass balances provide quantitative engineering design tools. Transport, harvest, processing and food safety are discussed, and sustainability (ecological and environmental aspects of aquacultural engineering design) as well as cutting edge research in the area are covered. Field trips; guest lectures/discussion, and hands on work is included to provide practical applications and experience.

Prerequisite: CE 282 or MAE 308; Restrictive Statement: Senior Standing
Typically offered in Spring only

BAE 488 Postharvest Engineering (3 credit hours)
An introduction to the engineering aspects of the proper postharvest handling of fresh produce. Topics addressed include cleaning, grading, sorting, cooling, storing, packaging, transport, and marketing. Issues relating to food safety will be integrated throughout all the course content. A class field trip is required during non-scheduled time.

Prerequisite: BAE 302 or MAE 310
Typically offered in Spring only

BAE 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

BAE 493 Special Problems in Biological and Agricultural Engineering (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

BAE 495 Special Topics in Biological and Agricultural Engineering (1-3 credit hours)
Offered as needed for presenting material not normally available in regular BAE departmental courses or for new BAE courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BAE 501/BAE 401 Sensors and Controls (3 credit hours)
Basic concepts of sensors and controls for biological systems. Study of transducers and circuits utilized in biological and agricultural engineering applications. Demonstration of concepts of error, accuracy and precision, linearity and other instrument characteristics by electronic models. Provision of hands-on experience for reinforcing lecture concepts in laboratories. Credit will not be given for both BAE 401 and BAE 501.

Prerequisite: BAE 305
Typically offered in Spring only

BAE 502 Instrumentation for Hydrologic Applications (3 credit hours)
Basic theory of instruments and measurements. Physical parameters of interest, available methods and sensors for assessment. Sensor characteristics. Dataloggers and sensor-datalogger communications. Data transfer, management, and processing. Emphasis on hydrologic and water quality research applications. Course offered by Distance Education only.

Prerequisite: MA 341, BAE 401 or ECE 331, ST 370 or ST 511
Typically offered in Spring only

BAE 525/BAE 425 Industrial Microbiology and Bioprocessing (3 credit hours)
Introduction to the structure and functions of microbial cells and their cultivation and utilization in Biological engineering processes. Topics covered include Fermentation systems and downstream processing methods. Enzyme kinetics, production and application. Biomanufacturing of fuels, industrial chemicals, food additives and food products such as beer, wine, cheese and yogurt, Microbial biomass production, Introduction to environmental biotechnology including wastewater treatment and bioremediation. Field trip is an essential educational component of the course and is are required. Credit will not be given for both BAE 425 and BAE 525.

Prerequisite: Junior or higher standing in CALS or COE; MB 351
Typically offered in Spring only

BAE 528 Biomass to Renewable Energy Processes (3 credit hours)
This course will introduce fundamental principles and practical applications of biomass-to-renewable energy processes, including anaerobic digestion of organic wastes for biogas and hydrogen production, bioethanol production from starch and lignocellulosic materials, biodiesel production from plant oils, and thermoconversion of biomass and waste materials. Restricted to engineering seniors and graduate standing in COE, CALS, PAMS or CNR.

Prerequisite: Introductory Organic Chemistry or Biochemistry
Typically offered in Fall only

BAE 535/BAE 435 Precision Agriculture Technology (3 credit hours)
Overview of technology available for implementation of a comprehensive precision agriculture program. Topics include computers, GPS, sensors, mechanized soil sampling, variable rate control system, yield monitors, and postharvest processing controls. Applications of precision agriculture in crop planning, tillage, planting, chemical applications, harvesting and postharvest processing. Credit may not be received for BAE 435 and BAE 535.

Prerequisite: Junior standing or Senior standing
Typically offered in Spring only

BAE 536 GIS Applications in Precision Agriculture (1 credit hours)
Exploration of geographic information systems (GIS) and its applications in precision agriculture. Topics will include file structure and formatting, interfacing with precision agriculture equipment, georeferencing maps, merging and clipping farm data, data field calculations, designing management zones, variable rate prescriptions, and basic data analysis.

Prerequisiste: GIS 410 or GIS 510 or BAE 435 or BAE 535
Typically offered in Spring only

BAE 555/BAE 455 R Coding for Data Management and Analysis (3 credit hours)
This course provides students with foundational coding skills in R, an open-source statistical software environment, as well as instruction on best practices for tidying, managing, and analyzing environmental and agricultural data, including geospatial, tabular, and time series observations. As this is an introductory course, prior programming experience is not required or expected. Coding approaches taught in the course will be targeted towards developing skills needed for summarizing data, creating data visualizations, and applying simple statistical models for analysis of environmental and agricultural data.

P: ST 311, or ST 370, or ST 512, or ST 515
Typically offered in Fall only

BAE 560 Aerosol Science and Engineering (3 credit hours)
This course is designed for students who have a desire to work in the area of air quality. It will provide students with fundamental knowledge of aerosol properties, behavior and physical principles, and with hands-on experience in applying this knowledge to aerosol/PM measurements and control.

Prerequisite: MA 341
Typically offered in Fall only

BAE 561 Agricultural Air Quality (3 credit hours)
This course will prepare students to identify agricultural air pollutants and their sources, understand the on-farm and off-farm impacts of these pollutants, measure these pollutants, characterize and model the fate of these pollutants, and select and/or design cost-effective remediation measures. This course is restricted to seniors in engineering and MEAS, and graduate students in CALS, PAMS, and CNR.

Prerequisite: MA 341
Typically offered in Spring only

BAE 565 Environmental and Agricultural Analytics and Modeling (3 credit hours)
This course provides students with a fundamental and practical understanding of data science and modeling approaches for environmental and agricultural systems analysis. The course is organized into three modules: (1) data retrieval, management, documentation, and visualization; (2) process-based modeling; and (3) data mining through statistical analysis and machine learning. Rather than develop a strong knowledge base in a specific methodology, students will gain broad and introductory understanding of a range of contemporary quantitative approaches and learn to think critically about the use of data analytics and models.

Prerequisite: Introductory statistics (e.g. ST 515) and experience coding in R (e.g. BAE 555)
Typically offered in Spring only

BAE 572/BAE 472 Irrigation and Drainage (3 credit hours)
Design, management and evaluation of irrigation and drainage systems; concepts and processes of system design. Credit will not be given for both BAE 472 and BAE 572.

Prerequisite: BAE 371
Typically offered in Spring only

BAE 573/SSC 573/SSC 473/BAE 473 Introduction to Hydrologic and Water Quality Modeling (3 credit hours)
Concepts in basic hydrologic, erosion and chemical transport used in modeling. Evaluation of typical hydrologic and water quality models on watershed systems. Project examples using state-of-the-art models. Credit will not be given for both BAE 473 and BAE 573.

Prerequisite: BAE 371
Typically offered in Fall only

BAE 574 DRAINMOD: Theory and Application (3 credit hours)
This course presents the theory of water movement and storage in poorly drained soils and applies the drainage/water management model DRAINMOD to a wide range of problems. Technical issues related to evaluation, design and management of drained soils and to wetland hydrology are analyzed. A series of problem sets provides experience in using the model, and demonstrates how the model may be applied to describe the complex interactions of multiple processses affecting hydrology of shallow water table soils.

Prerequisite: One of the following: BAE 471, BAE 472, BAE 573, BAE 771, or SSC 511
Typically offered in Spring only

BAE 575 Design of Structural Stormwater Best Management Practices (3 credit hours)
The design of structural stormwater Best Management Practices (BMPs) used in the urban and suburban environments is reviewed, including stormwater wetlands, bio-retention areas, sand filters, innovative wet ponds, green roofs, permeable pavement, and reinforced grass swales. The course is application oriented and includes a pair of field trips.

Prerequisite: BAE 471 or CE 383
Typically offered in Spring only

BAE 576 Watershed Monitoring and Assessment (3 credit hours)
Water measurement and structure sizing. Identification of water quality problems and water quality variable selection. Monitoring design, water quality sampling equipment, and sample collection and analysis. Statistical analysis and presentation of water quality data.

Prerequisite: [AES323 (SSC323/BAE323) or BAE471 or FOR429 (NR420) or CE586, and ST311 or ST361 or ST511
Typically offered in Fall only

BAE 577 Wetlands Design and Restoration (3 credit hours)
Fundamental understanding of hydrology, soils and ecology of natural wetland systems will be developed to serve as the basis for designing wetland systems for water treatment and restoring degraded natural wetland systems. Stormwater and wastewater treatment wetland design and implementation concepts will be emphasized. Wetland restoration will also be studied with emphasis on current wetland regulations, design, and implementation techniques. Engineered wetland concepts will be supplemented with relevant case studies. Basic understanding of biology, soils , hydrology, and soil and water engineering is required.

Typically offered in Spring only

BAE 578/BAE 478 Agricultural Waste Management (3 credit hours)
This course covers principles of managing, handling, treating and applying animal and poultry manures and organic byproducts from an engineering perspective. Topics include waste characterization, descriptions of systems and technology, land application principles, preparation of waste management plans, biochemical/biological processes, and potential impacts to the environment. Assignments include homework, quizzes, projects, and discussion that emphasize problem solving and analysis.

Prerequisite: AEC/PB 360 or PB 321 or SSC 332 or MB 351
Typically offered in Fall only

BAE 580 Introduction to Land and Water Engineering (3 credit hours)
This distance course introduces students to concepts of the hydrologic cycle, water quality, precipitation, evapotranspiration, infiltration, watershed delineation, surface runoff and open channel flow. Students will apply these concepts to an engineering design problem. This course is designed for non-engineering distance graduate students and lifelong education students and students from engineering disciplines outside of BAE. It will not substitute for BAE 471. The course is only open to students with senior standing or higher.

Prerequisite: MA 241
Typically offered in Fall only

BAE 581 Open Channel Hydraulics for Natural Systems (3 credit hours)
Theory and applications of hydraulics to open channels with an emphasis on natural streams and rivers. Course will introduce and develop principles of flow regimes (subcritical/critical/supercritical), and types (uniform flow, gradually varied and rapidly varied flow). Application will include hydraulics of flow measuring devices, step-backwater analysis and rating curve development, and flood studies using hydraulic models. A lab-scale flume will be used to illustrate concepts. Laptops will be used in class to learn and apply HEC-RAS (water surface profiles model). CE 382 or equivalent required. CE 381 recommended.

Prerequisite: CE 282 or equivalent. CE 381 recommended.
Typically offered in Fall only

BAE 582 Risk and Failure Assessment of Stream Restoration Structures (1 credit hours)
This course defines uncertainty and risk pertaining to stream restoration structures and identifies and quantifies sources of such. Students will review various in-stream structures and, using an example study of the rock cross vane as a guide, will investigate a structure of their choice applying the concepts of risk and uncertainty. Modules include: Introduction to structures and definitions; Types and modes of failure; Uncertainty in Stream Restoration Design; Probability of failures, cost of failures; and Failure modes and effects.

Prerequisite: CE 382 or MAE 308 or equivalent
Typically offered in Spring only

BAE 583 Stream Corridor 3 Es: Ecohydraulics, Engineering and Ethics (3 credit hours)
Overview of stream ecological and functional processes that structure stream corridors. Explore human interactions with streams including stream restoration structures and watershed scale practices that impact hydraulic, hydrologic, chemical, sedimentary and biotic functions. Discuss failure and risk analysis, policy and rights, and ethical use of our freshwater resources. As we move from a microscopic study of stream benthos to global-scale water concerns, students will develop a fluency in communicating human impacts on streams. Independent visits by students to a local stream required.

Restriction: Graduate or Senior Standing
Typically offered in Spring only

BAE 584 Introduction to Fluvial Geomorphology (3 credit hours)
This distance course provides an introduction to applied fluvial geomorphology as it relates to natural physical stream processes. Students will learn about watershed hydrology, stream gage data analysis, bankfull stage identification, hydraulic geometry relationships, stream channel assessment and classification, stream stability and channel evolution.

Prerequisite: BAE 471 or BAE 580
Typically offered in Fall only

BAE 586/BAE 486 Aquacultural Engineering (3 credit hours)
This course starts with a general background of aquaculture, both theoretical and practical. Based on this, engineering applications for both extensive (e.g. pond based) and intensive (e.g. recirculating aquaculture systems) culture systems are studied. Unit operations including biofiltration, aeration, degassing, sedimentation, pumps, piping and related topics, as well as mass balances provide quantitative engineering design tools. Transport, harvest, processing and food safety are discussed, and sustainability (ecological and environmental aspects of aquacultural engineering design) as well as cutting edge research in the area are covered. Field trips; guest lectures/discussion, and hands on work is included to provide practical applications and experience.

Prerequisite: CE 282 or MAE 308; Restrictive Statement: Senior Standing
Typically offered in Spring only

BAE 587 Biogeochemical processes for Ecological engineering and Environmental Sciences (3 credit hours)
The course provides the advanced theoretical knowledge of biogeochemical processes at play in man-made and natural filter systems, such as wetlands and other buffer systems, alleviating common pollutants associated with non-point source pollution, both in rural and suburban watersheds. Particular emphasis is put on the fate of excess nitrogen in these systems. This emphasis serves as a model for describing ecological engineering principles and quantifying processes at play for all pollutants. 20 students max. This course puts together biological, chemical, biochemical, and hydrological knowledge in one ensemble. Minimum proficiency in each of these is necessary to be able to follow the class with ease.

Typically offered in Fall only

BAE 590 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in biological and agricultural engineering.

Prerequisite: Senior standing or Graduate standing in Biological and Agricultural Engineering

BAE 591 Master's Research Methods I (1 credit hours)
This is the first in a series of research methods courses for MS students majoring in Biological and Agricultural Engineering. Students will develop research questions to be answered by their thesis project and produce a literature review focusing on those questions. Students will also observe formal seminar presentations, providing critiques and participating in discussions of proper seminar delivery. This course is restricted to MS students majoring in BAE.

Typically offered in Fall only

BAE 592 Master's Research Methods II (1 credit hours)
This is the second in a series of research methods courses for MS students majoring in Biological and Agricultural Engineering. Students will develop a research proposal for their thesis work and will present the proposal in a final seminar. This course is restricted to MS students majoring in BAE.

Prerequisite: BAE 591
Typically offered in Spring only

BAE 593 Introduction to Research Communications (1 credit hours)
This course introduces graduate students to the process of reading, analyzing, and communicating, in writing and multiple presentation formats, the findings of scientific literature searches. Students will progress from superficial reading to critical analysis of literature and will present their analyses in written, poster, presentation, and video formats. Related issues in research and professional communication will be discussed.

Prerequisite: Graduate Students in BAE Only
Typically offered in Fall only

BAE 610 Special Topics (1-6 credit hours)
A study of topics in the special fields of interest of graduate students under the direction of the graduate faculty.

Prerequisite: Graduate standing
Typically offered in Fall only

BAE 620 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in biological and agricultural engineering.

Prerequisite: Senior standing or Graduate standing in Biological and Agricultural Engineering
Typically offered in Fall and Spring

BAE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall only

BAE 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BAE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall only

BAE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BAE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

BAE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall and Spring

BAE 771/SSC 771 Theory Of Drainage--Saturated Flow (3 credit hours)
Discussion of physical concepts and properties of fluids and porous media in relation to soil-water movement. Derivation and discussion of the fundamental laws and equations governing saturated flow in porous media. Analysis of mathematical solutions of steady-state and transient flow equations to determine their applicability to drainage problems. Consideration of analogs and models of particular drainage problems.

Prerequisite: MA 301
Typically offered in Fall only

BAE 785/FS 785 Food Rheology (3 credit hours)
Principles and methods for measuring rheological properties. Theories of elastic, viscous, viscoelastic and viscoplastic behavior and relationships to food texture and commodity damage during harvest, handling and processing. Influence of time, composition and processing.

Prerequisite: FS 231 or MAE 314
Typically offered in Fall only

BAE 790 Special Topics (1-6 credit hours)
Special topics in BAE.

BAE 791 Doctoral Research Methods I (1 credit hours)
This is the first in a series of research methods courses for PhD students majoring in Biological and Agricultural Engineering. Students will develop PhD level research questions to be answered in their dissertation project and will produce a PhD level literature review on those questions. Students will also observe seminars, providing critiques and discussions of proper seminar delivery. This course is restricted to PhD students majoring in BAE

Typically offered in Fall only

BAE 792 Doctoral Research Methods II (1 credit hours)
This is the second in a series of research methods for PhD students majoring in Biological and Agricultural Engineering. Students will develop a research proposal appropriate for their dissertation project and will present the proposal in both a practice and final seminar. The course is restricted to PhD students majoring in BAE.

Prerequisite: BAE 791
Typically offered in Spring only

BAE 801 Seminar (1 credit hours)
Elaboration of subject areas, techniques and methods peculiar to professional interest through presentations of personal and published works; opportunity for students to present and critically defend ideas, concepts and inferences. Discussions to point up analytical solutions and analogies between problems in biological and agricultural engineering and other technologies, and to present relationship of biological and agricultural engineering to socio-economic enterprise.

Prerequisite: Graduate standing in BAE
Typically offered in Fall and Spring

BAE 810 Special Topics (1-6 credit hours)
A study of topics in the special fields of interest of graduate students under the direction of the graduate faculty.

Typically offered in Fall only

BAE 820 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in biological and agricultural engineering.

Prerequisite: Senior standing or Graduate standing in Biological and Agricultural Engineering
Typically offered in Fall and Spring

BAE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BAE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BAE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BAE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BAE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

BAE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertation.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Biological Sciences (BIO)

BIO 105 Biology in the Modern World (3 credit hours)
Concepts in biology taught from the perspective of civically engaging issues or problems. Themes and topics of wide interest, such as climate change, stem cells and cloning, antibiotic resistance, evolution, and human health. Lecture and the corresponding laboratory are designed to deepen an appreciation for the connections between science and "real-world" issues. For non-science majors. Students cannot receive credit for both BIO 105 and (BIO 181 or BIO 183).

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

BIO 106 Biology in the Modern World Laboratory (1 credit hours)
Laboratory experience in biological principles to complement BIO 105. For non-science students. Students may not receive credit for both BIO 106 and (BIO 181 or BIO 183).

Corequisite: BIO 105; May not receive credit for both BIO 106 and (BIO 181 or BIO 183)
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

BIO 140 Survey of Animal Diversity (3 credit hours)
Classification and phylogeny of animals; patterns of diversification in body design and relationship between body design and the environment; study of selected animal assemblages. Students may not receive credit for both BIO 140 and (BIO 350 or BIO 402 or BIO 403). Students may not receive credit for both BIO 140 and BIO 350 or BIO 402 or BIO 403 or ZO 150.

GEP Natural Sciences
Typically offered in Fall only

BIO 141 Animal Diversity Laboratory (1 credit hours)
Observation of living animals, dissections of preserved specimens, and microscopy; emphasis on classification of animals, patterns of diversification in body design, and relationship between body design and the environment. Students may not receive credit for both BIO 141 and BIO 350 or BIO 402 or BIO 403 or ZO 150.

Prerequisite: BIO 140
GEP Natural Sciences
Typically offered in Fall only

BIO 165 Introduction to Environmental Research (5 credit hours)
Introduction to environmental research is a hands-on learning experience for incoming freshmen interested in pursuing scientific research. The course introduces students to scientific methods and research through active participation in research on an environmental problem involving chemicals of environmental concern. Students will explore a topic in this field through guided readings, field samplings, and lab experimentation. Restricted to incoming freshmen who have been accepted into the HHMI RISE program. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

GEP Interdisciplinary Perspectives
Typically offered in Summer only

BIO 181 Introductory Biology: Ecology, Evolution, and Biodiversity (4 credit hours)
Introduction to ecology, evolution, and biodiversity within the context of structure and function including the adaptive strategies that organisms use to manage the everyday challenges of life. Emphasis on interactions of organisms with their environments, evolutionary change and role of natural selection in the evolution of life forms. Builds a foundation for understanding how science works, how to think critically and communicate scientifically.

X: Cannot receive credit for both BIO 181 and BIO 105 or BIO 106.
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

BIO 183 Introductory Biology: Cellular and Molecular Biology (4 credit hours)
Basic concepts and principles of molecular, cellular, and developmental biology. Emphasis is placed on the physical basis of life, on the molecular mechanisms that guide evolution, on the cell as the fundamental unit of life, and on the mechanisms involved in the development of multicellular organisms. The course promotes the development of crucial scientific skills including critical thinking, problem solving, design of experiments, and effective oral and written scientific communication. Students cannot receive credit for both BIO 183 and (BIO 105 or BIO 106).

Prerequisite: BIO 181 or CH 101
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

BIO 227 Understanding Structural Diversity through Biological Illustration (3 credit hours)
Biological concepts of diversity and anatomy taught through direct observation and illustrative techniques. Lecture topics include plant ID and structure, microscopic life forms, animal anatomy and identification. Laboratory work emphasizes close observation of structures and comparative anatomy as well as illustrative techniques to produce accurate drawings of specimens. Students will be required to provide their own transportation for one field trip.

GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Spring only

BIO 230 The Science of Studying Dinosaurs (3 credit hours)
This course introduces students to the scientific method as applied to the study of dinosaurs and the world in which they lived. Because we cannot directly observe dinosaurs, estimating biological features such as running speed, growth rates, and reproductive and other physiological strategies presents challenges. We will examine a range of biological concepts (including cellular biology and physiology, functional morphology and biomechanics, evolutionary relationships, and paleoecology), as well as geological concepts (such as sedimentology, radiometric dating, plate tectonics, and the geologic time scale) as they apply to dinosaurs as living organisms. An understanding of biology at the introductory college level will be assumed.

Prerequisite: C- or better in BIO 181 or BIO 183 or BIO 105
GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall only

BIO 240 Principles of Human Anatomy & Physiology (A): Nervous, Skeletal, Muscular, & Digestive Systems (4 credit hours)
BIO 240 provides an introduction to the anatomy and physiology of the nervous, skeletal, muscular, and digestive systems. Fundamental principles addressed throughout the course include (1) maintenance and regulation of homeostasis, (2) communication and control processes throughout the body, (3) integration and interdependence across organ systems, (4) structure-function relationships, and (5) anatomical and physiological adaptation. Together, BIO 240 and BIO 245 provide a strong foundation in human anatomy and physiology (through both lecture and lab) for students preparing for a variety of health-related professions.

Prerequisite: C- or better in BIO 183; Cannot receive credit for both this course and BIO 212 or BIO 421
Typically offered in Fall, Spring, and Summer

BIO 245 Principles of Human Anatomy & Physiology (B): Endocrine, Cardiovascular, Respiratory & Renal Systems (4 credit hours)
BIO 245 provides an introduction to the anatomy and physiology of the endocrine, cardiovascular, respiratory, and renal systems. Fundamental principles addressed throughout the course include (1) maintenance and regulation of homeostasis, (2) communication and control processes throughout the body, (3) integration and interdependence across organ systems, (4) structure-function relationships, and (5) anatomical and physiological adaptation. Together, BIO 240 and BIO 245 provide a strong foundation in human anatomy and physiology (through both lecture and lab) for students preparing for a variety of health-related professions.

Prerequisite: C- or better in BIO 183; Cannot receive credit for both this course and BIO 212 or BIO 421
Typically offered in Fall, Spring, and Summer

BIO 267 Research in the Life Sciences I: Research Skills (3 credit hours)
This course is designed to help first year students learn basic skills associated with scientific research. Class structure is interactive and relies on group collaboration for most projects. Students will become confident in reading and analyzing scientific literature, communicating scientific principles, compiling a poster presentation, presenting at scientific conferences, and attending local scientific symposia as well as practicing some basic laboratory techniques. The 2-semester Research PackTrack Program (BIO 267 and 269) is designed to prepare undergraduates for an original research experience in a scientific laboratory. A B- or better in BIO 267 is required to take BIO 269. Students in BIO 267 are required to attending one research symposium outside of regular class time. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: C- or better in BIO 181 and Corequisite: BIO 183
Typically offered in Fall and Spring

BIO 269 Research in the Life Sciences II: Guided Research (3 credit hours)
This course is designed to provide students with a laboratory framework for conducting original research and (together with BIO 267) preparation to move on to conducting research in a scientific laboratory. Students will generate their own research goals, write research proposals, conduct original mentored independent research, and present their findings at poster symposia both at NC State and at local conferences.

Prerequisite: C- or better in BIO 183 and B- or better in BIO 267
Typically offered in Fall and Spring

BIO 270 Introduction to Evolution (3 credit hours)
Evolution is the "grand unifying theory" that underlies all of modern biology. In this team-taught, lecture and discussion-based introductory course, students will learn about: the history of the concept of evolution and how it is discussed in modern society; sources of variation and forces of evolution; microevolution, speciation, and the nature of species; common descent, phylogeny, and the tree (and web) of life; macroevolution and modeling evolutionary trends; and the role of the fossil record, including that of our own lineage, in understanding evolution in deep time. Students will learn core foundational knowledge and how to discuss and contextualize evolutionary concepts.

Prerequisite: C- or better in BIO 181 or in (BIO 105 and 106)
Typically offered in Fall and Spring

BIO 310 Quantitative Approaches to Biological Problems (3 credit hours)
This course serves as an introduction to the use of mathematical, statistical and computational models and tools for understanding biology at the molecular, population, ecological and evolutionary scales. We will use discrete and continuous mathematics to model disease spread, ecological competition and biochemical systems. We explore the effect of random events in biochemistry and learn how to model such randomness in a statistical framework. We will also use computation tools to analyze genetic data and write a short computer program that simulates the change in allele frequencies in a population in time due to random effects. All course topics will involve hands-on computational exercises, but no prior experience in these tools and methods is expected.

Prerequisite: BIO 181 and MA 131 or MA 141 (or equivalents).
Typically offered in Spring only

BIO 315 General Parasitology (3 credit hours)
General principles of parasitic symbiosis. Emphasis on life cycles, epidemiology, and pathology of major parasites of humans and domestic animals.

Prerequisite: C- or better in BIO 181 and BIO 183
Typically offered in Fall and Summer

BIO 323 Paleoecology (3 credit hours)
Paleoecology offers insights into the ancient ecosystems of Earth across millions of years and how the study of these extinct realms compares and contrasts with ecological studies of the modern world. Students will learn about ancient organisms through firsthand observation of fossil specimens, will have hands-on experience with paleontological data collection, and will learn to perform data analysis on paleontological datasets. At least one optional weekend field trip (illustrating concepts learned in class) will be offered during the semester.

Prerequisite: BIO 181
Typically offered in Fall only

BIO 325 Paleontological Field Methods (4 credit hours)
Understanding the history of life is not possible without first and foremost unearthing it. Discovering, collecting, and conserving fossil specimens for research is a time- and labor-intensive endeavor that requires hands-on training in the field. This course provides introductions to the evolution of life; Mesozoic biodiversity, biostratigraphy, and biogeography; vertebrate skeletal anatomy; stratigraphic and sedimentary concepts; and geomorphology. The course also covers paleontological research methods, including: specimen data collection, conservation, and preparation; topographic and geologic maps; GPS techniques; prospecting and excavation of fossil localities; and taphonomic indicators. Field work in Utah; additional costs involved.

Prerequisite: BIO 120 or BIO 181 or BIO 330
Typically offered in Summer only

BIO 330 Evolutionary Biology (3 credit hours)
Principles and patterns of organic evolution. Topics will include the origin of life, patterns of genetic variation, adaptations, natural selection, and the formation of species, the relationship between micro and macroevolution, and the importance of evolution to humans and medicine.

Prerequisite: C- or better in BIO 181and BIO 183
Typically offered in Spring only

BIO 361 Developmental Biology (3 credit hours)
In this course students will discover the amazing journey that cells must take to get from an egg to an embryo, form a mature adult, and reproduce in order to continue the life cycle. Students will relate science to everyday life using developmental biology as a forum to integrate many aspects of biology from the molecules in single cells to the complete organism and how it is influenced by evolution and the environment. Cannot receive credit for both BIO 361 and GN 434.

Prerequisite: C- or better in BIO 183
Typically offered in Fall only

BIO 370 Developmental Anatomy of the Vertebrates (3 credit hours)
An integrated study of the functional anatomy, phylogeny, and embryonic development of organ systems in vertebrate animals.

Prerequisite: C- or better in BIO 181 or BIO 140
Typically offered in Spring only

BIO 375 Developmental Anatomy Laboratory (2 credit hours)
A hands-on study of embryonic development and organ systems in vertebrate animals, utilizing microscopic examination of living and preserved embryos, demonstrations of skeletons and mammalian organs, and dissections of preserved shark, salamander, and mink.

Prerequisite: C- or better in BIO 181 or BIO 140
Typically offered in Spring only

BIO 405 Functional Histology (3 credit hours)
Offered only as a distance education course via the internet. Functional Histology describes the cellular structure of tissues and organs. Human organs are emphasized, with brief consideration given to variation in other mammals. Tissue and organ structure is related to function, including examples of malfunction (histopathology). The course is especially appropriate for students planning a career in veterinary science, medicine, or allied health fields. Offered by distance education only.

Prerequisite: C- or better in BIO 183
Typically offered in Summer only

BIO 414 Cell Biology (3 credit hours)
The chemical and physical bases of cellular structure and function with emphasis on methods and interpretations.

Prerequisite: C- or better in BIO 183 and (CH 221 or CH 225)
Typically offered in Spring only

BIO 416 Cancer Cell Biology (3 credit hours)
Cancer cells are defective and yet they survive and often thrive despite having these defects. We will explore changes in tumor cells as they transition from normal cells - looking at disrupted growth signaling and cell death pathways, alterations in cell motility patterns and the induction of changes in other cells. Current research and treatments will be discussed. A focus will be on problem solving and critical thinking skills as we integrate case studies as well as primary and review literature into the course. This course will involve lecture, discussion, and group activities. Students will be expected to do assigned reading prior to coming to class, make presentations or lead discussions, analyze data, and design experiments.

P: C- or better in BIO 183 and GN 311. JR or SR standing; Students may not earn credit for both BIO/PB 414 and BIO 416.
Typically offered in Fall only

BIO 418 Cell Biology Research Lab (2 credit hours)
BIO 418 is a laboratory course that emphasizes collaborative, inquiry-based learning through research. Students will design and implement experiments to explore mechanisms relating to cellular growth, metabolism, cell signaling pathways, environmental toxins, and/or intrinsic and extrinsic apoptotic processes in various cell lines. This course will include primary literature analysis, experimental design and implementation, maintenance of lab notebooks, data analysis, discussions, and presentations.

C: BIO/PB 414 or BIO 416. JR or SR standing
Typically offered in Fall and Spring

BIO 424 Endocrinology (3 credit hours)
This course will explore the function of hormones and bioactive compounds in regulating animal physiology and homeostasis. Topics will include a study of hormones and their mechanism of actions in regulating various biological processes including development and growth; reproduction; feeding, digestion and metabolism; ion and water balance; stress and immunity; and sex determination. The methods used to study hormones and their physiological functions will also be addressed. 80% of enrollment is restricted to Biological Sciences and Zoology students with the remaning 20% open for all other majors.

Prerequisite: C- or better in BIO 250 or BIO 212 or BIO 240 or BIO 245
Typically offered in Fall, Spring, and Summer

BIO 432 Evolutionary Medicine (3 credit hours)
This course introduces the rapidly emerging field of evolutionary medicine as one approach to appreciating evolution as a unifying principle of biology. The primary goal is for students to better understand the evolutionary nature of many issues connected to human health and to better understand the field of evolution via examples that are medically relevant. The course will require reading and discussing scientific literature. Credit is not allowed for both BIO 432 and BIO 330.

R: Junior or Senior standing; Prerequisite: C- or better in BIO 181 or BIO 183 or GN 311.
Typically offered in Spring only

BIO 434 Hormones and Behavior (3 credit hours)
This course will focus on the field of behavioral neuroendocrinology, which explores mechanisms by which hormones affect and are affected by behavior. The course will use highly interactive lectures and discussions of material from the primary literature (seminal papers and recent exciting contributions). Student participation in class discussions and in-class assignments will be critical components of the learning process.

Prerequisite:C- or better in BIO 212 or Bio 250 or (ANS 205 & ANS 206) or BIO 240 or BIO 245
Typically offered in Spring only

BIO 440 The Human Animal: An Evolutionary Perspective (3 credit hours)
An in-depth look at the evolution of a wide range of human behaviors, and some aspects of physiology as well. We will critically explore the perceptions we hold of ourselves and the research that has sought to lend new insights into the fundamental bases of human behavior. New uses of evolutionary theory, including the field of evolutionary psychology, will be examined using a comparative approach and careful readings from primary and secondary literature in evolutionary biology and psychology. Classes will be largely discussion based.

Prerequisite: C- or better in one of the following: ZO 317, BIO 270, BIO 330, ZO 410, PSY 406, or PSY 416
GEP U.S. Diversity
Typically offered in Spring only

BIO 444 The Biology of Love and Sex (3 credit hours)
The need to find and seduce a mate is one of the most powerful forces in biology. In this course, we will examine the biological factors that contribute to love and sex. We will adopt a broad evolutionarily-based perspective, examining a variety of strategies in both human and animal systems. Our readings and discussions will cover current hypotheses and experimental methodologies spanning genetics, neuroscience, and endocrinology.

P: C- or better in two of the following: BIO 330, BIO 410, BIO 424, BIO 488, GN 311; R: Junior or Senior Standing
Typically offered in Spring only

BIO 481 Senior Capstone Project (1 credit hours)
This course provides students an opportunity to integrate and apply knowledge and skills gained from their major studies in addressing an important challenge or problem that they identify. Emphasis will be placed on (1) reflections on the value of experiences outside of the classroom, (2) using discipline-specific knowledge and approaches from both biology and from the second disciplinary area that they chose to study within the B.A. in Biological Sciences, and (3) peer- and self-critiques based on the intellectual standards of critical and creative thinking. Restricted to seniors who will graduate with a B.A. in Biological Sciences. 17BIOBA majors only.

Typically offered in Fall, Spring, and Summer

BIO 482 Capstone Course in Molecular, Cellular, and Developmental Biology (3 credit hours)
Topical problems in molecular, cellular, and developmental biology. BIO 482 provides a challenging opportunity for students to integrate and apply knowledge and skills gained from their major studies. Emphasis will be placed on collaborative learning and on effective, professional communication. Topics and instructors will vary from semester to semester. Priority will initially be given to seniors in the MCD curriculum; other students with the necessary prerequisites will be admitted on a space available basis.

Prerequisite: C- or better in BIO 361, BIO/PB 414, and one of the following: BCH 351 or BCH 451 or BIT 410 or GN 311.
Typically offered in Fall and Spring

BIO 483 Capstone Course in Integrative Physiology and Neurobiology (3 credit hours)
Topical problems in integrative physiology and neurobiology. BIO 483 provides a challenging opportunity for students to integrate and apply knowledge and skills gained from their major studies. Emphasis will be placed on collaborative learning and on effective, professional communication. Topics and instructors will vary from semester to semester. Priority will initially be given to seniors in the IPN curriculum; other students with the necessary prerequisites will be admitted on a space available basis.

Prerequisite: C- or better in BIO 424, BIO 488, and one of the following: BIO/PB 414 or BCH 351 or BCH 451 or GN 311 or ST 311.
Typically offered in Fall and Spring

BIO 484 Capstone Course in Human Biology (3 credit hours)
Topical problems in human biology. BIO 484 provides a challenging opportunity for students to integrate and apply knowledge and skills gained from their major studies. Emphasis will be placed on collaborative learning and on effective, professional communication. Topics and instructors will vary from semester to semester. Priority will initially be given to seniors in the HB curriculum; other students with the necessary prerequisites will be admitted on a space available basis.

Prerequisite: C- or better in BIO 421, MB 351 and one of the following: BCH 351 or BCH 451 or GN 311 or ST 311.
Typically offered in Fall and Spring

BIO 485 Capstone Course in Ecology, Evolution, and Conservation Biology (3 credit hours)
Topical problems in ecology, evolution, and conservation biology. BIO 485 provides a challenging opportunity for students to integrate and apply knowledge and skills gained from their major studies. Emphasis will be placed on collaborative learning and on effective, professional communication. Topics and instructors will vary from semester to semester. Priority will initially be given to seniors in the EEC curriculum; other students with the necessary prerequisites will be admitted on a space available basis.

Prerequisite: C- or better in BIO/PB 330, BIO/PB 360, and one of the following: BIO 460 or GN 311 or NR 406 or ST 311.
Typically offered in Fall and Spring

BIO 488/BIO 588 Neurobiology (3 credit hours)
Overview of the neurosciences, with a focus on fundamental principles in the function, structure, and development of the nervous system. Topics include neuroanatomy, electrical signaling, synaptic transmission, sensory and motor systems, neural development, neural plasticity, and complex brain functions. Multiple levels of analysis, from molecular to behavioral, with an emphasis on the mammalian nervous system. Motivated students who do not meet listed prerequisite can contact the instructor for permission to take the course.

Prerequisite: C- or better in BIO 250 or BIO 212 or BIO 240 or BIO 245 or permission of instructor
Typically offered in Fall only

BIO 498 Honors Project Part I (3 credit hours)
Together, BIO 498 and BIO 499 provide a two-semester sequence for honors projects conducted by students in good standing in an honors program within the Department of Biological Sciences. Before enrollment in BIO 498, students (1) identify a project in consultation with a faculty member, (2) work with that mentor to complete a contract describing the expectations for their work together in BIO 498, and (3) have the contract approved by the honors program coordinator. The approved contract will describe the specific requirements and expectations of the BIO 498 experience. Enrollment only by permission of the honors program director.

Typically offered in Fall, Spring, and Summer

BIO 499 Honors Project Part 2 (3 credit hours)
Together, BIO 498 and BIO 499 provide a two-semester sequence for honors projects by students in good standing in an honors program within the Department of Biological Sciences. Before beginning BIO 499, students will have successfully completed BIO 498 as well as a contract describing the expectations for their work with the mentor in BIO 499. The contract must be approved by the honors program director. The approved contract will describe the specific requirements and expectations of the BIO 499 experience. Enrollment only by permission of honors program director.

Prerequisite: BIO 498
Typically offered in Fall, Spring, and Summer

BIO 520 Skeletal Biological Laboratory Methods in Human Identification & Cold Cases (3 credit hours)
This laboratory-based course covers skeletal biological methods such as those used in human identification applied to medicolegal issues or issues of the law. Forensic identification methods will be introduced via lecture and students will apply these methods in the laboratory. The investigation of cold cases will be addressed through laboratory methodologies that intersects with missing persons cases. This course covers a broad array of investigative skeletal methods. However, students will not be qualified to practice after taking this course.

P: Graduate Standing
Typically offered in Fall only

BIO 555/PSC 555 Creative Media Production for Scientists (3 credit hours)
This course will be an introduction to producing videos and other online science media. Students will survey and discuss research-based best practices for online science media and will produce their own media pieces.

R: Grad Standing or Instructor Approval
Typically offered in Spring only

BIO 560/BMA 560 Population Ecology (3 credit hours)
Dynamics of natural populations. Current work, theories and problems dealing with population growth, fluctuation, limitation and patterns of dispersion, species interactions, community structure and ecological genetics. One semester of calculus and a junior/senior level ecology course are required.

Co-requisite: ST 511
Typically offered in Spring only

BIO 570 Evolutionary Ecology (3 credit hours)
This course provides a detailed overview of evolutionary ecology, the multidisciplinary interface of ecological and evolutionary processes. The course includes an historical perspective of the development of the field, major theoretical and empirical milestones, and the cutting edge of modern evolutionary ecology research and application. This is a discussion-oriented course, drawing heavily from peer-reviewed literature. Grading is centered on participation, leading discussions, critical literature reviews, and a research project. The course Moodle website will contain files for all assigned readings, the course syllabus, tips for leading discussions, and a schedule of class meetings and discussion leaders.

Prequisite: Graduate Standing or C- or better in AEC/PB 360 and Corequisite: C- or better in BIO 330 or BIO 432
Typically offered in Fall only

BIO 572/CH 572/BIT 572 Proteomics (3 credit hours)
Introduction and history of the field of proteomics followed by the principles and applications of proteomics technology to understand protein expression and protein post-transitional modifications. Laboratory sessions include growing yeast with stable-isotope labeled amino acids, protein purification, Western blots, protein identification and quantification, and protein bioinformatic analysis. This is a half-semester course.

Prerequisite: BIT 410 or BIT 510 or BCH 454 (or approval from the instructor)
Typically offered in Spring only

BIO 578 The Physiology of Stress (3 credit hours)
Stress is a nearly unavoidable component of modern life, bound to affect each of us at some point during the week (or day!) And stress can wreak havoc on both mental and physical health. Beginning with a look at the normal stress response in humans and animals, this course then examines the biological effects of both physical and psychological stress. We'll examine what happens to various systems in the body when the stress response occurs and doesn't shut down. Among the systems explored will be neuroendocrine, cardiovascular, digestive, immune, and reproductive. We'll also look at how stress affects sleep, depression, prenatal and childhood development, and memory and judgment. And we'll spend some time with stress management techniques (and why they do or don't work) as well.

P: Graduate Standing
Typically offered in Fall only

BIO 588/BIO 488 Neurobiology (3 credit hours)
Overview of the neurosciences, with a focus on fundamental principles in the function, structure, and development of the nervous system. Topics include neuroanatomy, electrical signaling, synaptic transmission, sensory and motor systems, neural development, neural plasticity, and complex brain functions. Multiple levels of analysis, from molecular to behavioral, with an emphasis on the mammalian nervous system. Motivated students who do not meet listed prerequisite can contact the instructor for permission to take the course.

Prerequisite: C- or better in BIO 250 or BIO 212 or BIO 240 or BIO 245 or permission of instructor
Typically offered in Fall only

BIO 592 Topical Problems (1-3 credit hours)
Organized, formal lectures and discussion of a special topic.

Typically offered in Fall, Spring, and Summer

BIO 624 Topical Problems (1-3 credit hours)
Organized, formal lectures and discussion of a special topic.

Typically offered in Fall and Spring

BIO 705/CBS 705 Fundamentals of Neuroscience (3 credit hours)
This is a fundamental course that will provide the student with an up-to-date coverage of molecular, cellular, physiological, and circuit-based aspects of Modern Neurosciences in the Comparative Biomedical Sciences Graduate Program. Being a graduate-level class, the instructors will assume that the students have acquired some background in basic biology and biochemistry. The most important goal of this course is to train PhD students in neuroscience function and disorders, preparing them for neuroscience research. Emphasis will be placed on the systems and skills needed to pursue experimental neuroscience activities. Important components of the learning process will be presentations from neuroscience experts, class discussions, exams and in class activities.

P: BIO 488 or permission of instructor
Typically offered in Fall only

BIO 727/CH 727 Biological Mass Spectrometry (3 credit hours)
Fundamentals of mass spectrometry including topics such as: mass, isotopic distributions, resolving power, mass accuracy. Ionization source topics: electron impact, chemical ionization, matrix-assisted laser desorption ionization, electrospray ionization and contemporary methods. Instrumentation and mass analyzers: quadrupole, time-of-flight, Fourier transform based mass analyzers; hybrid instruments such as a quadrupole orbitrap. Tandem mass spectrometry and dissociation. Applications: quantitation, small molecule analysis, and peptide sequencing.

Prerequisite: CH 223 or CH 227
Typically offered in Fall only

BIO 792 Topical Problems (1-6 credit hours)
Organized, formal lectures and discussion of a special topic.

Typically offered in Fall, Spring, and Summer

BIO 805/CBS 805 Special Topics in Neuroscience (1 credit hours)
Topics in neuroscience. This course will provide an opportunity for students to integrate and apply knowledge and skills gained from their graduate studies. Emphasis will be placed on primary literature, scientific practice, and on effective, professional communication and presentations. Topics and instructors will vary from semester to semester. Priority will initially be given to graduate students participating in the neuroscience concentration; other students with the necessary prerequisites will be admitted on a space available basis.

R: Grad Standing or Instructor Approval
Typically offered in Spring only

BIO 811 Forensic Sciences Seminar (1 credit hours)
This is a webinar series that includes professional development as well as practitioner presentations about the current state of the various forensic sciences disciplines. Topics covered fill in the background and gaps needed for a career as a forensic science practitioner and/or academician.

Prerequisite: Graduate Standing or Instructor Permission
Typically offered in Fall only

BIO 824 Topical Problems (1-3 credit hours)
Organized, formal lectures and discussion of a special topic.

Typically offered in Fall and Spring

Biomanufacturing Training Education Center (BEC)

BEC 220 Introduction to Drug Development and Careers in Biomanufacturing (1 credit hours)
Introduction to discovery and development of biopharmaceuticals, industrial enzymes, food ingredients and biologics. Discussion of majors that prepare students for positions in the biotechnology industry. Lectures from staff and from professionalsin the biotechnology industry focus on drug development, biopharmaceutical process development, design of biomanufacturing facilities, overview of methods used for manufacturing biopharmaceuticals, drug and enzyme purification, formulation, as well as careers in FDA compliance documentation related to manufacturing products using microbial biotechnology.

Typically offered in Fall and Spring

BEC 330 Principles and Applications of Bioseparations (2 credit hours)
Objectives, strategies, and approaches for recovery and purification of biomolecules, especially recombinant proteins. Description of common purification equipment, processes and materials used for cell lysis, precipitation, flocculation, membrane filtration, column chromatography, and centrifugation. Laboratories provide students with exposure to various techniques and the parameters that control protein isolation and purification of a recombinant protein. This is a half-semester course. Students who have completed BIT(CHE) 464 may not complete this course for credit.

Prerequisite: CH 223 or CH 227
Typically offered in Fall and Spring

BEC 425/BEC 525 Molecular Biology for Biomanufacturing (2 credit hours)
This course is an introduction to fundamental molecular biology techniques, applied to generate bacterial cell lines for the production of recombinant proteins. Course material provides a comprehensive description of an expression system, with emphasis on the central dogma of molecular biology, detailed gene structure, vector components and bacterial host cell characteristics. Different genetic, physiologic and growth condition aspects are included to ensure the overproduction of a functional protein of interest. This comprises different molecular approaches for gene cloning, bacterial selection/screening and regulation of genetic expression. The course provides hands-on experience during laboratory sessions, where students isolate a gene of interest, clone the gene into an expression vector, transform bacteria, select for positive clones, grow recombinant cells, and induce the production of the protein of interest. Techniques such as SDS-PAGE, Western blot, and ELISA are used for the detection and quantification of the active recombinant protein.

Prerequisite: BIO 183 or equivalent
Typically offered in Fall, Spring, and Summer

BEC 426/BBS 526/FS 526/BEC 526/BBS 426/FS 426 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

BEC 436/BEC 536 Introduction to Downstream Process Development (2 credit hours)
Objectives, strategies, and approaches for recovery and purification of biomolecules, especially recombinant proteins. Laboratories in the intermediate-scale pilot plant provide students with exposure to various unit operations and the parameters that control protein isolation and purification of a recombinant protein produced by an E. coli. This is a half-semester course. Students who have completed BEC 436 may not take BEC 536 for credit.

Prerequisite: BEC 330 or graduate standing
Typically offered in Fall and Spring

BEC 445/BEC 545 Cell Line Development for Biomanufacturing (2 credit hours)
This course provides the basic and advanced principles of genetic engineering in yeast and mammalian cells for the overproduction of a protein of interest. Students will use classical and novel strategies to establish a stable Chinese hamster ovary (CHO) cell line based on the industrially relevant strain, DG44 (DHFR system). Students will also generate a yeast expression system based on Pichia pastoris for the production of the same protein. The generation of two different cell lines for the overproduction of the same protein of interest should provide students with an appreciation of each system in terms of cost, speed, productivity and product quality.

Corequisite: BEC 425/525 or Prerequisite: BIT 410/510 or MB 351 or MB 352 or MB 354
Typically offered in Fall and Spring

BEC 448/BEC 548/CHE 548/CHE 448 Bioreactor Design (2 credit hours)
This course will cover critical aspects of bioreactor design, including design of reactors for enzyme-catalyzed reactions, fermentation of microorganisms, and scale-up considerations for bioreactors. Hands-on experiments involving fermentation of microorganisms and scale-up of bioreactors will be included. Students cannot get credit for both CHE 448 and CHE 548.

Prerequisite CHE 446 or instructor permission; Co-requisite BCH 451 or instructor permission
Typically offered in Spring only

BEC 462/BEC 562/CHE 462/CHE 562 Fundamentals of Bio-Nanotechnology (3 credit hours)
Concepts of nanotechnology are applied in the synthesis, characterization, recognition and application of biomaterials on the nanoscale. Emphasis will be given to hands-on experience with nanostructured biomaterials; students will also be familiarized with the potential impact of these materials on different aspects of society and potential hazards associated with their preparation and application.

Prerequisite: MA 241 and PY 208 and (CH 223 or CH 227)
Typically offered in Spring only

BEC 463/BIT 563/CHE 563/BEC 563/BIT 463/CHE 463 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall, Spring, and Summer

BEC 475/BEC 575 Global Regulatory Affairs for Medical Products (3 credit hours)
This lecture-based course introduces students to the quality systems used to meet the regulatory requirements for developing, testing, manufacturing, and selling medical products in the global marketplace. It provides a general background for those going into the medical products field, but is especially useful to students preparing for a career in the Regulatory Affairs or Quality Assurance Department within a pharmaceutical, biomanufacturing, or medical device company. BEC 575 students must have graduate standing.

Prerequisite: Senior standing
Typically offered in Fall and Spring

BEC 480/BEC 580 cGMP Fermentation Operations (2 credit hours)
Application of microbial fermentation techniques at production scale and evaluation of the inherent issues resulting from the integration of microbial fermentation unit operations, scale-up/production, and current Good Manufacturing (cGMP) compliance. Lectures prepare students for pilot-scale laboratory experiences in media preparation, bioreactor operation, process utilities, and manufacturing quality systems that simulate microbial cell growth and product expression in a commercial cGMP facility. This is a half-semester course. Students who have completed BEC 480 may not take BEC 580 for credit.

Corequisite: BBS/BEC/FS 426
Typically offered in Fall and Spring

BEC 483/BME 583/BEC 583/BME 483 Tissue Engineering Technologies (2 credit hours)
In this half-semester laboratory module, students will gain practical experience with two key elements of tissue engineering: tissue building and angiogenesis. Using advanced culture techniques, students will construct a complex living tissue that closely resembles its natural counterpart, then assess its ability to support ingrowth of capillaries (angiogenesis). The effects of different biomaterials and angiogenic factors will be evaluated. The engineered tissue will be embedded, sectioned and stained for histological analysis.

Prerequisite: BIT 466/566 or permission of instructor
Typically offered in Fall only

BEC 485/BEC 585 cGMP Downstream Operations (2 credit hours)
Application of downstream bioprocessing techniques at production scale and evaluation of the inherent issues resulting from the integration of recovery and purification unit operations, scale-up/production issues, and current Good Manufacturing Practice (cGMP) compliance. Lectures prepare students for pilot-scale laboratory experiences in cell removal, cell disruption, purification, and manufacturing quality systems that simulate downstream bioprocessing in a commercial cGMP facility. This is a half-semester course. Students who have completed BEC 485 may not take BEC 585 for credit.

Corequisite: BEC 436/536
Typically offered in Fall and Spring

BEC 488/CHE 488/BEC 588/CHE 588 Animal Cell Culture Engineering (2 credit hours)
Design and operation of animal cell culture bioreactors for therapeutic protein production. Topics include: batch, fed-batch and perfusion bioreactors, agitation and aeration for mixing and oxygen mass transfer, bioreactor monitoring and control, optimizing bioreactor performance, single-use [disposal] bioreactors, and the production of gene therapy vectors. This is a half-semester course. Time outside of the regularly scheduled class time may be required.

Prerequisite: BEC 463 or CHE 563 or BEC 363 or BEC 440/540 or BEC 441/541 or equivalent; or consent of instructor.
Typically offered in Spring only

BEC 495 Special Topics in Biomanufacturing (1-4 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis. Departmental approval required.

Typically offered in Fall, Spring, and Summer

BEC 497 Biomanufacturing Research Projects (1-3 credit hours)
Introduction to biomanufacturing research through experimental, theoretical, and literature studies. Oral and written presentation of reports. Departmental approval required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

BEC 515 Biopharmaceutical Product Characterization Techniques (2 credit hours)
This 8 week graduate course introduces engineering students to bioanalytical testing to processes that produce structurally complex biopharmaceuticals. Students will gain hands-on experience including assay validation, drug/biologic substance characterization (structural and activity) and biopharmaceutical purity. The technologies and related theory will include rapid micro SDS-PAGE, lab-on-a-chip, HPLC, mass spectrometry, UV/Vis absorbance and fluorescence spectroscopy. Students will also learn assay development and validation concepts as per ICH Q2(R1) and other U.S. and international government regulatory guidelines.

Prerequisite:CH 222 or equivalent
Typically offered in Fall only

BEC 525/BEC 425 Molecular Biology for Biomanufacturing (2 credit hours)
This course is an introduction to fundamental molecular biology techniques, applied to generate bacterial cell lines for the production of recombinant proteins. Course material provides a comprehensive description of an expression system, with emphasis on the central dogma of molecular biology, detailed gene structure, vector components and bacterial host cell characteristics. Different genetic, physiologic and growth condition aspects are included to ensure the overproduction of a functional protein of interest. This comprises different molecular approaches for gene cloning, bacterial selection/screening and regulation of genetic expression. The course provides hands-on experience during laboratory sessions, where students isolate a gene of interest, clone the gene into an expression vector, transform bacteria, select for positive clones, grow recombinant cells, and induce the production of the protein of interest. Techniques such as SDS-PAGE, Western blot, and ELISA are used for the detection and quantification of the active recombinant protein.

Prerequisite: BIO 183 or equivalent
Typically offered in Fall, Spring, and Summer

BEC 526/BBS 426/FS 426/BEC 426/BBS 526/FS 526 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

BEC 532 Biological Processing Science (2 credit hours)
Fundamental scientific principles underlying the recovery, purification and formulation of biologics (biotherapuetics), especially proteins, are examined. Emphasis is placed on delineating the key chemical and physical properties of biomolecules that impact processing and formulation development. Laboratories in the analytical and small-scale purification facility provide students with 'hands-on' exposure to key scientific principles and small scale unit operations. This is a half-semester course.

Prerequisite: BCH 451 or graduate standing
Typically offered in Fall and Spring

BEC 536/BEC 436 Introduction to Downstream Process Development (2 credit hours)
Objectives, strategies, and approaches for recovery and purification of biomolecules, especially recombinant proteins. Laboratories in the intermediate-scale pilot plant provide students with exposure to various unit operations and the parameters that control protein isolation and purification of a recombinant protein produced by an E. coli. This is a half-semester course. Students who have completed BEC 436 may not take BEC 536 for credit.

Prerequisite: BEC 330 or graduate standing
Typically offered in Fall and Spring

BEC 545/BEC 445 Cell Line Development for Biomanufacturing (2 credit hours)
This course provides the basic and advanced principles of genetic engineering in yeast and mammalian cells for the overproduction of a protein of interest. Students will use classical and novel strategies to establish a stable Chinese hamster ovary (CHO) cell line based on the industrially relevant strain, DG44 (DHFR system). Students will also generate a yeast expression system based on Pichia pastoris for the production of the same protein. The generation of two different cell lines for the overproduction of the same protein of interest should provide students with an appreciation of each system in terms of cost, speed, productivity and product quality.

Corequisite: BEC 425/525 or Prerequisite: BIT 410/510 or MB 351 or MB 352 or MB 354
Typically offered in Fall and Spring

BEC 548/CHE 548/CHE 448/BEC 448 Bioreactor Design (2 credit hours)
This course will cover critical aspects of bioreactor design, including design of reactors for enzyme-catalyzed reactions, fermentation of microorganisms, and scale-up considerations for bioreactors. Hands-on experiments involving fermentation of microorganisms and scale-up of bioreactors will be included. Students cannot get credit for both CHE 448 and CHE 548.

Prerequisite CHE 446 or instructor permission; Co-requisite BCH 451 or instructor permission
Typically offered in Spring only

BEC 562/CHE 462/CHE 562/BEC 462 Fundamentals of Bio-Nanotechnology (3 credit hours)
Concepts of nanotechnology are applied in the synthesis, characterization, recognition and application of biomaterials on the nanoscale. Emphasis will be given to hands-on experience with nanostructured biomaterials; students will also be familiarized with the potential impact of these materials on different aspects of society and potential hazards associated with their preparation and application.

Prerequisite: MA 241 and PY 208 and (CH 223 or CH 227)
Typically offered in Spring only

BEC 563/BIT 463/CHE 463/BEC 463/BIT 563/CHE 563 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall and Spring

BEC 575/BEC 475 Global Regulatory Affairs for Medical Products (3 credit hours)
This lecture-based course introduces students to the quality systems used to meet the regulatory requirements for developing, testing, manufacturing, and selling medical products in the global marketplace. It provides a general background for those going into the medical products field, but is especially useful to students preparing for a career in the Regulatory Affairs or Quality Assurance Department within a pharmaceutical, biomanufacturing, or medical device company. BEC 575 students must have graduate standing.

Prerequisite: Senior standing
Typically offered in Fall and Spring

BEC 577/CHE 577 Advanced Biomanufacturing and Biocatalysis (3 credit hours)
Overview of biomanufacturing using microorganisms (bacteria, yeast, fungi), eukaryotic cells (hybridomas, insect, plant, CHO) and recombinant enzymes focusing on methods used in industry. Course will emphasize process design for optimization of heterologous protein expression, metabolic/cell line engineering, metabolomics, protein engineering to alter enzymes and antibodies. Pathway engineering strategies include developing microbes to produce new therapeutic compounds or overproduce primary metabolites, antibiotics, biotherapeutics, therapeutic enzymes, diagnostics, recombinant vaccines, and biopharmaceuticals. Utilization of immobilized biocatalysts, and microbial kinetics are covered.

Graduate standing in engineering or life-science graduate program
Typically offered in Spring only

BEC 580/BEC 480 cGMP Fermentation Operations (2 credit hours)
Application of microbial fermentation techniques at production scale and evaluation of the inherent issues resulting from the integration of microbial fermentation unit operations, scale-up/production, and current Good Manufacturing (cGMP) compliance. Lectures prepare students for pilot-scale laboratory experiences in media preparation, bioreactor operation, process utilities, and manufacturing quality systems that simulate microbial cell growth and product expression in a commercial cGMP facility. This is a half-semester course. Students who have completed BEC 480 may not take BEC 580 for credit.

Corequisite: BBS/BEC/FS 426
Typically offered in Fall and Spring

BEC 583/BME 483/BEC 483/BME 583 Tissue Engineering Technologies (2 credit hours)
In this half-semester laboratory module, students will gain practical experience with two key elements of tissue engineering: tissue building and angiogenesis. Using advanced culture techniques, students will construct a complex living tissue that closely resembles its natural counterpart, then assess its ability to support ingrowth of capillaries (angiogenesis). The effects of different biomaterials and angiogenic factors will be evaluated. The engineered tissue will be embedded, sectioned and stained for histological analysis.

Prerequisite: BIT 466/566 or permission of instructor
Typically offered in Fall only

BEC 585/BEC 485 cGMP Downstream Operations (2 credit hours)
Application of downstream bioprocessing techniques at production scale and evaluation of the inherent issues resulting from the integration of recovery and purification unit operations, scale-up/production issues, and current Good Manufacturing Practice (cGMP) compliance. Lectures prepare students for pilot-scale laboratory experiences in cell removal, cell disruption, purification, and manufacturing quality systems that simulate downstream bioprocessing in a commercial cGMP facility. This is a half-semester course. Students who have completed BEC 485 may not take BEC 585 for credit.

Corequisite: BEC 436/536
Typically offered in Fall and Spring

BEC 588/CHE 588/BEC 488/CHE 488 Animal Cell Culture Engineering (2 credit hours)
Design and operation of animal cell culture bioreactors for therapeutic protein production. Topics include: batch, fed-batch and perfusion bioreactors, agitation and aeration for mixing and oxygen mass transfer, bioreactor monitoring and control, optimizing bioreactor performance, single-use [disposal] bioreactors, and the production of gene therapy vectors. This is a half-semester course. Time outside of the regularly scheduled class time may be required.

Prerequisite: BEC 463 or CHE 563 or BEC 363 or BEC 440/540 or BEC 441/541 or equivalent; or consent of instructor.
Typically offered in Spring only

BEC 590 Industry Practicum in Biomanufacturing (3 credit hours)
This is an industry case study course emphasizing scientific, engineering, analytical, and professional skills related to biomanufacturing of human therapeutics; the course will provide students with the opportunity to design a complete cGMP process and facility capable of licensure.

Typically offered in Fall only

BEC 595 Special Topics in Biomanufacturing (1-6 credit hours)
Offered to present graduate course content not available in existing courses or for offering of new graduate courses on a trial basis. Departmental approval required.

BEC 601 Biomanufacturing Seminar (1 credit hours)
Weekly seminars on topics of current interest in biomanufacturing and affiliated subjects. Seminars will be presented by resident faculty members, graduate students and visiting lectures from industry, government regulatory agencies such as the FDA or from academic programs related to biomanufacturing.

Typically offered in Fall and Spring

BEC 620 Leadership and Preparation for Industry Internship in Biomanufacturing (2 credit hours)
Advanced communication skills specific to the regulatory requirements of the biomanufacturing and biopharmaceutical industries regulated by the U.S. FDA. Instructors teach writing professional and technical resumes, advanced interview skills, team or project leadership, teamwork and communication skills required by industry to prepare and present discipline-specific documents to the FDA. Students learn change management in a biopharmaceutical company and how to develop emotional intelligence. Interviews by industry professionals give each student experience and feedback. Restricted to students with graduate standing.

Typically offered in Spring only

BEC 669 Biomanufacturing Research Projects (1-4 credit hours)
Introduction to biomanufacturing research through experimental, theoretical and literature studies under the mentorship of a member of the graduate faculty. Oral and written presentation of reports. Deptartmental approval required.

Prerequisite: Graduate standing in engineering, biological science or physical science
Typically offered in Fall, Spring, and Summer

Biomathematics (BMA)

BMA 560/BIO 560 Population Ecology (3 credit hours)
Dynamics of natural populations. Current work, theories and problems dealing with population growth, fluctuation, limitation and patterns of dispersion, species interactions, community structure and ecological genetics. One semester of calculus and a junior/senior level ecology course are required.

Co-requisite: ST 511
Typically offered in Spring only

BMA 567 Modeling of Biological Systems (4 credit hours)
An introduction to quantitative modeling in biology. Use of Forrester diagrams, probabilistic and deterministic description of dynamic processes, development of model equations, simulation methods and criteria for model evaluation. Examination of current literature dealing with application of models and simulation in biology. Individual and class modeling projects.

Prerequisite: MA 131

BMA 573/MA 573 Mathematical Modeling of Physical and Biological Processes I (3 credit hours)
Introduction to model development for physical and biological applications. Mathematical and statistical aspects of parameter estimation. Compartmental analysis and conservation laws, heat transfer, and population and disease models. Analytic and numerical solution techniques and experimental validation of models. Knowledge of high-level programming languages required.

Prerequisite: MA 341 and knowledge of high-level programming language.
Typically offered in Fall only

BMA 574/MA 574 Mathematical Modeling of Physical and Biological Processes II (3 credit hours)
Model development, using Newtonian and Hamiltonian principles, for acoustic and fluid applications, and structural systems including membranes, rods, beams, and shells. Fundamental aspects of electromagnetic theory. Analytic and numerical solution techniques and experimental validation of models.

Prerequisite: MA/BMA 573
Typically offered in Spring only

BMA 590 Special Topics (1-6 credit hours)
Special topics in BMA.

Typically offered in Fall, Spring, and Summer

BMA 591 Special Topics (1-6 credit hours)
Directed readings, problem sets, written and oral reports as dictated by need and interest of student, e.g., cellular, molecular and physiological modeling; new 500-level courses during the developmental phase.

Typically offered in Fall, Spring, and Summer

BMA 610 Special Topics (1-6 credit hours)
Directed readings, problem sets, written and oral reports as dictated by need and interest of student, e.g., cellular, molecular and physiological modeling; new 500-level courses during the developmental phase.

Typically offered in Fall, Spring, and Summer

BMA 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BMA 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

BMA 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BMA 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall and Spring

BMA 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

BMA 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BMA 771/MA 771/ST 771 Biomathematics I (3 credit hours)
Role of theory construction and model building in development of experimental science. Historical development of mathematical theories and models for growth of one-species populations (logistic and off-shoots), including considerations of age distributions (matrix models, Leslie and Lopez; continuous theory, renewal equation). Some of the more elementary theories on the growth of organisms (von Bertalanffy and others; allometric theories; cultures grown in a chemostat). Mathematical theories oftwo and more species systems (predator-prey, competition, symbosis; leading up to present-day research) and discussion of some similar models for chemical kinetics. Much emphasis on scrutiny of biological concepts as well as of mathematical structureof models in order to uncover both weak and strong points of models discussed. Mathematical treatment of differential equations in models stressing qualitative and graphical aspects, as well as certain aspects of discretization. Difference equation models.

Prerequisite: Advanced calculus, reasonable background in biology
Typically offered in Fall only

BMA 772/MA 772/ST 772 Biomathematics II (3 credit hours)
Continuation of topics of BMA 771. Some more advanced mathematical techniques concerning nonlinear differential equations of types encountered in BMA 771: several concepts of stability, asymptotic directions, Liapunov functions; different time-scales. Comparison of deterministic and stochastic models for several biological problems including birth and death processes. Discussion of various other applications of mathematics to biology, some recent research.

Prerequisite: BMA 771, elementary probability theory
Typically offered in Spring only

BMA 773/MA 773/OR 773/ST 773 Stochastic Modeling (3 credit hours)
Survey of modeling approaches and analysis methods for data from continuous state random processes. Emphasis on differential and difference equations with noisy input. Doob-Meyer decomposition of process into its signal and noise components. Examples from biological and physical sciences, and engineering. Student project.

Prerequisite: BMA 772 or ST (MA) 746
Typically offered in Spring only

BMA 774/OR 774/MA 774 Partial Differential Equation Modeling in Biology (3 credit hours)
Modeling with and analysis of partial differential equations as applied to real problems in biology. Review of diffusion and conservation laws. Waves and pattern formation. Chemotaxis and other forms of cell and organism movement. Introduction to solid and fluid mechanics/dynamics. Introductory numerical methods. Scaling. Perturbations, Asymptotics, Cartesian, polar and spherical geometries. Case studies.

Prerequisite: BMA 771 or MA/OR 731; BMA 772 or MA 401 or MA 501
Typically offered in Spring only

BMA 790 Special Topics (1-6 credit hours)

BMA 801 Seminar (1 credit hours)
Graduate students in biomathematics are expected to attend through most of their residence period.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

BMA 815 Advanced Special Topics (1-6 credit hours)
Directed readings, problem sets, written and oral reports as dictated by need and interest of student; new 600-level courses during the development phase (currently includes courses in stochastic modeling and biophysical theory).

Typically offered in Fall, Spring, and Summer

BMA 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BMA 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BMA 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BMA 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BMA 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

BMA 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Biomedical Engineering (BME)

BME 201 Computer Methods in Biomedical Engineering (3 credit hours)
Students develop computer-based problem solving techniques using Excel and MATLAB to solve introductory problems in Biomedical Engineering. Emphasis is on developing solution algorithms, implementing these with spreadsheets and computer programming, and presenting results in a clear and concise manner. Students registered for BME 201 who fail to matriculate into BME will be dropped from the course.

Prerequisite: BME matriculated students
Typically offered in Fall only

BME 205 Introduction to Biomedical Mechanics (4 credit hours)
Study of the state of rest or motion of bodies subjected to the action of forces. Properties of force systems, free body diagrams, concepts of equilibrium, kinematics of particles, newton's laws, conservational principles of energy of momentum in mechanics, mechanical vibrations and their applications in biomedical systems. Restricted to student in the Biomedical Engineering Department.

Credit cannot be received for both BME 205 and (CE 214 or MAE 206)
Typically offered in Spring only

BME 207 Biomedical Electronics (4 credit hours)
Fundamentals of analog and digital circuit analysis and design as applied to biomedical instrumentation and measurement of biological potentials. Passive circuit components, node and mesh analysis, transient behavior, operational amplifiers, frequency response, analog filter design, diode, transistors, biological signal acquisition, binary math and logical operators, digital circuit design, circuit simulation tools and techniques. Laboratory exercises supplement the topics presented in class lectures.

Prerequisites: PY 208/209, BME Majors Only
Typically offered in Spring only

BME 209 Introduction to the Materials Science of Biomaterials (4 credit hours)
This course covers the chemistry, physics, and engineering theory underlying materials science and also discusses the diagnostic and analytical techniques necessary to assess these properties experimentally. This strong foundation prepares students to conceive and build better materials for a wide assortment of biomedical applications.

Co-req: PY 208/209. Pre-req: BME Students Only. Credit cannot be received for BME 209 and (MSE 200, MSE 201, MSE 203 or BME 203)
Typically offered in Fall only

BME 215 Biomedical Mechanics Laboratory (1 credit hours)
This laboratory is part of BME 205 - Biomedical Mechanics and complements it with relevant labs and examples. Statics and dynamics subjects will be studied with experimental techniques, including strain gauges and accelerometers, and computational methods, including finite-element analysis and motion capture. Finally, the human arm will be studied to derive forces, moments, and kinematic properties during various exercises. BME student only.

Co-requisites: MAE 208
Typically offered in Spring only

BME 217/BMME 217L Biomedical Electronics Laboratory (1 credit hours)
Laboratory in analog and digital circuit analysis. Electrical safety; Exercises in resistor networks, capacitors and inductors, steady-state and dynamic circuit behavior, active circuits, amplifiers, logic gates, combinatorial and sequential circuits, elementary digital system design, A/D conversion, biomedical applications.

Prerequisite: ECE 331, BME Majors
Typically offered in Spring only

BME 219 Materials Science of Biomaterials Lab (1 credit hours)
Introductory laboratory experience focused on integrating biological engineering and materials engineering principles by exploring key topics in materials science. Topics include biomaterial fabrication, evaluation of their physical properties and interpretation of results.

Pre-requisite: MSE 200 or MSE 201 or MSE/BME 203. Credit cannot be received for both BME 219 and BME 209
Typically offered in Fall only

BME 295 Research in Biomedical Engineering for Undergraduates (1-3 credit hours)
Opportunity for faculty mentored research in biomedical engineering. Approved plan of work required with significant independent research culminating in a final paper. Students must identify an advisor or co-advisor from within the BME faculty with whom to work on a regular basis. The advisor and BME Undergraduate Affairs Committee must approve the student project prior to the student registering for the course.

R: BME Majors, Departmental Approval Required
Typically offered in Fall and Spring

BME 298 Biomedical Engineering Design and Manufacturing I (2 credit hours)
This is the first in a series of four courses in Biomedical Design. The course introduces the tools and problem-solving skills required in the field of Biomedical Engineering.

Co-requisites: PY 208/209, BME Majors only
Typically offered in Fall only

BME 299 BME Design and Manufacturing I Lab (1 credit hours)
BME 299 together with BME 252 or another course in CAD design fulfills the requirements of BME 298 Biomedical Engineering Design and Manufacturing I. In this course students learn some of the practical fundamentals of electronics manufacturing. Activities include use of bench equipment, soldering techniques, circuit board types, how to identify common electronic components and how they work in a circuit and simple C programming for microcontrollers.

Prerequisite: BME 252. Credit cannot be received for both BME 298 and BME 299
Typically offered in Fall only

BME 301/BMME 301 Human Physiology : Electrical Analysis (4 credit hours)
This course includes a quantitative approach to human physiology from the biomedical engineering perspective with an emphasis on neural, sensory, muscle, and cardiac physiology. Autonomic and somatic motor control will be discussed. Engineering applications, including neural stimulators, functional imaging, cochlear implants, artificial noses, vestibular implants, visual implants, artificial larynges, pacemakers and defibrillators will be discussed. Assignments include computer-based exercises using MATLAB.

Prerequisites: BIO 183, BM(M)E 201, [BME 210 or BM(M)E 207]
Typically offered in Fall only

BME 302 Human Physiology: Mechanical Analysis (4 credit hours)
This course explores a quantitative approach to human physiology from the biomedical engineering perspective with an emphasis on systems physiology described using mechanical properties. Topics include the physiological and mechanical behavior of the blood vessels, lungs, kidney muscles and larynx. In the course lab exercises, students investigate mechanical properties of fluids, electrolyte exchange in dialysis, spirometry and blood pressure measurement among other topics. The course culminates with the design of a novel laboratory experiment.

Prerequisite: BIO 183, [BM(M)E 205 or MAE 208], [BM(M)E 209 or BMME 150]
Typically offered in Spring only

BME 315 Biotransport (3 credit hours)
Quantification and modeling of heat and mass transfer in biomedical systems. Topics include heat transfer rate equations, conservation of energy, steady-state and transient heat transfer, Brownian motion, Fick's laws, conservation of mass equations, molecular transport through membranes, porous media, Stoke-Einstein relations, boundary layer theory, mass transfer coefficients and hemodialysis.

Prerequisite: BME/BMME 201 and (MA 341 or MA 331)
Typically offered in Spring only

BME 325 Biochemistry for Biomedical Engineers (3 credit hours)
An overview of how alterations in bioenergetics, enzyme catalysis, protein and membrane structure, carbohydrate, lipid and nucleic acid metabolism affect human health and how biomedical engineering tools are used to detect and monitor the problems by understanding these biochemical processes. Topics include: Biological Thermodynamics, Energy of macromolecular structure and binding, Structure/function of proteins, enzymes and nucleic acids, Kinetics, enzyme catalysis and biochemical network analysis, Generation of chemical and electrical potential in membranes, Carbohydrate/lipid/protein metabolism and energy production, DNA synthesis, transcription, Technologies used to monitor/detect biochemical processes including clinical imaging modalities.

Prerequisite: CH 221, (BME 209 or BME 203)
Typically offered in Fall only

BME 335/BMME 335 Biomaterials (3 credit hours)
Fundamental sciences behind the design and selection of biomaterials, including crystallography, polymer science, characterization, mechanical testing, and surface preparation. Integration of biomaterials into the body and its response, including inflammation and rejection. Semester-long research project.

Pre-req: BIO 183, (BME 209 or BME 203)
Typically offered in Spring only

BME 345 Biomedical Solid Mechanics (3 credit hours)
This course covers topics ranging from multi-body systems to stress superposition to failure criteria to prepare students for the more advanced subjects of biomechanics and rehabilitation engineering. Topics include the following: Free-body diagrams, Multibody statics and dynamics, Linkage kinematics and kinetics, Anthropometric kinematics, Stress/strain/torsion, Beam bending, Stress superposition, Constitutive relationship, Strain gauges, Finite-element analysis, Failure analysis, Failure mechanisms.

P: BME 201 and (BME 205 or MAE 208) and (BME 209 or BME 203)
Credit cannot be received for BME 345 and (MAE 214 or CE 313)
Typically offered in Spring only

BME 355 Biocontrols (3 credit hours)
Quantitative analysis of dynamic and feedback control systems, including modeling of physiological systems and physiological control systems, system time and frequency responses, control characteristics, and stability analysis. Design techniques for feedback systems in biomedical applications.

C: BM(M)E 365
Typically offered in Spring only

BME 365/BMME 365 Linear Systems in Biomedical Engineering (3 credit hours)
Fundamentals of linear systems analysis as applied to problems in biomedical modeling and instrumentation. Properties of biomedical systems and signals. Representation of continuous- and discrete-time signals and system response. Convolution. Fourier analysis in continuous and discrete domains. Laplace transform. Frequency response and its application in biomedical systems. Filter design. Circuit analogs to mechanical and thermodynamics systems and their applications in modeling biomedical systems. Applications in biomedical instrumentation. Students use MATLAB to simulate and analyze biomedical linear systems. BME majors only.

Pre-reqs: [BM(M)E 207 or BME 210], BM(M)E 201. Co-reqs: MA 341 or MA 331
Typically offered in Fall only

BME 375/BMME 375 Biomedical Microcontroller Applications (3 credit hours)
Overview of microcontroller-based systems, including applications, architecture, number systems, and languages. Students gain experience using a PIC-based microcontroller to input information from a user and output information using LEDs and LCD displays. Student will learn capabilities of the PIC through in class exercises and weekly programming assignments. Both assembly language and PIC-based C are used. Students develop a PIC-based heart rate monitor and work in pairs on a BME-related project of their choice.

Pre-reqs: [BM(M)E 207 or BME 210], BM(M)E 201. Co-reqs: BM(M)E 385 or BME 422
Typically offered in Fall only

BME 385/BMME 385 Bioinstrumentation (3 credit hours)
Fundamentals of biomedical instrument design and implementation. Sensing mechanisms, sensor microfabrication methods, sensor interfacing circuits, analog-to-digital conversion, biosignal capture and storage, embedded microprocessors, data compression methods, system integration and prototyping. Laboratory exercises using LabVIEW and MATLAB, supplement the topics presented in class lectures. Students build a sensor using cleanroom facilities in the BME department as part of a semester-long design project.

Pre-reqs: [BM(M)E 207 or BME 219], BM(M)E 201
Typically offered in Fall only

BME 398/BMME 398 Biomedical Engineering Design and Manufacturing II (2 credit hours)
Students will be required to continue their use of the tools learned in Biomedical Design and Manufacturing I in the context of modern design practices and manufacturing processes. The organizational and project management tools of moderm design will be introduced, and a technical discussion of a modern manufacturing technology will be introduced each week.

Pre-reqs: BM(M)E 298, [BM(M)E 207 or BME 210], BM(M)E 201
Typically offered in Spring only

BME 412 Biomedical Signal Processing (3 credit hours)
Fundamentals of continuous- and discrete-time signal processing as applied to problems in biomedical instrumentation. Properties of biomedical signals and instruments. Descriptions of random noise and signal processes. Interactions between randombiomedical signals and systems. Wiener filtering. Sampling theory. Discrete-time signal analysis. Applications of Z-transform and discrete Fourier transform. Digital filter design methods for biomedical instruments. BME or MS or PHD; credit not allowed for both BME 412 and BME 512.

Pre-reqs: BM(M)E 365 or BME 311
Typically offered in Spring only

BME 418/BME 518/ECE 518/ECE 418 Wearable Biosensors and Microsystems (3 credit hours)
This course surveys the methods and application of wearable electronics and microsystems to monitor human biometrics, physiology, and environmental conditions. Topics covered include wearable electrocardiograms, blood-glucose monitors, electronic tattoos, wearable energy harvesting, "smart" clothing, body area networks, and distributed population networks. Critical comparison of different sensor modalities, quantitative metrics, and how their limitations in realistic applications define the selection, design, and operation criteria of one type of sensor over another will be considered.

Prerequisite: Senior standing
Typically offered in Fall only

BME 425/BME 525 Bioelectricity (3 credit hours)
Quantitative analysis of excitable membranes and their signals, including plasma membrane characteristics, origin of electrical membrane potentials, action potentials, voltage clamp experiments, the Hodgkin-Huxley equations, propagation, subthresholdstimuli, extracellular fields, membrane biophysics, and electrophysiology of the heart. Design and development of an electrocardiogram analysis system.

Prerequisite: BME 302 or (ZO 421 and a course in electrical circuits)
Typically offered in Spring only

BME 444/BME 544 Orthopaedic Biomechanics (3 credit hours)
Students study human body kinematics, force analysis of joints, and the structure and composition of biological materials. Emphasis is placed on the measurement of mechanical properties and the development and understanding of models of biological material mechanical behavior.

P: BM(M)E 301, BM(M)E 302, [BM(M)E 345 or MAE 214 or CE 313]
Typically offered in Fall only

BME 451/BMME 451 BME Senior Design: Product Development (3 credit hours)
This course is part of a three year sequence and it expands on the skills and knowledge gained in BM(M)E 398. Students continue to learn the process of engineering design and learn new skills to produce solutions for unmet medical needs.

Pre-reqs: BME 398, BME 301 or 302, 2 gateway or specialty electives completed
Typically offered in Fall only

BME 452/BMME 452 BME Senior Design: Product Implementation and Strategy (3 credit hours)
This course is part of a three-year sequence and it expands on the skills and knowledge gained in prior design courses. Students continue to learn the process of engineering design and learn new skills to produce solutions for unmet medical needs. Implementation phase of the senior design experience.

Pre-reqs: BME 398, BME 301 or 302, 2 gateway or specialty electives completed; Co-req: taking at least 3 gateway or specialization electives
Typically offered in Spring only

BME 462 Biomaterials Characterization (3 credit hours)
Introductory laboratory experience focused on integrating engineering and biological principles by exploring key topics in biomaterials. Topics include evaluation and interpretation of experimental results, modeling and testing of tissues and cells, and biomaterial/tissue, cell interactions. BME and MSE Majors only; Juniors and Seniors.

Pre-reqs: [BM(M)E 325 or BCH351 or BCH 451], [BM(M)E 335 or MSE 485] and BME Majors.
Typically offered in Spring only

BME 466/TE 566/BME 566/TE 466 Polymeric Biomaterials Engineering (3 credit hours)
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including surface modification and characterization techniques. Bioresorbable polymers.

Prerequisite: PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and (MAE 206 or CE 214)
Typically offered in Fall only

BME 467/TE 467 Mechanics of Tissues & Implants Requirements (3 credit hours)
Application of engineering and biological principles to understand the structure and performance of tendons, ligaments, skin, and bone; bone mechanics; viscoelasticity of soft biological tissues; models of soft biological tissues; mechanics of skeletal muscle; and tissue-derived devices as well as interfaces between native tissues and synthetic devices.

Prerequisite: (ZO 160 or BIO 183) and (MAE 214 or CE 225)
Typically offered in Spring only

BME 481 Quality Management Systems for Engineers (3 credit hours)
This course is designed for biomedical engineering students who plan to work in industry. The course covers industry related topics including team work, conflict resolution, manufacturing and specifications, gap analysis, and root cause of analysis. Design topics including design of experiments, and standards and regulations relevant to the biomedical engineering profession are also covered. Lean and six sigma are taught with an option to test for a six sigma green belt if a six sigma project is completed in the following semester.

Co-reqs: BMME 697 or BME 451
Typically offered in Fall only

BME 483/BEC 483/BME 583/BEC 583 Tissue Engineering Technologies (2 credit hours)
In this half-semester laboratory module, students will gain practical experience with two key elements of tissue engineering: tissue building and angiogenesis. Using advanced culture techniques, students will construct a complex living tissue that closely resembles its natural counterpart, then assess its ability to support ingrowth of capillaries (angiogenesis). The effects of different biomaterials and angiogenic factors will be evaluated. The engineered tissue will be embedded, sectioned and stained for histological analysis.

Prerequisite: BIT 466/566 or permission of instructor
Typically offered in Fall only

BME 484/BME 584 Fundamentals of Tissue Engineering (3 credit hours)
This course covers essential concepts of organ and tissue design and engineering using living components, including cell-based systems and cells/tissues in combination with biomaterials, synthetic materials and/or devices. Topics include: In vivo tissue structure and function; Isolation and culture of primary cells and stem cells; Principles of cellular differentiation; Mass transport processes in cell culture systems; Design, production and seeding of scaffolds for 3D culture; Design of bioreactors to support high-density cell growth; State-of-the-art engineered tissue systems; Clinical translation; and Ethics.

Prerequisite: BIO 183, CH 221, and (MAE 201 or MSE 301 or CHE 315 or TE 303 or BME 315 or BME 325)
Typically offered in Spring only

BME 490 Special Topics in Biomedical Engineering (1-4 credit hours)
Offered as needed for presenting material not normally available in regular BME Department courses or for new BME courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BME 491 Biomedical Engineering Honors Thesis I (3 credit hours)
First in a two-semester sequence of research courses that partially fulfills the requirements for graduation with departmental honors. Prior approval needed for enrollment. Students should identify a research mentor and research topic before applying. Minimum GPA requirement and written report are required. The course does not meet a graduation requirement, and can only be used to meet the requirements of graduation with departmental honors.

Typically offered in Fall and Spring

BME 492 Biomedical Engineering Honors Thesis II (3 credit hours)
Second in a two-semester sequence of research courses that partially fulfills the requirements for graduation with departmental honors. Students work with a mentor on an independent research project. Minimum GPA requirement and written report are required. The course does not meet a graduation requirement if used to meet the requirements of graduation with departmental honors.

Prerequisite: BME 491 and project continuation approval by the BME Undergraduate Research Committee
Typically offered in Fall and Spring

BME 498 Undergraduate Research in Biomedical Engineering (3 credit hours)
Opportunity for hands-on faculty mentored research project in biomedical engineering. Course may be a stand-alone project completed in one semester/summer or serve as part of a two-semester project. Approved plan of work required with significant independent research culminating in a final paper and presentation at the NC State Undergraduate Research Symposium or other appropriate venue. Students must identify an advisor from within the BME faculty with whom to work on a regular basis. The advisor must approve the student prior to the student registering for the course. The BME Undergraduate Coordinator must approve the use of the course as a restricted elective for the BME degree. Departmental Approval Required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

BME 501 Biomedical Innovation and Entrepreneurship I - Needs Discovery (4 credit hours)
This course utilizes clinical immersion to identify medical device and other healthcare opportunities. Students will be exposed to diverse healthcare environments and learn to triage opportunities based on financial, regulatory and intellectual property landscapes. Guest lectures will feature experts in the medical device, pharmaceutical and healthcare industries as well as local entrepreneurs.

Prerequisite: Graduate Standing; R: Restricted to students enrolled in the M.S. Biomedical Engineering Program
Typically offered in Summer only

BME 502 Biomedical Innovation and Entrepreneurship II - Design and Regulation (4 credit hours)
This course teaches path-to-market concepts including regulatory aspects unique to medical devices and pharmaceuticals. Topics include detailed analyses of Phase I-IV clinical trials, 510(k) and PMA approvals, Investigational Device Exemption (IDE) Investigational New Drug (IND) application, Good Laboratory Practices (GLP) and clinical research organizations (CROs). Students will participate in frequent visits to local biotech companies. Guest lectures will feature experts in FDA processes, clinical research and early stage biotech ventures.

Prerequisite: Graduate Standing; R: Restricted to students enrolled in the M.S. Biomedical Engineering Program
Typically offered in Fall only

BME 503 Biomedical Innovation and Entrepreneurship III - Product Development (4 credit hours)
This course covers product development and project management for new biomedical-related products from accessing various streams of funding to allocation of resources for rapid prototyping and scale-up manufacturing. Students will visit local biotech companies and prototyping facilities. A guest lecture series will feature best practices from entrepreneurs and industry practitioners.

Prerequisite: Graduate Standing; R: Restricted to students enrolled in the M.S. Biomedical Engineering Program
Typically offered in Spring only

BME 512 Biomedical Signal Processing (3 credit hours)
Fundamentals of continuous- and discrete-time signal processing as applied to problems in biomedical instrumentation. Properties of biomedical signals and instruments. Descriptions of random noise and signal processes. Interactions between random biomedical signals and systems. Wiener filtering. Sampling theory. Discrete-time signal analysis. Applications of Z-transform and discrete Fourier transform. Digital filter design methods for biomedical instruments. Biomedical applications of filter design, signal restoration, and signal detection.

Prerequisite: BME 311, and ST 370 or ST 371
Typically offered in Spring only

BME 516/BMME 516 Advanced Drug Delivery (3 credit hours)
This course covers the engineering of novel pharmaceutical delivery systems with enhanced efficacy and safety profiles, with an emphasis on the design and application of materials that overcome drug delivery barriers or challenges. Topics will include drug delivery fundamentals and transport mechanisms, materials and formulations for drug delivery, and applications.

R: For Undergraduate students taking the course at the 500 level: BME 302 and BME 209 and CH 221; For Graduate students: Graduate standing
Typically offered in Spring only

BME 518/ECE 518/ECE 418/BME 418 Wearable Biosensors and Microsystems (3 credit hours)
This course surveys the methods and application of wearable electronics and microsystems to monitor human biometrics, physiology, and environmental conditions. Topics covered include wearable electrocardiograms, blood-glucose monitors, electronic tattoos, wearable energy harvesting, "smart" clothing, body area networks, and distributed population networks. Critical comparison of different sensor modalities, quantitative metrics, and how their limitations in realistic applications define the selection, design, and operation criteria of one type of sensor over another will be considered.

Prerequisite: Senior standing
Typically offered in Fall only

BME 522/ECE 522 Medical Instrumentation (3 credit hours)
Fundamentals of medical instrumentation systems, sensors, and biomedical signal processing. Example instruments for cardiovascular and respiratory assessment. Clinical laboratory measurements, theraputic and prosthetic devices, and electrical safetyrequirements. Students should have background in electronics design using operational amplifiers.

Typically offered in Spring only

BME 525/BME 425 Bioelectricity (3 credit hours)
Quantitative analysis of excitable membranes and their signals, including plasma membrane characteristics, origin of electrical membrane potentials, action potentials, voltage clamp experiments, the Hodgkin-Huxley equations, propagation, subthresholdstimuli, extracellular fields, membrane biophysics, and electrophysiology of the heart. Design and development of an electrocardiogram analysis system.

Prerequisite: BME 302 or (ZO 421 and a course in electrical circuits)
Typically offered in Spring only

BME 540 Nanobiotechnology Processing, Characterization, and Applications (3 credit hours)
Topics at the interface of nanoscale science and biotechnology will be discussed. Chemical, physical, and biological properties of nanostructured biomaterials, devices, and systems. Lectures and problem-based learning will be used to present development of nanobiotechnology-enhanced materials and devices.

Prerequisite: BIO 183 and PY 212
Typically offered in Spring only

BME 544/BME 444 Orthopaedic Biomechanics (3 credit hours)
Students study human body kinematics, force analysis of joints, and the structure and composition of biological materials. Emphasis is placed on the measurement of mechanical properties and the development and understanding of models of biological material mechanical behavior.

P: BM(M)E 301, BM(M)E 302, [BM(M)E 345 or MAE 214 or CE 313]
Typically offered in Fall only

BME 551 Medical Device Design (3 credit hours)
Student multidisciplinary teams work with local medical professionals to define specific medical device concepts for implementation. Medical specialty immersion with clinical departments at local medical centers; design input based on stakeholder-needs assessment' market analysis and intellectual property review; new medical devices with broad markets; design output and device specification; product feasibility and risk assessment; design for medical device manufacturing.

Typically offered in Fall only

BME 560/BMME 560 Medical Imaging: X-ray, CT, and Nuclear Medicine Systems (3 credit hours)
Overview of medical imaging systems using ionizing radiation. Interaction of radiation with matter. Radiation production and detection. Radiography systems and applications. Tomography. PET and SPECT systems and applications.

Prerequisite: BME 311, ST 370 or ST 371, and PY 208

BME 566/TE 466/BME 466/TE 566 Polymeric Biomaterials Engineering (3 credit hours)
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including surface modification and characterization techniques. Bioresorbable polymers.

Prerequisite: PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and (MAE 206 or CE 214)
Typically offered in Fall only

BME 570 ImmunoEngineering (3 credit hours)
The immune system influences nearly all aspects of human health and therefore deserves consideration by investigators developing devices, drugs and strategies to improve human health. The course begins with a brief review of the immune system, fundamental immunological assays and the role of the immune system in disease. The second part of the course focuses on immune responses to a range of biomaterials. The third part will explore immune responses in the context of vaccines, immunotherapies and regenerative medicine.

P: Graduate Standing
Typically offered in Spring only

BME 571 Intro to Nano-Biomaterials (3 credit hours)
Chemical, physical, biological, and engineering aspects of nanostructured materials used in medical implants.

Prerequisites: Introduction to the Materials Science of Biomaterials (BME (MSE) 203), Human Physiology for Engineers I (BME 301) and Human Physiology for Engineers II (BME 302). Equivalent courses accepted at discretion of instructor.
Typically offered in Spring and Summer

BME 583/BEC 583/BME 483/BEC 483 Tissue Engineering Technologies (2 credit hours)
In this half-semester laboratory module, students will gain practical experience with two key elements of tissue engineering: tissue building and angiogenesis. Using advanced culture techniques, students will construct a complex living tissue that closely resembles its natural counterpart, then assess its ability to support ingrowth of capillaries (angiogenesis). The effects of different biomaterials and angiogenic factors will be evaluated. The engineered tissue will be embedded, sectioned and stained for histological analysis.

Prerequisite: BIT 466/566 or permission of instructor
Typically offered in Fall only

BME 584/BME 484 Fundamentals of Tissue Engineering (3 credit hours)
This course covers essential concepts of organ and tissue design and engineering using living components, including cell-based systems and cells/tissues in combination with biomaterials, synthetic materials and/or devices. Topics include: In vivo tissue structure and function; Isolation and culture of primary cells and stem cells; Principles of cellular differentiation; Mass transport processes in cell culture systems; Design, production and seeding of scaffolds for 3D culture; Design of bioreactors to support high-density cell growth; State-of-the-art engineered tissue systems; Clinical translation; and Ethics.

Prerequisite: BIO 183, CH 221, and (MAE 201 or MSE 301 or CHE 315 or TE 303 or BME 315 or BME 325)
Typically offered in Spring only

BME 590 Special Topics in Biomedical Engineering (1-6 credit hours)
A study of topics in the special fields under the direction of the graduate faculty.

Prerequisite: Senior or Graduate standing in Engineering or physical or biological sciences or textiles
Typically offered in Fall, Spring, and Summer

BME 650 Internship in Biomedical Engineering (1 credit hours)
Students obtain professional experience through advanced engineering work in industrial and commercial settings under joint supervision of a member of the graduate faculty and an outside professional.

Prerequisite: Graduate standing in BME
Typically offered in Summer only

BME 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

BME 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BME 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BME 790 Advanced Special Topics in Biomedical Engineering (1-6 credit hours)
A study of topics in advanced or emerging special areas under the direction of the graduate faculty. Experimental doctoral level courses.

Prerequisite: Graduate standing in engineering, physical, or biological sciences or textiles
Typically offered in Fall, Spring, and Summer

BME 802 Advanced Seminar in Biomedical Engineering (1 credit hours)
Elaboration of advanced subject areas, techniques and methods related to professional interest through presentations of personal and published works; opportunity for students to present and critically defend ideas, concepts, and inferences; opportunity for distinguished scholars to present results of their work. Discussions to uncover analytical solutions and analogies between problems in biomedical engineering and other technologies, and to present relationship of biomedical engineering to society.

Prerequisite: Doctoral student in BME or other engineering, physical science, or biological science majors, or textiles
Typically offered in Fall and Spring

BME 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning but the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BME 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Summer only

BME 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

BME 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

BME 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Bioprocessing (BBS)

BBS 201 Introduction to Biopharmaceutical Science (3 credit hours)
Through this course, students will experience laboratory and manufacturing terminology relevant to the biomanufacturing industries. Students will also gain exposure to regulatory and compliance procedures and issues facing this industry. This coursewill provide an introduction to prepare students to meet the demands and expectations of this industry and the bioprocessing science program.

Typically offered in Spring only

BBS 301 Process Validation Science (3 credit hours)
Process validation is a tested and documented subset of the panel of activities that are performed during the production of a biopharmaceutical. This course will introduce the concept of process validation as it applies to the biotechnology industry, and more specifically, to the manufacture of protein molecules as therapeutic agents.

Prerequisite: (FS 231 and BBS 201) or BBS 426.
Typically offered in Fall only

BBS 325/FS 325 Introduction to Brewing Science and Technology (3 credit hours)
For centuries brewing has been and remains a vitally important application of fermentation science, both economically and socially. This course will provide a detailed description of the fundamental chemical and biological processes involved in brewing beer, as well as the physical and hygienic aspects of modern beer production. Successful completion of this course will provide students with the understanding of the science and technology underlying the key steps in a commercial brewing process and provide the basic knowledge necessary for an entry level position in a commercial brewery.

Prerequisite: CH 101 and BIO 183 or BIO 181
Typically offered in Spring only

BBS 326/FS 326 Brewing Practices and Analyses (3 credit hours)
This course will provide a hands on learning experience to both complement the classroom lectures offered in BBS/FS 325 and acquaint the student with the equipment and practices encountered in real-world analytical labs of breweries of all scales. The laboratory experience will replicate the sequence of events encountered in actual beer production and illustrate the relevant evaluations and analyses which are concurrent with those processing steps, stressing at each stage not only the execution of the appropriate analytical or testing techniques, but also corrective action that may be taken should undesirable results be obtained.

Prerequisite: BBS/FS 325 Introduction to Brewing Science and Technology
Typically offered in Fall only

BBS 426/FS 426/BEC 426/BBS 526/FS 526/BEC 526 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

BBS 427/FS 427 Brewing Equipment, Controls and Operations (3 credit hours)
Modern commercial brewing is an equipment and utility intensive endeavor. Emphasis on efficiency, flexibility and sanitation has led to equipment and controls which have vastly improved the volume and consistency of brewery output while also improving safety and the quality of the working environment. In order to manage the transfer of material and energy in the brewing process, individual components within the brewing system, as well holistic function of the brewery environment have been adapted to maximize efficiency. Knowledge of the specific design and operation of these components within the overall system is crucial to the proper functioning of a brewery. The operation of individual components and processes within the brewery will be examined in terms of the physics and engineering principles driving their function. On completion, this course will provide sufficient knowledge of brewery equipment and operations to function successfully in an entry to mid-level position.

Corequisite: BBS 325 or FS 325
Typically offered in Spring only

BBS 526/FS 526/BEC 526/BBS 426/FS 426/BEC 426 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

Biotechnology (BIT)

BIT 100 Current Topics in Biotechnology (4 credit hours)
This course provides both science and non-science students an opportunity to learn about current issues in biotechnology that play a role in our society. Topic areas will include contemporary and historical applications of biotechnology. From alternative fuel sources to the ramifications of the elucidation of the human genome on health care issues, advances in biotechnology are constantly reshaping the world we live in. Students will give presentations and participate in discussions in the classroom, as well as be engaged in the laboratory on a variety of different topics in biotechnology that affects all our lives.

Prerequisite: High School Biology
GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall only

BIT 200 Early Research in Biotechnology (4 credit hours)
This course offers first-and second-year students an opportunity for a mentored research experience in a small class environment. Students will learn how to apply the scientific method to make new discoveries and contribute to scientific knowledge. Students may need to come to the lab outside class meeting times to complete work on occasion (flexible hours). Examples of research questions to be investigated in different sections: - Investigating bacteriophage for the management of American Floubrood Disease (AFS) of honey bees - Using planarian as a model system for studying genes important in stem cell differentiation and regeneration - Investigating the genetic potential of complex microbial populations. - Gene expression profiling in zebrafish embryos exposed to antibiotics and anti-acne compounds Freshmen and Sophomores only.

Prerequisite: High School Biology
GEP Natural Sciences
Typically offered in Fall and Spring

BIT 210/MB 210 Phage Hunters (3 credit hours)
This course offers first-year students an opportunity for mentored research. Students will apply the scientific method to make novel discoveries. Students will isolate and characterize naturally-occurring bacteriophage (viruses that infect bacteria, but not humans) from the environment. They will present their data to each other, and the genome of one phage will be sequenced. Students have the option to continue in a second semester to annotate that genome, culminating in a submission to genbank and a poster presentation. Students in the course are part of the National Genome Research Initiative funded by The Howard Hughes Medical Institute. Student should have had a high school biology course before taking this course.

GEP Natural Sciences
Typically offered in Fall only

BIT 211/MB 211 Phage Genomics (2 credit hours)
This course offers first-year students an opportunity for mentored research. Student will apply the scientific method to make novel discoveries. Students will build on the work they began in BIT/MB 210; The novel phage isolated in the previous semester will undergo genome sequencing over winter break, and in this course students will learn to analyze and annotate the genome sequence. This semester will culminate in a submission to genbank and a poster presentation. Students in the course are part of the national genome research initiative funded by the Howard Hughes Medical Institute.

Prerequisite: BIT(MB) 210
GEP Natural Sciences
Typically offered in Spring only

BIT 295 Special Topics in Biotechnology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BIT 402/BIT 502 Biotechnology Networking and Professional Development (1 credit hours)
This course provides students interested in the biotechnology field an opportunity to gain valuable network, job application and interviewing skills. Over the course of the semester students will meet with ~30 biotechnology professionals in our area. In addition, students will learn from individuals in biotechnology jobs about the diverse careers options available and strategies for navigating the job market successfully.

Typically offered in Spring only

BIT 410 Manipulation of Recombinant DNA (4 credit hours)
Introduction to molecular biology and protein chemistry. Theory behind laboratory techniques and overview of cloning strategies starting from nucleic acid or protein sequence data. Laboratory sessions involve subcloning, preparation of competent cells, transformation, screening recombinant DNA by colony hybridization and PCR, SDS-PAGE of recombinant protein, affinity purification, and western blots.

Prerequisite: BIO 183 or ZO/BIO 160 and CH 223 or CH 227 with a C- or better
Typically offered in Fall, Spring, and Summer

BIT 463/CHE 463/BEC 463/BIT 563/CHE 563/BEC 563 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall and Spring

BIT 464/BIT 564 Protein Purification (2 credit hours)
Comparison of several different chromatography techniques for protein purification. Construction of purification tables and SDS-and native-PAGE analysis. Cost-benefit analysis of industrial-scale procedures. Half semester course, second part.

Prerequisite: BIT 410 or BIT 510 or BCH 454
Typically offered in Spring only

BIT 465/BIT 565 Real-time PCR Techniques (2 credit hours)
Real time PCR is an evolving technique with its basis in the dynamic properties of the polymerase chain reaction and fluorescent detection. We will review current real-time theory, techniques, machinery, troubleshooting, tools, and advanced protocols for sequence detection including SYBR green, TaqMan, Beacons, multiplexing, and single nucleotide polymorphism analysis. Students will have the opportunity to utilize skills learned during lecture in a laboratory environment. At the conclusion of this course, students should feel comfortable with real-time experimental design, its tools, and analysis of generated data. This is a half-semester course. Student must register for both lecture and lab sections.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 466/BIT 566 Animal Cell Culture Techniques (2 credit hours)
Introduction to animal cell culture techniques. Aseptic technique for vertebrate cell culture, media formulation, primary cell culture, long-term maintenance of cell lines, application of molecular techniques to in vitro situations. Half semester course, first part.

Typically offered in Fall, Spring, and Summer

BIT 467/BIT 567 PCR and DNA Fingerprinting (2 credit hours)
Introduction to polymerase chain reaction. Optimization of PCR reactions and primer design for DNA sequences using DNA databases available on the web. Laboratory sections include using rapid techniques for isolating and sequencing DNA from small amounts of sample and forensic identification of individuals using isolated human hairs. Credit is not allowed for both BIT 467 and BIT 567.

Prerequisite: BIT 410/510
Typically offered in Spring only

BIT 471/BIT 571 RNA Interference and Model Organisms (2 credit hours)
Introduction and history of RNA interference technology. Principles, mechanism, and applications of RNA interference in model organisms. Laboratory sessions include RNA interference-mediated silencing of genes in plants, C. elegeans, and mammalian cell culture. This is a half-semester course (8 weeks). Student may not earn credit for both BIT 471 and BIT 571.

Prerequisite: BIT 410 or BIT 510 or BCH 454
Typically offered in Spring only

BIT 473/BIT 573 Protein Interactions (2 credit hours)
The interactions of proteins mediate numerous biological processes of cells. This course focuses on ways to identify and study protein-protein interactions, focusing on the advantages and limitations of each technique and how to apply the methods in a laboratory setting. In lab, students will perform a yeast two-hybrid experiment and a co-immunoprecipitation from proteins expressed in mammalian cell culture to confirm detected interactions. This a half-semester course.

Prerequisite: BIT 410 or BCH 454
Typically offered in Fall only

BIT 474/BIT 574 Plant Genetic Engineering (2 credit hours)
This course covers fundamental hands-on techniques and strategies in plant genetic engineering. Plants are major sources of food, fiber and fuel and provide model systems for both fundamental and applied research. Students will learn techniques for stable and transient transformation of plants and plant cell cultures and selection and detection of transgene expression. Additional topics covered will include methods to generate and screen for mutants, synthetic biology and applications of plant genetic engineering. This is a half-semester course. Credit is not allowed for both BIT 474 and BIT 574.

Prerequisite: BIT 410 or BIT 510 or BCH 454 or PB 421
Typically offered in Fall only

BIT 476 Applied Bioinformatics (2 credit hours)
The haploid human genome occupies a total of just over 3 billion DNA base pairs. This information is not contained in books, but stored in electronic databases. Computational biology utilizes infer function by comparative analysis. This course is designed for life scientists from all fields to introduce them to the power of bioinformatics and enable them to access and utilize biological information in databases for their own research.

Prerequisite: BIT 410 or BCH 454 or GN 311
Typically offered in Fall only

BIT 477/BIT 577 Metagenomics (2 credit hours)
Participants will be introduced to a variety of methods for studying the complex microbial populations that surround us, including theory, applications, limitations, and health and legal implications. Students will apply deep sequencing techniques to mine the genetic diversity of complex microbial populations such as the rhizosphere, a swine lagoon sample, or even the communities of microbes growing happily inside your kitchen sink drain. This course will provide hands-on experience with molecular and computational tools that can be used to study the relationships between microbial communities and ecosystems or hosts.

Prerequisite: BIT 410 or 510
Typically offered in Fall only

BIT 479/BIT 579 High-Throughput Discovery (2 credit hours)
In this eight-week lab module, participants will be introduced to high-throughput (HT) discovery science and the underlying quantitative biology skills necessary for robust assay design. Participants will learn modern high-throughput screening approaches that will prepare them to design, validate, and perform cutting-edge screens. Different HT approaches will be discussed using authentic case studies and critical thinking scenarios based on published studies. Essential quantitative biology skills for the design and analysis of HT discovery science will be emphasized and tested regularly using "biomath" quizzes. The power of automation and robotics will be highlighted and hands-on experience with a liquid handler and the software used to operate it will be routine in the lab sessions. Participants will also be exposed to novel high-throughput approaches through discussions of new technologies and guest speakers who are experts in the field. Students will not receive credit for both BIT 479 and BIT 579.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 480/BIT 580 Yeast Metabolic Engineering (2 credit hours)
Participants will be introduced to a variety of methods for using yeast to produce commercially relevant products. Topics will include cultivation, genetic manipulation to delete or replace genes, transformation, heterologous gene expression and codon optimization/gene synthesis. Various modern molecular cloning approaches and computational resources will be discussed. Students will apply gene manipulation approaches to engineer Saccharomyces cerevisiae to produce beta-carotene and/or other relevant biotechnology products. This will be accomplished by assembling a series of optimized genes in the biosynthetic pathway using the versatile genetic assembly system (VEGAS) that exploits the capacity of Saccharomyces cerevisiae to join sequences with terminal homology by homologous recombination. Expression will be compared by assembling libraries of transcriptional units with different promoters and using different genetic knock-outs as hosts. Additionally, computational modeling of metabolic processes will be used to assess perturbations to metabolic fluxes.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 481/PB 481 Plant Tissue Culture and Transformation (2 credit hours)
Basic techniques in plant tissue culture and transformation. Empirical approaches to techniques in plant tissue culture, designing transgenes for expression in specific plant cell organelles and tissues, use of reporter genes to optimize transformation, and troubleshooting transformation. Laboratory sessions provide hands-on experience with plant tissue culture and transformation. Use of reporter genes, fluorescence microscopy and digital imaging. Half semester course, first part.

Typically offered in Spring only

BIT 482/BIT 582 Virus Biotechnology: Pathogens to Therapeutics (2 credit hours)
In this course, students will be introduced to concepts spanning principles in molecular virology through to engineering of viruses as molecular therapeutics. Students will be able to describe the basic tenets of molecular virology, articulate several principle uses of viruses in biotechnology applications, and perform data analysis on several fundamental virus assays.

Prerequisite: BIT 410
Typically offered in Fall and Spring

BIT 492 External Learning Experience (1-6 credit hours)
A learning experience in the area of biotechnology within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, and the departmental teaching coordinator prior to the experience. Project must be approved by the Academic Coordinator or Program Director of the Biotechnology Program.

Typically offered in Summer only

BIT 493 Special Problems in Biotechnology (1-6 credit hours)
A learning experience within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective mentor(s) must be initiated by student and approved by a faculty adviser, the prospective mentor, and the departmental teaching coordinator prior to the experience. Project must be approved by the Academic Coordinator of Program Director of the Biotechnology Program.

Typically offered in Fall, Spring, and Summer

BIT 495 Special Topics in Biotechnology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BIT 501 Ethical Issues in Biotechnology (1 credit hours)
Students investigate and discuss current controversial issues in biotechnology. This course emphasizes thinking about new technologies in a rational and thoughtful way.

Typically offered in Fall and Spring

BIT 502/BIT 402 Biotechnology Networking and Professional Development (1 credit hours)
This course provides students interested in the biotechnology field an opportunity to gain valuable network, job application and interviewing skills. Over the course of the semester students will meet with ~30 biotechnology professionals in our area. In addition, students will learn from individuals in biotechnology jobs about the diverse careers options available and strategies for navigating the job market successfully.

Typically offered in Spring only

BIT 510 Core Technologies in Molecular and Cellular Biology (4 credit hours)
Basic technologies of recombinant DNA procedures, gene expression, isolation and identification of nucleic acids and proteins.

Prerequisite: Equivalent of CH 223 and (MB 351 or GN 311)
Typically offered in Fall, Spring, and Summer

BIT 563/CHE 563/BEC 563/BIT 463/CHE 463/BEC 463 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall and Spring

BIT 564/BIT 464 Protein Purification (2 credit hours)
Comparison of several different chromatography techniques for protein purification. Construction of purification tables and SDS-and native-PAGE analysis. Cost-benefit analysis of industrial-scale procedures. Half semester course, second part.

Prerequisite: BIT 410 or BIT 510 or BCH 454
Typically offered in Spring only

BIT 565/BIT 465 Real-time PCR Techniques (2 credit hours)
Real time PCR is an evolving technique with its basis in the dynamic properties of the polymerase chain reaction and fluorescent detection. We will review current real-time theory, techniques, machinery, troubleshooting, tools, and advanced protocols for sequence detection including SYBR green, TaqMan, Beacons, multiplexing, and single nucleotide polymorphism analysis. Students will have the opportunity to utilize skills learned during lecture in a laboratory environment. At the conclusion of this course, students should feel comfortable with real-time experimental design, its tools, and analysis of generated data. This is a half-semester course. Student must register for both lecture and lab sections.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 566/BIT 466 Animal Cell Culture Techniques (2 credit hours)
Introduction to animal cell culture techniques. Aseptic technique for vertebrate cell culture, media formulation, primary cell culture, long-term maintenance of cell lines, application of molecular techniques to in vitro situations. Half semester course, first part.

Typically offered in Fall, Spring, and Summer

BIT 567/BIT 467 PCR and DNA Fingerprinting (2 credit hours)
Introduction to polymerase chain reaction. Optimization of PCR reactions and primer design for DNA sequences using DNA databases available on the web. Laboratory sections include using rapid techniques for isolating and sequencing DNA from small amounts of sample and forensic identification of individuals using isolated human hairs. Credit is not allowed for both BIT 467 and BIT 567.

Prerequisite: BIT 410/510
Typically offered in Spring only

BIT 571/BIT 471 RNA Interference and Model Organisms (2 credit hours)
Introduction and history of RNA interference technology. Principles, mechanism, and applications of RNA interference in model organisms. Laboratory sessions include RNA interference-mediated silencing of genes in plants, C. elegeans, and mammalian cell culture. This is a half-semester course (8 weeks). Student may not earn credit for both BIT 471 and BIT 571.

Prerequisite: BIT 410 or BIT 510 or BCH 454
Typically offered in Spring only

BIT 572/BIO 572/CH 572 Proteomics (3 credit hours)
Introduction and history of the field of proteomics followed by the principles and applications of proteomics technology to understand protein expression and protein post-transitional modifications. Laboratory sessions include growing yeast with stable-isotope labeled amino acids, protein purification, Western blots, protein identification and quantification, and protein bioinformatic analysis. This is a half-semester course.

Prerequisite: BIT 410 or BIT 510 or BCH 454 (or approval from the instructor)
Typically offered in Spring only

BIT 573/BIT 473 Protein Interactions (2 credit hours)
The interactions of proteins mediate numerous biological processes of cells. This course focuses on ways to identify and study protein-protein interactions, focusing on the advantages and limitations of each technique and how to apply the methods in a laboratory setting. In lab, students will perform a yeast two-hybrid experiment and a co-immunoprecipitation from proteins expressed in mammalian cell culture to confirm detected interactions. This a half-semester course.

Prerequisite: BIT 410 or BCH 454
Typically offered in Fall only

BIT 574/BIT 474 Plant Genetic Engineering (2 credit hours)
This course covers fundamental hands-on techniques and strategies in plant genetic engineering. Plants are major sources of food, fiber and fuel and provide model systems for both fundamental and applied research. Students will learn techniques for stable and transient transformation of plants and plant cell cultures and selection and detection of transgene expression. Additional topics covered will include methods to generate and screen for mutants, synthetic biology and applications of plant genetic engineering. This is a half-semester course. Credit is not allowed for both BIT 474 and BIT 574.

Prerequisite: BIT 410 or BIT 510 or BCH 454 or PB 421
Typically offered in Fall only

BIT 577/BIT 477 Metagenomics (2 credit hours)
Participants will be introduced to a variety of methods for studying the complex microbial populations that surround us, including theory, applications, limitations, and health and legal implications. Students will apply deep sequencing techniques to mine the genetic diversity of complex microbial populations such as the rhizosphere, a swine lagoon sample, or even the communities of microbes growing happily inside your kitchen sink drain. This course will provide hands-on experience with molecular and computational tools that can be used to study the relationships between microbial communities and ecosystems or hosts.

Prerequisite: BIT 410 or 510
Typically offered in Fall only

BIT 579/BIT 479 High-Throughput Discovery (2 credit hours)
In this eight-week lab module, participants will be introduced to high-throughput (HT) discovery science and the underlying quantitative biology skills necessary for robust assay design. Participants will learn modern high-throughput screening approaches that will prepare them to design, validate, and perform cutting-edge screens. Different HT approaches will be discussed using authentic case studies and critical thinking scenarios based on published studies. Essential quantitative biology skills for the design and analysis of HT discovery science will be emphasized and tested regularly using "biomath" quizzes. The power of automation and robotics will be highlighted and hands-on experience with a liquid handler and the software used to operate it will be routine in the lab sessions. Participants will also be exposed to novel high-throughput approaches through discussions of new technologies and guest speakers who are experts in the field. Students will not receive credit for both BIT 479 and BIT 579.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 580/BIT 480 Yeast Metabolic Engineering (2 credit hours)
Participants will be introduced to a variety of methods for using yeast to produce commercially relevant products. Topics will include cultivation, genetic manipulation to delete or replace genes, transformation, heterologous gene expression and codon optimization/gene synthesis. Various modern molecular cloning approaches and computational resources will be discussed. Students will apply gene manipulation approaches to engineer Saccharomyces cerevisiae to produce beta-carotene and/or other relevant biotechnology products. This will be accomplished by assembling a series of optimized genes in the biosynthetic pathway using the versatile genetic assembly system (VEGAS) that exploits the capacity of Saccharomyces cerevisiae to join sequences with terminal homology by homologous recombination. Expression will be compared by assembling libraries of transcriptional units with different promoters and using different genetic knock-outs as hosts. Additionally, computational modeling of metabolic processes will be used to assess perturbations to metabolic fluxes.

Prerequisite: BIT 410 or 510
Typically offered in Spring only

BIT 581 Plant Transformation (2 credit hours)

BIT 582/BIT 482 Virus Biotechnology: Pathogens to Therapeutics (2 credit hours)
In this course, students will be introduced to concepts spanning principles in molecular virology through to engineering of viruses as molecular therapeutics. Students will be able to describe the basic tenets of molecular virology, articulate several principle uses of viruses in biotechnology applications, and perform data analysis on several fundamental virus assays.

Prerequisite: BIT 410
Typically offered in Fall and Spring

BIT 590 Independent Study in Biotechnology (1-3 credit hours)
Independent study in Biotechnology under the supervision of a Biotechnology faculty member. Restricted to graduate students in the Biotechnology Program with consent of the supervising faculty. May not be taken in the first semester of graduate study.

Typically offered in Fall, Spring, and Summer

BIT 595 Special Topics (1-6 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BIT 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Master's students only
Typically offered in Fall and Spring

BIT 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

BIT 790 Independent Study in Biotechnology (1-3 credit hours)
Independent study in Biotechnology under the supervision of a Biotechnology faculty member. Restricted to graduate students in the Biotechnology Program with consent of the supervising faculty. May not be taken in the first semester of graduate study.

Typically offered in Fall, Spring, and Summer

BIT 815 Advanced Special Topics (1-6 credit hours)
Intensive three-week or six-week courses in advanced technologies such as DNA sequencing, downstream processing, immunological techniques, construction of c-DNA libraries, mammalian embryo manipulation, plant transformation, bioreactor design, cloning in gram positive bacteria, electron microscopy or techniques in yeast molecular biology.

Prerequisite: BIT 510
Typically offered in Summer only

BIT 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Doctoral students only (DR)
Typically offered in Fall and Spring

Business Administration (MBA)

MBA 501 Financial Accounting for Decision Makers (1 credit hours)
Methods used by accountants record to economic events such as operating, investing, and financing activities, in the income statement, balance sheet, and statement of cash flows. Analysis of financial statements and disclosures. Impact of accounting standards and managerial incentives on the financial reporting process. Restricted to MBA students.

Typically offered in Fall, Spring, and Summer

MBA 502 Managerial Accounting for Decision Makers (1 credit hours)
Foundational knowledge in managerial accounting for decision making. Internal uses of accounting information for decision making within the organization. Identification of revenue and cost information to conduct break-even analyses, assign product costs, complete operational budgets, assess performance, and complete other management decision-making processes. Restricted to MBA students.

Prerequisite: MBA 501
Typically offered in Fall, Spring, and Summer

MBA 505 Essential Economics for Managers (2 credit hours)
Survey of economic concepts applied to management decisions. Competition. Market power. The firm, production, and cost. Pricing practices. Output. Market success. Market failure. Restricted to MBA students.

Typically offered in Fall and Spring

MBA 506 Data-Driven Managerial Decisions 1 (1 credit hours)
Business cases and problems where data analysis is part of the decision-making process. Applications to finance, management, marketing, and operations. Proficiency in Excel methods commonly used in management. Completion of a project where students follow a business problem from formulation to solution using data analysis. Restricted to MBA students.

Prerequisite: BUS/ST 350
Typically offered in Fall, Spring, and Summer

MBA 507 Data-Driven Managerial Decisions 2 (1 credit hours)
Continuation of a series of business cases and problems where data analysis is part of the decision making process. Estimation of linear relationships among variables, with applications to finance, management, marketing, and operations. Proficiency with Excel methods commonly used for estimation. Completion of a project where students follow a business problem from formulation to solution using the methods covered the course. Restricted to MBA students.

Prerequisite: MBA 506
Typically offered in Fall and Spring

MBA 510 Critical Thinking for Managers (1 credit hours)
Structure for critically analyzing and evaluating an issue, claim, text, or speech from a management perspective. Systematic analysis and evaluation of information, concepts, and ideas in order to identify underlying assumptions, purposes, and questions. Synthesis of this knowledge to logically form conclusions and recognize implications. Communication of arguments and beliefs and recognition of common language barriers in the written and spoken word. For online sections, must be enrolled in MBA program.

Typically offered in Fall and Spring

MBA 511 Data Security and Privacy (3 credit hours)
Data security and privacy necessary for todayÃ¿s business environment. Common vulnerabilities, securing data, encryption, policies, privacy management, standards, and compliance.

Typically offered in Fall and Spring

MBA 512 Ethical Thinking for Managers (1 credit hours)
This course provides students a foundation for thinking through business issues from an ethical perspective. Students will advance their skills for recognizing and reasoning through ethical dilemmas in management, with an aim toward developing essential ethical traits including integrity, empathy, courage, fairmindedness,autonomy. perseverance, humility, and confidence in reason. Students will apply a structured, reasoned process for resolving ethical dilemmas, and will engage in personal reflection to continue to develop their intellectual traits.

Restriction: MBA Students Only; MBA 510 (Critical thinking for managers) is a required prereq.
Typically offered in Fall and Spring

MBA 515 Enterprise Resource Planning Systems (3 credit hours)
Market and evolution of enterprise resource planning (ERP) systems and ERP technology. Business process reengineering in sales, purchasing, human capital, accounting, plant maintenance and warehousing using SAP Security issues. Course can lead to SAP University Alliance Recognition.

Typically offered in Fall and Spring

MBA 518 Enterprise Risk Management (3 credit hours)
Integrated approach to managing the risks that can prevent an organization from achieving its objectives, both financial and non-financial. Core elements of an effective enterprise risk management process. Links to management strategy. Risk assessment methodologies.

Typically offered in Fall only

MBA 519 Enterprise Risk Management Practicum (3 credit hours)
Applied approach to managing the risks that can prevent an organization from achieving its objectives, both financial and nonfinancial, by working in teams to address real problems in real organizations.

Prerequisite: MBA 518
Typically offered in Spring only

MBA 520 Financial Management of Corporations (2 credit hours)
Financial decision making at profit-motivated businesses: decisions about what to produce and how and decisions about how to finance the assets needed for production. Cash as the basis of asset valuation. Capital budgeting decisions under certainty and uncertainty. Capital market theory. Cost of capital. Bond and stock valuation. Restricted to MBA students.

Prerequisite: MBA 501 Financial Accounting for Decision Makers
Typically offered in Fall, Spring, and Summer

MBA 521 Advanced Corporate Finance (3 credit hours)
Overview of financial management. Evaluation of projects and valuation of real assets using traditional discounted cash flow analysis and real options. Role of financial leverage; optimal capital structure. Conflicts between security holders and management; stockholder-bondholder conflicts; financial distress, bankruptcy and reorganization; corporate control and restructuring; corporate governance issues.

Prerequisite: MBA 520
Typically offered in Fall and Spring

MBA 522 Financial Modeling (3 credit hours)
This course examines models for capital budgeting, equity and bond valuation, capital structure, dividend policy, among other topics, using spreadsheet analyses. The course will take a very hands-on approach in building spreadsheet models. The course also includes sensitivity analysis, pro-forma analysis and using financial statements.

Prerequisite: MBA 520
Typically offered in Fall only

MBA 523 Investment Theory and Practice (3 credit hours)
Advanced topics in investments with a focus on underlying theory and practical application using real world data. Stock valuation models, bond valuation, derivatives, portfolio performance evaluation, investment strategies, efficient market theory and other current issues in investment finance.

Prerequisite: MBA 520
Typically offered in Fall and Spring

MBA 524 Equity Valuation (3 credit hours)
Advanced quantitative course on applied equity valuation. Students conduct stock valuation analysis which is then used to select stocks for the student-managed SunTrust MBA fund. Topics include the investment decision making process, empirical evidence on securities returns, forecasting financial statements, industry and macro-economic analysis, valuation models, portfolio performance evaluation and performance attribution. Students will also learn how to write computer programs using SAS software in order to generate statistical tests of investment strategies using "big financial data.

Prerequisite: MBA 520
Typically offered in Spring and Summer

MBA 525 Taxes and Business Strategy (3 credit hours)
Importance of tax consideratoins in business decisions. Framework for understanding how taxes affect business strategy and financing decisions in a wide variety of settings.

Typically offered in Spring only

MBA 526 International Finance (3 credit hours)
Theory and practice of financial management in the international arena, including spot and forward markets for foreign exchange, currency futures and options contracts, international arbitrage conditions, foreign exchange exposure, foreign trade financing instruments, direct and portfolio investment abroad, and the role of country risk in determining investments.

Prerequisite: MBA 520
Typically offered in Fall only

MBA 530 Leading People (3 credit hours)
This course is about the fundamentals of leading people, a critical aspect of every management position and leadership role. The course will focus at three levels of analysis: the individual, the group and the organization. Students will gain exposure to topics and issues in the field of organizational behavior and human resource management. These include knowing about and dealing with individual differences, international and cultural issues, working in groups (both virtually and geographically co-located), motivation, leadership, organizational structures and cultures, change management, empowerment, delegation, communication, and management ethics. Restricted to MBA students.

Typically offered in Spring only

MBA 531 Leading People 1 (1 credit hours)
This one-credit course is designed for part-time and online students and serves as the first part of the Leading People series. The Leading People series focuses at three levels of analysis: the individual, the group and the organization. In this series, students will gain exposure to topics and issues in the field of organizational behavior and human resource management. Content covered in part 1 addresses team leadership and change management. This course also includes instruction on improving communication skills, making presentations, leading from strengths, and emotional intelligence. Restricted to MBA students. Students may not receive credit in MBA 530 and MBA 531.

Restriction: Restricted to MBA students. Students may not receive credit in MBA 530 and MBA 531.
Typically offered in Fall and Spring

MBA 532 Leading People 2 (2 credit hours)
This two-credit course is designed for part-time and online students and serves as the second part of the Leading People series. The Leading People series focuses at three levels of analysis: the individual, the group and the organization. Students will gain exposure to topics and issues in the field of organizational behavior and human resource management. Content covered in this course includes dealing with individual differences, international and cultural issues, working in groups (both virtually and geographically co-located), motivation, leadership, organizational structures and cultures, empowerment, delegation, and management ethics. Restricted to MBA students. Students may not receive credit in MBA 530 and MBA 532.

Restriction: Restricted to MBA students. Students may not receive credit in MBA 530 and MBA 532.
Typically offered in Spring and Summer

MBA 533 Negotiation and Conflict Management (3 credit hours)
Course emphasizes ensuring that the organization benefits from inevitable conflicts that occur. It provides skills in diagnosis, negotiation, and building trust and cooperative working relationships in organizations.

Typically offered in Fall only

MBA 534 Core Concepts of Human Capital Management (3 credit hours)
The course will cover the core concepts behind successfully acquiring, deploying and motivating talent to achieve organization competitiveness. Students will think strategically about company human assets, learn basic HRM concepts and then create practical solutions to typical HCM problems. At the end of this course, students will demonstrate a basic understanding of the topics of equal opportunity employment, diversity, recruiting and selection, performance evaluation, performance goal setting, performance coaching and feedback, competitive compensation and benefits, fair discipline and termination processes and strategic talent management and succession programs.

Typically offered in Fall only

MBA 535 Leading Teams (1 credit hours)
More and more organizations are using team-based work to accomplish tasks. This course provides the latest, evidence-based best practices for working in, and leading, teams in organizations. The course is designed to be activity-driven and hands-on to give students the opportunity to practice and improve their team skills.

Typically offered in Fall only

MBA 536 Experience Innovation and Strategic Design (3 credit hours)
Successful innovation involves creating more valuable experiences for users and customers. The course covers key concepts and methodologies for experience-based innovation, drawing on design and creativity frameworks to fully understand customer experiences. Course activities include exercises and a project to practice innovation and "design-thinking" tools and techniques in a business context. Relevant strategic perspectives for designing innovative products and services are addressed through case studies and other managerial readings with practical business application. The importance of a multi-disciplinary approach to experience innovation is emphasized, such that the course is suitable for students in all disciplines with an interest in innovation.

Typically offered in Spring only

MBA 538 Women as Leaders (1 credit hours)
This course focuses on helping women uncover and reflect on their leadership styles so that they can become more empowered leaders, take responsibility for recognizing the potential in people and ideas, and have the courage to develop that potential.

Typically offered in Spring only

MBA 539 Jenkins Leadership Challenge (1 credit hours)
Leadership skills are highly valued in today's business environment. This is the capstone course for the Jenkins MBA Leadership Certificate. In other classes in the leadership series, students have learned what a successful leader is, what a successful leader does, and how a successful leader deals with contingencies in an effective way. In this class participants will review the Five Practices of Exemplary Leadership and select behaviors in their own leadership practice that need to be adjusted for stronger leadership performance. Students will then plan and execute a personal leadership challenge to address these behaviors. Course content includes a leadership assessment, lectures and readings, required participation in group coaching, periodic individual reflections, development of videos for leadership challenge proposals and testimonials, and a final paper that reflects on the student's journey through the leadership program and identifies plans for the future.

Prerequisite: MBA 510 and MBA 530 or MBA 531 and MBA 532.
Typically offered in Fall and Spring

MBA 540 Principles of Operations and Supply Chain Management (2 credit hours)
Design and management of operations and supply chains. Analysis of strategies, processes, planning and control, and advanced techniques using a variety of managerial frameworks and quantitative tools. Restricted to MBA students.

Prerequisite: MBA 507
Typically offered in Fall and Spring

MBA 541 Supply Management (3 credit hours)
Major themes and strategies of supply management relationships. The focus is on establishing a basis for collaborative relationships with suppliers through focused market intelligence research, relationship assessment and management, negotiation, collaborative contracting, and on-going management of relationships in global supply chains. Emphasis on the importance of collaboration through the application of practical tools and approaches that drive mutually beneficial outcomes. Core processes around initial exploration and assessment of supply chain relationships, establishing metrics/expectations for the relationship, crafting and managing contracts, and sustaining continuous performance improvement in sourcing, logistics and operations. Every student will participate in a team-based supply chain project with an organization and will learn the team-based, deadline-driven nature of supply chain initiatives in a real-company setting.

Co-requisite: MBA 540 Operations and Supply Chain Management
Typically offered in Fall and Spring

MBA 542 Supply Chain Logistics (3 credit hours)
Effective logistics decision-making using a variety of conceptual frameworks and quantitative tools. Relationship between logistics and broader issues of managing the entire supply chain and fulfilling the strategic objectives of a firm. Inventorymanagement. Transportation. Network design.

Typically offered in Fall and Spring

MBA 543 Planning and Control Systems (3 credit hours)
Design and management of planning and control systems within the organization and across the supply chain. Business planning, master production scheduling, material requirements planning, just-in-time and theory of constraints. Enterprise resourceplanning (ERP) and business-to-business (B2B) systems. Impact of information technologies on planning and control systems. Major project using state-of-the-art ERP system.

Typically offered in Spring only

MBA 545 Decision Making under Uncertainty (3 credit hours)
Structured framework for modeling and analyzing business decisions in the presence of uncertainty and complex interactions among decision parameters. Topics include decision models, value of information and control, risk attitude, spreadsheet applications, and decision analysis cycle. Interactive case study.

Typically offered in Fall, Spring, and Summer

MBA 548 Analytical Supply Chain Management (3 credit hours)
The objective of the course is to build an understanding of how to manage and improve the performance (efficiency and responsiveness) of operations and supply chains through decision making that is based on analysis and facts, rather than intuition. The course introduces fundamental aspects of operations and supply chain management as well as analytical modeling tools and techniques that can be used to support decision making (e.g., optimization, regression analysis, simulation). The approach taken in the course is entirely example-based and hands-on, since all these techniques will be implemented in Excel, either with Excel's built-in tools or with Excel add-ins.

Prerequisites: MBA 507 and MBA 540
Typically offered in Fall only

MBA 549 Supply Chain Management Practicum (3 credit hours)
Research project examining supply chain management issues at an organization, usually a member of the Supply Chain Resource Cooperative. Projects will typically focus on procurement, logistics, materials management, operations, or integrated supply chain issues.

Prerequisite: MBA 540
Typically offered in Fall and Spring

MBA 551 Predictive Analytics for Business and Big Data (3 credit hours)
This course is designed around the full analytics lifecycle which encompasses the business problem, the data, the analysis, and the decision. Students will learn to identify and clearly explain business problems that can be addressed with analytics. They will learn to determine which analytic methods are best suited to solve particular problems and clearly explain the results of an analytic model and how those results might impact the business bottom line. Analytical methods to be covered include data, visualization, a review of regression analysis; logistic regression; classification and regression trees (including boosting and bagging methodologies); and clustering (segmentation) methods. Students will also develop at least a beginning proficiency with several statistical software packages including Tableau, JMP, R, and SAS Enterprise Miner. Emphasis will be placed on analyzing real data and understanding how analytical thinking can be applied to solve big data problems.

Prerequisites: MBA 506 and MBA 507
Typically offered in Fall, Spring, and Summer

MBA 552 Data Engineering, Management and Warehousing (3 credit hours)
This course examines how to collect and process data to make it useful, how to validate, protect, and process data to make it available, and how to create a place to properly store data.

Typically offered in Fall, Spring, and Summer

MBA 555 Product Design and Development (4 credit hours)
Total product realization process, including customer needs analysis, product design and engineering, manufacturability assessment and marketing plan development. Definition of relevant market, design and engineering principles, financial considerations and manufacturing aspects of product development process. Application and integration of business, design and engineering methodologies, concepts and tools on actual product design and development project.

Typically offered in Fall only

MBA 558 Artificial Intelligence in Management (1 credit hours)
This course will discuss artificial intelligence (AI) and its applications to help make data-driven decisions in business and management. Students will learn to understand the language of AI, discuss different applications of AI, and work with actual AI tools at a high level to develop new insights. Hands-on examples will be complemented by applications of AI drawn from different industries.

Typically offered in Spring only

MBA 559 Business Analytics Practicum (3 credit hours)
This course focuses on solving a real-world business problem that includes a heavy data analytic component. The business problem will vary according to the client but could include problems from finance, human resources, marketing, finance, supply chain, or other management areas.

Prerequisite: MBA 506 and MBA 507 and MBA 551
Typically offered in Fall and Spring

MBA 560 Marketing Management and Strategy (2 credit hours)
Market segmentation, targeting, and positioning. Channels of distribution, promotion strategy, product development strategy, and pricing strategy. Relationship marketing and marketing strategy. Applications in high-tech environments. Restricted to MBA students.

Typically offered in Fall, Spring, and Summer

MBA 561 Consumer Behavior (3 credit hours)
Consumer perception of products and brands, including the role of product design and development of consumer attitudes. Analysis of how consumers make decisions and how those decisions can be influenced by messaging, pricing, and emotions.

Typically offered in Fall and Spring

MBA 562 Research Methods In Marketing (3 credit hours)
A systematic approach to structure, implementation and analysis of marketing research for decision making. Models of consumer demand and firm behavior analyzed in a marketing context.

Typically offered in Fall only

MBA 563 Product and Brand Management (3 credit hours)
Marketing planning and product management. New product concept evaluation and selection. Managing products over the life cycle. Developing and implementing a brand strategy. Repositioning and revitalizing brands Brand extension. Managing globalbrands.

Typically offered in Fall and Spring

MBA 564 Business Relationship Management (3 credit hours)
Strategic, successful management of the multitude of business relationships that contemporary managers face. Universal and idiosyncratic business relationship skills to allow technically-oriented managers such as engineers and scientists to interact with a variety of constituents. Integrated perspective of marketing communications as a process of successfully interacting with each constituency with the goal of fostering long-term satisfaction and loyalty, which ultimately translates to sustainable competitive advantage.

Typically offered in Fall and Spring

MBA 565 Marketing Analytics (3 credit hours)
Analytical techniques to convert a wealth of data on customers and markets into insights to guide business decisions. Taking a hands-on and systematic approach on the steps involved in harnessing knowledge from data, the course covers the various data techniques and steps involved in data- and model-driven management decisions. Techniques include market response models, conjoint analysis, discrete choice models.

Prerequisites: MBA 507 and MBA 560
Typically offered in Fall and Spring

MBA 566 Digital Marketing (3 credit hours)
This course covers the basics of digital marketing from an analytics perspective. Each channel of digital marketing, such as search engine optimization, social, mobile, web, email, and video, are examined and their relationship to overall firm marketing strategy is explored.

Typically offered in Spring only

MBA 570 Opportunity Evaluation and Value Creation (3 credit hours)
First course in a two-course entrepreneurship sequence focusing on opportunities outside the technology arena. Management of the innovative activities of a firm (new and/or existing) to facilitate entrepreneurship-the discovery, evaluation, and exploitation of opportunities to create value. Generation and screening of new product/process ideas or concepts. Transformation of such ideas into products, processes, or services that satisfies stakeholders (e.g., customers, employees). Topics include self-assessment of personal aspirations, skills, and competencies, as well as opportunity identification/evaluation, business model design, and launching and scaling ventures.

Credit not allowed in MBA 570 if the student has already taken MBA 576 or MBA 577.
Typically offered in Fall only

MBA 571 High Growth Entrepreneurship (3 credit hours)
Second course in a two-course entrepreneurship sequence focusing on opportunities outside the technology arena. Theoretical and practical, team-based, approach to the evaluation and assessment of opportunities for value creation. Emphasis on how to discover, validate, and then execute on an action plan to create value. Credit not allowed if the student has already taken MBA 576 or MBA 577.

Prerequisite: MBA 570. Credit not allowed if the student has already taken MBA 576 or MBA 577.
Typically offered in Spring only

MBA 572 Venture Opportunity Analytics (3 credit hours)
Application of the process-based model for new business startups to multiple clients. Emphasis is placed on data gathering, data analysis and data interpretation in the context of evaluating opportunities for new business. Students work in teams on a variety of projects with technology commercialization clients such as Wolfpack Investment Network and Office of Technology Commercialization and New Ventures.

Typically offered in Fall and Spring

MBA 576/MSE 576 Technology Entrepreneurship and Commercialization I (3 credit hours)
First course in a two-course entrepreneurship sequence focusing on opportunities for technology commercialization. Evaluation of commercialization of technologies in the context of new business startups. Emphasis is placed on creating value through technology portfolio evaluation and fundamentals of technology-based new business startups. This includes development of value propositions and strong technology-product-market linkages. The process based approach is appropriate for new business startup as well as entrepreneurship in existing organizations through spinoffs, licensing, or new product development. Credit not allowed for MBA 576 if the student has already taken MBA 570 or MBA 571.

Credit not allowed in MBA 576 if the student has already taken MBA 570 or MBA 571
Typically offered in Fall and Spring

MBA 577/MSE 577 Technology Entrepreneurship and Commercialization II (3 credit hours)
Continuation of evaluation of technologies for commercialization through new business startups. Emphasis is placed on creating value through strong technology-products-markets linkages using the TEC algorithm. Topics include industry and market testing of assumptions, legal forms of new business startups, funding sources and creating a quality, integrative new business startup plan. Credit not allowed in 577 for students who have already taken 570 or 571.

Prerequisite: MBA/MSE 576. Credit not allowed in 577 for students who have already taken 570 or 571.
Typically offered in Fall and Spring

MBA 578 Venture Launch (3 credit hours)
Immersion in the activities of opportunity exploitation. Students work in groups to plan and execute the launch of a new value creating entity. Strategy formulation and strategy implementation for a new business startup. Includes all aspects of value creation for success as a new venture.

Prerequisite: MBA 571 or MBA 577
Typically offered in Fall and Spring

MBA 579 Entrepreneurship Clinic Practicum (3 credit hours)
Inspired by the university teaching hospital model, the NC State Entrepreneurship Clinic is a place where students, faculty, entrepreneurs, and service providers go to teach, learn and build the next generation of businesses in Raleigh. Each person in this class will take on the role of "Clinic Lead" managing groups of undergraduate students working with clients of the NC State Entrepreneurship Clinic during the semester developing ideas, evaluating options, and providing insights to emerging ventures.

Typically offered in Fall and Spring

MBA 580 Creating Value in Organizations (3 credit hours)
Process-based approach to creating high value in existing organizations by understanding strategy formulation and implementation. The approach also will reapplied to entrepreneurs in new venture startups as well as organizations managing innovation and technology changes. Emphasis is placed on learning by applying these processes to existing organizations through strategic management and to new business startups through entrepreneurship. Restricted to MBA students.

Typically offered in Fall, Spring, and Summer

MBA 582 Sustainability and Business (3 credit hours)
Explore the current sustainability trends. Learn how business are integrating sustainability into their strategies. Gain an understanding of the tools businesses are using to operate businesses in a sustainability manner. Experience current and evolving sustainability reporting practices. Explore future trends.

Typically offered in Fall only

MBA 585 Current Topics in BioSciences Management (3 credit hours)
Business processes and strategies across the global BioSciences value chain, including the R&D realities, product life cycles, key elements of product discovery and development, intellectual property, regulatory trials, government approval, production, sourcing, logistics, sales, marketing and customer service. The complete value chain of a new biotechnology-based product.

Typically offered in Spring only

MBA 586 Legal, Regulatory and Ethical Issues in Life Science Industries (3 credit hours)
Exploration of unique environment in which biotechnology research is conducted and resultant drugs and products are sold. Legal restraints affecting pharmaceutical marketing and reimbursement options; regulatory issues; pre-clinical research. Laws limiting or affecting pharmaceutical and biomedical marketing Ethical issues in the research and marketing processes.

Typically offered in Fall only

MBA 589 Jenkins Consulting Practicum (3 credit hours)
This class provides the opportunity to learn about business consulting and be part of a consulting team, helping real clients with real business challenges and market opportunities. Students will help their client organization by understanding a problem, conducting analyses, and suggesting relevant, actionable steps that clients can take to become more competitive or achieve important goals. Projects will deal with creative, complex, risky, and ambiguous issues involved in developing new products/services, serving new markets, achieving quality standards, or creating new business models in an enterprise setting.

Restriction: MBA Students Only
Typically offered in Fall, Spring, and Summer

MBA 590 Special Topics In Business Management (1-6 credit hours)
Presentation of material not normally available in regular courses offerings or offering of new courses on a trial basis.

MBA 610 Special Topics in Business Administration (1-6 credit hours)
Special topics course dealing with issues not covered in regularly scheduled courses. Restricted to MBA students.

MBA 630 Independent Study In Business Management (1-3 credit hours)
Detailed investigation of topics of particular interest to graduate students under faculty direction on a tutorial basis. Determination of credits and content by faculty member in consultation with department head.

Typically offered in Fall, Spring, and Summer

Business Management (BUS)

BUS 225 Personal Finance (3 credit hours)
Economic and financial strategies used to accumulate, manage and protect personal assets. Emphasizing income generation, expense reduction, investment selection, and wealth creation to meet future needs and goals. Topics include investing (mutual funds, stocks, etc.), annuities, insurance, retirement planning, and estate planning.

Typically offered in Fall, Spring, and Summer

BUS 295 Special Topics in Business Management (1-6 credit hours)
Experimental course development. Special topics in Business Management at the introductory level.

BUS 320 Financial Management (3 credit hours)
Financial decision making by businesses, including capital structure and dividend decisions, capital budgeting and working capital management. Basic financial concepts are covered such as risk and return measurement, portfolio theory and the time value of money.

Prerequisite: ACC 210
Typically offered in Fall, Spring, and Summer

BUS 340 Information Systems Management (3 credit hours)
Fundamentals of information systems development and use in organizational setting. Information systems (IS), concepts, hardware, software, telecommunications, database management. IS development, applications and management in telecommunications,database management, various business processes, global issues, security and ethical challenges.

Typically offered in Fall, Spring, and Summer

BUS 350/ST 350 Economics and Business Statistics (3 credit hours)
Introduction to statistics applied to management, accounting, and economic problems. Emphasis on statistical estimation, inference, simple and multiple regression, and analysis of variance. Use of computers to apply statistical methods to problems encountered in management and economics.

Prerequisite: MA 114
Typically offered in Fall, Spring, and Summer

BUS 351 Predictive Analytics for Business (3 credit hours)
This course builds on BUS/ST 350 with an emphasis on the application of statistical methods using software. The course uses analytical methods and tools to drive actionable business decisions. Students will be exposed to a variety of statistical and machine learning methods including linear regression, logistic regression, decision analysis, classification trees, clustering techniques, optimization, monte carlo simulation, and statistical forecasting.

Prerequisites: BUS 340 and (BUS/ST 350, or ST 312, or ST 370, or ST 372); Corequisite: ST 307 or ST 308
Typically offered in Fall and Spring

BUS 360 Marketing Methods (3 credit hours)
Examination of decisions affecting marketing of goods and services in consumer, industrial and international markets. Emphasis on the role of marketing in a managerial context. Areas studied include: the activities of marketing research, identification of marketing opportunities, and the development of marketing mix strategies including the decisions concerning pricing, distribution, promotion and product design.

Prerequisite: MIE 201, Sophomore standing
Typically offered in Fall, Spring, and Summer

BUS 370 Operations and Supply Chain Management (3 credit hours)
Concepts in planning, controlling, and managing the operations function of manufacturing and service firms. Topics include operations strategy, process choice decisions, forecasting, production planning and control, and trends in operations management. Common tools for informed decision-making in these areas.

Typically offered in Fall, Spring, and Summer

BUS 420 Financial Management of Corporations (3 credit hours)
Advanced theory and practice of corporate financial management. Topics covered include: asset management, evaluating financial statements, capital budgeting, alternative investments, cash flow management, equity valuation, and financing. Corporate financial policy decisions will include: cost of capital, capital structure, and dividend policy decisions.

Prerequisite: BUS 320 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Fall, Spring, and Summer

BUS 422 Investments and Portfolio Management (3 credit hours)
Analysis of the investment process, dichotomized into security analysis and portfolio management. Background information on financial assets, securities markets, and risk-return concepts. Analysis of valuation theory and techniques, modern portfoliotheory and portfolio performance.

Prerequisite: BUS 320 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Fall and Spring

BUS 425 Advanced Personal Financial Management (3 credit hours)
Detailed economic, financial and legal analysis of risk management, retirement planning, investments, and estate planning. Additional emphasis on professional financial planning for those interested in personal finance as a career.

Prerequisite: BUS 320
Typically offered in Fall and Spring

BUS 426 International Financial Management (3 credit hours)
Foreign exchange markets, forward markets and derivatives, and their implications for direct and portfolio investment abroad. International capital markets. Multinational company exchange rate exposure measurement and management. Instruments of financing international trade and investment. Multinational capital budgeting and cost of capital.

Prerequisite: BUS 320 and (BUS/ST 350 or ST 305 or ST 312 or ST 370 or ST 372)
Typically offered in Fall and Spring

BUS 428 Financial Analytics (3 credit hours)
Advanced course examining the use of big data analytics in finance. The focus will be on the application of these tools in the areas of asset management and equity valuation. Topics covered include risk-return tradeoff, financial intermediaries in asset management (e.g., mutual funds, hedge funds, etc.), stock valuation models, and using financial statement information in stock selection / asset management. Students will complete a semester-long project involving data analysis (e.g., write an equity research report on a publicly traded U.S. firm, backtest an investment strategy, etc.).

Prerequisite: BUS 320
Typically offered in Spring only

BUS 429 Financial Modeling (3 credit hours)
BUS 429 is 'corporate finance in Excel.' Starting from the theoretical base gained in BUS320, students work through problems in time value of money, capital budgeting, and valuation (among other things) using spreadsheet analyses. The course will take a very hands-on approach in building financial spreadsheet models. Microsoft Excel is the primary tool we will use to implement these financial models and the course will go into detail on the proficient use of Excel.

Prerequisite: BUS 320
Typically offered in Fall and Spring

BUS 440 Database Management (3 credit hours)
The fundamentals of database management within business applications. Data structures, user requirements, structured query language, query by example, application development, user interface design.

Prerequisite: ACC 340 or BUS 340
Typically offered in Fall and Spring

BUS 441 Business Data Communications and Networking (3 credit hours)
The fundamentals of computer networking and the use of computer networks in business applications. Client-server networks, architecture, network hardware and software, key issues in network management, network security, and the fundamentals of datacommunications.

Prerequisite: ACC 340 or BUS 340
Typically offered in Fall and Spring

BUS 442 Information Systems Development (3 credit hours)
This course provides concepts and skills necessary for designing, developing, and deploying information systems (applications) to aid in business and managerial decisions. It includes hands-on experience with development (coding) theory and concepts, objected-oriented algorithm design and development concepts, graphical user interface design concepts, and SQL and data structures using the C# programming language and the Microsoft. NET IDE.

Prerequisite: ACC 340 or BUS 340
Typically offered in Fall and Spring

BUS 443 Web Development for Business Applications (3 credit hours)
This course provides current technologies for designing and developing interactive, web-based systems for business. Topics may include current programming languages, server-side programming, client-side programming, server-side scripting, database integration, and more. Design concepts will be implemented through team projects.

Prerequisite: BUS 442; Corequisite: BUS 440
Typically offered in Fall and Spring

BUS 444 Systems Analysis and Design (3 credit hours)
This course provides an overview of methods for developing Information Systems. Principles and techniques of systems analysis and design are introduced so that students can successfully cope with the complexities of developing information systems. Topics include software development frameworks, project management, requirements analysis, systems analysis techniques, and systems design. Systems analysis and design methods covered include agile software engineering, structured analysis and design, and object-oriented analysis and design techniques.

Prerequisite: ACC 340 or BUS 340
Typically offered in Fall and Spring

BUS 449 Information Technology Capstone (3 credit hours)
This is a completely project-oriented course. Students will work on real applications for national or local firm(s) to solve "live" IT problems. Students will work in teams to develop client deliverables and present their final work to an appropriate industry-based management team. Field trips and/or outside class activities (including client/consultant work) are a major part of this course. Students who are unable to participate in these types of events should not enroll in this course.

Prerequisite: BUS 440 or 441 or 442 or 443 or 444.
Typically offered in Spring only

BUS 458/ACC 458 Analytics: From Data to Decisions (3 credit hours)
Students will develop and apply their data analytics skills by analyzing case studies built around real business problems and real data. Case studies are designed around the full analytics lifecycle which encompasses the business problem, data, analysis, and decision. Students will learn to identify and explain business problems that can be addressed with analytics. They also will learn to determine which analytic methods are best suited to solve particular problems and will evaluate the impact of applying analytic methods. Finally, they will learn to explain the results of an analytic model and how those results impact the business "bottom line.

Prerequisite: BUS 351
Typically offered in Fall and Spring

BUS 459 Business Analytics Practicum (3 credit hours)
Advanced application of business analytics skills, tools and methodologies to solve business issues and problems. Small teams of students will undertake projects to identify business issues, confirm the information needed to address the issues, and apply the required data analytics tools and methodologies. The projects will include interaction with business personnel, refinement of business issues, gathering information, development of business analytics models, and presentation of results through data visualization. Each project will culminate with the student team presenting their findings and recommendations to the organization.

Prerequisites: BUS 351 and BUS 458
Typically offered in Fall and Spring

BUS 460 Consumer Behavior (3 credit hours)
The consumer decision process, with emphasis on consumer decision making, satisfaction/dissatisfaction factors, perception, learning, group influences, and marketing strategy implications. Restricted to majors within the College of Management.

Prerequisite: BUS 360
Typically offered in Spring only

BUS 461 Channel and Retail Marketing (3 credit hours)
Retailing composes a substantial component of the US economy, creating millions of jobs. Marketing channels are where marketing mix strategy and tactics ultimately impact customers and produce sales. This course is designed to prepare students for roles such as buying, merchandising, store management, professional selling, distribution, inventory management or other retailing-oriented careers. Emphasis will be placed on developing students relevant skill sets in key areas such as retail metrics, site analysis, pricing tactics, merchandising strategy, and customer relationship management. Relevant aspects of consumer behavior and organizational leadership in a retail setting will be covered.

Prerequisite: BUS 360
Typically offered in Fall and Spring

BUS 462 Marketing Research (3 credit hours)
The use, collection, organization and analysis of information pertinent to marketing decisions. Use of qualitative and quantitative data in the solution of specific marketing problems.

Prerequisite: BUS 360 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Fall, Spring, and Summer

BUS 463 Sales and Marketing Practicum (3 credit hours)
This course is a team-based project course where students work on a sales/marketing problem for a business enterprise. Students, company team leads (clients), and the NCSU faculty advisor will work together to document the project scope early in the semester. Ultimately, the student team will be responsible for project management. Components of this typically include a project scope, project work plan, key deliverables and milestones. The projects usually consist of building a framework for analyzing the project data, development of reasonable recommendations for action in both the long and short term, and various reports and presentations to project stakeholders: company participants and management, and the NCSU faculty advisor.

P: BUS 360 and one other Marketing Concentration Course (BUS 460, 461, 462, 465, 466, 467, 468, or 469)
Typically offered in Fall and Spring

BUS 464 International Marketing (3 credit hours)
Explores moving from a national marketing approach to a global marketing strategy, and discusses competitive advantages and challenges in making the transition. Both traditional countries of Western Europe and emerging markets will be examined. Students will analyze culture considerations when evaluating the impact on local business strategies. In addition to learning the impact on the world's economy through globalization, emphasis will also be placed on developing necessary professional skills.

Prerequisite: BUS 360
Typically offered in Spring only

BUS 465 Traditional and Digital Brand Promotion (3 credit hours)
This course focuses on advertising and integrated brand promotions, spanning both traditional and digital media. Emphasis is on the brand. Includes development of marketing communications strategy and campaign materials, from consumer insight generation to creative execution.

Prerequisite: BUS 360
Typically offered in Fall and Spring

BUS 466 Personal Selling (3 credit hours)
Revolves around the art of people-to-people interaction, which applies not only to the business-to-business sales environment but is also applicable to other professions. The selling process will be examined along with activities necessary to be successful in sales. With a common thread of developing and nurturing relationships, students will examine building partnerships, implications of ethical and legal issues, adapting the approach to the situation and identifying social styles with associated behaviors. Attention will also be focused on the steps involved in the sales cycle and how to be successful in their execution.

Prerequisite: BUS 360
Typically offered in Fall and Spring

BUS 467 Product and Brand Management (3 credit hours)
Provides an in-depth understanding of marketing planning and implementation involved in product and brand management. The course places emphasis on developing specific marketing strategies to support the creation and launch of new products and to successfully manage existing products and brands.

Prerequisite: BUS 360
Typically offered in Fall and Spring

BUS 468 Marketing Strategy (3 credit hours)
This course is designed to build on the core marketing principles you learned in your introductory marketing course and to enhance your understanding of their strategic implications.

Prerequisite: BUS 360
Typically offered in Spring only

BUS 469 Digital Marketing Practicum (3 credit hours)
This course provides you with an introduction to the digital marketplace through an experiential learning approach. After conducting a client audit, your team will develop a digital marketing campaign including appropriate major digital platforms. Post-campaign metrics and data analytics will be utilized to measure campaign effectiveness and future marketing strategy. The course pedagogy emphasizes class discussion, industry expert lectures, digital simulation, and a client digital project.

Prerequisite: BUS 360
Typically offered in Fall and Spring

BUS 470 Operations Modeling and Analysis (3 credit hours)
Tools, techniques, and strategies used for analyzing and improving business operations, including process mapping, capacity analysis, demand forecasting, and quality analysis and improvement. Emphasis on Excel as a tool for analysis, particularly on Excel functions and modules relevant to operations analysis.

Prerequisite: BUS 370 and (BUS/ST 350 or ST 305 or ST 312 or ST 370 or ST 372)
Typically offered in Fall and Spring

BUS 472 Operations Planning and Control Systems (3 credit hours)
Design and management of operations planning and control systems for manufacturing and service firms. Forecasting, capacity management, production and work force scheduling, project management, just-in-time and time-based competition, the impact ofinformation technologies on planning and control systems.

Prerequisite: BUS 370; Co-requisite: BUS 470
Typically offered in Fall and Spring

BUS 473 Supply Chain Strategy (3 credit hours)
THERE ARE NO PLANS TO OFFER THIS COURSE IN THE FORESEEABLE FUTURE. Purchasing, materials management, and logistics. Purchasing systems, supplier-based strategies, price-cost management, value analysis. Inventory strategies, quantity and quality decisions, materials planning. Logistics strategies for services and manufacturing.

Prerequisite: BUS 370; Co-requisite: BUS 470
Typically offered in Spring only

BUS 474 Logistics Management (3 credit hours)
Management of physical flows of goods between firms, management of inventories that support those flows, and assessment of the effects of freight transportation choices on these management activities. A variety of conceptual frameworks and quantitative tools are used to formulate the basis for effective logistics decision making and relate those decisions to broader issues in managing the entire supply chain and fulfilling the strategic objectives of a firm. A nominal fee for simulation software may be required.

Prerequisite: BUS 370; Co-requisite: BUS 470
Typically offered in Fall and Spring

BUS 475 Purchasing and Supply Management (3 credit hours)
This course is designed to help students develop knowledge of basic principles in purchasing and supply management. Students will be able to explain the potential contributions of these efforts of the competitiveness of the firm.

Prerequisite: BUS 370; Co-requisite: BUS 470
Typically offered in Fall and Spring

BUS 476 Decision Modeling and Analysis (3 credit hours)
Structured framework and process for modeling and analyzing business decisions. Business decisions are frequently made difficult by the presence of uncertainty and complex interactions among key drivers of the decision. In today's global environment the stakes of bad outcomes may be too high to justify learning by experience. Filled with in-depth insights and practical advice, this course covers the essential tools and techniques to improve your skills, such as: decision trees, influence diagrams, spreadsheet-based decision modeling, Monte Carlo simulation, demand forecasting, and methods to obtain and model decision-relevant data from subject matter experts in an unbiased manner.

Prerequisite: BUS 340 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Fall and Spring

BUS 479 Supply Chain Management Undergraduate Practicum (3 credit hours)
This course is comprised of a team-based project working on a Supply Chain Resource Consortium (SCRC) partner company's supply chain management issues. These projects vary in scope as are company's supply chain issues and improvement initiatives.Student groups need to provide their own transportation to off-campus sites.

Prerequisite: BUS 370 and one 400-level Operations/Supply Chain Management course
Typically offered in Fall and Spring

BUS 495 Special Topics in Business Management (1-6 credit hours)
Presentation of material not normally available in regular course offerings, or offering of new courses on a trial basis.

BUS 498 Independent Study in Business Management (1-6 credit hours)
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction on a tutorial basis. Credits and content determined by faculty member in consultation with Department Head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

BUS 501 Strategic Management Foundations (3 credit hours)
This course is designed to help students with an engineering or scientific undergraduate degree understand the world of business. The class will cover key business functions including finance, marketing, operations, strategy, organizational behavior. Students will undertake a semester-long group project to design and plan for a new company or new product within an existing company. Restricted to students with an engineering, scientific, or other technical background.

Typically offered in Fall and Spring

BUS 541 Strategic Risk Analysis Using Excel (1 credit hours)
This course explores the use of data analysis techniques and tools that are useful for organizing and categorizing large volumes of information for use by executives to make strategic business decisions. The course exposes students to various Excel techniques through a business case to support management's decision making and focuses on how data analysis can be used to inform management and the board about top strategic risk issues.

Typically offered in Fall and Spring

BUS 542 Forecasting and Scenario Planning Using Monte Carlo Simulation (1 credit hours)
This course explores how forecasting and scenario planning are used to support management's decision making. The course focuses on how data analysis techniques and tools are useful for organizing and categorizing large volumes of information for use by executives to make strategic business decisions and it exposes students to Monte Carlo Simulation and Optimization techniques to support strategic business decisions. The course then focuses on communicating this information to inform management and the board about top strategic risk issues.

Typically offered in Fall and Spring

BUS 543 Communicating Risk Information Using Tableau (3 credit hours)
This course provides an introduction as well as hands-on experience in data visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate managerial decision-making. Students develop an understanding of the fundamentals of communication and alignment around concepts that are required for effective data presentation and it provides an overview and develop an introductory level of competency on the use of the Tableau software tool that can be used for data visualization.

Typically offered in Fall and Spring

BUS 554 Project Management (3 credit hours)
Life cycle view of organizing and managing technical projects, including project selection, planning, and execution. Methods for managing and controlling project costs, schedules, and scope. Techniques for assessing project risk. Use of popular project management software tools. Application of project management tools and methods to product development, software, and process reengineering projects.

Typically offered in Spring and Summer

BUS 558 Communications, Privacy, and Ethics in Data Science (2 credit hours)
This class will give you the opportunity to explore the ethical issues associated with the development and use of Big Data and data science activities. The data science lifecycle will serve as a backdrop within which to examine ethical concerns related to the design, collection, use and dissemination of data. These include issues of AI and bias, transparency in communications and data design, privacy and data collection, among others.

Typically offered in Spring only

BUS 571 High Growth Entrepreneurship (3 credit hours)
Second course in a two-course entrepreneurship sequence focusing on opportunities outside the technology arena. Theoretical and practical, team-based, approach to the evaluation and assessment of opportunities for value creation. Emphasis on how to discover, validate, and then execute on an action plan to create value. Credit not allowed if the student has already taken MBA 576 or MBA 577.

Prerequisite: MBA 570. Credit not allowed if the student has already taken MBA 576 or MBA 577.
Typically offered in Fall and Spring

BUS 590 Special Topics In Business Management (1-6 credit hours)
Presentation of material not normally available in regular courses offerings or offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

BUS 790 Special Topics In Business Management (1-6 credit hours)
Presentation of material not normally available in regular courses offerings or offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

Chemical Engineering (CHE)

CHE 205 Chemical Process Principles (4 credit hours)
Engineering methods of treating material balances, stoichiometry, phase equilibrium calculations, thermophysics, thermochemistry and the first law of thermodynamics. Introduction to equation solving packages and spreadsheets for solving problems related to chemical engineering calculations.

Prerequisite: Grade of C or better in MA 241, PY 205, and (CH 201 or CH 221 or CH 225)
Typically offered in Fall, Spring, and Summer

CHE 225 Introduction to Chemical Engineering Analysis (3 credit hours)
Introduction of mathematical and computational tools for analyzing chemical engineering problems. Sequential modular and equation-based simulation of steady-state chemical processes using advanced spreadsheet methods and multivariate root-finding algorithms. Material and energy balances on transient processes and their solution using analytical and numerical methods. Introduction to microscopic material and energy balances using the "shell balance" approach to develop the governing differential equations. Solutions to steady-state boundary value problems in heat conduction and Fickian diffusion.

Prerequisite: C- or better in CHE 205 and MA 242; Corequisite: MA 341
Typically offered in Fall, Spring, and Summer

CHE 311 Transport Processes I (3 credit hours)
Fundamental aspects of momentum and heat transfer, and the use of these fundamentals in solving problems in transport operations.

Prerequisite: Grade of C- or better in both CHE 225 and MA 341
Typically offered in Fall, Spring, and Summer

CHE 312 Transport Processes II (3 credit hours)
Fundamental aspects of mass transfer and the use of these basic principles in solving problems in transport operations.

Prerequisite: Grade of C- or better in CHE 311
Typically offered in Fall and Spring

CHE 315 Chemical Process Thermodynamics (3 credit hours)
Laws of thermodynamics and their application to chemical engineering problems, both in theory and in practice. Criteria of equilibrium in physical and chemical changes. Behavior of real fluids, including mixtures.

Prerequisite: Grade of C- or better in CHE 225
Typically offered in Fall and Spring

CHE 316 Thermodynamics of Chemical and Phase Equilibria (3 credit hours)
Systematic study of chemical reaction equilibria and phase equilibria. Use of fugacity, activity and chemical potential concepts for predicting the effect of such variables as temperature, pressure on equilibrium compositions. Methods for measuring and estimating thermodynamic properties important to equilibrium calculation in real systems.

Prerequisite: Grade of C- or better in CHE 315
Typically offered in Fall, Spring, and Summer

CHE 330 Chemical Engineering Lab I (4 credit hours)
Laboratory experiments in unit operations of heat transfer and fluid flow. Laboratory safety, technical report writing, statistics, experimental design, error analysis and instrumentation.

Prerequisite: CHE 311
Typically offered in Fall and Spring

CHE 331 Chemical Engineering Lab II (2 credit hours)
Laboratory experiments in mass transfer and reaction kinetics. Experimental planning, technical report writing and oral presentations are emphasized.

Prerequisite: CHE 312, CHE 330
Typically offered in Fall and Spring

CHE 395 Professional Development Seminar (1 credit hours)
Professional development and topics of current interest in chemical engineering.

Typically offered in Fall and Spring

CHE 435/TE 435 Process Systems Analysis and Control (3 credit hours)
Dynamic analysis and continuous control of chemical and material engineering processes. Process modeling; stability analysis, design and selection of control schemes. Solution of differential equations using Laplace transform techniques.

Prerequisite: (MA 341 and TE 205) or CHE 312
Typically offered in Fall and Spring

CHE 446 Design and Analysis of Chemical Reactors (3 credit hours)
Characterization and measurement of the rates of homogeneous and heterogeneous reactions. Design and analysis of chemical reactors. Credit cannot be received for both CHE 446 and CHE 546.

Prerequisite: CHE 316
Typically offered in Fall only

CHE 447 Bioreactor Engineering (3 credit hours)
Design and analysis of chemical reactors with emphasis on enzyme-catalyzed reactions, microbial fermentation, and animal cell culture. Empirical kinetics of enzymatic reactions and cell growth. Design and scale-up of suspension bioreactors. Immobilized-enzyme and immobilized-cell bioreactors, including the classical Thiele reaction-diffusion analysis.

Prerequisite: CHE 312 and CHE 316; Corequisite: BCH 451
Typically offered in Fall only

CHE 448/BEC 448/BEC 548/CHE 548 Bioreactor Design (2 credit hours)
This course will cover critical aspects of bioreactor design, including design of reactors for enzyme-catalyzed reactions, fermentation of microorganisms, and scale-up considerations for bioreactors. Hands-on experiments involving fermentation of microorganisms and scale-up of bioreactors will be included. Students cannot get credit for both CHE 448 and CHE 548.

Prerequisite CHE 446 or instructor permission; Co-requisite BCH 451 or instructor permission
Typically offered in Spring only

CHE 450 Chemical Engineering Design I (3 credit hours)
Applications of cost accounting, cost estimation for new equipment, manufacturing cost and measures of profitability. Use of computer simulation design and cost programs. Procedures for sizing unit operations commonly encountered in the chemical process industry. Heuristics for selection of separation processes and heat exchanger network synthesis.

Prerequisite: CHE 312; Corequisite: CHE 446 or CHE 447
Typically offered in Fall only

CHE 451 Chemical Engineering Design II (3 credit hours)
Chemical process design and optimization. The interplay of economic and technical factors in process development, site selection, project design, and production management. Comprehensive design problems.

Prerequisite: CHE 450, and (CHE 446 or CHE 447)
Typically offered in Spring only

CHE 452/CHE 552 Biomolecular Engineering (2 credit hours)
This course will cover modern methods in biomolecule design, including gene expression regulators, RNA structure, protein structure, and metabolic networks. Current methods in genetic engineering and 'omics-based analysis will be discussed, followed by a critical review of current literature on the applications of these methods to engineering microbes, cells, and multi-species communities. Hands-on assignments involving computational design will be included.

Corequisites: CHE 448 and BCH 451
Typically offered in Spring only

CHE 460/CHE 560 Chemical Processing of Electronic Materials (3 credit hours)
This course is an introduction to electronic materials, chemical processes used in their fabrication, and basic physical principles of electronic device operation and function. The course will address how principles of chemical engineering are applied to design and fabricate current and emerging electronic systems. We will also discuss emerging areas of electronic technologies, including organic semiconductors, advanced energy conversion, and quantum computing and related systems. Credit for both CHE 460 and CHE 560 is not allowed.

Prerequisite: CHE 446 or permission of instructor
Typically offered in Spring only

CHE 461 Polymer Sciences and Technology (3 credit hours)
Concepts and techniques for polymerization of macromolecules. Structure, properties, and applications of commercially important polymers.

Prerequisite: (CH 223 or CH 227) and CHE 316
Typically offered in Fall only

CHE 462/CHE 562/BEC 462/BEC 562 Fundamentals of Bio-Nanotechnology (3 credit hours)
Concepts of nanotechnology are applied in the synthesis, characterization, recognition and application of biomaterials on the nanoscale. Emphasis will be given to hands-on experience with nanostructured biomaterials; students will also be familiarized with the potential impact of these materials on different aspects of society and potential hazards associated with their preparation and application.

Prerequisite: MA 241 and PY 208 and (CH 223 or CH 227)
Typically offered in Spring only

CHE 463/BEC 463/BIT 563/CHE 563/BEC 563/BIT 463 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall and Spring

CHE 465 Colloidal and Nanoscale Engineering (3 credit hours)
The first part of this course will present the fundamentals of nanoscale colloidal processes, including interactions and self-assembly of particles, surfactants and biomolecules. The applications of these fundamentals to the nanotechnology and engineering on the nanoscale will be discussed. The nanoscience has led to the development of many new technologies with relevance to chemical engineering, including microfluidics, lab-on-a-chip, bioarrays and bioassays. These emerging technologies will be presented and discussed in the second half of this course.

Prerequisite: C- or better in CHE 311 and CHE 315.
Typically offered in Fall and Spring

CHE 467 Polymer Rheology (3 credit hours)
Theoretical principles and experimental techniques associated with flow and deformation of polymer systems. Systems include: meffs and solutions, suspension, gels, emulsions, and thixotropic materials.

Prerequisite: CHE 311
Typically offered in Spring only

CHE 468/CHE 568/ECE 568/ECE 468 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems (3 credit hours)
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

Prerequisite: E 304
Typically offered in Fall only

CHE 475/CHE 575 Advances in Pollution Prevention: Environmental Management for the Future (3 credit hours)
Design of industrial processes which minimize or eliminate wastes. Regulations and the corporate organization of current pollution prevention efforts. Current pollution prevention research. Product life cycle analysis and the application to design of more efficient processes.

Prerequisite: PY 208, MA 341
Typically offered in Spring only

CHE 488/BEC 588/CHE 588/BEC 488 Animal Cell Culture Engineering (2 credit hours)
Design and operation of animal cell culture bioreactors for therapeutic protein production. Topics include: batch, fed-batch and perfusion bioreactors, agitation and aeration for mixing and oxygen mass transfer, bioreactor monitoring and control, optimizing bioreactor performance, single-use [disposal] bioreactors, and the production of gene therapy vectors. This is a half-semester course. Time outside of the regularly scheduled class time may be required.

Prerequisite: BEC 463 or CHE 563 or BEC 363 or BEC 440/540 or BEC 441/541 or equivalent; or consent of instructor.
Typically offered in Spring only

CHE 495 Honors Thesis Preparation (1 credit hours)
Development and presentation of Honors Thesis in Chemical Engineering and discussion of graduate school selection and preparation.

Prerequisite: CHE 497, Senior standing
Typically offered in Spring only

CHE 497 Chemical Engineering Projects I (3 credit hours)
Introduction to chemical engineering research through experimental, theoretical and literature studies. Oral and written presentation of reports.

Prerequisite: Junior standing
Typically offered in Fall, Spring, and Summer

CHE 498 Chemical Engineering Projects II (1-3 credit hours)
Projects in research, design or development in various areas of chemical engineering.

Prerequisite: Junior standing
Typically offered in Fall, Spring, and Summer

CHE 525 Process System Analysis and Control (3 credit hours)
Dynamic analysis and continuous control of chemical engineering processes. Process modeling; stability analysis, design and selection of control schemes. Solution of differential equations using Laplace transform techniques. Credit for both CHE 425 and CHE 525 is not allowed.

Prerequisite: CHE 312
Typically offered in Spring only

CHE 543 Polymer Science and Technology (3 credit hours)
Concepts and techniques for polymerization of macromolecules. Structure, properties, and applications of commercially important polymers.

Prerequisite: CHE 223, CHE 316
Typically offered in Fall and Summer

CHE 546 Design and Analysis of Chemical Reactors (3 credit hours)
Characterization and measurement of rates of homogeneous and heterogeneous reactions. Design and analysis of chemical reactors. Credit for both CHE 446 and CHE 546 is not allowed.

Prerequisite: CHE 316
Typically offered in Fall only

CHE 548/CHE 448/BEC 448/BEC 548 Bioreactor Design (2 credit hours)
This course will cover critical aspects of bioreactor design, including design of reactors for enzyme-catalyzed reactions, fermentation of microorganisms, and scale-up considerations for bioreactors. Hands-on experiments involving fermentation of microorganisms and scale-up of bioreactors will be included. Students cannot get credit for both CHE 448 and CHE 548.

Prerequisite CHE 446 or instructor permission; Co-requisite BCH 451 or instructor permission
Typically offered in Spring only

CHE 551 Biochemical Engineering (3 credit hours)
Enzyme and microbial kinetics and reactor designs for processes involving enzymes and single and mixed cultures. Samples drawn from full range of applications: food processing, single cell proteins, tissue culture and vaccines, monoclonal antibodies, recombinant DNA and hybridomas, artificial organs, biological waste treatment and environmental processes.

Prerequisite: CHE 312 and (CHE 446 or CHE 447)
Typically offered in Spring only

CHE 552/CHE 452 Biomolecular Engineering (2 credit hours)
This course will cover modern methods in biomolecule design, including gene expression regulators, RNA structure, protein structure, and metabolic networks. Current methods in genetic engineering and 'omics-based analysis will be discussed, followed by a critical review of current literature on the applications of these methods to engineering microbes, cells, and multi-species communities. Hands-on assignments involving computational design will be included.

Corequisites: CHE 448 and BCH 451
Typically offered in Spring only

CHE 560/CHE 460 Chemical Processing of Electronic Materials (3 credit hours)
This course is an introduction to electronic materials, chemical processes used in their fabrication, and basic physical principles of electronic device operation and function. The course will address how principles of chemical engineering are applied to design and fabricate current and emerging electronic systems. We will also discuss emerging areas of electronic technologies, including organic semiconductors, advanced energy conversion, and quantum computing and related systems. Credit for both CHE 460 and CHE 560 is not allowed.

Prerequisite: CHE 446 or permission of instructor
Typically offered in Spring only

CHE 562/BEC 462/BEC 562/CHE 462 Fundamentals of Bio-Nanotechnology (3 credit hours)
Concepts of nanotechnology are applied in the synthesis, characterization, recognition and application of biomaterials on the nanoscale. Emphasis will be given to hands-on experience with nanostructured biomaterials; students will also be familiarized with the potential impact of these materials on different aspects of society and potential hazards associated with their preparation and application.

Prerequisite: MA 241 and PY 208 and (CH 223 or CH 227)
Typically offered in Spring only

CHE 563/BEC 563/BIT 463/CHE 463/BEC 463/BIT 563 Fermentation of Recombinant Microorganisms (2 credit hours)
Introduction to fermentation and protein chemistry. Theory behind laboratory techniques and overview of industrial scale expression systems. Laboratory sessions involve use of microbial expression vectors, fermentation systems, and large-scale purification of recombinant protein. Half semester course, first part.

Prerequisite: CH 223 or CH 227; Corequisite: (BIT 410 or BCH 452 or MB 352 or BEC 363)
Typically offered in Fall and Spring

CHE 568/ECE 568/ECE 468/CHE 468 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems (3 credit hours)
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

Prerequisite: E 304
Typically offered in Fall only

CHE 575/CHE 475 Advances in Pollution Prevention: Environmental Management for the Future (3 credit hours)
Design of industrial processes which minimize or eliminate wastes. Regulations and the corporate organization of current pollution prevention efforts. Current pollution prevention research. Product life cycle analysis and the application to design of more efficient processes.

Prerequisite: PY 208, MA 341
Typically offered in Spring only

CHE 577/BEC 577 Advanced Biomanufacturing and Biocatalysis (3 credit hours)
Overview of biomanufacturing using microorganisms (bacteria, yeast, fungi), eukaryotic cells (hybridomas, insect, plant, CHO) and recombinant enzymes focusing on methods used in industry. Course will emphasize process design for optimization of heterologous protein expression, metabolic/cell line engineering, metabolomics, protein engineering to alter enzymes and antibodies. Pathway engineering strategies include developing microbes to produce new therapeutic compounds or overproduce primary metabolites, antibiotics, biotherapeutics, therapeutic enzymes, diagnostics, recombinant vaccines, and biopharmaceuticals. Utilization of immobilized biocatalysts, and microbial kinetics are covered.

Graduate standing in engineering or life-science graduate program
Typically offered in Spring only

CHE 588/BEC 488/CHE 488/BEC 588 Animal Cell Culture Engineering (2 credit hours)
Design and operation of animal cell culture bioreactors for therapeutic protein production. Topics include: batch, fed-batch and perfusion bioreactors, agitation and aeration for mixing and oxygen mass transfer, bioreactor monitoring and control, optimizing bioreactor performance, single-use [disposal] bioreactors, and the production of gene therapy vectors. This is a half-semester course. Time outside of the regularly scheduled class time may be required.

Prerequisite: BEC 463 or CHE 563 or BEC 363 or BEC 440/540 or BEC 441/541 or equivalent; or consent of instructor.
Typically offered in Spring only

CHE 596 Special Topics in Chemical Engineering (1-3 credit hours)
Typically offered in Fall and Spring

CHE 597 Chemical Engineering Projects (1-3 credit hours)
Independent study of some phase of chemical engineering or related field.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

CHE 601 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

CHE 610 Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

CHE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall only

CHE 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall and Spring

CHE 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall only

CHE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CHE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CHE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CHE 697 Advanced Chemical Engineering Projects (1-12 credit hours)
Independent study of some phase of chemical engineering or related field.

Prerequisite: Graduate standing in CHE
Typically offered in Fall, Spring, and Summer

CHE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CHE 701 Introduction to Chemical Engineering Research (2 credit hours)
Introduction to graduate research guidelines and practices. Topics include research ethics, electronic literature searching, research proposal structure, technical writing styles, research problem identification, advisor expectations, intellectual property and patents, laboratory notebooks, proposal creation and oral presentation. Graduate standing in chemical engineering or permission of instructor.

Typically offered in Fall only

CHE 702 Chemical Engineering Research Proposition (2 credit hours)
Preparation of a professional quality chemical engineering research proposal. Includes selecting a novel research topic, drafting and finalizing the proposal according to NSF formats, and orally presenting and defending the proposal to a faculty advisory committee. Ethics in proposal preparation.

Prerequisite: CHE 701
Typically offered in Spring only

CHE 711 Chemical Engineering Process Modeling (3 credit hours)
Applications of methods of mathematical analysis to formulation and solution of problems in transport phenomena, process dynamics and chemical reaction engineering.

Prerequisite: (CHE 312, MA 301 or MA 341) or equivalent
Typically offered in Fall only

CHE 713 Thermodynamics I (3 credit hours)
In-depth coverage of chemical engineering thermodynamics principles. Application of non-ideal fluid-phase chemical potentials to problems in phase and chemical reaction equilibria. Relations of molecular structure and intermolecular forces to macroscopic thermodynamic properties.

Prerequisite: CHE 316 or equivalent
Typically offered in Fall only

CHE 715 Transport Phenomena (3 credit hours)
A theoretical unified study of transport of momentum, energy and matter. Introduction to diffusional operations including coupled heat and mass transfer in light of the theory.

Prerequisite: CHE 311 or equivalent
Typically offered in Spring and Summer

CHE 717 Chemical Reaction Engineering (3 credit hours)
Rates and mechanisms of homogeneous and heterogeneous reactions. Design, analysis and scale-up of batch and continuous chemical reactors.

Prerequisite: CHE 446 or CHE 447 or equivalent
Typically offered in Fall only

CHE 718 Advanced Chemical Reaction Engineering (3 credit hours)
Topics relating to design, analysis and operation of homogeneous and heterogeneous chemical reactors.

Prerequisite: CHE 717

CHE 719 Electrochemical Systems Analysis (3 credit hours)
Electrochemical thermodynamics, electrochemical kinetics and catalysis, coupled charge and material transport in an electric field and electrophoretic effects. Design and analysis of electrochemical reactors. Survey of electrochemical industry.

Prerequisite: CHE 715, 717
Typically offered in Spring only

CHE 752 Separation Processes For Biological Materials (3 credit hours)
Definition and engineering analysis of major bioseparation techniques useful in product isolation and purification. Solid-liquid separation, crystallization, filtration, extraction, chromatography, membrane processes, distillation, drying, combined operations and process economics.

Prerequisite: CHE 721 or CHE 551

CHE 761/MSE 761 Polymer Blends and Alloys (3 credit hours)
Thermodynamics, morphological characteristics and properties of multiphase polymer systems composed of homopolymers or copolymers. Interfacial characteristics and modification of multicomponent polymer blends through emulsification and reactive blending. Microphase ordering in block copolymers, and emerging technolgies employing these nanostructured materials. Conformational properties and dynamics of macromolecules constrained near an interface.

Prerequisite: CHE 316 or MAT 301
Typically offered in Fall only

CHE 775 Multi-Scale Modeling of Matter (3 credit hours)
Current methods for modeling liquids, soft matter (polymers, surfactant solutions, colloids, liquid crystals, etc), nano-structured materials (nanoparticles, nano-composites, nano-porous materials, etc.), biomolecular systems, and reacting systems at the electronic, atomistic, meso-scale and continuum levels. Graduate level thermodynamics and differential and integral calculus required.

Prerequisite: Graduate level thermodynamics, and differential and integral calculus
Typically offered in Spring only

CHE 796 Special Topics In Chemical Engineering (1-6 credit hours)
Directed reading of chemical engineering literature, introduction to research methodology, and lectures and seminar discussion on topics which vary from term to term.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

CHE 797 Chemical Engineering Projects (1-3 credit hours)
Independent study of some phase of chemical engineering or related field.

Prerequisite: Graduate standing
Typically offered in Fall only

CHE 798 Advanced Chemical Engineering Projects (1-3 credit hours)
Independent study of some phase of chemical engineering or related field.

Prerequisite: Graduate standing in CHE
Typically offered in Fall, Spring, and Summer

CHE 801 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

CHE 810 Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

CHE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall only

CHE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

CHE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

CHE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CHE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CHE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Chemistry (CH)

CH 100 Chemistry and Society (4 credit hours)
Awareness and understanding of chemistry in everyday life for the non-science student. Non-mathematical treatment of essential fundamental concepts. Emphasis on practical applications of chemistry to consumer affairs, energy, medicine, food, sports, and pollution. Laboratory activities are designed to provide a personal experience with the concepts discussed in the course. Credit is not allowed for CH 100 if student has prior credit for CH 101.

R: Credit is not allowed for CH 100 if student has prior credit for CH 101.
GEP Natural Sciences
Typically offered in Fall and Spring

CH 101 Chemistry - A Molecular Science (3 credit hours)
A fundamental study of molecular bonding, structure, and reactivity. Principles of atomic structure, ionic and covalent bonding, reaction energetics, intermolecular forces, precipitation reactions, acid/base reactions, oxidation/reduction processes, and introductions to organic and inorganic chemistry.

Prereq: One yr of high school chemistry and successful completion of the Chem Placement Exam or Chem Modules Exam, or completion of CH 111 w/ C- or better. Coreq: CH 102. ADD BOTH CH 101 and CH 102 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CH 102 General Chemistry Laboratory (1 credit hours)
Laboratory experience to accompany CH 101. Introduction to basic laboratory equipment and skills.

Corequisite: CH 101
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CH 103 General Chemistry I for Students in Chemical Sciences (3 credit hours)
A study of the structure of atoms and the periodic trends of the elements, chemical bonding, the spatial and electronic structure of molecules, chemical reactions, quantification of materials and reactions, energy changes of reactions, and properties of gases. First half of a two semester sequence for students interested in a chemistry or closely related career. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 11BIOCHBS, 11LSFY-11BCHI, and 17MARSCBS-17MARSCCHM majors and to students with departmental approval. Students cannot receive credit for both CH 101 and CH 103.

Prerequisites: (Pass Chemistry Placement Exam, or Chemistry Placement Modules Exam, or CH 111 with a grade of C- or better) and eligibility for MA 107; Co-requisite: CH 104
GEP Natural Sciences
Typically offered in Fall only

CH 104 General Chemistry Laboratory I for Students in Chemical Sciences (1 credit hours)
Laboratory and computer-based experiments in chemical formulas, atomic structure, bonding, qualitative analysis, solutions, quantitative analysis of acids and bases, and calorimetry. First half of a two semester sequence for students interested in a chemistry or closely related career. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 11BIOCHBS, 11LSFY-11BCHI and 17MARSCBS-17MARSCCHM majors and to students with departmental approval. Students cannot receive credit for both CH 102 and CH 104.

Co-requisite: CH 103
GEP Natural Sciences
Typically offered in Fall only

CH 111 Preparatory Chemistry (3 credit hours)
Preparation for CH101. Review of main topics from high school emphasizing nomenclature, vocabulary, the periodic table and problem solving. Emphasis on mathematical skills, data handling, reaction types, stoichiometry and solutions. Credit for CH 111 is not allowed if a student has prior credit in CH 101. Credit for CH 111 does not count towards graduation for students in curricula that require CH 101.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CH 201 Chemistry - A Quantitative Science (3 credit hours)
Detailed quantitative aspects of solutions, solution stoichiometry, thermodynamics, chemical equilibrium, acid-base equilibria, solubility equilibria, electrochemistry, chemical kinetics, and nuclear chemistry.

Prerequisite: CH 101 with grade C- or better, CH 102, and eligibility for MA 121 or higher, Corequisite: CH 202
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CH 202 Quantitative Chemistry Laboratory (1 credit hours)
Laboratory experience to complement CH 201. Experimental exploration of thermodynamic, kinetic, and electrochemical behavior.

Prerequisite: CH 101, CH 102, Corequisite: CH 201
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CH 203 General Chemistry II for Students in Chemical Sciences (3 credit hours)
A study of intermolecular forces between molecules, and their affect on the properties of solids, liquids and gases, and on phase changes. The interplay of energetics and chemical kinetics on equilibria, including gas phase, acid-base, redox, and solubility equilibria. Second half of a two semester sequence for students interested in a chemistry or closely related career. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 11BIOCHBS, 11LSFY-11BCHI, and 17MARSCBS-17MARSCCHM majors and to students with departmental approval. Students cannot receive credit for both CH 201 and CH 203.

Prerequisites: (CH 101 with a minimum of 3 grade points or CH 103), and (CH 102 or CH 104), and eligibility for MA 131 or higher; Co-requisite: CH 204
GEP Natural Sciences
Typically offered in Spring only

CH 204 General Chemistry Laboratory II for Students in Chemical Sciences (1 credit hours)
Laboratory experiments in solid state materials, preparation and analysis of an organic compound, separations, gases, solutions, equilibrium, acids and bases, and kinetics. Second half of a two semester sequence for students interested in a chemistry or closely related career. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 11BIOCHBS, 11LSFY-11BCHI, and 17MARSCBS-17MARSCCHM majors and to students with departmental approval. Students cannot receive credit for both CH 202 and CH 204.

Prerequisite: CH 104 with a minimum of C-. Co-requisite: CH 203
GEP Natural Sciences
Typically offered in Spring only

CH 220 Introductory Organic Chemistry (3 credit hours)
A one-semester course in the fundamental principles of organic chemistry. Preparation, reactions, and physical properties of alkanes, cycloalkanes, alcohols, alkyl halides, aromatic compounds, aldehydes, ketones, organic acids, acid derivatives, and amines. Credit is not allowed for both CH 220 and CH 221.

Prerequisite: CH 101. Corequisite: CH 222.
Typically offered in Fall, Spring, and Summer

CH 221 Organic Chemistry I (3 credit hours)
First half of two-semester sequence in the fundamentals of modern organic chemistry. Structure and bonding, stereochemistry, reactivity and synthesis of carbon compounds. Detailed coverage of aliphatic hydrocarbons, alcohols, ethers, and alkyl halides. Introduction to spectral techniques of IR, UV-vis, and NMR. Students cannot receive credit for both CH 221 and CH 225.

Prerequisite: CH 101 with a grade of C- or better and CH 102; Corequisite: CH 222
Typically offered in Fall, Spring, and Summer

CH 222 Organic Chemistry I Lab (1 credit hours)
Laboratory experience to accompany CH 220 or CH 221. Introduction to basic organic laboratory equipment and techniques. Students cannot receive credit for both CH 222 and CH 226.

Prerequisite: CH 101 and CH 102; Corequisite: CH 220 or CH 221
Typically offered in Fall, Spring, and Summer

CH 223 Organic Chemistry II (3 credit hours)
Second half of two-semester sequence in the fundamentals of modern organic chemistry. Structure and bonding, stereochemistry, reactivity and synthesis of carbon compounds. Detailed coverage of aromatic hydrocarbons, condensation reagents, and selected biological chemistry topics such as carbohydrates, lipids, and amino acids. Students cannot receive credit for both CH 223 and CH 227.

Prerequisite: CH 221 with a grade of C- or better and CH222; Corequisite: CH 224
Typically offered in Fall, Spring, and Summer

CH 224 Organic Chemistry II Lab (1 credit hours)
Laboratory experience to accompany CH 223. Introduction to basic organic laboratory equipment and techniques. Students cannot receive credit for both CH 224 and CH 228.

Prerequisite: CH 221 and CH 222; Corequisite: CH 223
Typically offered in Fall, Spring, and Summer

CH 225 Organic Chemistry I for Students in Chemical Sciences (3 credit hours)
First half of a two semester sequence in organic chemistry for students interested in a chemistry or closely related career. Structure and bonding, stereochemistry, reactivity and synthesis of aliphatic hydrocarbons, alcohols, ethers and alkyl halides. Introduction to IR, NMR, and mass spectral techniques. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 14CHEBS, 11BIOCHBS, 11LSFY-11BCHI, and 17MARSCBS-17MARSCHM majors and to students with departmental approval. Students cannot receive credit for both CH 221 and CH 225.

Prerequisites: (CH 201 or CH 203) and (CH 202 or CH 204); Co-requisite: CH 226
Typically offered in Fall only

CH 226 Organic Chemistry Laboratory I for Students in Chemical Sciences (1 credit hours)
First half of a two semester laboratory sequence in organic chemistry for students interested in a chemistry or closely related career. Laboratory experiments in the determination of physical properties of organic compounds, separation of mixtures and purification of compounds, synthesis and spectroscopic characterization of organic compounds, and the execution of a multi-step synthesis. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 14CHEBS, 11BIOCHBS, 11LSFY-11BCHI and 17MARSCBS-17MARSCHM majors and to students with departmental approval. Students cannot receive credit for both CH 222 and CH 226.

Co-requisite: CH 225
Typically offered in Fall only

CH 227 Organic Chemistry II for Students in Chemical Sciences (3 credit hours)
Second half of a two semester sequence in organic chemistry for students interested in a chemistry or other closely related career. Structure and bonding, stereochemistry, reactivity and synthesis of aromatic compounds. Condensation reactions and organic compounds of biological interest. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 14CHEBS, 11BIOCHBS, 11LSFY-11BCHI and 17MARSCBS-17MARSCHM majors and to students with departmental approval. Students cannot receive credit for both CH 223 and CH 227.

Prerequisites: (CH 221 B or better or CH 225) & (CH 222 or CH 226); Corequisite: CH 228; Restricted to:17CHEMBS, 17CHEMBA, 14CHEI, 14CHEBS, 11BIOCHBS, or 17MARSCHM majors or dept approval. Students cannot receive credit for both CH 223 and CH 227.
Typically offered in Spring only

CH 228 Organic Chemistry Laboratory II for Students in Chemical Sciences (1 credit hours)
Second half of a two semester laboratory sequence in organic chemistry for students interested in a chemistry or closely related career. Laboratory experiments in multi-step organic synthesis, identification and characterization of compounds by spectroscopic methods. Searching the chemical literature. This course is open to 17CHEMBS, 17CHEMBA, 14EFY-14CHEI, 14CHEBS, 11BIOCHBS, 11LSFY-11BCHI and 17MARSCBS-17MARSCHM majors and to students with departmental approval. Students cannot receive credit for both CH 224 and CH 228.

Co-requisite: CH 227
Typically offered in Spring only

CH 230 Computational Chemistry Lab I (1 credit hours)
An introduction to computational methods in the chemical sciences. A quantitative introduction to inter- and intramolecular forces in gas and condensed phases. Potential energy surfaces of molecules and chemical reactions. First of a two-semester sequence.

Prerequisite: CH 221 or CH 225: Co-requisite: MA 241
Typically offered in Fall only

CH 232 Computational Chemistry Lab II (1 credit hours)
An introduction to computational methods in the chemical sciences. A computer-based introduction to quantum mechanics, including atomic and molecular orbitals and molecular orbital theory with applications to inorganic chemistry.

Prerequisite: CH 221 or CH 225, Corequisite: MA 241
Typically offered in Spring only

CH 295 Special Topics in Chemistry (1-3 credit hours)
Special topics in chemistry at the early undergraduate level. Trial offerings of new or experimental courses in chemistry. Enrollment requires permission of the department.

Typically offered in Fall, Spring, and Summer

CH 315 Quantitative Analysis (3 credit hours)
Introduce the fundamental principles and modern techniques of chemical analyses. This includes examination of electrolytic solutions, including acid-base, oxidation-reduction, and solubility equilibria, and introduction to spectrochemical, electrochemical, volumetric and chromatographic methods of analysis, modern chemical instrumentation, and interpretation of data.

Prerequisite: (CH 201 or CH 203) with a grade of C- or better, Co-requisite: CH 316
Typically offered in Fall, Spring, and Summer

CH 316 Quantitative Analysis Laboratory (1 credit hours)
Application of spectrochemical, electrochemical, volumetric, and chromatographic methods of analysis for the identification and quantification of components in a mixture.

Prerequisite: (CH 201 or CH 203) and (CH 202 or CH 204); Corequisite: CH 315
Typically offered in Fall, Spring, and Summer

CH 331 Introductory Physical Chemistry (4 credit hours)
Fundamental physiochemical principles including chemical thermodynamics, physical and chemical equilibrium, electrochemistry and reaction kinetics. For students requiring only a single semester of physical chemistry.

Prerequisite: (CH 201 or CH 203) and (CH 202 and 204) and (MA 231 or 241) and (PY 205 or PY 211)
Typically offered in Fall, Spring, and Summer

CH 335/PSE 335 Principles of Green Chemistry (4 credit hours)
Introduction to the topic of green chemistry as an emerging field; Identification of hazards and classes; overview of sources; alternative solvents and reagents; sustainability of chemical reactions; alternative chemical reactions and pathways; alternative feedstocks; enzymatic catalysis; ionic liquids; re-engineering of chemical processes; chemical synthesis.

Prerequisite: Grade of C or better in CH 101/102, CH 201/202 (or equivalent general chemistry series), and CH 221/22 (or equivalent)
Typically offered in Fall only

CH 345 Chemistry and War (3 credit hours)
This course will cover the influence of chemical discoveries on major military conflicts, from World War I to the present, as well as the effect that military conflicts during this time had on chemical discoveries. Topics will include but are not limited to: explosives, chemical weapons, nuclear weapons, military medicine, and chemical/biological weapons detection.

Prerequisites: CH 223 or CH 227
GEP Interdisciplinary Perspectives
Typically offered in Spring only

CH 401 Systematic Inorganic Chemistry I (3 credit hours)
Descriptive chemistry of the elements with particular attention to their reactions in aqueous solution. Emphasis on the chemistry of the main group elements and the periodicity of their chemical properties. Introduction to transition element and coordination chemistry. Major paper required.

Prerequisite: (CH 201 or CH 203) with grade of C- or better.
Typically offered in Fall and Spring

CH 403 Systematic Inorganic Chemistry II (3 credit hours)
Development and application of theoretical principles to the structure and energies of inorganic substances. Particular attention to the chemistry of coordination compounds of the transition elements. Special applications to bioinorganic chemistry,organometallic chemistry, and inorganic solid state chemistry.

Prerequisite: CH 401, CH 431
Typically offered in Fall and Spring

CH 415 Analytical Chemistry II (3 credit hours)
Methods of quantitative analysis based on electronic instrumentation. Signal processing and electronics, spectroscopy (atomic, x-ray fluorescence, infrared/Raman, surface), voltammetry, chromatography (gas, liquid), mass spectrometry as well as chemical transducers and statistical methods of data handling.

Prerequisite: CH 315 or PCC 412
Typically offered in Fall only

CH 431 Physical Chemistry I (3 credit hours)
Development of the basic concepts of quantum mechanics and wavefunctions as applied to atomic structure, to the translational, rotational and vibrational motion in molecules, and to molecular spectroscopy. Development of partition functions as applied to thermodynamic properties of materials. Cannot get credit for both CH 431 and CH 437.

Prerequisite: (CH 201 or CH 203) and MA 242 and (PY 203 or 208); Corequisite: MA 341
Typically offered in Fall and Spring

CH 433 Physical Chemistry II (3 credit hours)
A classical thermodynamic treatment of states of matter, activities and chemical potentials, energy changes, equilibria, and electrochemical processes. The kinetics of multi-step, catalytic and enzyme reactions.

Prerequisite: MA 341
Typically offered in Fall and Spring

CH 435 Introduction to Quantum Chemistry (3 credit hours)
An introduction to the basic principles of quantum theory and its application to atomic and molecular structure and spectroscopy.

Prerequisite: CH 431
Typically offered in Spring only

CH 437 Physical Chemistry for Engineers (4 credit hours)
Selected physiochemical principles including quantum theory, spectroscopy, statistical thermodynamics, and rates of chemical reactions. Credit may not be claimed for both CH 431 and CH 437.

Prerequisite: PY 208 and CHE 315 and MA 341
Typically offered in Spring only

CH 441 Forensic Chemistry (3 credit hours)
Chemical identification (recognition), and chemical separation techniques (identification) used to demarcate class and individual characteristics relevant in legal claims.

Prerequisite: (CH 201 or CH 203) and (CH 223 or CH 227)
Typically offered in Spring only

CH 442 Advanced Synthetic Techniques (4 credit hours)
An advanced laboratory class in the synthesis, separation and characterization of organic, inorganic, and polymeric materials. Techniques include reactions under inert atmosphere, column chromatography, fractional distillations, NMR spectroscopy, and other advanced procedures. Scientific writing is emphasized.

Prerequisite: CH 223 or CH 227, Corequisite: CH 401
Typically offered in Fall and Spring

CH 444 Advanced Synthetic Techniques II (4 credit hours)
An advanced laboratory class in the synthesis, separation and characterization of organic, inorganic, polymer and materials compounds. Techniques include literature searches, reactions, under inert atmosphere, column chromatography, fractional distillations, NMR spectroscopy, and other advanced procedures. This course builds upon the skills acquired in CH 442 and has significant independent work.

Prerequisite: CH 442
Typically offered in Spring only

CH 452 Advanced Measurement Techniques I (4 credit hours)
Modern analytical and physical chemistry laboratory techniques. Emphasis on statistical methods, chemical thermodynamics, chromatography, atomic and molecular spectroscopy, report writing, scientific methodology, and laboratory safety.

Prerequisites: CH 315 and CH 316 and 431, all with grade of C- or better.
Corequisites: CH 415 and CH 433
Typically offered in Fall and Spring

CH 454 Advanced Measurement Techniques II (4 credit hours)
Advanced analytical techniques including Liquid Chromatography (HPLC), Gas Chromatography (GC), Atomic Absorption Spectroscopy (AAS), Spectrophotometry, Molecular Fluorescence, and Mass Spectrometry (MS). Physical aspects including time resolved spectrophotometric measurement of kinetics, dynamic fluorescence quenching and resonance Raman spectroscopy. Students will also participate in carrying out a project through consultation with the instructor and search of the literature.

Prerequisite: CH 452 with a grade of C- or better
Typically offered in Fall only

CH 463/CH 563 Molecular Origins of Life (3 credit hours)
Survey of the present state of understanding of the molecular mechanisms leading to the emergence of sustainable self-replicating systems in the prebiotic era on the early Earth, including historical context, experimental studies, and theoretical foundation. The course will include a focus on the fundamental chemistry of and mechanisms for the plausible prebiotic formation of diverse biomolecules (including amino acids, sugars, nucleotides, lipids, tetrapyrroles) and self-organizing chemistry leading to protocells, the proposed early progenitors of living cells. Credit will not be given for both CH 463 and CH 563.

Prerequisite: BCH 351 or BCH 451 or Permission of Instructor
Typically offered in Spring only

CH 495 Special Topics in Chemistry (1-4 credit hours)
Special topics in chemistry at the advanced undergraduate level. Trial offerings of new or experimental courses in chemistry. Enrollment requires permission of the department.

Typically offered in Fall, Spring, and Summer

CH 499 Undergraduate Research in Chemistry (1-3 credit hours)
Independent investigation of a research problem under the supervision of a chemistry faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Two years of chemistry
Typically offered in Fall, Spring, and Summer

CH 563/CH 463 Molecular Origins of Life (3 credit hours)
Survey of the present state of understanding of the molecular mechanisms leading to the emergence of sustainable self-replicating systems in the prebiotic era on the early Earth, including historical context, experimental studies, and theoretical foundation. The course will include a focus on the fundamental chemistry of and mechanisms for the plausible prebiotic formation of diverse biomolecules (including amino acids, sugars, nucleotides, lipids, tetrapyrroles) and self-organizing chemistry leading to protocells, the proposed early progenitors of living cells. Credit will not be given for both CH 463 and CH 563.

Prerequisite: BCH 351 or BCH 451 or Permission of Instructor
Typically offered in Spring only

CH 572/BIT 572/BIO 572 Proteomics (3 credit hours)
Introduction and history of the field of proteomics followed by the principles and applications of proteomics technology to understand protein expression and protein post-transitional modifications. Laboratory sessions include growing yeast with stable-isotope labeled amino acids, protein purification, Western blots, protein identification and quantification, and protein bioinformatic analysis. This is a half-semester course.

Prerequisite: BIT 410 or BIT 510 or BCH 454 (or approval from the instructor)
Typically offered in Spring only

CH 601 Seminar (1 credit hours)
Review and discussion of scientific articles, progress reports on research and special problems of interest to chemists.

Prerequisite: Graduate standing in CH
Typically offered in Fall and Spring

CH 610 Special Topics In Chemistry (1-6 credit hours)
Detailed study of a particular problem or technique pertaining to chemistry.

Typically offered in Fall and Spring

CH 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall only

CH 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Summer only

CH 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CH 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CH 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CH 701 Advanced Inorganic Chemistry I: Structure and Bonding (3 credit hours)
Study of periodic table/trends, symmetry and molecular orbital theory of small molecules and extended structures, transition-metal coordination complexes, acid/base and redox reactivity of polyatomic ions, solid-state structures, and selected special topics.

Typically offered in Fall only

CH 703 Advanced Inorganic Chemistry II: Applications of Group Theory to Bonding and Spectroscopy (3 credit hours)
This course uses group theory as the basis for developing molecular orbital theory, vibrational spectroscopy, and electronic spectroscopy. Together, these methods are used to discuss topics of current research interest in inorganic chemistry.

Prerequisite: CH 701 or equivalent
Typically offered in Spring only

CH 705 Organometallic and Inorganic Reaction Mechanism (3 credit hours)
Coverage of concepts of bonding and structure of transition metal complexes with emphasis on the interaction of transition metal fragements with organic ligands; study of experimental methods of mechanistic study; treatment of inorganic and organometallic reactions including metal-mediated organic synthesis, metal-catalyzed polymer synthesis, and models of bioinorganic systems.

Prerequisite: Graduate standing
Typically offered in Spring only

CH 711 Advanced Analytical Chemistry I (3 credit hours)
First semester of two-semester integrated sequence covering advanced methods for extraction and interpretation of chemical information from electronic/optical signals in chemical analysis. Digital and analog electronics, signal acquisition and processing, chemometrics, and instrumentation.

Prerequisite: CH 433; CH 415
Typically offered in Fall only

CH 721 Advanced Organic Chemistry I (3 credit hours)
Introduction to physical organic chemistry. Topics include: bonding/introductory molecular orbital theory, reactive intermediates, aromaticity, pericyclic reactions, thermochemistry, linear free-energy relationships, kinetics, and transition-state theory. Topics and concepts are related to molecular reactivity and reaction mechanisms.

Prerequisite: CH 223 or CH 227 or CH 433 or CH 435
Typically offered in Fall only

CH 723 Advanced Organic Chemistry II (3 credit hours)
Introduction to acid-base theory and mechanistic organic chemistry as applied to synthetically useful organic reactions.

Prerequisite: CH 721
Typically offered in Spring only

CH 725 Physical Methods in Organic Chemistry (3 credit hours)
Application of physical methods to the solution of structural problems in organic chemistry. Methods discussed include electronic absorption spectroscopy, vibrational spectroscopy, nuclear magnetic resonance, and mass spectrometry.

Prerequisite: (CH 223 or CH 227) and CH 433 or CH 435
Typically offered in Fall only

CH 727/BIO 727 Biological Mass Spectrometry (3 credit hours)
Fundamentals of mass spectrometry including topics such as: mass, isotopic distributions, resolving power, mass accuracy. Ionization source topics: electron impact, chemical ionization, matrix-assisted laser desorption ionization, electrospray ionization and contemporary methods. Instrumentation and mass analyzers: quadrupole, time-of-flight, Fourier transform based mass analyzers; hybrid instruments such as a quadrupole orbitrap. Tandem mass spectrometry and dissociation. Applications: quantitation, small molecule analysis, and peptide sequencing.

Prerequisite: CH 223 or CH 227
Typically offered in Fall only

CH 730 Advanced Physical Chemistry (3 credit hours)
Survey of chemical thermodynamics and kinetics, with emphasis on reactions in liquid phase. Problem solving an important part of course. Designed for review and expansion on materials usually covered in a one-year undergraduate physical chemistry course.

Prerequisite: Graduate standing
Typically offered in Fall only

CH 732 Advanced Physical Chemistry in Biological Applications (3 credit hours)
Modern views on structure, function, and thermodynamic stability of biological macromolecules including proteins, nucleic acids, and biological membranes; theories and models of protein folding, high resolution experimental methods for structure determination of soluble and membrane proteins including solution and solid-state NMR spectroscopy.

Prerequisite: CH 431 or CH 433 or BCH 453 or equivalent

CH 734 Spectroscopic Methods in Chemical Biology (3 credit hours)
Physical principles underlying the experimental spectroscopic methods used to study structure and dynamics of biological macromolecules. Detailed discussion of experimental techniques include high-resolution solution Nuclear Magnetic Resonance, Electron Paramagnetic Resonance in combination with spin labeling and spin trapping methods, and fluorescence spectroscopy, including single molecule methods and fluorescence microscopy. This course is offered every third semester from Spring 2010.

Prerequisite: CH 331 or CH 431, CH 433 or equivalent

CH 735 Magnetic Resonance in Chemistry (3 credit hours)
This course is focused on physical and quantum mechanical principles that make magnetic resonance the most important spectroscopic technique in chemistry. Detailed discussion of description of magnetic resonance phenomena and NMR and EPR experimental techniques covers both classical and quantum mechanical treatments. Students of diverse backgrounds will gain in-depth knowledge of modern magnetic resonance as applied to problems in chemistry, materials, and nano-science, and biophysics.

Prerequisite: CH 331 or CH 431, CH 433 or equivalent

CH 736 Chemical Spectroscopy (3 credit hours)
Introduction to rotational, vibrational and electronic molecular spectroscopy from a quantum mechanical viewpoint. Emphasis on the elucidation of structure, bonding and excited state properties of organic and inorganic molecules.

Prerequisite: CH 435
Typically offered in Spring only

CH 737 Quantum Chemistry (3 credit hours)
Elements of wave mechanics applied to stationary energy states and time-dependent phenomena. Applications of quantum theory to chemistry, particularly chemical bonds.

Prerequisite: MA 301, CH 435 or PY 407
Typically offered in Fall only

CH 743 Electrochemistry (3 credit hours)
Thermodynamics and kinetics of electrode reactions presented as well as experimental methods for studying them. Particular emphasis on measurement of standard potential and establishing number of electrons transferred. Applications of electrochemistry in production/storage of energy and in chemical analysis.

Prerequisite: CH 431 or CH 433
Typically offered in Spring only

CH 745 Chemical Separation (3 credit hours)
Basic principles of methods in chemical separation including gas chromatography, liquid chromatography, etc. Theory, instrumentation and applications of various chromatographic and electrophoretic techniques.

Prerequisite: CH 415, CH 416, Corequisite: CH 610 or 810
Typically offered in Fall only

CH 755 Organic Reaction Mechanisms (3 credit hours)
Effects of structure and substituents on direction and rates of organic reactions.

Prerequisite: CH 723, CH 433
Typically offered in Fall only

CH 765 Chemistry of Materials (3 credit hours)
Detailed examination of the relationship between chemical structure and physical properties of materials with potential use in applications. Different classes of molecules and materials requirements for several applications will be emphasized.

Prerequisite: CH 201 or equivalent
Typically offered in Spring only

CH 770 Bioinorganic Chemistry (3 credit hours)
The interface between inorganic and biological chemistry will be explored, focusing on the catalytic processes in metalloenzymes, and with an emphasis on the diverse roles of transition metals in biology. The physical methods required for the study of bioinorganic systems will be introduced, with application toward determining enzymatic mechanisms. Selected topics will include heme chemistry, nitrogen fixation, C-H bond activation, electron transfer, oxygen transport, metal ion uptake and toxicity, drug activation and/or metabolism by metalloenzymes, and metallodrugs.

Prerequisite: CH 401
Typically offered in Spring only

CH 772 Solid State Chemistry (3 credit hours)
Selected topics in solid-state chemistry including: extended symmetry, structure, bonding, characterizations, and special topics. Graduate standing in Chemistry required.

Prerequisite: CH 701 or equivalent
Typically offered in Spring only

CH 795 Special Topics in Chemistry (1-6 credit hours)
Typically offered in Fall and Spring

CH 801 Seminar (1 credit hours)
Review and discussion of scientific articles, progress reports on research and special problems of interest to chemists.

Prerequisite: Graduate standing in CH
Typically offered in Fall and Spring

CH 810 Special Topics In Chemistry (1-6 credit hours)
Detailed study of a particular problem or technique pertaining to chemistry.

Typically offered in Fall only

CH 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall only

CH 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall only

CH 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CH 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CH 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Civil Engineering (CE)

CE 214 Engineering Mechanics-Statics (3 credit hours)
Basic force concepts and equilibrium analysis; distributed forces; centroids; moments of inertia; application to structural elements. Credit will not be given for both CE 214 and MAE 206.

Grade of C or better in PY 205 and MA 241; Co-requisite: MA 242.
Typically offered in Fall, Spring, and Summer

CE 225 Mechanics of Solids (3 credit hours)
Elementary analysis of deformable solids subjected to force systems. Concepts of stress and strain; one, two and three-dimensional stress-strain relationships for the linear elastic solid. Statically determinate and indeterminate axial force, torsion and bending members. Stress transformations, pressure vessels, combined loadings. Introduction to column buckling.

Grade of C- or better in CE 214; MA 242.
Typically offered in Fall, Spring, and Summer

CE 250 Introduction to Sustainable Infrastructure (3 credit hours)
History and future of civil infrastructure; engineering problem solving; environmental sustainability and life-cycle assessment; social sustainability; engineering economics; problem-driven, sustainability-focused case studies related to different aspects of civil infrastructure.

CE, ENE, or CON majors only; co-requisite: CSC 111 and CE 214.
Typically offered in Fall and Spring

CE 263 Introduction to Construction Engineering (3 credit hours)
Introduction to fundamental concepts in Construction Engineering and Management including principles of project management; profit, risk, and profitability; estimating, including WBS, productivities, costs, durations, and fundamentals of equipment selection and utilization; scheduling using both CPM and Linear scheduling techniques; contract methods and control principles; professional and legal aspects of construction; fundamentals of leadership; and basic construction safety.

Corequisites: CE 214 and CE 250; R: CON Majors Only.
Typically offered in Spring only

CE 282 Hydraulics (3 credit hours)
Fluid properties; mass, energy and momentum conservation laws; dimensional analysis and modeling; laminar and turbulent flows; surface and form resistance; flow in pipes and open channels; elementary hydrodynamics; fluid measurements; characteristics of hydraulic machines. Credit will not be given for both CE 282 and MAE 308.

Prerequisite: C- or better in CE 214; Corequisites: MA 341 or MA 305 or ST 370
Typically offered in Fall, Spring, and Summer

CE 297 Current Topics in Civil Engineering (1-4 credit hours)
Presentation of material not normally available in regular course offerings, or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with Department Head.

Typically offered in Fall, Spring, and Summer

CE 301 Civil Engineering Surveying and Geomatics (3 credit hours)
Plane surveying, topographical surveying, horizontal and vertical curves, topographic surveys, construction surveys, earthwork, route surveying. Data collection using sight-based, laser-based, and global positioning system equipment. Methods for analysis and presentation of surveying and positioning data, including dealing with errors. Use and applications of GPS information. Limited to CON and CE majors. Credit will not be given for both BAE 325 and CE 301.

Junior standing; CON and CE Majors.
Typically offered in Fall and Spring

CE 305 Traffic Engineering (3 credit hours)
Integrated approach to planning, design, and operation of transportation systems with an emphasis on highway and street systems. Roadway design, traffic operations and performance, and control systems.

C- or better in CE 250; Corequisite: ST 370.
Typically offered in Fall and Spring

CE 325 Structural Analysis I (3 credit hours)
Analysis of determinate and indeterminate bars, trusses, beams and frames using the matrix displacement method. Qualitative deflected shapes and shear and bending moment diagrams. Implementation of analysis procedures through computer programming and commercial structural analysis software.

CSC 111 and C- or better in CE 225.
Typically offered in Fall and Spring

CE 327 Reinforced Concrete Design (3 credit hours)
Behavior, strength, and design of reinforced concrete members subjected to moment, shear, and axial forces. Introduction to the design of reinforced concrete structures.

Prerequisite: C- or better in CE 225
Typically offered in Fall and Spring

CE 332 Materials of Construction (3 credit hours)
Fundamental characteristics that govern material behavior. Properties of metals, ceramics, polymers, fiber reinforced composites, aggregates, portland cement concrete, and asphalt concrete. Portland cement concrete and asphalt concrete mixture designs. Materials testing according to established standards.

MSE 200 and C- or better in CE 225.
Typically offered in Fall and Spring

CE 339 Civil Engineering Systems (3 credit hours)
A broad perspective, systematic approach to civil planning, analysis, evaluation and design for large scale projects in construction, structures, transportation, water resources and other civil engineering areas.

CSC 111 and (MA 341 or MA 305); Junior standing.
Typically offered in Spring only

CE 342 Engineering Behavior of Soils and Foundations (4 credit hours)
Description, identification, and engineering classification of soils. The basic principles and mechanics of flow of water through soils, deformation and strength of soils, and the processes of consolidation and compaction. Effective stress concepts, stress and settlement analyses, and evaluation of shear strength. Methods of analysis and geotechnical engineering design concepts.

C- or better in CE 225 and CE 282.
Typically offered in Fall and Spring

CE 365 Construction Equipment and Methods (3 credit hours)
Study of construction operations as dynamic production processes. Utilization of equipment and other resources to achieve highest levels of productivity, safety, and quality. Covers a wide range of traditional and state-of-the-art construction methods.

Corequisite: CE 263 and ST 370
Typically offered in Spring only

CE 367 Mechanical and Electrical Systems in Buildings (3 credit hours)
Introduction to mechanical and electrical systems in building construction. Includes HVAC, lighting and electrical systems, focusing on design concepts, equipment application, design of the construction process, and coordination using BIM, for modern building systems.

C- or better in CE 282.
Typically offered in Spring only

CE 373 Fundamentals of Environmental Engineering (3 credit hours)
Concepts of sustainability and green engineering; energy and climate; overview of contaminants in water, air and terrestrial environments; introduction to water and wastewater treatment, air pollution control, and solid waste management.

Corequisites: CE 250 and (CHE 205 or CE 282).
Typically offered in Fall and Spring

CE 378 Environmental Chemistry and Microbiology (4 credit hours)
Principles of Environmental Chemistry and Microbiology, experimental techniques for assessing water and air quality; sampling; statistical interpretation of data.

Prerequisite: Junior standing in Environmental Engineering, MEA 323 or SSC 442, and C- or better in CE 250 and CE 373; Corequisite: ST 370.
Typically offered in Fall only

CE 381 Hydraulics Systems Measurements Lab (1 credit hours)
Introduction to experimental techniques for the analysis of hydraulic systems; measurement of viscosity, fluid pressures, velocity distributions, flow rates; investigations into the friction, momentum transfer, and turbulence on fluid flow.

Corequisite: CE 282
Typically offered in Fall and Spring

CE 383 Hydrology and Urban Water Systems (3 credit hours)
Study of engineering hydrology and design of elements of urban stormwater systems. Commonly encountered applications in urban stormwater management, flood control and groundwater engineering. Familiarization with effects of watershed development on quantity and quality of streamflow.

C- or better in CE 282; Corequisite: ST 370; CE, ENE, and CON Majors.
Typically offered in Fall and Spring

CE 401/CE 501 Transportation Systems Engineering (3 credit hours)
Multi-modal transportation systems; railroads, airports, highways, and other modes. Planning, analysis, and design. Fundamental concepts; supply, demand, flows, impacts, and network optimization.

Prerequisite: C- or better in CE 305
Typically offered in Fall only

CE 402/CE 502 Traffic Operations (3 credit hours)
Highway capacity; traffic control systems; intelligent vehicle/highway systems; and other advanced topics. Credit for both CE 402 and CE 502 is not allowed.

Prerequisite: C- or better in CE 305
Typically offered in Fall only

CE 403/CE 503 Highway Design (3 credit hours)
Corridor selection; highway alignment; design of roadsides, intersections, and interchanges. Completion of research paper for students taking course for graduate credit. Credit will not be given for both CE 403 and CE 503.

Prerequisite: C- or better in CE 305
Typically offered in Spring and Summer

CE 405/CE 505 Railroad System Planning, Design, and Operation (3 credit hours)
Students will learn about railroad technology and how to plan, design, and operate rail systems especially the design of alignments, track, and terminals; and the operation of freight and passenger services (ranging from transit through commuter rail to intercity and high speed rail). Field trips are involved during non-scheduled class time. Students must be able, if necessary, to provide their own transportation.

Prerequisite: CE 305
Typically offered in Spring only

CE 413 Principles of Pavement Design (3 credit hours)
Basic principles of analysis, design and performance of highway and airport pavements with critical evaluation of current design and maintenance strategies.

CE 332 and CE 342
Typically offered in Fall only

CE 420 Structural Engineering Project (3 credit hours)
Planning, analysis and design of complete structural systems composed of steel and reinforced concrete. Professional topics in structural engineering practice.

C- or better in CE 325 and CE 327 and CE 342 and CE 426.
Typically offered in Fall and Spring

CE 426 Structural Steel Design (3 credit hours)
Design and behavior of structural steel members and their connections subjected to moment, shear, and axial forces. Introduction to the design of steel structures.

C- or better in CE 225.
Typically offered in Fall, Spring, and Summer

CE 435 Engineering Geology (3 credit hours)
Application of both geology and geotechnical engineering to engineering projects. Illustrations of relevant materials properties and techniques utilized in describing subsurface conditions.

Prerequisite: MEA 101 and Junior standing in colleges of Agriculture and Life Sciences, Engineering, Natural Resources, College of Sciences or Textiles
Typically offered in Spring only

CE 437 Civil Engineering Computing (3 credit hours)
Computational approaches to modeling with applications in construction, structures, transportation, water resources and other civil engineering areas; matrix computations, digital terrain modeling, network applications and algorithms, heuristic optimization.

Senior standing; CSC 111 and (MA 341 or MA 305).
Typically offered in Fall only

CE 443 Seepage, Earth Embankments and Retaining Structures (3 credit hours)
Review of shear strength concepts; ground water hydraulics; slope stability; lateral earth pressure problems; placement of fills.

C- or better in CE 342.
Typically offered in Spring only

CE 444 An Introduction to Foundation Engineering (3 credit hours)
This course will cover the basics of subsurface analysis and foundation design. Subsurface analysis includes the planning and interpretation of site investigation programs, including insitu testing and sampling, and laboratory testing and data interpretation. Foundation design will include the study of shallow and deep foundations subject to a combination of vertical and lateral loads.

C- or better in CE 342.
Typically offered in Fall only

CE 450 Civil Engineering Project (3 credit hours)
Integrated multi-disciplinary team approach to large-scale civil engineering design including topics from geotechnical engineering, land development, transportation engineering, and water resources engineering. Professional topics in civil engineering practice and ethics.

Prerequisite: CE 305 & CE 342 & CE 383; Corequisite: one of (CE 403, CE 413, CE 443, CE 444, or CE 488).
Typically offered in Fall and Spring

CE 463 Construction Estimating, Planning, and Control (3 credit hours)
Overview of the construction industry; life cycle of construction projects, work breakdown structure, activity cost and time estimation, computerized planning and scheduling methods, resource leveling, time-cost tradeoff; computerized cost estimating, bidding and negotiation strategies; and cost/schedule control systems.

Prerequisite: CE 263 and CE 365 and TDE 220
Typically offered in Fall only

CE 464/CE 564 Legal Aspects of Contracting (3 credit hours)
Legal aspects of contract documents, drawings and specifications; owner-engineer-constructor relationships and responsibilities; bids and contract performance, Labor laws; governmental administrative and regulatory agencies; torts; business organizations; ethics and professionalism.

Prerequisite: CE 463; Corequisite: CE 365
Typically offered in Spring only

CE 466 Building Construction Engineering (3 credit hours)
Construction processes for buildings and other structures including codes and standards, structural and architectural components and systems, form work and bracing design, erection and assembly methods.

Corequisite: CE 327
Typically offered in Fall only

CE 468/CE 568 Construction Engineering Laboratory (1 credit hours)
Measurements with and calibration of measurement instruments used in construction engineering field tests for quality and safety of the construction process. Interpretation of ANSI, ASTM, ACI and AISC specifications and standards. Credit for both CE 468 and CE 568 is not allowed.

Prerequisite: CE 332, Corequisite: CE 327 or CE 426
Typically offered in Spring only

CE 469 Construction Engineering Project (3 credit hours)
Capstone course involving integrated team approach in the design of the construction process, utilizing computerized tools for cost estimation, planning, scheduling, process design, and management of two construction projects. Each student also selects an individual project. Lecture topics include: ethics, professionalism, marketing, bid presentations, business planning, finance, and other appropriate topics by guest speakers from industry.

Prerequisite: CE 463 Co-requisite: CE 464
Typically offered in Spring only

CE 476 Air Pollution Control (3 credit hours)
Introduction to air pollution control fundamentals and design. Fundamentals include the physics, chemistry and thermodynamics of pollutant formation, prevention and control. Design will include gas treatment, process modification, and feedstock modification. Pollutants to be addressed include sulfur dioxide, nitrogen oxides, particulate matter, volatile organic compounds, hydrocarbons, and air toxics. Credit for both CE 476 and CE 576 will not be given.

CE 373 and MAE 201; Corequisite: ST 370 or CHE 450 (CHE majors)
Typically offered in Fall only

CE 477 Principles of Solid Waste Engineering (3 credit hours)
Solid waste management including generation, storage, transportation, processing, land disposal and regulation. Processing alternatives including incineration and composting. Integration of policy alternatives with evaluation of engineering decisions.

CE 250, CE 282 and CE 373.
Typically offered in Spring only

CE 478/CE 578 Energy and Climate (3 credit hours)
Interdisciplinary analysis of energy technology, natural resources, and the impact on anthropogenic climate change. Topics include basic climate science, energetics of natural and human systems, energy in fossil-fueled civilization, the impact of greenhouse gas emissions on climate, and technology and public policy options for addressing the climate challenge. The course is quantitative with a strong emphasis on engineering and science.

Prerequisite: Senior standing
Typically offered in Fall only

CE 479/MEA 479 Air Quality (3 credit hours)
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain: problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579.

CE 282 and CE 373; or CHE 311(CHE Majors); or MEA 421 (MEA Majors); Corequisite: ST 370; or ST 380 (MEA Majors)
Typically offered in Spring only

CE 481 Environmental Engineering Project (3 credit hours)
Engineering design of selected projects in environmental engineering involving interactions with other scientific and engineering disciplines. Discussion of ethical conduct and professional engineering practice.

Prerequisite: CE 378, 383 Corequisite: CE 484 and two of: CE 476, 477, 479, 488
Typically offered in Spring only

CE 484 Water Supply and Waste Water Systems (3 credit hours)
Elements of the design of water supply and wastewater disposal systems.

CE 282 and CE 373.
Typically offered in Fall only

CE 487 Introduction to Coastal and Ocean Engineering (3 credit hours)
Introduction to the analysis of civil engineering projects in the ocean and along the coastline. Basic wave mechanics, tides, and ocean dynamics as applied to the understanding of coastal erosion control and other marine problems. An optional two-day field trip to the North Carolina Outer Banks at a nominal student expense is a regular feature of the course.

Senior standing and CE 282.
Typically offered in Spring only

CE 488/CE 588 Water Resources Engineering (3 credit hours)
Extension of the concepts of fluid mechanics and hydraulics to applications in water supply, water transmission, water distribution networks and open channels to include water-supply reservoirs, pump and pipe selection, determinate and indeterminate pipe networks, and analysis of open channels with appurtenances.

Prerequisite: CE 339 and CE 383
Typically offered in Fall only

CE 493 Independent Study in Civil Engineering (1-4 credit hours)
Independent study of a topic in Civil Engineering. Topic and mode of study determined by faculty member(s) and student(s). Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

CE 497 Current Topics in Civil Engineering (1-4 credit hours)
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

Typically offered in Fall, Spring, and Summer

CE 498 Special Problems in Civil Engineering (1-4 credit hours)
Directed reading in the literature of civil engineering, introduction to research methodology, seminar discussion dealing with special civil engineering topics of current interest.

Prerequisite: Senior standing
Typically offered in Fall and Spring

CE 499 Undergraduate Research Thesis in Civil, Construction and Environmental Engineering (1-3 credit hours)
Faculty mentored research related to civil, construction or environmental engineering. A plan of work is required describing the independent research culminating in a thesis. Presentation at the NC State Undergraduate Research Symposium, or other similar venue, may be included. The student must identify a research advisor from within the CCEE faculty. Departmental approval is required.

Senior standing. Departmental Approval Required.
Typically offered in Fall and Spring

CE 501/CE 401 Transportation Systems Engineering (3 credit hours)
Multi-modal transportation systems; railroads, airports, highways, and other modes. Planning, analysis, and design. Fundamental concepts; supply, demand, flows, impacts, and network optimization.

Prerequisite: C- or better in CE 305
Typically offered in Fall only

CE 502/CE 402 Traffic Operations (3 credit hours)
Highway capacity; traffic control systems; intelligent vehicle/highway systems; and other advanced topics. Credit for both CE 402 and CE 502 is not allowed.

Prerequisite: C- or better in CE 305
Typically offered in Fall only

CE 503/CE 403 Highway Design (3 credit hours)
Corridor selection; highway alignment; design of roadsides, intersections, and interchanges. Completion of research paper for students taking course for graduate credit. Credit will not be given for both CE 403 and CE 503.

Prerequisite: C- or better in CE 305
Typically offered in Spring and Summer

CE 504 Airport Planning and Design (3 credit hours)
Analysis, planning and design of air transportation facilities.

Prerequisite: C- or better in CE 305
Typically offered in Fall only

CE 505/CE 405 Railroad System Planning, Design, and Operation (3 credit hours)
Students will learn about railroad technology and how to plan, design, and operate rail systems especially the design of alignments, track, and terminals; and the operation of freight and passenger services (ranging from transit through commuter rail to intercity and high speed rail). Field trips are involved during non-scheduled class time. Students must be able, if necessary, to provide their own transportation.

Prerequisite: CE 305
Typically offered in Spring only

CE 506 Transportation Engineering Data Collection and Analysis (3 credit hours)
Broad range of transportation engineering data collection and analysis applications encompassing the modes of highway, transit and pedestrian travel and the contexts of system planning, design and operation. Proposal preparation with primary focus on methodology and work plan development for addressing important research and practice questions.

Prerequisite: CE 305, ST 370
Typically offered in Fall only

CE 507 Sensors, Instrumentation, and Data Analytics for Transportation Networks (3 credit hours)
Students will learn about the use of sensors, instrumentation, and big data analysis in transportation systems to observe, monitor, and evaluate performance. This includes the technology employed, the deployment strategies, the challenges associated with obtaining high-quality data, the fusion of data from independent sources, the imputation of missing data elements, and evaluation of performance based on the data assembled. The highway mode is the principal focus, including analyses of travel times, delays, queue dynamics, and spatial and temporal demand patterns.

Typically offered in Spring only

CE 509 Highway Safety (3 credit hours)
Methods to reduce collisions and injuries on highways. Identifying promising locations, choosing appropriate countermeasures, and evaluating past projects. Understanding the institutional context and establishing appropriate highway design standards.

Prerequisite: CE 305, Corequisite: ST 370 or equivalent
Typically offered in Spring only

CE 515 Advanced Strength of Materials (3 credit hours)
Stresses and strains at a point; rosette analysis; torsion and unsymmetrical bending of open and closed sections; nonlinear and curved beams; stress concentration; beams on elastic foundations; shear deformation of beams; classical plasticity; fracture mechanics.

Prerequisite: CE 225 or MAE 314
Typically offered in Fall only

CE 522 Theory and Design Of Prestressed Concrete (3 credit hours)
Principles and concepts of design in prestressed concrete including elastic and ultimate strength analyses for flexure, shear, torsion, bond and deflection. Principles of concordancy and linear transformation for indeterminate prestressed structures. Application of pre-stressing to tanks and shells.

Prerequisite: CE 327
Typically offered in Fall only

CE 523 Theory and Behavior Of Steel Structures (3 credit hours)
Theory and behavior of steel structures leading to the development of design requirements contained in current specifications; flexural, torsional and flexural-torsional buckling of columns; plastic analysis of beams and frames; lateral-torsional buckling of beams; stability and strength of flat plates; beam-columns.

Prerequisite: CE 426
Typically offered in Fall only

CE 524 Analysis and Design Of Masonry Structures (3 credit hours)
Theory and design of masonry arches, culverts, dams, foundations and masonry walls subjected to lateral loads.

Prerequisite: CE 327
Typically offered in Spring only

CE 525 Advanced Structural Analysis (3 credit hours)
Analysis of 1D bar and beam, 2D/3D truss, and 2D/3D frame structures using the matrix displacement method. Introduction to the finite element method of analysis by deriving the element stiffness matrices and equivalent nodal loads using the Principle of Virtual Work. Derivation of Timoshenko beam elements for including shear deformation effects. Development of techniques to handle non-standard loading (e.g. support displacements, temperature changes) and accurately model member-releases. Introduction to material/geometric nonlinearity. Implementation of analysis procedures through computer programming and commercial structural analysis software.

Prerequisite: CE 325
Typically offered in Fall only

CE 526 Finite Element Method in Structural Engineering (3 credit hours)
Development of the finite element method with an emphasis on understanding the fundamental principles governing the analysis technique. Applications to two-dimensional solids with particular attention to applications in structural engineering. Typical modeling considerations are reviewed and applied to the analysis of a realistic structure.

Prerequisite: CE 515
Typically offered in Spring only

CE 527 Structural Dynamics (3 credit hours)
Analysis of single and multi-degree-of-freedom structures subjected to various types of excitations and initial conditions. Computational aspects of dynamic analysis. Introduction to approximate methods of analysis.

Prerequisite: CE 425 or CE 525
Typically offered in Spring only

CE 528/FB 528 Structural Design in Wood (3 credit hours)
Behavior, strength and design of wood structural members subjected to moment, shear and axial forces. Design of connections and introduction to design of wood structural systems.

Prerequisite: C- or better in CE 325
Typically offered in Spring only

CE 529 FRP Strengthening and Repair of Concrete Structures (3 credit hours)
Fundamental behavior of Fiber-Reinforced Polymer (FRP) strengthened/repaired reinforced concrete structures. Creation of sustainable and resilient civil infrastructure by extending the useful life of existing structures using advances materials. Applications to practical strengthening design of realistic reinforced concrete structures.

Prerequisite: CE 327 and CE 325
Typically offered in Fall only

CE 530 Properties of Concrete and Advanced Cement-Based Composites (3 credit hours)
This course consists of three parts. First part covers basic properties of cements, mineral/chemical admixtures, and concrete production. Second part covers mechanical properties including compressive and tensile strength, multi-axial loading, composite models, and fracture mechanics. Models of porosity and microstructures are also discussed. Third part covers durability and deterioration mechanisms including corrosion of steel in concrete, mass transport, service life prediction. Advanced laboratory techniques are discussed. This course also covers emerging topics such as geopolymers and aluminate cements.

Prerequisite: CE 332 and CE 225
Typically offered in Spring only

CE 536 Introduction to Numerical Methods for Civil Engineers (3 credit hours)
Introduction to widely-used numerical methods through application to civil and environmental engineering problems. Emphasis will be on implementation and application rather than the mathematical theory behind the numerical methods.

Prerequisite: MA 302, MA 341, or MA 401
Typically offered in Spring and Summer

CE 537/OR 537 Computer Methods and Applications (3 credit hours)
Computational approaches to support civil planning, analysis, evaluation and design. Applications to various areas of civil engineering, including construction, structures, transportation and water resources.

Prerequisite: CSC 112 and (MA 341 or MA 305)
Typically offered in Fall only

CE 538 Information Technology and Modeling (3 credit hours)
Computing research and advanced technologies of interest to civil engineers. Issues in the design and development of engineering software systems and engineering modeling of structures, assemblies, processes and phenomena. Additional topics from the most predominant and recent developments and advances in civil engineering computing.

Prerequisite: CE 390
Typically offered in Fall and Spring

CE 548 Engineering Properties Of Soils I (3 credit hours)
Significant soil properties in earthwork engineering, including soil elasticity and soil mineralogy, hydraulic conductivity, stress-strain relations and shear strength, compressibility and compaction. Evaluating laboratory work including plasticity, triaxial compression, permeability, consolidation and compaction tests.

Prerequisite: CE 342
Typically offered in Fall only

CE 549 Soil and Site Improvement (3 credit hours)
Principles and design methodologies for techniques related to densification, including dynamic compaction, vibro-compaction and compaction grouting; drainage, including wick drains, horizontal drains and dewatering; physical and chemical modification, including admixtures, chemical and cement grouting, soil mixing, jet grouting and soil freezing; and use of inclusions, including stone columns, soil nailing, and meta and geosynthetic reinforcement.

Prerequisite: CE 342
Typically offered in Spring only

CE 550 Professional Engineering Communication (3 credit hours)
Communicating effectively is central to the success of any engineering project and to advance in your engineering career. In this course you will learn principles of writing clearly and effectively for the wide range of communication activities professional engineers must do for a variety of audiences. Topics covered include writing reports, writing proposals, delivering presentations, planning and revising writing, providing feedback, and more. Students will get hands-on experience working on a wide range of documents for their career.

P: Graduate Standing
Typically offered in Spring and Summer

CE 557 Engineering Measurement and Data Analysis (3 credit hours)
The course will introduce students to fundamentals of experimental design, measurement systems and applied data analysis techniques and includes 'hands-on' laboratory exercises with sensors and computer-based data acquisition. Emphasis is on general concepts and their practical application towards engineering problems. The goal of the class is to build needed background, skills and vocabulary to develop students' experimental practice rather than focusing on the underlying fundamentals of distinct areas. Students will develop more topic/media-specific knowledge through a team experimental project. Prerequisites include a course in statistics (e.g. ST 370, ST 515 or equivalent) and some coursework or experience involving scientific programming (e.g. CE 536 or 537; Matlab, Python, R, Igor Pro, IDL). Appropriate background can be determined via discussion with instructor.

Typically offered in Fall only

CE 561 Construction Project Management (3 credit hours)
Construction project management and control using network based tools, time-money analysis and other quantitative and qualitative techniques. Planning and scheduling, critical path, lead-lag, resource allocation, uncertainty, cash flow and payment scheduling, change orders, project acceleration, coordination and communication, record keeping. Emphasis on computer-based techniques.

Prerequisite: CE 463

CE 562 Lean Construction Concepts and Methods (3 credit hours)
Student teams apply concepts and methods in field studies of real project management processes and construction operations by using principles and methods in Lean Production, Construction, Design, Assembly, Supply, Production Control, and Work Process Design.

Prerequisite: CE 463
Typically offered in Fall only

CE 564/CE 464 Legal Aspects of Contracting (3 credit hours)
Legal aspects of contract documents, drawings and specifications; owner-engineer-constructor relationships and responsibilities; bids and contract performance, Labor laws; governmental administrative and regulatory agencies; torts; business organizations; ethics and professionalism.

Prerequisite: CE 463; Corequisite: CE 365
Typically offered in Spring only

CE 565 Construction Safety Management (3 credit hours)
Fundamentals of safety management principles. Detailed review of OSHA regulations and standards critical to construction engineers and managers who expect to design and administer safety related systems in a construction project. Analysis and design of example minimum safety requirements for application in construction field operations. Review of OSHA Standards for the Construction Industry, a review of selected sections of OSHA Standards for General Industry, a review of general principles of construction safety management.

Prerequisite: CE 465 or CE 466
Typically offered in Spring only

CE 566 Global Construction Engineering and Management Practices (3 credit hours)
Construction is a global business. It is common to find design simultaneously performed in different countries (24/7 design); material procured from sources around the globe; and construction performed by a workforce that is multicultural, multilingual, and multinational. Because of these characteristics those involved with this profession need to embrace this reality and become more aware of the various design and construction practices found throughout the world. This course provides students with such a global awareness by revealing construction practices and innovations found in both developed and emerging countries. To introduce this global awareness, unique construction perspectives will be offered by a consortium of universities located in China, Thailand, Africa, and the U.S. Special topic lecturers will present practices found in other parts of the world including the Middle East, Europe and Central and South America.

Restriction: Graduate standing in the Department of Civil, Construction, and Environmental Engineering unless otherwise agreed upon by instructor
Typically offered in Fall and Spring

CE 567 Risk and Financial Management in Construction (3 credit hours)
Fundamental concepts in financial and risk analysis in construction; accounting and financial metrics in construction; risk assessment and risk management in construction including the cost of risk, decision making strategies, the role of sureties, effects of risk in project delivery methods and contract types; risk effects in project financing including a review of financing sources, considerations for financing local and international projects; and the impact of financial and risk management in strategic planning in construction.

Prerequisite: ACC 220, CE 463
Typically offered in Spring only

CE 568/CE 468 Construction Engineering Laboratory (1 credit hours)
Measurements with and calibration of measurement instruments used in construction engineering field tests for quality and safety of the construction process. Interpretation of ANSI, ASTM, ACI and AISC specifications and standards. Credit for both CE 468 and CE 568 is not allowed.

Prerequisite: CE 332, Corequisite: CE 327 or CE 426
Typically offered in Spring only

CE 571 Physical Principles of Environmental Engineering (3 credit hours)
Mass balances, equation of motion for small particles, small particle interactions, particle collision/fast coagulation, partitioning, adsorption isotherms, fluid mechanics, diffusion, interphase mass transport and resistance models, elementary/non-elementary reactions, residence time distributions.

Prerequisite: CE 282, Graduate standing
Typically offered in Spring only

CE 573 Biological Principles of Environmental Engineering (3 credit hours)
Concepts in environmental microbiology including cell structure and function, phylogeny, survey of environmentally relevant microbial groups, metabolism under different redox conditions, catabolism of macromolecules, methods in microbial ecology. Relationships to engineering processes and systems will be emphasized.

Prerequisite: Graduate standing in CE, BAE, CHE, or SSC
Typically offered in Fall only

CE 574 Chemical Principles of Environmental Engineering (3 credit hours)
Inorganic and organic environmental chemistry including acid-base equilibria, precipitation, complexation, redox reactions, and natural organic matter. The role of these factors in controlling the fate of contaminants in engineered treatment systems and natural environments.

Prerequisite: Graduate standing in CE, CHE, BAE, NE, MEA, SSC
Typically offered in Fall only

CE 576 Engineering Principles Of Air Pollution Control (3 credit hours)
Introduction to air pollution control fundamentals and design. Fundamentals including physics, chemistry and thermodynamics of pollutant formation, prevention and control. Design including gas treatment and process and feedstock modification. Addressed pollutants including sulfur dioxide, nitrogen oxides, particulate matter, volatile organic compounds, hydrocarbons and air toxins. Investigation of current research. Credit for both CE 476 and CE 576 is not allowed.

Prerequisite: CE 375, CE 470, CHE 315 or MAE 301, Corequisite: ST 511 or 515
Typically offered in Fall only

CE 577 Engineering Principles Of Solid Waste Management (3 credit hours)
Solid waste management including generation, storage, transportation, processing, land disposal and regulation. Processing alternatives including incineration and composting. Integration of policy alternatives with evaluation of engineering decisions. Investigation of current research. Credit is only allowed for one of CE 477 and CE 577.

Prerequisite: CE 373
Typically offered in Spring only

CE 578/CE 478 Energy and Climate (3 credit hours)
Interdisciplinary analysis of energy technology, natural resources, and the impact on anthropogenic climate change. Topics include basic climate science, energetics of natural and human systems, energy in fossil-fueled civilization, the impact of greenhouse gas emissions on climate, and technology and public policy options for addressing the climate challenge. The course is quantitative with a strong emphasis on engineering and science.

Prerequisite: Senior standing
Typically offered in Fall only

CE 579 Principles of Air Quality Engineering (3 credit hours)
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain" problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579.

Prerequisite: CE 373, CE 382 or CHE 311(CHE Majors), or MEA 421(MEA Majors), Corequisite: ST 370, ST 380(MEA Majors)
Typically offered in Spring only

CE 581/MEA 581 Fluid Mechanics in Natural Environments (3 credit hours)
Free surface flows of water and air occurring in natural fluid systems and influencing environmental transport and mixing. Review of fundamental principles of fluids, covering the scales relevant to both engineering and geo-physical applications. Topics and examples include waves, instability, stratification, turbulent boundary layers, jets and plumes, and open channel flows. Cannot receive credit for both CE 581 and MEA 581.

Prerequisite: CE 282 or MEA 463 or permission of instructor
Typically offered in Fall only

CE 582 Coastal Hydrodynamics (3 credit hours)
This course gives an introduction to water wave mechanics for engineers and scientists. Topics include wave generation, propagation, kinematics, transformation, breaking, forces, and dissipation.

Prerequisite: CE 282 or permission of instructor.
Typically offered in Spring only

CE 583 Engineering Aspects Of Coastal Processes (3 credit hours)
Coastal environment, engineering aspects of mechanics of sediment movement, littoral drift, beach profiles, beach stability, meteorological effects, tidal inlets, inlet stability, shoaling, deltas, beach nourishment, mixing processes, pollution of coastal waters, interaction between shore processes and man-made structures, case studies.

C- or better in CE 282.
Typically offered in Spring only

CE 584 Hydraulics Of Ground Water (3 credit hours)
Introduction to ground water hydraulics and hydrology. Hydrologic cycle, basic ground water hydraulics, numerical solution of governing equations, ground water hydrology of North Carolina, well design and construction, flow net development, and ground water contamination sources.

Prerequisite: CE 382
Typically offered in Fall only

CE 585 Principles of Surface Water Quality Modeling (3 credit hours)
This course addresses how human inputs affect natural and engineered aquatic systems, through mathematical modeling of system dynamics. Course topics integrate physical, chemical, and biologic processes related to pollutants and lower food-web dynamics. Lectures and assignments cover both theory and application. Applications are relevant to informing management, protection, and restoration of inland and coastal waters.

Prerequisite courses include environmental processes (e.g., CE 373) and quantitative calculus-based hydrology (e.g., CE 383), or permission of instructor.
Typically offered in Spring only

CE 586 Engineering Hydrology (3 credit hours)
Hydrologic principles underlying procedures for surface water modeling; applications of common hydrologic models to actual watersheds.

Prerequisite: CE 383
Typically offered in Fall only

CE 588/CE 488 Water Resources Engineering (3 credit hours)
Extension of the concepts of fluid mechanics and hydraulics to applications in water supply, water transmission, water distribution networks and open channels to include water-supply reservoirs, pump and pipe selection, determinate and indeterminate pipe networks, and analysis of open channels with appurtenances.

Prerequisite: CE 339 and CE 383
Typically offered in Fall only

CE 590 Special Topics In Civil Engineering (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 591 Special Topics in Civil Engineering Computing (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 592 Special Topics in Construction Engineering (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 593 Special Topics in Geotechnical Engineering (1-3 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 594 Special Topics in Structures and Mechanics (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 595 Special Topics in Transportation Engineering (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 596 Special Topics in Water Resource and Environmental Engineering (1-6 credit hours)
New or special course on recent developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 603 Construction Engineering Seminar (1 credit hours)
Discussions and reports of subjects in civil engineering and allied fields.

Typically offered in Fall and Spring

CE 605 Structures and Mechanics Seminar (1 credit hours)
Discussions and reports of subjects in civil engineering and allied fields.

Typically offered in Fall and Spring

CE 607 Water Resource and Environmental Engineering Seminar (1 credit hours)
Discussions and reports of subjects in civil engineering and allied fields.

Typically offered in Fall and Spring

CE 610 Special Topics CE (1-6 credit hours)

CE 635 Advanced Reading In Civil Engineering (1-3 credit hours)
Directed reading of advanced topics in some phase of civil engineering.

Prerequisite: Graduate standing
Typically offered in Summer only

CE 675 Civil Engineering Projects (1-6 credit hours)
Research- or design-oriented independent study and investigation of a specific civil engineering topic, culminating in final written report.

Typically offered in Fall, Spring, and Summer

CE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CE 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Summer only

CE 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Summer only

CE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Summer only

CE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Summer only

CE 701 Urban Transportation Planning (3 credit hours)
Planning and design of urban transportation systems as related to comprehensive urban planning; principles of land use planning, urban thoroughfare planning and regional planning

Prerequisite: CE 501
Typically offered in Spring only

CE 702 Traffic Flow Theory (3 credit hours)
Stream flow, shock wave, queuing, and other macroscopic theories;car following, gap acceptance, and other microscopic theories; distributions of traffic stream parameters; building traffic simulation models.

Prerequisite: CE 502, Corequisite: ST 370
Typically offered in Fall only

CE 703 Economic Analysis of Transportation Systems (3 credit hours)
Transportation economics in terms of its supply and demand, costs, pricing, and regulation, especially the way in which the theory of economics in the marketplace and for public and private firms applies to the transportation market given its unique characteristics.

Typically offered in Fall only

CE 705 Intelligent Transportation Systems (3 credit hours)
Intelligent Transportation Systems (ITS) planning and human factor elements; application of monitoring, communications and information dissemination technologies to transportation systems; advanced traffic management for freeway and arterial systems; traveler information and public transportation systems; automated vehicle and highway systems. ITS evaluation methods and models.

Prerequisite: CE 501 and CE 502
Typically offered in Fall only

CE 706 Advanced Traffic Control (3 credit hours)
Advanced signalized traffic control methods at intersections, arterials and networks. Applications of mathematical optimization techniques to signal timing and coordination. Use of traffic simulation and optimization models for signal evaluation and design. Roundabout analysis and design.

Prerequisite: CE 502
Typically offered in Spring only

CE 707 Transportation Policy and Funding (3 credit hours)
Understanding and debating important current transportation policy issues in the U.S. Raising and allocating funds for building and maintaining the transportation system. Highway, public transit, rail, air, and other modes.

Prerequisite: CE 501 or graduating in Economics or Public Administration
Typically offered in Spring only

CE 708 Transportation Logistics Planning and Optimization (3 credit hours)
The mathematical treatment of transportation logistics from the perspective of infrastructure providers and system operators, including models used by freight service providers to determine how they will meet the demands for freight service. Private and common carrier operations are covered. Rail, truck, and air are the primary modes examined.

Typically offered in Fall only

CE 714 Stress Waves (3 credit hours)
Theory of stress waves in solids. Origins and nature of longitudinal transverse and surface waves originating at an impact site or from other transient disturbances. Determination of stresses, particle velocities, wave velocities. Wave interaction with other waves and with boundaries and dissimilar materials. Modern instrumentation and seismic refraction exploration.

Prerequisite: MA 341; CE 225 or PY 411 or MA 401
Typically offered in Fall only

CE 718 Constitutive Modeling of Engineering Materials (3 credit hours)
Stresses and strains (vectors, tensors and indicial notations), general theorems for elastic-plastic solids, constitutive modeling of metals and concrete, numerical implementations of plasticity models.

Prerequisite: CE 515 (old CE 715)
Typically offered in Spring only

CE 721 Matrix and Finite Element Structural Analysis (3 credit hours)
Advanced topics in matrix structural analysis and finite element method. Introductory review of the method, isoparametric quadrilateral element and three-dimensional elements. Energy methods and convergence criteria. Higher order elements. Isoparametric beam and plant elements, shear locking. Isoparametric curved beam and shell elements. Axisymmetric elements, Fourier series load and displacement representation. Analysis of systems with geometric and material nonlinearities.

Prerequisite: CE 526
Typically offered in Spring only

CE 723 Advanced Structural Dynamics (3 credit hours)
Finite element formulation of equations of motion; advanced analysis techniques for discrete parameter systems; investigation of damping; analysis of continuous systems; applications to civil engineering structures.

Prerequisite: CE 527
Typically offered in Fall only

CE 724 Probabilistic Methods Of Structural Engineering (3 credit hours)
Application of probability theory and stochastic processes to study safety of structures. Fundamentals of probability theory and stochastic processes; probabilistic modelings of structural loadings, material properties and risk. Reliability analysisof structures; reliability-based design criteria. Random vibration of simple structures; safety analysis of structures under dynamic loads.

Prerequisite: MA 421
Typically offered in Fall only

CE 725 Earthquake Structural Engineering (3 credit hours)
Effects of earthquakes on structures and of design of structures to resist earthquake motions; earthquake mechanisms and ground motions; response of structures to earthquake motions; behavior of materials, structural elements and assemblages subjected to earthquakes; principles of earthquake-resistant design practice; soil-structure interaction; and special topics.

Prerequisite: CE 527
Typically offered in Fall only

CE 726 Advanced Theory Of Concrete Structures (3 credit hours)
Inelastic theory of structural concrete members under flexure, axial load, combined flexure and axial compression, shear and torsion. Yield line theory of slabs. Limit analysis of beams and frames of reinforced and prestressed concrete.

Prerequisite: CE 522
Typically offered in Spring only

CE 727 Seismic Analysis, Assessment, and Design of Concrete Buildings (3 credit hours)
This course covers the seismic analysis, assessment and design of concrete building structures. The progression through the course follows four areas, namely: Concrete non-linear material behavior; Frame analysis and design; Wall analysis and design; assessment and retrofit. The emphasis during the course will be on the relationships between engineer's choices, analysis and design.

P: CE 725 or equivalent
Typically offered in Spring only

CE 728 Performance Based Seismic Design of Bridges (3 credit hours)
This course covers the seismic analysis and design of bridge structures. The progression through the course follows six thematic areas, namely: Conceptual design; Analysis approaches; Capacity Design; Response Verification; Assessment and Retrofit of Bridges; and New (or underutilized) frontiers in bridge engineering. The emphasis during the course will be on the relationships between engineer's choices, analysis, and design.

Prerequisite: CE 725
Typically offered in Spring only

CE 730 Mechanics and Failure of Quasi-Brittle Materials (3 credit hours)
This course is in three parts. Part one covers fundamentals of composites including estimating the mechanical and thermomechanical properties, failure of composites, laminate, and shear-lag model. Advanced topics including homogenization theories, Eigenstrain and Eigenstress, dilute, self-consistent and Mori-Tanaka methods are also covered. Part two covers fundamental of fracture mechanics including Griffith theory, stress field at crack tip, energy release rate, crack tip plasticity, and mixed mode fracture. Part three covers interface cracks, cracks approaching an interface, and fracture of composites.

Prerequisite: CE 515 and Corequisite: CE526
Typically offered in Fall only

CE 737 Computer-Aided Engineering Systems (3 credit hours)
Design and implementation issues for building real-world computer-aided engineering systems. Engineering data modeling; data definition, query and manipulation methodologies; application program interfaces; problem-oriented languages and software supervisors; and knowledge-based systems to support engineering design and decision making.

Prerequisite: CE 537 or 538
Typically offered in Spring only

CE 741 Geomechanics of Stress Deformation (3 credit hours)
Concepts of volume change and effective stress, stress-strain behavior of clays and sands, stress path and failure conidtions; mechanistic interaction between solids and water, problems in elasticity and plasticity pertaining to stress distribution, elstic, consolidation and secondary settlements, and tolerance limits to deformation levels.

Prerequisite: CE 440, or CE 443 or CE 548

CE 742 Deformation and Instability of Soils (3 credit hours)
Deformation and failure of soils. Limit equilibrium analyses for: slope stability, lateral earth pressure, bearing capacity of shallow foundations. Constitutive models for soils. Linear elasticity and theory of plasticity. Critical state model for soil behavior. Limit analysis.

Prerequisite: CE 440, or CE 443 or CE 548

CE 744 Foundation Engineering (3 credit hours)
Subsoil investigations; excavations; design of sheeting and bracing systems; control of water; footing, grillage and pile foundations; caisson and cofferdam methods of construction.

Prerequisite: CE 342
Typically offered in Spring only

CE 746 Soil Dynamics and Earthquake Engineering (3 credit hours)
Dynamics of discrete and continuous systems with application to soil dynamics: dynamic soil properties, analysis of foundation vibration, construction-induced vibration, dynamic soil-structure interaction. Geotechnical earthquake engineering: ground motion characteristics, dynamic response of soil sites, effect of local site conditions on design ground motion, liquefaction of soils.

Prerequisite: CE 440, or CE 443 or CE 548

CE 747 Geosynthetics in Geotechnical Engineering (3 credit hours)
Introduction to use, manufacturing techniques, design and construction of geosynthetics in geotechnical engineering applications; design and analysis of geotextiles, geonets, geogrids and geomembranes in pavements base and subbase reinforcement, reinforced walls, slopes, moisture barriers, dams and hazardous impoundment, landfill liners and covers.

Prerequisite: CE 548
Typically offered in Spring only

CE 751 Theory Of Concrete Mixtures (3 credit hours)
In-depth study of theory of portland cement concrete mixtures including types and properties of portland special cements; chemical reactions; brief examination of history of mixture design; detailed study of current design methods; properties of fresh and hardened concretes; strength-age-curing relationships; durability; admixtures; special concretes; production and quality control.

Prerequisite: CE 332
Typically offered in Fall only

CE 755 Highway Pavement Design (3 credit hours)
Theoretical analysis and design of highway pavements with critical evaluation of current design practices. Pavement materials characterization; stresses and strains in pavements; traffic consideration; pavement performance models; and actual thickness design of pavements using different methodologies.

Prerequisite: CE 342
Typically offered in Fall only

CE 757 Pavement Management Systems (3 credit hours)
Fundamental concepts in process of pavement management at both network level and project level. Distress identification and evaluation; concepts and methods for rehabilitation and maintenance techniques; nondestructive testing of pavements; performance prediction models; and principles of prioritization/optimization.

Prerequisite: CE 755
Typically offered in Spring only

CE 758 Multiscale Characterization of Asphalt Materials (3 credit hours)
Multiscale characterization of asphalt concrete. Chemical, rheological, and damage characterization of asphalt binder; asphalt binder oxidative aging; asphalt modification; asphalt emulsions; asphalt mastics; fine aggregate matrix; coarse aggregate structure. Graduate course on Asphalt and Bituminous Materials or consent by the instructor.

Typically offered in Spring only

CE 759 Inelastic Behavior Of Construction Materials (3 credit hours)
Application of principles of linear and nonlinear viscoelasticity, fracture mechanics and damage mechanics to modeling inelastic behavior of construction materials. Mechanical analog of time-dependent response; linear and nonlinear elastic-viscoelastic correspondence principles; time-temperature superposition; stress intensity factor; energy release rate; J-integral; and continuum damage mechanics.

Prerequisite: CE 515
Typically offered in Spring only

CE 761 Design Of Temporary Structures in Construction (3 credit hours)
Computer-based analysis of temporary structures in construction and their design, safety and control. Emphasis on concrete formwork, falsework, earth support, cofferdams, underpinning, lifting and rigging.

Prerequisite: CE 522 or CE 744 or CE 766
Typically offered in Fall only

CE 762 Construction Productivity (3 credit hours)
Methods of collecting, assembling and analyzing construction productivity data in order to increase construction productivity. Applications of methods improvement techniques such as time-lapse photography, flow charts, process charts and time standards to improvement of construction productivity. Safety and human factors in construction and their relation to construction productivity.

Prerequisite: CE 463
Typically offered in Spring only

CE 763 Materials Management In Construction (3 credit hours)
Fundamental concepts and methods; construction specific models for integrated materials management; computer usage; vendor analysis and "best-buy;" materials requirement planning and control; management of material waste; automated materials tracking; materials handling; study of current issues; development of practical solution to a real-world problem.

Prerequisite: CE 463, CE 465
Typically offered in Spring only

CE 765 Construction Equipment Systems (3 credit hours)
Analysis of heavy construction processes as systems in order to optimize the selection and employment of construction equipment. Considerations in system design, cost and productivity estimation, operational procedures, safety and maintenance. Computer applications utilizing analytical and simulation techniques.

Prerequisite: CE 761 or 762
Typically offered in Spring only

CE 766 Building Construction Systems (3 credit hours)
Construction engineering of conventional and industrialized building systems. Emphasis in areas of structural systems utilizing cast-in-place concrete, precast concrete, prestressed concrete, structural steel, cold-formed steel, masonry, timber, composite and mixed materials. Mechanisms for resisting and transmitting loads, detailing, fabrication, transportation, erection, stability, shoring, quality control and integration of service systems.

Prerequisite: CE 466 or CE 327 or Graduate standing in ARC
Typically offered in Fall and Spring

CE 771 Physical-Chemical Water Treatment Processes (3 credit hours)
Physical-chemical treatment processes for the treatment of water, including sedimentation, flotation, filtration, coagulation, oxidation, disinfection, precipitation, adsorption, and membrane treatment processes. Current issues in drinking water quality and treatment are discussed.

Prerequisite: CE 574, Corequisite: CE 571
Typically offered in Spring only

CE 772/NE 772 Environmental Exposure and Risk Analysis (3 credit hours)
Course covers the identification, transport, and fate of hazardious substances in the environment; quantification of human exposures to such substances; dose-response analysis; and uncertainty and variability analysis. The general risk assessment framework, study design aspects for exposure assessment, and quantitative methods for estimating the consequences and probablity of adverse health outcomes are emphasized.

Prerequisite: ST 511 or 515
Typically offered in Spring only

CE 774 Environmental Bioprocess Technology (3 credit hours)
Principles of microbiological, biochemical, and biophysical processes used in environmental waste treatment and remediation processes, with particular emphasis on water quality control processes.

Prerequisite: CE 573, CE 574
Typically offered in Spring only

CE 775 Modeling and Analysis Of Environmental Systems (3 credit hours)
Movement and fate of pollutant discharges. Development and application of analytical solutions and numerical models. Role of these models in planning and management. Mathematical programming models. Alternative management strategies: direct regulation, charges and transferable discharge permits. Multiple objectives: cost, equity and certainty of outcome.

Prerequisite: CE 339 and CE 282
Typically offered in Fall only

CE 776 Advanced Water Management Systems (3 credit hours)
Application of systems analysis methods to design, analysis and management of water resources and environmental engineering.

Prerequisite: CE 339, CE 775
Typically offered in Spring only

CE 777 Stochastic Methods in Water Resources and Environmental Engineering (3 credit hours)
Stochastic modeling, water resources and environmental data analysis, Dimension reduction, estimation and detection of periodicities in water resources and environmental data, parametric and non-parametric methods in water and environmental modeling.

Prerequisite: CE 586 or ST 515
Typically offered in Spring only

CE 779 Advanced Air Quality (3 credit hours)
Local, regional and global scale chemical interactions, transport and behavior of trace gases (sulfur carbon, nitrogen, hydrocarbon, and photo-chemical oxidants) in the atmosphere. covers three primary elements of air quality: anthropogenic and natural emissions of trace gases; interactions of the pollutants in the atmosphere; and monitoring and sampling of gaseous and particulate pollutants.

Prerequisite: (CH 201 or CH 203) and MEA(CE) 479
Typically offered in Spring only

CE 784 Ground Water Contaminant Transport (3 credit hours)
Introduction to movement and attenuation of contaminants in the subsurface. Common contaminant sources; advection and dispersion; numerical modeling of contaminant transport; chemical and biological processes in the subsurface; and ground water restoration technology.

Prerequisite: CE 584 and 574
Typically offered in Spring only

CE 786 Hydroclimatology (3 credit hours)
Hydroclimatology, El-Nino southern oscillation, climate and streamflow forecasting, forecast verification measures, downscaling, Budyko's Framework, long-term water balance, data assimilation, ensemble Kalman Fiter.

Prerequisite: CE 586
Typically offered in Spring only

CE 790 Advanced Topics In Civil Engineering (1-3 credit hours)
New or special course on advanced developments in some phase of civil engineering. Specific topics and prerequisites identified for each section and varied from term to term.

Typically offered in Fall and Spring

CE 791 Advanced Topics in Civil Engineering Computing (1-3 credit hours)
Typically offered in Fall and Spring

CE 792 Advanced Topics in Construction Engineering (1-3 credit hours)
Typically offered in Fall and Spring

CE 793 Advanced Topics in Geotechnical Engineering (1-3 credit hours)
Typically offered in Fall and Spring

CE 794 Advanced Topics in Structures and Mechanics (1-3 credit hours)
Typically offered in Fall and Spring

CE 795 Advanced Topics in Transportation Engineering (1-3 credit hours)
Typically offered in Fall and Spring

CE 796 Advanced Topics in Water Resource and Environmental Engineering (1-3 credit hours)
Typically offered in Fall and Spring

CE 803 Advanced Construction Engineering Seminar (1 credit hours)
Typically offered in Fall and Spring

CE 805 Advanced Structures and Mechanics Seminar (1 credit hours)
Typically offered in Fall and Spring

CE 807 Advanced Water Resource and Environmental Engineering Seminar (1 credit hours)
Typically offered in Fall and Spring

CE 839 Advanced Reading In Civil Engineering (1-3 credit hours)
Directed reading of advanced topics in some phase of civil engineering.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

CE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Summer only

CE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Summer only

CE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Spring and Summer

CE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CE 899 Doctoral Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Summer

College of Natural Resources (CNR)

CNR 250 Diversity and Environmental Justice (3 credit hours)
Differences between people can impact how they see one another and engage with one another. In this class we talk about those differences and address numerous facets of diversity to pique the curiosity of the students. As we learn together, we investigate content that can influence dynamics (how we feel) and we explore different ways to investigate environmental justice issues. This course is designed to create a safe learning environment for reflection, engagement, risk-taking, and the development of personal awareness while looking at how each individual can improve environmental justice. 75% of the seats will be restricted for CNR students.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall and Spring

CNR 295 Special Topics in College of Natural Resources (1-3 credit hours)
Special topics in the College of Natural Resources at the 200 level for offering of courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

CNR 490 Senior Honors Seminar (2 credit hours)
Oral presentations of the results of the senior honors projects. Additional special seminars and group discussions to enrich and broaden student perspectives.

Prerequisite: 4 credit hours of Independent Study
Typically offered in Fall, Spring, and Summer

College of Sciences (COS)

COS 100 Science of Change (2 credit hours)
This course will examine change, both scientific and personal. Students will reflect on change in the past and looking forward as they transition to college life and scientific careers. Case studies, readings and discussions about global change topics will be used to highlight the scientific approaches of disciplines represented in the College of Sciences. In-class activities and out-of-class reflections will be used to practice skills necessary for success in college and career.

Restriction: New freshmen (NFR) in the College of Sciences only
GEP Interdisciplinary Perspectives
Typically offered in Fall only

COS 110 Exploring Issues of Diversity, Equity, and Inclusion in the Sciences (1 credit hours)
This course is designed to assist students in their successful transition to the college academic environment. Topics include academic success strategies, critical thinking, and factors that contribute to disparities in fields within science, technology, engineering and math (STEM). Students will explore their own scientific identity and examine intersections of diversity and inclusion in STEM. This course requires that participants actively explore their biases, work together to recognize systemic inequities, and examine practices that impact the way in which people interact with one another and the scientific enterprise.

Restriction: COS First Year Students
GEP U.S. Diversity
Typically offered in Fall and Spring

COS 295 Special Topics in the College of Sciences (1-3 credit hours)
Special topics in the College of Sciences at the early undergraduate level. Available as directed individual or group study.

Typically offered in Fall, Spring, and Summer

COS 498 Spec Topics in the College of Sciences 2 (3 credit hours)
Special Topics for advanced undergraduates will be selected from the mathematical, physical, and biological sciences.

Communication (COM)

COM 110 Public Speaking (3 credit hours)
Research skills, topic selection, speech organization, skills in speech delivery. Listening for analysis and evaluation of in-class speech presentation.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

COM 112 Interpersonal Communication (3 credit hours)
Interpersonal communication competence: self-concept, language and culture, self-disclosure, active listening, verbal and nonverbal communication, and conflict management.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

COM 200 Communication Media in a Changing World (3 credit hours)
Traces ongoing evolution of communication media. Examines the place and influence of the major media companies that control access to and the content of the contemporary mediascape. Challenges students to examine their use of media from cellphone, to computer, to music and gaming platforms. Restricted to non-Communication majors.

R: Non-COM majors only
GEP Humanities
Typically offered in Fall, Spring, and Summer

COM 201 Introduction to Persuasion Theory (3 credit hours)
Impacts of persuasive communication on attitudes and behavior. Uses humanistic and social scientific theories to explain the persuasive process.

Typically offered in Fall, Spring, and Summer

COM 202 Small Group Communication (3 credit hours)
Theory and practice of effective communication in small groups, including: stages of group development, role emergence, leadership functions, decision making strategies, conflict management, and the significance of power.

Typically offered in Fall and Spring

COM 211 Argumentation and Advocacy (3 credit hours)
Theory-based analysis of public argument in specialized settings of law, politics, academic debate, business and organizations, and interpersonal relations.

GEP Humanities
Typically offered in Fall, Spring, and Summer

COM 226 Introduction to Public Relations (3 credit hours)
Public relations as a communication function of organizations. Public relations process, principles, history, and practice. Analysis of environmental, organizational, communication, and audience influences on public relations practice; career opportunities.

Typically offered in Fall and Spring

COM 230 Introduction to Communication Theory (3 credit hours)
Micro- and macro-analytic theories used in the study of human communication: perspectives and assumptions of major theories; utility and application of major theories; contexts, cultures, and media.

R: Communication Majors
Typically offered in Fall, Spring, and Summer

COM 240 Communication Inquiry (3 credit hours)
Qualitative and quantitative methods of inquiry in communication: types of questions; strategies for answering questions; nature of evidence; advantages and disadvantages of different methods; reference tolls in the field; and channels of distribution for research-based information.

Prerequisite: Communication Majors
Typically offered in Fall, Spring, and Summer

COM 250 Communication and Technology (3 credit hours)
Examination of past, current, and future intersections of technology, culture, and communication in everyday life. Impact of communication technology policies. Analysis of communication technologies in interpersonal, organizational, societal, and global contexts. Development of technology skills for the competent communicator.

Prerequisite: Communication Majors. Credit is not allowed for both COM 250 and COM 200
Typically offered in Fall, Spring, and Summer

COM 257 Media History and Theory (3 credit hours)
Historical development and social implications of telecommunications, print, photography, film, broadcasting, and computer-mediated communication. Theoretical and methodological approaches to the field of communication media: media history; media economics and policy; media effects and power; media as producers of meaning; media audiences; media technologies; and roles of the media in social, cultural, and political change.

Prerequisite: COM 230
Typically offered in Fall and Spring

COM 267 Electronic Media Writing: Theory and Practice (3 credit hours)
Media writing as a social practice. Roles of writing and writers in media production processes. Social, political, economic, and professional conditions that enable or constrain writing and the writer. Specific media writing genres and formats. Research and preparation for media writing. Students write research-based scripts for news, commentary, and fictional genres in radio, television, film, and emerging media.

Prerequisite: COM 230
Typically offered in Fall and Spring

COM 289 Science Communication and Public Engagement (3 credit hours)
This course is an introduction to the principles and practices of communicating scientific and technological issues to public audiences, through interpersonal discussion, mass media, social media, and other means. It is open to students in all majors who want to deepen and broaden their understanding of how citizens make sense of science and technology in their everyday lives. The course features a mixture of theory-based readings and discussion with practical skill-building for communication in real-world contexts. Equal emphasis is given to humanities and social science perspectives. The application of communication concepts to controversial science contexts is emphasized, including case studies of issues such as GMOs, climate change, vaccines, and gene editing. Theoretical perspectives covered include argumentation and debate; audience analysis (through quantitative survey data and metrics); philosophy and ethics of communicating science; using narratives, framing, and metaphors to communicate science; and the cultural image of science in popular media.

GEP Humanities, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Spring only

COM 292 Language, Communication, and Culture (3 credit hours)
We use different modes of communication depending on whether we are participating in classroom discussion, talking with our parents or boss, hanging out with our friends, or visiting a different country. However, rarely do we have the opportunity to consciously reflect upon our communicative behaviors. In this class we will unpack some of the ways culture and society influence our communication, as well as how our communication affects the culture and the society in which we live. Becoming aware of the effect that our words, shared meanings, and contexts have on how we express ourselves can be the difference between positive and negative communicative experiences.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

COM 296 Communication Internship-Non-Local (1 credit hours)
Non-local directed work experience for Communication majors with supervision from the work site and the University. COM 296 may be taken more than once only with the permission of the Internship Director and the Assoc. Dept. Head. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

R: Communication Majors
Typically offered in Fall, Spring, and Summer

COM 298 Special Projects in Communication (1-3 credit hours)
A special projects course to be utilized for guided research or experimental classes at the sophomore level, topic determined by instructor.

Typically offered in Fall and Spring

COM 301 Presentational Speaking (3 credit hours)
Design, organization and delivery of oral presentations for policy determination, policy implementation, and sales.

Prerequisite: COM 110
Typically offered in Spring only

COM 304 Audio Production (3 credit hours)
Basic principles of audio production, including studio operation, performing, writing, and producing.

P: COM 267
Typically offered in Spring only

COM 316 Public Relations Writing (3 credit hours)
Communication processes and procedures of public relations programs. Media techniques, preparation of materials, channels of distribution.

Prerequisite: COM 226 and either ENG 316 or ENG 214
Typically offered in Fall and Spring

COM 321/ENG 321 Survey of Rhetorical Theory (3 credit hours)
Principles of rhetorical theory from its classical origins through the modern period to the present time. Key concepts and theories that provide a critical understanding of the processes of persuasive symbol use.

Prerequisite: Sophomore standing and above
Typically offered in Fall only

COM 322 Nonverbal Communication (3 credit hours)
Theory and research in nonverbal communication, including: environment; space; physical appearance, movement; eyes and facial expressions; and vocal cues. Nonverbal communication in personal, workplace and cross-cultural setting.

Prerequisite: COM 112
Typically offered in Fall only

COM 327 Critical Analysis of Communication Media (3 credit hours)
Theoretical frameworks, methods, and aims of various approaches to critical analysis of the media. Critiques of media production and its relation to social, economic, and technological power; social biases of informational, fictional, and hybrid media content; and historical forms of audiences and the public. Critical awareness of media's role in politics, public culture, and everyday life.

P: COM 257
Typically offered in Fall and Spring

COM 332 Relational Communication (3 credit hours)
Communication patterns in the development and deterioration of interpersonal relationships. Functional and dysfunctional communication behaviors in family relationships.

Prerequisite: COM 112
Typically offered in Fall and Spring

COM 334 Video Production (3 credit hours)
Principles of producing, directing, and editing techniques for video. Students script, storyboard, shoot, and edit short video projects.

P: COM 267 or ENG 330
Typically offered in Fall and Spring

COM 336 Newsletter Writing and Production (3 credit hours)
Newsletters are an important part of the corporate, non-profit, government, and small business portfolio of communication tools. Just about all organizations use newsletters - print or electronic - to reach their audiences with their key messages. Many young public relations practitioners start their careers working on newsletters for their organization or their clients. Students in this course will work collaboratively to write and produce a newsletter as well as other public relations publications.

Typically offered in Fall and Spring

COM 342 Qualitative Research Methods in Communication (3 credit hours)
Introduction to qualitative methods in communication research. Research paradigms, research ethics, research design, qualitative data collection, data analysis and interpretation, written and multimedia reporting of research results. Students are responsible for providing their own transportation to research sites for fieldwork.

Prerequisite: COM 240
Typically offered in Fall and Spring

COM 346 Case Studies in Public Relations (3 credit hours)
Application of theory, principles, and problem-solving techniques used in public relations to organizational case studies.

Prerequisite: COM 226 and COM 230
Typically offered in Fall and Spring

COM 354 Critical Media Making (3 credit hours)
Production lab and seminar combined. Critical making of visual images, audio, and video for the web and other electronic platforms informed by theories of visual communication and digital culture. Critical analysis of the assumptions underlying the development and deployment of media, and their social, economic, and political impact. Development of practical skills and critical thinking.

P: COM 267
Typically offered in Fall and Spring

COM 362/WGS 362 Communication and Gender (3 credit hours)
Effects of gender on the interpersonal communication process. Construction of gendered identities via communication practices. Examination of theories of gender and the role of gender in organizational, institutional, and media communication practices.

Prerequisite: Junior standing, COM 112
Typically offered in Fall only

COM 364/ENG 364 History of Film to 1940 (3 credit hours)
Technological developments and aesthetic movements that shaped international cinema production from the beginning of the industry to 1940. Formal evolution in camera movement, editing, sound, narrative form, and the documentary. The rise to prominence of Hollywood and international cinemas in historical, economic, and cultural contexts.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

COM 374/ENG 374 History of Film From 1940 (3 credit hours)
Technological developments and aesthetic movements that have shaped international cinema production from 1940 to the present. Evolution in camera movement, editing, sound, narrative form, and the documentary. Post-war Hollywood cinema and international film industries (both established and emerging) in historical, economic and cultural context.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

COM 384 Television Production (3 credit hours)
Basic techniques of television studio production, including producing, writing, directing and electronic graphics production.

P: COM 267
Typically offered in Fall and Spring

COM 386 Quantitative Communication Research Methods (3 credit hours)
Design and implementation of communication research methods, including experimental and survey research procedures. Use of computer software for statistical analysis.

Prerequisite: COM 240
Typically offered in Fall, Spring, and Summer

COM 392/HSS 392 International and Crosscultural Communication (3 credit hours)
Patterns and problems of verbal and non-verbal forms of crosscultural communication. Avoidance and management of cultural conflict arising from awareness of characteristics and crosscultural communication. Impact on communication of differing cultural perspectives.

GEP Global Knowledge, GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Summer

COM 395/ENG 395 Studies in Rhetoric and Digital Media (3 credit hours)
Study of the influence of emerging technologies on rhetorical theory and practice. Rhetorical analysis of texts, including visual and audio texts. Invention and construction of digital media texts as a means of engaging rhetorical theory and analysis. Topics vary to adapt to emerging technologies and changing vernacular practices.

Prerequisite: ENG 101
GEP Humanities
Typically offered in Fall and Spring

COM 402 Advanced Group Communication (3 credit hours)
Communication processes and outcomes in groups with complex, strategic, and critical public or corporate functions. Focus on participating in, intervening in, leading, and constructing group processes. Advanced theory with application.

Prerequisite: COM 202
Typically offered in Spring only

COM 404 Advanced Audio Production (3 credit hours)
Advanced multichannel techniques for audio production. Studio acoustics, audio signal processing, and advanced microphone techniques, writing, and performing.

P: COM 307
Typically offered in Fall only

COM 411/ENG 411 Rhetorical Criticism (3 credit hours)
Rhetorical analysis of public speeches, social movements, political campaigns, popular music, advertising, and religious communication. Neo-Aristotelian criticism, movement studies, genre criticism, dramatistic analysis, content analysis, fantasy theme analysis.

Prerequisite: Junior standing

COM 417 Communication & Race (3 credit hours)
Seminar examining the construction of racial and ethnic identities through communication practices. Exploration of theories of race and identity and the ways communication works to construct, undermine, and reinforce understanding across social groups.

GEP U.S. Diversity
Typically offered in Fall and Spring

COM 421 Communication Law (3 credit hours)
Explores the historical, philosophical, and legal foundations of communication rights and responsibilities. Philosophies and regulations affecting sources, messages, channels, receivers, and situations provide the central focus of the course.

Prerequisite: Junior standing.
Typically offered in Fall only

COM 427 Game Studies (3 credit hours)
Exploration of the social and cultural significance of digital games. Overview of major approaches and theories used in studies of digital play. Histories and current conditions of digital games platforms, practices, and industries across multiple cultural contexts. Contemporary applications of games in and across multiple domains, including education, art, sports, and work.

P: STS 214 or COM 257 or COM 250 or COM 200
Typically offered in Fall and Spring

COM 431 Communication in Political Campaigns (3 credit hours)
Roles of analysis and criticism of oral communication in political campaigns; analysis of special political communication situations; ghostwriting, news conferences, negative advertising.

Prerequisite: COM 110 or COM 201
Typically offered in Fall only

COM 434 Advanced Video Production (3 credit hours)
Hands-on experience in video production. Production of informational videos. Practical experience in all phases of the production process, including pre-production organization and critical analysis of the final product.

P: COM 334
Typically offered in Spring only

COM 436 Environmental Communication (3 credit hours)
Critical analysis of environmental discourse in organizational, mass media, political, cultural, and international contexts. Investigates public participation in environmental advocacy and deliberation; environmental conflict management; rhetorical constructions of nature and human relationships with nature; environmental justice; environmental risk communication; and competing ecological paradigms.

Prerequisite: COM 230 or STS 214
Typically offered in Fall only

COM 441 Ethical Issues in Communication (3 credit hours)
Critical analysis of ethical problems in interpersonal and public communication practices.

Prerequisite: COM 110, 112
Typically offered in Fall and Spring

COM 442 Communication and Conflict Management (3 credit hours)
Examination of conflict styles and theories; conflict management strategies such as negotiation and third party intervention; and relevant contexts for conflict such as workplace, families, and interpersonal relationships. Practical, theoretical and critical analyses of conflict and negotiation in variety of contexts.

Prerequisite: COM 112
Typically offered in Fall only

COM 444 Film Production (3 credit hours)
Principles of cinematography, production, and editing technologies for film. Script, shoot, and edit short 16mm films. Post-production on digital non-linear editing systems. Critical analysis of production of classic and contemporary feature films.

Prerequisite:COM 267 or ENG 330
Typically offered in Fall and Spring

COM 447 Communication and Globalization (3 credit hours)
History and current trends in globalization of media, information, and telecommunications technologies, organizations, policies, and contents. Political cultural implications of globalization, including debates over corporate vs. public control of global communication, U.S. dominance vs. international cooperation, and the global influence of American culture. Internet-based group research projects on globalization in collaboration with students in other countries.

P: STS 214 or COM 257 or COM 250 or COM 200
GEP Global Knowledge
Typically offered in Summer only

COM 451 Visual Rhetoric (3 credit hours)
Examine the rhetorical strategies employed in various primarily visual forms of communication including advertising, photography, digital images, visual art, and public commemorative artifacts and sites. Explore the concepts and methods used to rhetorically analyze and interpret visual images and artifacts. Includes one or more required field trips to which students will provide own transportation.

Prerequisite: COM 201 or COM 321
Typically offered in Spring only

COM 456 Organizational Communication (3 credit hours)
Role of human communication in organizations, the assumptions inherent in management philosophies about effective communication, and an investigation of the relationships among communication, job satisfaction, productivity, development, and employeemotivation.

Prerequisite: COM 230
Typically offered in Fall and Spring

COM 457 Media and the Family (3 credit hours)
Impact of mediated messages upon children and the family unit. Origins of the empirical literature and continuing research. Assessment of the qualitative literature. Implications of commercial structure of the media industries on the structure and distribution of media messages designed for children and families. Consideration of both pro- and anti-social impacts.

P: STS 214 or COM 257 or COM 250 or COM 200
Typically offered in Fall only

COM 466 Nonprofit Leadership & Development (3 credit hours)
Nonprofit Leadership and Development is a service-learning course in which students will be expected to make a commitment to service in a local nonprofit organization for 30-hours. Students will critically examine theories of communication and leadership with concentration on issues pertaining to nonprofits such as working with executive boards, volunteer management, and resource development. Students are responsible for transportation and purchase of internship insurance.

Typically offered in Fall and Spring

COM 467 Advanced Topics in Gender and Communication (3 credit hours)
Advanced Topics seminar examining construction of gender identities through communication practices. History and analysis of gender representations. Theoretical and critical approaches to social, political, and economic impact of gender constructions.

P: COM 362 or STS 210 or COM 257 or COM 250 or COM 200
Typically offered in Fall and Spring

COM 476 Public Relations Campaigns (3 credit hours)
Management of the public relations function in organizations and public relations counseling; communication theory and nature of materials emanating from public relations departments and counseling firms, practical analysis and development of public relations publicity and campaigns.

Prerequisite: COM 226, COM 316, COM 386 and Corequisite: COM 346 (Note: COM 346 may be taken as a prerequisite or co-requisite)
Typically offered in Fall and Spring

COM 477 Mobile Communication (3 credit hours)
Mobile communication technologies and their role in communication patterns and social behavior. Conceptualization of cell phones beyond mobile telephones, as internet access points and gaming devices. History, current uses, and future perspectives for the social, cultural, and political uses of mobile interfaces. Locative media and the creation of mobile networks. Use of mobile media across cultures and places, such as Asia, Africa, and Latin America.

P: STS 214 or COM 257 or COM 250 or COM 200
Typically offered in Fall and Spring

COM 479/COM 579 Climate Change Communication (3 credit hours)
An exploration of the communication successes and failures surrounding climate change and public opinion. Topics addressed include: agenda setting, media effects, framing, data visualizations, fear responses, naming, risk communication and theory, argumentation and refutation, and persuasion as well as issues and current events related to the challenges associated with communicating climate change to multiple stakeholders.

Typically offered in Fall only

COM 484 Advanced Television Production (3 credit hours)
Television program production utilizing advanced production techniques. Emphasis on refinement of writing, producing, and directing skills through work in TV studio on production of sophisticated program formats.

P: COM 384
Typically offered in Spring only

COM 487 Internet and Society (3 credit hours)
Social uses and historic overview of the internet as a social network. History of the internet from the ARPANET to the mobile web. The development of interfaces that changed how we access the internet, such as personal computers, the graphic user interface (GUI), mobile phones, and Internet of Things. MUDs and synchronous communication environments as the origins of social media. The development of the www and web 2.0. and the transformation of users into "produsers". Social issues related to the internet, such as net neutrality, privacy, surveillance, big data, artificial intelligence, and the digital divide.

P: STS 214 or COM 257 or COM 250 or COM 200
Typically offered in Fall and Spring

COM 493 Advanced Topics in Public Relations (3 credit hours)
This course addresses current trends and recent development in the public relations profession through extensive analysis of industry practices. Course content will change each semester subject to faculty availability, but may include topics such as social media, media relations, crisis communication, international public relations, and other public relations specializations. Juniors and Seniors only.

Typically offered in Fall and Spring

COM 496 Communication Internship (3 credit hours)
Directed work experience for Communication majors with supervision from the work site and the University. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

R: Senior standing AND Communication Majors AND 12 hours in COM at 300/400-level
Typically offered in Fall, Spring, and Summer

COM 497 Advanced Topics in Media Studies (3 credit hours)
This course examines special topics in media studies through intensive study of media history, theory, research, methods and/or practice. Course content will change each semester depending on faculty areas of expertise.

Prerequisite: COM 250 or COM 257 or COM 357
Typically offered in Fall and Spring

COM 498 Advanced Topic in Communication (1-3 credit hours)
Advanced study of contemporary theories, methods, practices, processes, or issues related to the field of communication. Topic varies.

Prerequisite:Junior or senior standing
Typically offered in Fall and Spring

COM 499 Advanced Independent Research (1-3 credit hours)
Special projects in communication developed under the direction of a faculty member on a tutorial basis. Must have permission of department to enroll. May enroll only twice. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Nine credits in Communication courses. Junior standing or Senior standing in Communication
Typically offered in Fall and Spring

COM 506/ENG 506 Verbal Data Analysis (3 credit hours)
Research strategies for understanding how spoken and written language shapes activities (e.g., design, instruction, counseling, gaming interactions, e-commerce, etc.). Tracking patterned uses of language as verbal data (e.g., grammatically topically, thematically), formulating research questions, and designing studies to answer those questions through quantitative descriptive means. Sampling, collecting and managing data, developing coding schemes, achieving reliability, using descriptive statistical measures, and reporting the results.

Typically offered in Fall only

COM 508/GES 508 Emerging Technologies and Society (3 credit hours)
Provides frameworks for understanding emerging technologies and their social, political, and cultural contexts. Presents historical case studies, ethnographic accounts, and theoretical perspectives that introduce students to ways of thinking about science and technology, nature and culture, and democracy and expertise. Graduate standing is required.

Typically offered in Spring only

COM 514/ENG 514 History Of Rhetoric (3 credit hours)
Historical development of rhetorical theory with attention to contemporaneous rhetorical practice and philosophical trends. Major focus on the classical period with briefer coverage of medieval, Renaissance, 18th-century, and 19th-century developments. Implications for contemporary theory and practice, including pedagogical practice.

Typically offered in Fall only

COM 516/ENG 516 Rhetorical Criticism: Theory and Practice (3 credit hours)
Development, achievements, limitation of major critical methods in the 20th century, including neo-Aristotelian, generic, metaphoric, dramatistic, feminist, social-movement, fantasy-theme and postmodern approaches. Criticism of political discourse,institutional discourse, discourses of law, medicine, religion, education, science, the media. Relations between rhetorical and literary criticism and other forms of cultural analysis.

Prerequisite: Graduate Standing or the equivalent of COM/ENG 321 or COM/ENG 411
Typically offered in Spring only

COM 521 Communication and Globalization (3 credit hours)
Economic, political, cultural dimensions of globalization. Role of information and communication technologies, networks, institutions, and practices in human social organization.

Prerequisite: Graduate standing
Typically offered in Summer only

COM 522 Critical Approaches to Organizational Communication (3 credit hours)
Overview of critical and interpretive organizational communication research studies. Application of insights to enriching and transforming working lives.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 523 International and Intercultural Communication (3 credit hours)
Survey of intercultural, cross-cultural, and international communication theories and issues.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 525 Group/Team Communication (3 credit hours)
Comprehensive review of principles, theory, research, and practices involving group/team communication; associated with decision making, conflict management, relationship building, and evaluation of group/team effectiveness. Emphasis on guidelines for effective communication in groups and teams. Graduate standing required.

Prerequisite: Graduate standing
Typically offered in Fall only

COM 526 Media Economics (3 credit hours)
This course provides an overview of economic perspectives on media and communication, particularly examining cases, topics, and controversies that stem from the many linkages between media and the economy. It reviews a range of perspectives on the economy of media, including the critical political economic approaches commonly employed in the field of communication, but also emerging neoclassical, behavioral, institutional, and heterodox approaches to economics, as applied to a range of possible topics. These may include: media ownership and the economics of journalism; labor and social media; data and surveillance economies; copyright and intellectual property; piracy, sharing, and collaboration; digital gift economies; social media celebrity and influencers; bitcoin and other virtual currencies; debt, credit, and algorithmic calculation; microfinance apps; "on-demand" platforms such as Uber and Lyft; automation and the future of employment; global supply chains in the manufacture of technology; the disposal of waste; consumerism and unsustainable energy use.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 527 Seminar in Organizational Conflict Management (3 credit hours)
Examination of conflict antecedents, interventions, outcomes through multiple texts, journal articles. Emphasis on workplace conflict, organizational outcomes, dispute system design. Evaluation through participation in class discussion, independent papers, research project, presentation.

Prerequisite: Graduate standing
Typically offered in Summer only

COM 528 Communication Culture and Technology (3 credit hours)
Examine Communication technology via historical examples. Inquiry into the development of early sound and screen technologies. Analysis of computer-mediated Communication genres.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 529 Communication Campaigns (3 credit hours)
Prepares students to design, implement, monitor, and evaluate a successful communication campaign for a health, public relations, or political organization that is grounded in sound theoretical approaches. The students conduct focus groups for audience research and professionally present a campaign plan to a real client for any of the mentioned types of organizations. The course emphasizes theoretical and hands on practical skills to developing successful communication campaigns.

Typically offered in Spring only

COM 530 Interpersonal Communication in Science and Technology Organizations (3 credit hours)
Blends theory and research to understand and analyze interpersonal communication practices and issues within organizations, including managing impressions and conversations, engaging in active listening, managing conflict, influencing others, and communicating in teams. Focus on developing and maintaining effective interpersonal at work and improving student's communication competence.

Prerequisite: Graduate standing
Typically offered in Summer only

COM 532 Communication Consulting (3 credit hours)
This course provides an introduction to the art and methods of consulting particularly as applied to communication problems in organizational settings. It also provides students the opportunity to develop and/or refine training and facilitation skills and to link communication theory and research to organizational practice. Graduate standing required.

Typically offered in Fall only

COM 536 Seminar in Environmental Communication (3 credit hours)
Critical analysis of environmental discourse in organizational, mass media, political, cultural, and international contexts. Investigates public participation in environmental advocacy and deliberation; environmental conflict management; rhetorical constructions of nature and human relationships with nature; environmental justice; environmental risk communication; and competing ecological paradigms. Must hold graduate standing.

P: Graduate Standing
Typically offered in Spring only

COM 537 Gaming and Social Networks (3 credit hours)
Exploration of inter-relations among mobile technologies (cell phones, PDAs), location-based activities, and playful/social spaces. Investigates: (1) the definition of basic gaming concepts (community, narrative, play, and space); (2) the history of games as social environments, with particular emphasis on multi-user domains (MUDs); and (3) the definition of games, which use the physical space as the game environment, such as pervasive games, location-based games, and hybrid reality games. Discussion of inter-connections among games, education, and art. By permission of department.

COM 538 Risk Communication (3 credit hours)
Comprehensive review of principles, theory, research, and practices involving consensus building; associated with environmental, health and safety; enabling analysis and management of risks. Emphasis on risks associated with emerging science and technology. No quantitative experience necessary. Graduate standing required.

Typically offered in Fall only

COM 539/PA 539 Fund Development (3 credit hours)
Identifies and assesses techniques and best practices of fund development, annual giving, capital campaigns, endowments. Topics include setting achievable goals, organizing and staffing a fund development campaing, and identifying donors. Discusses links between fund development and organization mission and governance, ethical issues, and government regulations. PBS status or Graduate standing.

COM 540 Critical and Interpretive Inquiry in Communication (3 credit hours)
Theoretical foundations and analytical techniques in critical and interpretive communication research. Analysis of culture and power in communicative practices, texts, technologies, production, and reception. Historical, political economic, archival, contextual, interpretive, rhetorical, and cultural modes of analysis and critique are highlighted. Graduate standing required.

Typically offered in Fall only

COM 541 Quantitative Research Methods in Applied Communication (3 credit hours)
Introduction to research methods in applied communication. Knowledge of design, implementation, and analysis of various quantitiative research methods.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 542 Qualitative Research Methods in Applied Communication (3 credit hours)
Theoretical and practical dimensions of conducting qualitative research. Issues include asking good questions, field observation, ethics, focus groups, interviews, representation of data, analyzing texts and discourse, writing qualitative reports.

Prerequisite: Graduate standing
Typically offered in Spring only

COM 543 Visual Content Analysis (3 credit hours)
Research methods class in social science-orientated quantitative or qualitative analysis. Students will advance visual research by developing and/or testing theoretical concepts for visual media. Readings will focus on analytic techniques and concepts for still or moving images in digital or traditional media. Contexts include social media, organizational websites, blogs, online news sites, films, games, mobile media, and more. Students use qualitative and quantitative analysis software. Graduate standing required

Typically offered in Fall only

COM 546 Nonprofit Marketing and Public Relations (3 credit hours)
Survey of the marketing and public relations principles and practices applicable to nonprofit organizations.

COM 547 Mobile Media and Communication (3 credit hours)
Mobile communication technologies and their influence on communication patterns and social behavior. Conceptualization of cell phones beyond mobile telephones, as Internet access points and gaming devices. History, current uses and future perspectives for the social use of mobile interfaces. The creation of new mobile communities. The influence of mobile images on communication and the creation of mobile networks. Use of mobile phones across cultures and places, such as Asia, Scandinavia, Africa, and Latin America. Permission of department.

COM 554/ENG 554 Contemporary Rhetorical Theory (3 credit hours)
Contemporary rhetorical theory covering the 20th and 21st centuries. Conceptual connections with and disruptions of the classical tradition and its, successors; relationship between rhetorical theory and philosophical trends, institutional histories, socioeconomic circumstances, and pedagogical needs. Attention to current issues such as the revival of invention, rhetorical agency, and ethics.

Typically offered in Spring only

COM 556 Seminar In Organizational Communication (3 credit hours)
Theoretic and applied approaches for studying communication perspectives of organizational behavior. Topics relate communication with organizational theories, research methods, leadership, power, attraction, conflict and theory development.

Prerequisite: Advanced Undergraduate standing or Graduate standing
Typically offered in Spring only

COM 561 Human Communication Theory (3 credit hours)
The role of theory in study of human communication. General social scientific theories as well as context-based theories including interpersonal, public, group, organizational and mass communication contexts.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

COM 562 Communication and Social Change (3 credit hours)
Examine persuasive theories and methods including compliance gaining techniques. Evaluate effectiveness of public communication campaigns directed at social change.

Prerequisite: Graduate standing
Typically offered in Fall only

COM 563 Public Relations Theory (3 credit hours)
Study the theoretical body of knowledge in public relations and its application to practice. Graduate Standing required.

Typically offered in Spring only

COM 566 Seminar In Crisis Communication (3 credit hours)
Working within theoretical perspectives of communication, conflict management and organizational designs, a theoretical understanding for crisis communication, including thorough guidelines for strategic communication planning for, managing and evaluating crises.

Typically offered in Spring only

COM 579/COM 479 Climate Change Communication (3 credit hours)
An exploration of the communication successes and failures surrounding climate change and public opinion. Topics addressed include: agenda setting, media effects, framing, data visualizations, fear responses, naming, risk communication and theory, argumentation and refutation, and persuasion as well as issues and current events related to the challenges associated with communicating climate change to multiple stakeholders.

Typically offered in Fall only

COM 581/ENG 581 Visual Rhetoric: Theory and Criticism (3 credit hours)
Application of visual theory to rhetoric and of rhetorical theory to visual forms of communication. Discussion and analysis may include advertising, photography, news and informational media, political communication, instructional material, scientific visualization, visual arts, public commemorative artifacts, internet and other digital media.

R: Graduate Students Only
Typically offered in Spring only

COM 585 Teaching College Communication (3 credit hours)
Introduction to communication education theory and research. Course divided into primary parts: 1)education theory and philosphy and 2)instructional design theory and practice.

Prerequisite: Graduate standing
Typically offered in Fall only

COM 587 Internet & Society (3 credit hours)
Overview of the development of the internet and its social uses, including the historical context that led to the development of the ARPANET and the World Wide Web. Analysis of the transition from mainframes to personal computers, to the internet of things. Treatment of principal social and communication issues related to the use of the internet, such as digital privacy, digital divide, net neutrality, and civic engagement. Development of mobile internet, social networking sites and location-based social networks.

Typically offered in Fall only

COM 598 Special Topics In Communication (1-6 credit hours)
Detailed investigation of a special topic in communication. No more than 6 hrs. may be used as credit toward graduation with master's degree.

Typically offered in Fall, Spring, and Summer

COM 630 Independent Study in Communication (1-3 credit hours)
Special projects course to be utilized for guided research at graduate level. Topic determined by instructor. No more than 6 hrs. may be used as credit toward graduation with master's degree.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

COM 650 Communication Internship (1-6 credit hours)
The internship experience provides the students the opportunity to practice professional communication skills in a workplace setting under the supervision of a communication practitioner. Restricted to MS in Communication students.

Prerequisite: Acceptance into MS in Communication Program
Typically offered in Fall, Spring, and Summer

COM 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Summer

COM 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

COM 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall and Spring

COM 695 MR Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

COM 696 Summer Thesis Res (1 credit hours)
Typically offered in Summer only

COM 798 Special Topics in Communication (3-6 credit hours)
Intensive exploration of specialized or emerging topics in an area of communication theory, rhetoric, media, or other aspect of Communication studies. Emphasis on student research and writing. May be used to test and develop new courses. May be repeated for credit. Doctoral students only.

Typically offered in Fall and Spring

COM 810 Directed Readings in Communication (1-6 credit hours)
Intensive study of a specific topic from various specializations of the Communication faculty. Negotiation between the student and the director for variable credit and approved by Director of Graduate Studies. May be repeated for credit. Doctoralstudents only.

Typically offered in Fall, Spring, and Summer

COM 896 Summer Dissert Res (1 credit hours)

Communication Rhetoric & Digital Media (CRD)

CRD 701 History and Theory of Media Technologies (3 credit hours)
Foundational study of media and technology through examination of historical perspectives on technological change. Discussion of media theory, media archaeology, feminist theory, political economy, cultural studies, and functionalist perspectives on technology. Examination of media and power, social movements, alternative media, technology and development, participatory communication, technological diffusion. Research paper and seminar presentation.

Prerequisite: Doctoral student
Typically offered in Fall only

CRD 702 Rhetoric and Digital Media (3 credit hours)
Critical study and evaluation of the conceptual vocabulary of rhetoric and its relationship to digital communication and digital media.

Prerequisite: COM/ENG 514 or 516 or ENG 515, Doctoral student
Typically offered in Fall only

CRD 703 Communication Networks (3 credit hours)
Intensive study of theories, histories, and practices of networked communication. Emergence, development, acceptance, and dissolution of a variety of networks organized around information and communication technologies. Survey of network theory and methods for studying networks, networked communication practices, and their effects on issues such as identity, labor, organization, power, etc. Research/applications project developed in consultation with the instructor.

Restriction: CRDM students only
Typically offered in Spring only

CRD 704 Communication, Technologies, and Pedagogy (3 credit hours)
History, theory, research, and practice of integrating technology in higher education. Design, implementation, and critique of instructional strategies; ethical and professional issues; effects on the practices of teaching and learning and the development of communication abilities.

Prerequisite: Doctoral student
Typically offered in Fall only

CRD 790 Scholarly and Professional Paths in Disciplinary and Interdisciplinary Research (3 credit hours)
This seminar aims to 1) foster discussion about disciplinarity and interdisciplinarity, particularly in fields relevant to research in communication, rhetoric and digital media; and 2) develop and sharpen participants' theoretical and methodological positionings as they prepare to pursue their professional goals.

Prerequisite: CRD 701, 702, 703, 704, Doctoral student
Typically offered in Spring only

CRD 791 Special Topics in Communication, Rhetoric, and Digital Media (3-6 credit hours)
An intensive seminar examining a particular topic or issue in the communication and rhetoric of digital media.

Prerequisite: CRD 701
Typically offered in Fall and Spring

CRD 809 Colloquium in Communication, Rhetoric, and Digital Media (1 credit hours)
Professional development, ethical inquiry, and discussion and evaluation of interdisciplinary research in a colloquium setting. In successive fall semesters, students participate in three one-credit colloquia that include faculty and students from across the program.

Prerequisite: Doctoral student
Typically offered in Fall only

CRD 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment

Prerequisite: Doctoral student
Typically offered in Fall and Spring

CRD 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

CRD 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Typically offered in Fall, Spring, and Summer

CRD 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CRD 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CRD 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Comparative Biological Science (CBS)

CBS 461/CBS 561 Principles of Collaboration and Team Science (2 credit hours)
The focus of this course is exploring how to effectively communicate as a member of a cross-disciplinary team. Specifically, this course offers strategies and techniques about engaging in team science to pursue complex research questions, work effectively with team members, identify and address unconscious bias, and assess team performance in order to produce high impact research outcomes. To that end, we will examine aspects of group process and communication related to professional relationship development, teamwork, leadership, and conflict resolution.

Typically offered in Spring only

CBS 463/SLC 463/CBS 563/SLC 563 Leadership in Interdisciplinary Biomedical Sciences (2 credit hours)
This is a two-credit, dual-level undergraduate/graduate course designed for graduate and advanced undergraduate students interested in gaining an understanding of how to lead others effectively through complex situations as it relates to ethical and leadership dilemmas within interdisciplinary biomedical sciences. Students will develop leadership skills and negotiation strategies for working with interdisciplinary teams in biomedicine. Through interaction with professionals in the biomedical field, students will evaluate, apply and propose action plans for how to respond to situations as it relates to theories and practices discussed in the course. This course complements, but does not replace, Responsible Conduct in Research requirements.

P: Graduate Standing
Typically offered in Fall only

CBS 493 Undergraduate Research in Biomedical Sciences (1-3 credit hours)
A learning experience in College of Veterinary Medicine within an academic framework that utilizes campus facilities and resources for supervised undergraduate research. Arrangements must be initiated by the student and be approved by a faculty adviser, the college Undergraduate Research Coordinator, and the Associate Dean of Research Training and Graduate Programs. Students who enroll in this course are required in this course to complete and submit an Agreement for Non-Standard Courses form through Registration and Records.

Requisite: Sophomore Standing or Above
Typically offered in Fall and Spring

CBS 510 Animal Production Topics (1-3 credit hours)
Students will be provided with experience in management of production animals with an emphasis on the veterinary aspects of population health. Experience will come in the form of hands-on experiences and working through relevant literature to specific and relevant population health issues.

Typically offered in Fall and Spring

CBS 550 Population Medicine Forum (1 credit hours)
Population medicine forum is a seminar-based class during which current topics in population health are presented and discussed. Topics covered include: Outbreak investigation, observational epidemiologic research, risk analysis, spatial analysis, the application of unique diagnostic technologies and epidemiologic modeling.

Typically offered in Fall and Spring

CBS 561/CBS 461 Principles of Collaboration and Team Science (2 credit hours)
The focus of this course is exploring how to effectively communicate as a member of a cross-disciplinary team. Specifically, this course offers strategies and techniques about engaging in team science to pursue complex research questions, work effectively with team members, identify and address unconscious bias, and assess team performance in order to produce high impact research outcomes. To that end, we will examine aspects of group process and communication related to professional relationship development, teamwork, leadership, and conflict resolution.

Typically offered in Spring only

CBS 563/SLC 563/CBS 463/SLC 463 Leadership in Interdisciplinary Biomedical Sciences (2 credit hours)
This is a two-credit, dual-level undergraduate/graduate course designed for graduate and advanced undergraduate students interested in gaining an understanding of how to lead others effectively through complex situations as it relates to ethical and leadership dilemmas within interdisciplinary biomedical sciences. Students will develop leadership skills and negotiation strategies for working with interdisciplinary teams in biomedicine. Through interaction with professionals in the biomedical field, students will evaluate, apply and propose action plans for how to respond to situations as it relates to theories and practices discussed in the course. This course complements, but does not replace, Responsible Conduct in Research requirements.

P: Graduate Standing
Typically offered in Fall only

CBS 565 Fundamentals of Biomedical Sciences (3 credit hours)
Introductory course for students interested in gaining a broad understanding of: comparative genomics, comparative immunology, comparative physiology, pharmacokinetics, emerging zoonotic diseases, epidemiology and translational research models and methods. This course also provides an overview of current technologies relevant to comparative biomedical research and a foundation for implementing the scientific method (e.g. experimental design, data analyses, statistics). Priority will be given tofirst-year students in CBS graduate program; Enrollment of all students requires consent of instructor.

Typically offered in Fall only

CBS 570 Methods in Biomedical Sciences (1 credit hours)
Introductory course for students interested in gaining a broad understanding of various laboratory methods used in molecular, cellular and "omics" based biomedical research.

Typically offered in Fall only

CBS 579 Advanced Specialty Training (1-3 credit hours)
This course is designed to give students clinical experience and training to understand basic health management strategies, handle clinical evaluations, use diagnostic tools to facilitate accurate diagnosis, and develop prevention and/or treatment plans for health management. This course is restricted to Students in the SVM program.

Typically offered in Fall and Spring

CBS 580 Clinical Veterinary Epidemiology (3 credit hours)
To expose students to the concepts and principles of epidemiology from the perspective of assessing health and disease in animal and human populations, and the measures to control disease status. Specifically to study the principles and concepts ofveterinary epidemiology, to learn basic epidemiology methodology, critically review major veterinary care studies, and enhance oral and written communication skills.

Prerequisite: ST 511
Typically offered in Fall only

CBS 586 One Health: From Philosophy to Practice (2 credit hours)
Graduate/professional seminar (with team project) addressing intersections of veterinary medicine, human medicine, and environmental health. Co-listed at UNC CH Gillings School of Global Public Health and Duke University School of Medicine. Includes participants from these three institutions, plus related private-sector members, non-governmental organizations, and government professionals. Its purpose is to facilitate understanding of one health as a system of systems, and promote cross-campus and cross-discipline interactions. Weekly evening course held at NC Biotechnology Center, RTP. Requires graduate student standing at NCSU or professional student standing within the College of Veterinary Medicine. Limit: 15 students per university.

Typically offered in Fall only

CBS 595 Special Topics (1-6 credit hours)

CBS 615 Advanced Animal Production Topics (1-3 credit hours)
Students will be provided with practice and experience in advanced topics related to management of production animals with an emphasis on the veterinary aspects of population health. Actual in-the-field, hands-on practice and investigation of relevant literature will provide the basis for study of advanced animal production topics. Course is restricted to students in the SVM program

Prerequisite: SVM 510
Typically offered in Fall and Spring

CBS 624 Special Problems In Gastrointestinal Physiology (1 credit hours)
1 credit for a 1-hour in depth discussion session of current journal articles presented by students on the subject of gastrointestinal physiology. Journals recommended include the American Journal of Physiology, Gut and Gastroenterology. Each session will focus on one student's selected paper. MS students are expected to present 1 paper, and PhD students are expected to present up to 2 papers each semester. Students should be enrolled in a graduate course of study in a field related to or focused on physiology. Undergraduate students require special permission.

Typically offered in Fall and Spring

CBS 649 Issues in Preventive Medicine and Public Health (1 credit hours)
Issues in Preventive Medicine and Public Health is a literature review course designed to assist students with their preparation for careers in public health, ecosystem health, biosecurity and public policy, disaster management, and application for Board Certification in the American College of Preventive Veterinary Medicine. Permission by course instructor required for enrollment.

Prerequisite: A prior degree in veterinary medicine or public health

CBS 650 Population Medicine Forum (1 credit hours)
Population medicine forum is a seminar-based class during which current topics in population health are presented and discussed. Topics covered include: Outbreak investigation, observational epidemiologic research, risk analysis, spatial analysis, the application of unique diagnostic technologies and epidemiologic modeling.

Typically offered in Fall and Spring

CBS 660 Fundamentals of Comparative Molecular Medicine (3 credit hours)
This is a 3 credit, graduate level course designed for incoming graduate students and advanced undergraduate students interested in gaining a broad understanding of: translational/clinical research, interdisciplinary research related to molecular medicine, basic principles of genetics, cell biology and engineering and how they are applied to the study/treatment of disease. The importance of large animal models to facilitate clinical translation to humans will also be covered. Course instructors include both basics scientists with active research programs as well as clinicians (MD and DVM).

Prerequisite: Graduate Standing or Background in Biology at the Advanced Undergraduate Level
Typically offered in Fall only

CBS 662 Professional Conduct in Biomedical Research (1 credit hours)
Plagiarism, authorship, fraud, safety, sexual harassment, IACUC, consulting agreements, serving as an expert witness, contacting elected officials, working with press, human subjects committee, and related topics.

Typically offered in Spring only

CBS 680 MR Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

CBS 682 Seminar - Poultry Medicine (1-3 credit hours)
Typically offered in Fall only

CBS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CBS 686 Food Animal Health Teachings (1-3 credit hours)

CBS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CBS 695 Master's Thesis Research (1-9 credit hours)
Thesis research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CBS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CBS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CBS 705/BIO 705 Fundamentals of Neuroscience (3 credit hours)
This is a fundamental course that will provide the student with an up-to-date coverage of molecular, cellular, physiological, and circuit-based aspects of Modern Neurosciences in the Comparative Biomedical Sciences Graduate Program. Being a graduate-level class, the instructors will assume that the students have acquired some background in basic biology and biochemistry. The most important goal of this course is to train PhD students in neuroscience function and disorders, preparing them for neuroscience research. Emphasis will be placed on the systems and skills needed to pursue experimental neuroscience activities. Important components of the learning process will be presentations from neuroscience experts, class discussions, exams and in class activities.

P: BIO 488 or permission of instructor
Typically offered in Fall only

CBS 711 Applications in Reproductive Physiology (2 credit hours)
Students with advanced interests in Theriogenology will meet weekly to discuss a wide range of current topics surrounding animal reproduction, including comparative physiology and endocrinology, reproductive management, reproductive pharmacologic/technologic advances in Theriogenology. Each student will be expected to present 2-3 topics with typed, referenced notes and an oral presentation. All students will be expected to actively participate in group discussions and briefly present a review of one topic-related article from the past 5 years during each lecture.

Typically offered in Fall only

CBS 712 Reproductive Management and Disease in Domestic Animals (1 credit hours)
Students will meet every other week to review current literature and discuss a wide range of topics surrounding animal reproduction, focused on clinical causes of infertility and their treatments in domestic and non-domestic species. Students will explore 3-5 preassigned questions surrounding a particular topic and prepare an in-depth handout answering those questions prior to arrival. Each student will be expected to actively participate in group discussions

Typically offered in Fall and Spring

CBS 733 Pharmacology I (2 credit hours)
This course focuses on the action of drugs in animals and basic principles of drug disposition and pharmacokinetics. The course will provide presentations on the principles of pharmacology of medications used in animals. Principles of autonomic pharmacology will form a foundation that is important to other drug groups. Important drug groups discussed during the course will be sympathetic and parasympathetic agonists and antagonists, anesthetic, sedative, and tranquilizer drugs. During the chemotherapy portion of the course, anti-infective agent chemotherapy will be discussed, which includes antibacterial, antiparasitic, antifungal, and antiviral drugs. Anticancer agents also will be considered in the chemotherapy portion of the course.

Typically offered in Fall only

CBS 734 Pharmacology II (2 credit hours)
This is a course in veterinary pharmacology. This course focuses on the action of drugs in animals and basic principles of drug disposition and pharmacokinetics. The course will provide presentations on the principles of pharmacology of medications used in animals. Important drug groups discussed during the course will be anti-infective agents used in chemotherapy. These include antibacterial drugs, antifungal drugs, antiviral drugs, and antiparasitic drugs. Anticancer drugs also will be included. Also included in the course are drugs that affect specific body systems such as ophthalmology, gastrointestinal, cardiovascular, and kidneys.

Bachelors Degree in Biological
Typically offered in Spring only

CBS 750 Techniques in Pharmacological Research (2 credit hours)
Theory and applications of modern scientific instrumentation to analysis of tissues, body fluids and drugs in pharmacological research. Discussion of appropriate aspects of the pharmacological use of spectroscopy, microscopy, chromatography, electrophoresis, radioisotope usage and centrifugation.

Prerequisite: BCH 452B or CH 315 or Equivalent and Graduate standing
Typically offered in Spring only

CBS 754 Epidemiology II (3 credit hours)
Study design, data management, and statistical analysis including applications of logistic regression and survival analysis. Main focus on descriptive, analytical and experimental epidemiology pertinent to disease etiology and prevention.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

CBS 762 Principles of Pharmacology (3 credit hours)
The action of drugs in animals and man including basic principles of drug disposition, pharmacokinetics, drug resistance, and signal transduction. Modification of physiological processes by drugs influencing nervous, renal, cardiovascular, and endocrine systems and the antimicrobic and antineoplastics agents.

Typically offered in Spring only

CBS 764/NTR 764/PHY 764 Advances in Gastrointestinal Pathophysiology (3 credit hours)
This course will focus on advanced gastrointestinal physiology and the pathophysiology of deseases of relevance to scientsts involved in animal-related research. In particular, the course will cover the pathophysiology of ulceration, infectious diarrhea, ischemia, motility disorders, and inflammatory diseases of the gut. An in-depth review paper will be required based on recent literature rgarding a specific gastrointestinal disease.

Prerequisite: PHY 503, PHY 504
Typically offered in Fall only

CBS 770 Cell Biology (3 credit hours)
Advanced cell and organelle structure and function and recent advances in molecular biology. Emphasis on current literature and application of research procedures.

Prerequisite: BCH 451 and BIO 183 and (CH 223 or CH 227)
Typically offered in Spring only

CBS 771/TOX 771 Cancer Biology (4 credit hours)
A comprehensive graduate course focusing on the molecular and cellular bases of cancer. Targets of oncogenic mutations will be discussed as well as their impact on cell proliferation, cell survival, and the invasion of normal tissues by tumorigeniccells. State-of-the-art technologies to detect oncogenic mutations and characterize transformed cells will be discussed as well as therapeutic strategies for the rational treatment of cancer.

Prerequisite: CBS 770
Typically offered in Fall only

CBS 775 Designing population-based research (3 credit hours)
The objective of this course is to introduce graduate students to the design of contemporary population-based research, defined broadly as research involving populations including epidemiological, clinical, and outcomes-based studies. Students will be introduced to basic concepts necessary to design and conduct population-based research, as well as, emergent technologies and concepts in the field of population health. Students will gain practice by creating a protocol for a research study addressing a relevant research question in their specific area of interest.

Prerequisite: ST 511
Typically offered in Spring only

CBS 783/IMM 783/MB 783 Advanced Immunology (3 credit hours)
In depth study of the basic cellular and molecular mechanisms of immunity, including antigen processing and presentation, T cell development, initiation of the immune response, effector mechanisms, and immunological memory. The course is designed for advanced graduate students who wish to focus on the current concepts in immunology.

Prerequisite: MB (IMM) 751
Typically offered in Fall only

CBS 787 Pharmacokinetics (3 credit hours)
Mathematical models to describe disposition of drugs and toxic chemicals in the animal body. Areas including classic compartmental and nonlinear models as well as physiological approaches. Discussion of application of these techniques to toxicologicstudies.

Prerequisite: CBS 560, working knowledge of calculus
Typically offered in Fall only

CBS 795 Special Topics in Comparative Biomedical Sciences (1-6 credit hours)
Special Topics in Comparative Biomedical Sciences

Prerequisite: Graduate Students, DVM or equivalent degree

CBS 800 CBS Seminar (1 credit hours)
Presentation and discussions on ongoing research and current topics in biomedical sciences.

Typically offered in Fall only

CBS 803 Seminar in Surgical Pathology (1 credit hours)
Description and interpretation of microscopic changes in tissues from diseased domestic and laboratory animals. Students attend and participate in a one-hour weekly seminar where microscopic lesions described, interpreted and discussed.

Prerequisite: Those holding the DVM or equivalent degree
Typically offered in Spring only

CBS 804 Seminar in Necropsy Pathology (1 credit hours)
Description and interpretation of gross changes in tissues from diseased domestic animals. Students attend daily (M-F) 15-to 30-minute review of necropsy lesions presented by a member of the graduate staff.

Prerequisite: Those holding the DVM or equivalent degree
Typically offered in Spring only

CBS 805/BIO 805 Special Topics in Neuroscience (1 credit hours)
Topics in neuroscience. This course will provide an opportunity for students to integrate and apply knowledge and skills gained from their graduate studies. Emphasis will be placed on primary literature, scientific practice, and on effective, professional communication and presentations. Topics and instructors will vary from semester to semester. Priority will initially be given to graduate students participating in the neuroscience concentration; other students with the necessary prerequisites will be admitted on a space available basis.

R: Grad Standing or Instructor Approval
Typically offered in Spring only

CBS 806 Animal Models in Comparative and Translational Research (2 credit hours)
This course provides an overview of several models of comparative and translational research including the discussion of naturally occurring vs experimental models of disease. We will review 12 animal models and use them as examples to discuss the challenges faced during model development, relevance of the selected models to other animal species and humans, and the advantages/disadvantages of each animal model.

R: Comparative Biomedical Sciences students with an interest in translational animal models.
Typically offered in Spring only

CBS 810 Special Topics (1-6 credit hours)
Designed to present new or special subject matter within the scope of pathology, veterinary microbiology, morphology or pharmacology. The studies may include independent investigations, seminars and/or formal lectures.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall, Spring, and Summer

CBS 816 Advanced Topics In Immunology (1 credit hours)
Selected topics of current interest in immunology. A different topic will be covered each semester to focus on the most recent developments in the field.

Typically offered in Fall and Spring

CBS 817 Advanced Topics In Zoological Medicine I (2 credit hours)
Selected topics of current interest in clinical zoological medicine focused on marine mammals, fish, reptiles, amphibians, waterfowl, ratites, raptors and medical issues in free-ranging wildlife. Review of current clinical and basic science literature, student-lead discussion sessions and participation in faculty-lead discussions.

Prerequisite: Graduate standing or enrollment in DVM curriculum
Typically offered in Fall only

CBS 818 Advanced Topics in Zoological Medicine (2 credit hours)
This course provides breadth and depth of knowledge in zoological medicine to prepare Zoological Medicine residents to pass American College of Zoological Medicine (ACZM) boards. Veterinary students are exposed to more in depth information related to zoological medicine than covered in their core curriculum. Each Fall (CBS 817) and Spring (CBS 818) semesters, different aspects of zoological medicine are covered. Topics rotate every 3 years so that all major groups of animals within the sub-groups, avian, aquatic, herptile, wildlife, and zoo are addressed.

Prerequisite: Graduate standing or enrollment in DVM curriculum
Typically offered in Spring only

CBS 820 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in CBS.

Typically offered in Fall and Spring

CBS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CBS 886 Interdisciplinary Research Team Mentoring (3 credit hours)
This course will be a guided teaching experience within an academic framework that utilizes campus facilities and resources for supervised research. This course requires that you develop a research project with another graduate student and/or postdoctoral fellow and that, once approved, that an undergraduate student is added to the research team. This team then works together to complete the project. In addition, the teams will meet with course directors to ensure that the mentoring and research experience meets the course requirements The course includes hands-on mentoring in a laboratory setting, as well as participation in group meetings to develop skills associated with organizing and presenting research results both in written and verbal format.

This course is related to the CMI Young Scholars Program that requires a graduate students to mentor an undergraduate in a pre-approved research project. https://research.ncsu.edu/cmi/young-scholars-program/
Typically offered in Fall, Spring, and Summer

CBS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CBS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CBS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Comparative Literature (CL)

CL 495 Special Topics in Comparative Literature (3 credit hours)
Detailed investigation of a topic in comparative literature. Topic and mode of study determined by faculty member(s) in consultation with Comparative Literature Committee and heads of departments of English and Foreign Languages.

Computer Science (CSC)

CSC 110 Computer Science Principles - The Beauty and Joy of Computing (3 credit hours)
This course explores the principles of computer science while emphasizing the relevance of computing to students and to society. Students will learn about beautiful computing applications that have changed the world and how computing empowers discovery and innovation. Students will learn the joy of programming a computer using a friendly, graphical language, capable of creating apps, simulations, and games. Students who complete the course will be able to solve meaningful problems with computers, apply design processes to take an idea from concept to implementation, develop a computer program, and analyze computing artifacts from both design and computing perspectives. Students will complete a substantial team programming project related to their interests. 20% of seats will be restricted to Computer Science or CS-Intended students. Enrolling students must not have received credit for or a grade in CSC 116 or CSC 200.

Restriction: Cannot have taken CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or CSC 200
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

CSC 111 Introduction to Computing: Python (3 credit hours)
Computation problem solving through writing Python programs. Particular elements include: careful development of Python programs from specifications; documentation and style; appropriate use of control structures, data types and subprograms; abstractions and verification; engineering applications. Most seats reserved for Civil, Construction, and Environmental Engineering majors.

Co-requisite: E 115 or COS 100 and MA 121 or MA 131 or MA 141
Typically offered in Fall and Spring

CSC 112 Introduction to Computing-FORTRAN (3 credit hours)
Problem solving through writing FORTRAN programs. Particular elements include: careful development of FORTRAN programs from specifications; documentation and style; appropriate use of control structures, data types and subprograms; abstractions and verification; engineering applications.

Co-requisite: E 115 or COS 100 and MA 121 or MA 131 or MA 141
Typically offered in Fall, Spring, and Summer

CSC 113 Introduction to Computing - MATLAB (3 credit hours)
Problem solving through writing MATLAB programs. Particular elements include: careful development of MATLAB programs from specifications; documentation and style; appropriate use of control structures, data types and subprograms; abstractions and verification; engineering applications. Most seats reserved for Aerospace, Mechanical, and Biomedical Engineering majors.

Co-requisite: E 115 or COS 100 and MA 121 or MA 131 or MA 141
Typically offered in Fall and Spring

CSC 116 Introduction to Computing - Java (3 credit hours)
An introductory course in computing in Java. Emphasis on algorithm development and problem solving. Careful and methodical development of Java applications from specifications; documentation and style; appropriate use of control structures; classes and methods; data types and data abstraction; object-oriented programming and design; software testing. Most seats reserved for Computer Science majors.

Co-requisite: E 115 or COS 100 and MA 121 or MA 131 or MA 141
Typically offered in Fall, Spring, and Summer

CSC 216 Software Development Fundamentals (3 credit hours)
The second course in computing, intended for majors and minors. Emphasis is on exploring encapsulation; polymorphism; composition; inheritance; finite state machines; linear data structures (including array lists, linked lists, stacks, queues, and the tradeoffs in implementation); and recursion (including recursive linked lists) in the context of the software development lifecycle including the processes and practices for designing, implementing, and testing high quality software.

Prerequisite: CSC 116 with a grade of C or better; Corequisite: CSC 217
Typically offered in Fall, Spring, and Summer

CSC 217 Software Development Fundamentals Lab (1 credit hours)
Laboratory course to accompany CSC 216 lecture course. Application of the software processes and practices to design, implement, and test the development of software solutions requiring composition; inheritance; finite state machines; and linear data structures, including recursive linked lists.

Prerequisite: CSC 116 with a C or better; Corequisites: CSC 216
Typically offered in Fall, Spring, and Summer

CSC 226 Discrete Mathematics for Computer Scientists (3 credit hours)
Propositional logic and predicate calculus. Logic gates and circuits. Methods of proof. Mathematical induction. Recursive definitions and functions. Solving recurrences. Asymptotic growth of functions. Elementary combinatorics and probability. Introduction to graph theory. Binary relations, including posets and equivalence relations. This course assumes knowledge of topics covered in high-school Algebra I and II. Most seats reserved for CSC and CPE majors and Computer Programming minors.

Typically offered in Fall, Spring, and Summer

CSC 230 C and Software Tools (3 credit hours)
In this course, students will develop skills in several important areas. First, we'll get some experience working in C, a language that lets us think like procedural rather than object-oriented developers. Also, being a fairly low-level language, C lets us see and control more of what's going on in the hardware. This can help us think about using the hardware more effectively, whether we're actually programming in C or in a higher-level language. While we learn C, we'll also learn about tools and techniques that help us build, manage, debug and analyze software projects.

Prerequisite: CSC 216 with a C or better.
Typically offered in Fall, Spring, and Summer

CSC 236 Computer Organization and Assembly Language for Computer Scientists (3 credit hours)
Computer architecture topics required by professional software developers, including binary and hexadecimal numbers, hardware component organization, machine instruction sets, assembler language programming, linking assembler language with high-level languages, program testing, computer hardware design issues, computer software design issues, and trends in current computer design.

Prerequisite: CSC 230 or ECE 209
Typically offered in Fall, Spring, and Summer

CSC 246 Concepts and Facilities of Operating Systems for Computer Scientists (3 credit hours)
This course prepares students to understand fundamental issues in operating systems. Students will be introduced to multi-threading, synchronization, scheduling, virtual memory, security and communication/networking. The material will be covered in terms of operating systems services exported by the operating systems interface. Current trends will be discussed to give a better understanding of future developments likely to be included in operating systems.

Prerequisite: CSC 230 or ECE 209
Typically offered in Fall, Spring, and Summer

CSC 251 Web Page Development (1 credit hours)
Syntax and semantics of HTML (HyperText Markup Language). Students will learn necessary skills to develop web pages on their EOS/Unity account. In addition to mechanics, design aspects and bandwidth conservancy are covered. Several pages will be created including a final project.

Prerequisite: E 115 or equivalent knowledge of EOS/Unity system
Typically offered in Spring only

CSC 255 String Processing Languages (1 credit hours)
Syntax and semantics of a string manipulation language, currently SNOBOL 4. Application of the language to programming problems in non-numeric areas. Discussion of other string processing languages such as PERL.

Prerequisite: Programming knowledge
Typically offered in Fall only

CSC 281 Foundations of Interactive Game Design (3 credit hours)
Surveys history, technology, narrative, ethics, and design of interactive computer games. Work in teams to develop novel game designs and computer games. Introduction to the interplay of narrative, technology, rule systems, play and culture in the creation of interactive games. Programming experience not required. Enrollment restricted to students with at least sophomore status.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

CSC 295 Special Topics in Computer Science (1-3 credit hours)
Special topics in CSC at the early undergraduate level.

CSC 297 Cybersecurity Topics (1 credit hours)
Introductory cybersecurity topics that may cover areas like cybersecurity policy, law, attacks and defenses, ethics, forensics, social engineering, usability, or privacy. Topics will vary by section and semester. Course may be taken multiple times only if topic is different.

Typically offered in Fall and Spring

CSC 298 Introduction to Computer Science Research Methods (3 credit hours)
Introduction to computer science research methods for first or second year Computer Science undergraduate students. Topics include creating research problems, reading research papers, conducting a literature review, designing research studies, qualitative and quantitative data analysis, communication of research findings, teamwork, and research directions. Students will work on teams to complete a mentored research proposal.

Typically offered in Fall only

CSC 299 Mentored Research in Computer Science (1-3 credit hours)
Mentored research experience in Computer Science. The experience must be arranged in advance by the student and approved by the Department of Computer Science prior to enrollment. A minimum of 45 hours must be completed for each credit hour earned. A final report approved by the faculty mentor and the department are required. Individualized/Independent Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" to be completed by the student and faculty member prior to registration by the department. CSC 299 may not be repeated.

Typically offered in Spring only

CSC 302 Introduction to Numerical Methods (3 credit hours)
Numerical computations with digital computers; floating point arithmetic and implications of round-off error; Monte Carlo methods. Algorithms and computer techniques for the numerical solution of problems in: function evaluation; zeros of functions; interpolation; numerical differentiation and integration; linear systems of equations; curve fitting; solutions of non-linear equations; optimization.

Prerequisite: CSC 116 with a grade of C or higher and MA 305 or MA 405
Typically offered in Fall only

CSC 316 Data Structures and Algorithms (3 credit hours)
Abstract data types; abstract and implementation-level views of data types. Linear and branching data structures, including stacks, queues, trees, heaps, hash tables, graphs, and others at discretion of instructor. Best, worst, and average case asymptotic time and space complexity as a means of formal analysis of iterative and recursive algorithms.

Prerequisite: CSC 216 with a grade of C or better and (CSC 226 or MA 225) with a grade of C or better
Typically offered in Fall, Spring, and Summer

CSC 326 Software Engineering (4 credit hours)
Application of software engineering methods to develop complex products, including the following skills: quality assurance, project management, requirements analysis, specifications, design, development, testing, production, maintenance, security, privacy, configuration management, build systems, communication, and teaming.

Prerequisite: [CSC 230 or ECE 209] and [CSC 316 or ECE 309]
Typically offered in Fall and Spring

CSC 333 Automata, Grammars, and Computability (3 credit hours)
Study of three classical formal models of computation--finite state machines, context-free grammars, and Turing machines--and the corresponding families of formal languages. Power and limitations of each model. Parsing. Non-determinism. The Halting Problem and undecidability. The classes P and NP, and NP-completeness.

Prerequisite: Grade of C or better in either MA 225 or CSC 226
Typically offered in Fall and Spring

CSC 342 Applied Web-based Client-Server Computing (3 credit hours)
This course explores client-server computing on the World Wide Web. The course focuses on the architecture of web-based client-server applications and accepted industry practices. Students work in teams to develop web applications with dynamic content delivery.

Prerequisite: Grade of C or better in CSC 216

CSC 379 Ethics in Computing (1 credit hours)
Computers have become ubiquitous and advances in computing power and accessibility have enabled applications that were speculation a generation ago. Computing professionals, as the gatekeepers of this technology, have significant responsibilities to society. This course examines the role of the computing professional in modern society, focusing on the ethical and moral responsibilities of the profession. Additional topics will include moral/ethical decision-making, whistle-blowing, global organizations, licensure, and emerging technologies.

Requirement: Junior Standing
Typically offered in Fall and Spring

CSC 401 Data and Computer Communications Networks (3 credit hours)
This course provides an introduction to fundamental concepts in the design and implementation of computer networks, their protocols, and applications with a particular emphasis on the Internet's TCP/IP, OSPF/BGP, Ethernet, IEEE 802.11 protocol suite. Topics to be covered include: network architectures, packet/circuit switching, network applications, sockets, reliable data transport, flow control, congestion control, routing, link protocols, addressing, local area networks, wireless networks, mobility, management, network security, software defined networking and the design of network services. Credit is not allowed for both CSC 401 and ECE 407.

Prerequisite: ST 370 and CSC 246
Typically offered in Fall, Spring, and Summer

CSC 402 Networking Projects (3 credit hours)
Through a series of hands-on networking labs, students will gain experience in practical topics such as network configuration, troubleshooting, and static and dynamic routing. The course prepares students sufficiently for an industry certification.

Prerequisite: CSC 401
Typically offered in Spring only

CSC 405 Computer Security (3 credit hours)
Basic concepts and techniques in information security and management such as risks and vulnerabilities, applied cryptography, program security, malicious software, authentication, access control, operating systems security, multilevel security, trusted operating systems, database security, inference control, physical security, and system assurance and evaluation. Coverage of high-level concepts such as confidentiality, integrity, and availability applied to hardware, software, and data.

Corequisite: CSC 246
Typically offered in Spring only

CSC 406/CSC 506/ECE 506/ECE 406 Architecture Of Parallel Computers (3 credit hours)
The need for parallel and massively parallel computers. Taxonomy of parallel computer architecture, and programming models for parallel architectures. Example parallel algorithms. Shared-memory vs. distributed-memory architectures. Correctness and performance issues. Cache coherence and memory consistency. Bus-based and scalable directory-based multiprocessors. Interconnection-network topologies and switch design. Brief overview of advanced topics such as multiprocessor prefetching and speculative parallel execution. Credit is not allowed for more than one course in this set: ECE 406, ECE 506, CSC 406.

Typically offered in Fall and Spring

CSC 411 Introduction to Artificial Intelligence (3 credit hours)
Overview and definitions of Artificial Intelligence (AI). Search, including depth-first and breadth-first techniques with backtracking. Knowledge representation with emphasis on logical methods, Horn databases, resolution, quantification, unification, skolemization and control issues; non-monotonic reasoning; frames; semantic nets. AI systems, including planning, learning, natural language and expert systems. An AI programming language may be taught at the instructor's discretion.

Prerequisite: CSC 316 or ECE 309
Typically offered in Spring only

CSC 412/CSC 512 Compiler Construction (3 credit hours)
The course will concentrate on the theory and practice of compiler-writing. Topics to be covered will include techniques for parsing, code generation, and optimization. Furthermore, the theoretical underpinnings of compilers such as LR parsing will be covered. Finally, the students will be exposed to compiler construction tools, and will obtain hands-on experience in building a compiler for a small programming language. Besides the listed prerequisite courses, other helpful courses include CSC 253, CSC 224, CSC 234, and MA 121.

Prerequisites: Graduate standing and CSC 316 and CSC 333 or equivalent classes.
Typically offered in Fall only

CSC 414/CSC 514/MA 414/MA 514 Foundations of Cryptography (3 credit hours)
Cryptography is the study of mathematical techniques for securing digital information, systems and distributed computation against adversarial attacks. In this class you will learn the concepts and the algorithms behind the most used cryptographic protocols: you will learn how to formally define security properties and how to formally prove/disprove that a cryptographic protocol achieves a certain security property.
You will also discover that cryptography has a much broader range of applications. It solves absolutely paradoxical problems such as proving knowledge of a secret without ever revealing the secret (zero-knowledge proof), or computing the output of a function without ever knowing the input of the function (secure computation). Finally, we will look closely at one of the recent popular application of cryptography: the blockchain technology. Additionally, graduate students will study some of the topics in greater depth.

Prerequisite: (CSC 226 AND CSC 333) OR MA 225
Typically offered in Fall only

CSC 415 Software Security (3 credit hours)
Introduces students to the discipline of designing, developing, and testing secure and dependable software-based systems. Students will learn about risks and vulnerabilities, and effective software security techniques. Topics include common vulnerabilities, access control, information leakage, logging, usability, risk analysis, testing, design principles, security policies, and privacy. Project required.

Corequisite: CSC 326
Typically offered in Fall only

CSC 416/MA 416 Introduction to Combinatorics (3 credit hours)
Basic principles of counting: addition and multiplication principles, generating functions, recursive methods, inclusion-exclusion, pigeonhole principle; basic concepts of graph theory: graphs, digraphs, connectedness, trees; additional topics from:Polya theory of counting, Ramsey theory; combinatorial optimization - matching and covering, minimum spanning trees, minimum distance, maximum flow; sieves; mobius inversion; partitions; Gaussian numbers and q-analogues; bijections and involutions; partially ordered sets.

Prerequisite: Grade of C or better in either MA 225 or CSC 226
Typically offered in Spring only

CSC 417 Theory of Programming Languages (3 credit hours)
Theory of programming languages with emphasis on programming language semantics and implementation issues. Formal models of syntax and semantics. Static versus dynamic scoping. Parameter passing mechanisms. Garbage collection. Programming in alternate paradigms such as applicative, functional, logic, and object-oriented programming languages.

Prerequisite: CSC 316 or ECE 309
Typically offered in Fall and Spring

CSC 422/CSC 522 Automated Learning and Data Analysis (3 credit hours)
This course provides an introduction to concepts and methods for extracting knowledge or other useful forms of information from data. This activity, also known under names including data mining, knowledge discovery, and exploratory data analysis, plays an important role in modern science, engineering, medicine, business, and government. Students will apply supervised and unsupervised automated learning methods to extract patterns, make predictions and identify groups from data. Students will also learn about the overall process of data collection and analysis that provides the setting for knowledge discovery, and concomitant issues of privacy and security. Examples and projects introduce the students to application areas including electronic commerce, information security, biology, and medicine. Students cannot get credit for both CSC 422 and CSC 522.

Prerequisite: CSC 226 or LOG 201, ST 370, MA 305 or MA 405
Typically offered in Fall and Spring

CSC 427/MA 427 Introduction to Numerical Analysis I (3 credit hours)
Theory and practice of computational procedures including approximation of functions by interpolating polynomials, numerical differentiation and integration, and solution of ordinary differential equations including both initial value and boundary value problems. Computer applications and techniques.

Prerequisite: (MA 341 or MA 301) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or MA 116 or PY 251 or ST 114 or ECE 209)
Typically offered in Fall only

CSC 428/MA 428 Introduction to Numerical Analysis II (3 credit hours)
Computational procedures including direct and iterative solution of linear and nonlinear equations, matrices and eigenvalue calculations, function approximation by least squares, smoothing functions, and minimax approximations.

Prerequisite: (MA 305 or MA 405) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or MA 116 or PY 251 or ST 114 or ECE 209)
Typically offered in Spring only

CSC 431 File Organization and Processing (3 credit hours)
Hardware characteristics of storage devices. Basic file organizations including sequential, direct, and indexed sequential; hashing and collision resolution; perfect hashing; signatures; bloom filters; sorting and other bit level structures. Tree structures including binary search trees, B-trees, and trees. Dynamic hashing techniques. Structures including grid files. Applying file structures to practical problems.

Prerequisite: CSC 230 or ECE 209 and CSC 316 or ECE 309
Typically offered in Fall and Spring

CSC 433 Privacy in the Digital Age (3 credit hours)
Privacy is a growing concern in our modern society. We interact and share our personal information with a wide variety of organizations, including financial and healthcare institutions, web service providers and social networks. Many times such personal information is inappropriately collected, used or shared, often without our awareness. This course introduces privacy in a broad sense, with the aim of providing students an overview of the challenging and emerging research topics in privacy. This course will expose students to many of the issues that privacy engineers, program managers, researchers and designers deal with in industry. ST 370 is recommended.

P: CSC 316
Typically offered in Spring only

CSC 440 Database Management Systems (3 credit hours)
Introduction to database concepts. This course examines the logical organization of databases: the entity-relationship model; the relational data model and its languages. Functional dependencies and normal forms. Design, implementation, and optimization of query languages; security and integrity, concurrency control, transaction processing, and distributed database systems.

Prerequisite: CSC 316 or ECE 309
Typically offered in Fall only

CSC 442/ST 442 Introduction to Data Science (3 credit hours)
Overview of data structures, data lifecycle, statistical inference. Data management, queries, data cleaning, data wrangling. Classification and prediction methods to include linear regression, logistic regression, k-nearest neighbors, classification and regression trees. Association analysis. Clustering methods. Emphasis on analyzing data, use and development of software tools, and comparing methods.

Prerequisite: (MA 305 or MA 405) and (ST 305 or ST 312 or ST 370 or ST 372 or ST 380) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or ST 114 or ST 445)
Typically offered in Fall only

CSC 447 Introduction to Cloud Computing (3 credit hours)
The course will provide an introduction and overview to cloud computing principles and architectures at the undergraduate level. The course will start by reviewing the history of centralized and distributed computing and trace how developments over the years have resulted in today's current cloud computing technology. The course will provide an in-depth overview of cloud types and services, virtualization, cloud architectures for both private and public cloud offerings, computer networking topics of relevance to cloud computing, cloud computing security and both the economic and legal aspects of cloud computing systems along with advanced topics such as cloud storage and cloud hosted databases. The course will also include hands-on installation and operation of the NC State VCL private cloud computing system on a dedicated compute node assigned to each student and an individual account on the Amazon AWS public cloud service for gaining practical experience with cloud computing instances.

Prerequisite: CSC 246
Typically offered in Fall only

CSC 450 Web Services (3 credit hours)
Concepts, theories, and techniques for Web services. This course examines architectures for Web applications based on the classical publish, find, and bind triangle. It considers the description, discovery, and engagement of Web services. It emphasizes Web service composition. Key topics include semantics, transactions, processes, agents, quality of service, and compliance.

Prerequisite: CSC 316 or ECE 309
Typically offered in Fall only

CSC 453 Introduction to Internet of Things (IoT) Systems (3 credit hours)
CSC 453: Introduction to Internet of Things (IoT) Systems is a senior-level CSC restricted undergraduate elective on the concepts, protocols, techniques and design methodology underlying current and emerging networked wireless sensor/actuator systems coming to be known as IoT systems, at the intersection of physical computing, semantics and analytics, wireless communications, and networked distributed systems. Design considerations of such systems include diverse metrics such as delay, stability, privacy, expandability. The course includes (i) descriptive material on basic concepts and techniques appropriate to sensor networks, and analytics and semantics concepts appropriate to IoT systems, and (ii) hands-on work with a sampling of representative sensors and actuators, small format computers, networked application programming, and validation in real physical environments. The course includes a term project with assigned teams and project areas to design and implement a complete small IoT system. Students will be expected to purchase equipment for the course, costing about $70-$130.

Prerequisite: CSC 246 or ECE 306 and CSC 230 or ECE 209 and CSC 316 or ECE 309
Typically offered in Spring only

CSC 454 Human-Computer Interaction (3 credit hours)
A survey of concepts and techniques for user interface design and human computer interaction. Emphasizes user-centered design, interface development techniques, and usability evaluation.

Prerequisite: CSC 316 or ECE 309
Typically offered in Spring only

CSC 455 Social Computing and Decentralized Artificial Intelligence (3 credit hours)
This course surveys the field of social computing, introducing its key concepts, paradigms, and techniques. Specific topics are selected from the following list: social media and social network analytics, sociological underpinnings, crowdsourcing and surveys, human computation, social mobilization, human decision making, voting theory, judgment aggregation, prediction markets, economic mechanisms, incentives, organizational modeling, argumentation, contracts, norms, mobility and social context, sociotechnical systems, and software engineering with and for social computing. This course incorporates ideas from diverse disciplines (including sociology, psychology, law, economics, political science, logic, statistics, philosophy, business) to provide essential background for future computer science careers in industry and research.

Prerequisite: CSC 226 and CSC 316
Typically offered in Fall only

CSC 456 Computer Architecture and Multiprocessors (3 credit hours)
Major components of digital computers and the organization of these components into systems. Begins with single processor systems and extends to parallel systems for multiprocessing. Topics include computer organization, instruction set design, cache memory, pipelined processors, and multiprocessors. Recent developments in PC and desktop architectures are also studied.

Prerequisite: CSC 236 and CSC 316
Typically offered in Fall only

CSC 461 Computer Graphics (3 credit hours)
Principles of computer graphics with emphasis on two-dimensional and aspects of three-dimensional raster graphics. Topics include: graphics hardware devices, lines and polygons, clipping lines and polygons to windows, graphical user interface, vectors, projections, transformations, polygon fill. Programming projects in C or C++.

Prerequisite: MA 305 or MA 405 and CSC 230 or ECE 209 and CSC 316 or ECE 309
Typically offered in Fall only

CSC 462 Advanced Computer Graphics Projects (3 credit hours)
Principles of computer graphics with emphasis on three-dimensional graphics. Topics include: 3-D projections and transformations, curves and surfaces, color and texture, animation, visualization, and global illumination techniques. Programming project required.

Prerequisite: CSC 461
Typically offered in Spring only

CSC 467 Multimedia Technology (3 credit hours)
Methods of creating, recording, compressing, parsing, editing and playing back on a computer the following media: sound, music, voice, graphics, images, video, and motion. Introduction to basic principles: signal processing, information theory, real-time scheduling. Also includes discussion of standards, programming tools and languages, storage and I/O devices, networking support, legal issues, user interfaces, and applications. Includes significant hands-on experience.

Prerequisite: CSC 246
Typically offered in Spring only

CSC 471 Modern Topics in Cybersecurity (3 credit hours)
Exploration of three modern or emerging topics in Cybersecurity beyond the core cybersecurity curriculum. These topics may vary by semester. Enrollment is open to CSC majors only.

Prerequisite: CSC 405; Corequisite: CSC 474
Typically offered in Fall only

CSC 472 Cybersecurity Projects (3 credit hours)
Application of cybersecurity principles and basic computer science to solve a cybersecurity problem. Project with comprehensive written and oral project report is required. Enrollment is open to CSC majors only.

Prerequisite: CSC 471 and Senior Status
Typically offered in Spring only

CSC 474 Network Security (3 credit hours)
Basic concepts and techniques in information security and management such as risks and vulnerabilities, applied cryptography, authentication, access control, multilevel security, multilateral security, network attacks and defense, intrusion detection, physical security, copyright protection, privacy mechanisms, security management, system assurance and evaluation, and information warfare. Coverage of high-level concepts such as confidentiality, integrity, and availability applied to hardware, software, and data. Credit not allowed for both CSC 474 and CSC 574.

Prerequisite: CSC 230 or ECE 209
Typically offered in Fall only

CSC 481/CSC 581 Game Engine Foundations (3 credit hours)
In this course we will examine some of the components of a commercial strength game engine. We will survey different genres of games, using some of the unique design challenges each genre provides as a motivation for an in-depth examination of the affordances games engines provide for designing games of that genre. We will cover topics ranging from data structures, resource management, game loops and logical timing systems, scripting, error logging, and networking. A sequence of programming assignments will lead students through the implementation of their own game engine, which they will use to design their own game.

Prerequisite: CSC 316 or ECE 309; Restriction: CSC Majors Only
Typically offered in Fall only

CSC 482 Advanced Computer Game Projects (3 credit hours)
Principles of computer game development with emphasis on 3D first-person game engines. Topics include: advanced character behavior control, procedural content generation, large scale mulit-player game design and infrastructure, serious games for education, training and other applications, the game production pipeline and project built on top of a commercial game engine. Consideration of the game production pipeline, including project pitches, requirements and design detail. Programming project with written and oral reporting is required. Enrollment open to CSC majors only.

Prerequisite: CSC 481
Typically offered in Spring only

CSC 484/CSC 584 Building Game AI (3 credit hours)
In this course we will examine Artificial Intelligence (AI) techniques that are used in the design of computer games. We will look at techniques for game playing as well as the design of AI opponents tasked with creating "good experiences" for players. The course will begin with a discussion of general AI, common algorithms, data structures, and representations. From there, we will cover topics in character movement, pathfinding, decision making, strategy, tactics, and learning. In a sequence of programming assignments students will create increasingly sophisticated AI implementations. Students will also critically review the projects conducted by graduate students enrolled in CSC584. CSC majors only. Students cannot get credit for both CSC 484 and CSC 584.

Prerequisite: CSC 316
Typically offered in Spring only

CSC 486 Computational Visual Narrative (3 credit hours)
Computational Visual Narrative is a project-based course for developing computational media with visual computing tools such as game engines. Within this course we will gain familiarity with the repertoire and practice of individuals involved in the design and development of digital interactive experiences. In the process, you will gain an understanding of the underlying concepts, techniques and technologies of computational and digital systems, software development and its role and potential in narrative practice.

Prerequisite: CSC 316 or ECE 309
Typically offered in Spring only

CSC 492 Senior Design Project (3 credit hours)
Application of software engineering principles and basic computer science to the total development of a software system. Consideration of the software system design process, including requirements and design detail. Development and evaluation of a prototype accomplished through design team activity. Comprehensive written and oral project report is required. Open to CSC majors. Restricted to students with 6 hours of Computer Science Restricted Elective.

Prerequisite: CSC 326
Typically offered in Fall and Spring

CSC 495 Special Topics in Computer Science (1-6 credit hours)
Topics of current interest in computer science not covered in existing courses. Each special topics course will have one or more prerequisites from the Computer Science core courses. CSC 495 may be repeated for credit if a different topic is chosen.

Typically offered in Fall, Spring, and Summer

CSC 498 Independent Study in Computer Science (1-6 credit hours)
Detailed investigation of computing topics of particular interest to advanced undergraduate computer science majors under faculty direction. Appropriate topics may include software development projects, tutorial work on new or emerging technologies, or exploration of an emerging computing topic. The experience must be arranged in advance by the student and approved by the Department of Computer Science prior to enrollment. A minimum of 45 hours must be completed for each credit hour earned. An independent study proposal and final report approved by the faculty mentor and the department are required. Individualized/Independent Study courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department. At most 6 credit hours of CSC 498 and/or CSC 499 may be applied to degree.

Typically offered in Fall, Spring, and Summer

CSC 499 Independent Research in Computer Science (1-6 credit hours)
Independent investigation of a research problem under the supervision of a faculty member in the Department of Computer Science. The experience must be arranged in advance by the student and approved by the Department of Computer Science prior to enrollment. A minimum of 45 hours must be completed for each credit hour earned. An independent research proposal and final report approved by the faculty mentor and the department are required. Individualized/Independent Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" to be completed by the student and faculty member prior to registration by the department. At most 6 credit hours of CSC 498 and/or CSC 499 may be applied to degree.

Typically offered in Fall, Spring, and Summer

CSC 501 Operating Systems Principles (3 credit hours)
Fundamental issues related to the design of operating systems. Process scheduling and coordination, deadlock, memory management and elements of distributed systems.

Prerequisite: CSC 246, CSC 316 and MA 421
Typically offered in Fall and Spring

CSC 503 Computational Applied Logic (3 credit hours)
Introduction to the conceptual and formal apparatus of mathematical logic, to mathematical concepts underlying the process of logical formalization, and to the applications of various logics across a broad spectrum of problems in computer science and artificial intelligence.

Prerequisite: CSC 333 of LOG 335 or LOG 435
Typically offered in Fall only

CSC 505 Design and Analysis Of Algorithms (3 credit hours)
Algorithm design techniques: use of data structures, divide and conquer, dynamic programming, greedy techniques, local and global search. Complexity and analysis of algorithms: asymptotic analysis, worst case and average case, recurrences, lower bounds, NP-completeness. Algorithms for classical problems including sorting, searching and graph problems (connectivity, shortest paths, minimum spanning trees).

Prerequisite: CSC 316 and CSC 226
Typically offered in Fall, Spring, and Summer

CSC 506/ECE 506/ECE 406/CSC 406 Architecture Of Parallel Computers (3 credit hours)
The need for parallel and massively parallel computers. Taxonomy of parallel computer architecture, and programming models for parallel architectures. Example parallel algorithms. Shared-memory vs. distributed-memory architectures. Correctness and performance issues. Cache coherence and memory consistency. Bus-based and scalable directory-based multiprocessors. Interconnection-network topologies and switch design. Brief overview of advanced topics such as multiprocessor prefetching and speculative parallel execution. Credit is not allowed for more than one course in this set: ECE 406, ECE 506, CSC 406.

Typically offered in Fall, Spring, and Summer

CSC 510 Software Engineering (3 credit hours)
An introduction to software life cycle models; size estimation; cost and schedule estimation; project management; risk management; formal technical reviews; analysis, design, coding and testing methods; configuration management and change control; and software reliability estimation. Emphasis on large development projects. An individual project required following good software engineering practices throughout the semester.

Prerequisite: CSC 316 and CSC 226
Typically offered in Fall and Spring

CSC 512/CSC 412 Compiler Construction (3 credit hours)
The course will concentrate on the theory and practice of compiler-writing. Topics to be covered will include techniques for parsing, code generation, and optimization. Furthermore, the theoretical underpinnings of compilers such as LR parsing will be covered. Finally, the students will be exposed to compiler construction tools, and will obtain hands-on experience in building a compiler for a small programming language. Besides the listed prerequisite courses, other helpful courses include CSC 253, CSC 224, CSC 234, and MA 121.

Prerequisites: Graduate standing and CSC 316 and CSC 333 or equivalent classes.
Typically offered in Fall only

CSC 513 Electronic Commerce Technology (3 credit hours)
Exploration of technological issues and challenges underlying electronic commerce. Distributed systems; network infrastructures; security, trust, and payment solutions; transaction and database systems; and presentation issues. Project required. No Audits.

Prerequisite: CSC 501
Typically offered in Spring only

CSC 514/MA 414/MA 514/CSC 414 Foundations of Cryptography (3 credit hours)
Cryptography is the study of mathematical techniques for securing digital information, systems and distributed computation against adversarial attacks. In this class you will learn the concepts and the algorithms behind the most used cryptographic protocols: you will learn how to formally define security properties and how to formally prove/disprove that a cryptographic protocol achieves a certain security property. You will also discover that cryptography has a much broader range of applications. It solves absolutely paradoxical problems such as proving knowledge of a secret without ever revealing the secret (zero-knowledge proof), or computing the output of a function without ever knowing the input of the function (secure computation). Finally, we will look closely at one of the recent popular application of cryptography: the blockchain technology. Additionally, graduate students will study some of the topics in greater depth.

Prerequisite: (CSC 226 AND CSC 333) OR MA 225
Typically offered in Fall only

CSC 515 Software Security (3 credit hours)
Introduces students to the discipline of designing, developing, and testing secure and dependable software-based systems. Students will learn about risks and vulnerabilities, and effective software security techniques. Topics include common vulnerabilities, access control, information leakage, logging, usability, risk analysis, testing, design principles, security policies, and privacy. Project required.

Prerequisite: CSC 510
Typically offered in Spring only

CSC 517/ECE 517 Object-Oriented Design and Development (3 credit hours)
The design of object-oriented systems, using principles such as the GRASP principles, and methodologies such as CRC cards and the Unified Modeling Language (ULM). Requirements analysis. Design patterns Agile Methods. Static vs. dynamic typing. Metaprogramming. Open-source development practices and tools. Test-first development. Project required, involving contributions to an open-source software project.

Prerequisite: CSC 326 or ECE 309
Typically offered in Fall and Spring

CSC 519 DevOps: Modern Software Engineering Practices (3 credit hours)
Modern software development organizations require entire teams of DevOps to automate and maintain software engineering processes and infrastructure vital to the organization. In this course, you will gain practical exposure to the skills, tools, and knowledge needed in automating software engineering processes and infrastructure. Students will have the chance to build new or extend existing software engineering tools and design a DevOps pipeline.

Prerequisite: CSC 510 or (graduate or senior standing with at least a 3.0 GPA) and good knowledge of at least one high level programming language
Typically offered in Fall and Spring

CSC 520 Artificial Intelligence I (3 credit hours)
Introduction to and overview of artificial intelligence. Study of AI programming language such as LISP or PROLOG. Elements of AI problem-solving technique. State spaces and search techniques. Logic, theorem proving and associative databases. Introduction to knowledge representation, expert systems and selected topics including natural language processing, vision and robotics.

Prerequisite: CSC 316 and either CSC 226 or LOG 201 or LOG 335 or background in symbolic logic
Typically offered in Fall and Spring

CSC 522/CSC 422 Automated Learning and Data Analysis (3 credit hours)
This course provides an introduction to concepts and methods for extracting knowledge or other useful forms of information from data. This activity, also known under names including data mining, knowledge discovery, and exploratory data analysis, plays an important role in modern science, engineering, medicine, business, and government. Students will apply supervised and unsupervised automated learning methods to extract patterns, make predictions and identify groups from data. Students will also learn about the overall process of data collection and analysis that provides the setting for knowledge discovery, and concomitant issues of privacy and security. Examples and projects introduce the students to application areas including electronic commerce, information security, biology, and medicine. Students cannot get credit for both CSC 422 and CSC 522.

Prerequisite: CSC 226 or LOG 201, ST 370, MA 305 or MA 405
Typically offered in Fall and Spring

CSC 530 Computational Methods for Molecular Biology (3 credit hours)
Computer algorithms supporting genomic research: DNA sequence comparison and assembly, hybridization mapping, phylogenetic reconstruction, genome rearrangement, protein folding and threading.

Prerequisite: CSC 316, Corequisite: CSC 505
Typically offered in Fall only

CSC 533 Privacy in the Digital Age (3 credit hours)
Privacy is a growing concern in our modern society. We interact and share our personal information with a wide variety of organizations, including financial and healthcare institutions, web service providers and social networks. Many times such personal information is inappropriately collected, used or shared, often without our awareness. This course introduces privacy in a broad sense, with the aim of providing students an overview of the challenging and emerging research topics in privacy. This course will expose students to many of the issues that privacy engineers, program managers, researchers and designers deal with in industry. ST 370 is recommended but not mandatory.

Prerequisite: CSC 316
Typically offered in Fall only

CSC 537 Systems Attacks and Defenses (3 credit hours)
This class will: explore several aspects of security research with the goal of understanding the attacker's mindset; help the students to develop a foundation and a well-rounded view of security research; and cover some of the state-of-the-art attack/defense techniques and ongoing research activities in a number of topics in software security, web security, privacy and network security.

P: CSC 246 and CSC 401 or equivalent
Typically offered in Spring only

CSC 540 Database Management concepts and Systems (3 credit hours)
Advanced database concepts. Logical organization of databases: the entity-relationship model; the relational data model and its languages. Functional dependencies and normal forms. Design, implementation, and optimization of query languages; security and integrity, consurrency control, transaction processing, and distributed database systems.

Prerequisite: CSC 316
Typically offered in Fall and Spring

CSC 541 Advanced Data Structures (3 credit hours)
Complex and specialized data structures relevant to design and development of effective and efficient software. Hardware characteristics of storage media. Primary file organizations. Hashing functions and collision resolution techniques. Low level and bit level structures including signatures, superimposed coding, disjoint coding and Bloom filters. Tree and related structures including AVL trees, B*trees, tries and dynamic hashing techniques.

Prerequisite: CSC 316
Typically offered in Spring only

CSC 546/ISE 546 Management Decision and Control Systems (3 credit hours)
Planning, design, and development and implementation of comprehensive computer-based information systems to support management decisions. Formal information systems principles; information requirements analysis; knowledge acquisition techniques; information modeling. Information resource management for quality operational control and decision support; system evaluation, process improvement and cost effectiveness.

Prerequisite: CSC 423 or BUS 541
Typically offered in Fall only

CSC 547/ECE 547 Cloud Computing Technology (3 credit hours)
Study of cloud computing principles, architectures, and actual implementations. Students will learn how to critically evaluate cloud solutions, how to construct and secure a private cloud computing environment based on open source solutions, and how to federate it with external clouds. Performance, security, cost, usability, and utility of cloud computing solutions will be studied both theoretically and in hands-on exercises. Hardware-, infrastructure-, platform-, software-, security-, - "as-a-service".

Prerequisites: CSC 501 and either ECE/CSC 570 or ECE/CSC 573
Typically offered in Spring only

CSC 548 Parallel Systems (3 credit hours)
Basic concepts of parallel computation; parallel programming models and algorithm design; load balancing and performance optimization; parallel I/0 and high-end storage systems; high performance parallel applications.

Prerequisite: CSC 246 or CSC 451 or CSC 501
Typically offered in Fall only

CSC 554 Human-Computer Interaction (3 credit hours)
Basic theory and concepts of human-computer interaction. Human and computational aspects. Cognitive engineering. Practical HCI skills. Significant historical case studies. Current technology and future directions in user interface development.

Prerequisite: CSC 316
Typically offered in Spring only

CSC 555 Social Computing and Decentralized Artificial Intelligence (3 credit hours)
This course surveys the field of social computing, introducing its key concepts, paradigms, and techniques. Specific topics are selected from the following list: social media and social network analytics, sociological underpinnings, crowdsourcing and surveys, human computation, social mobilization, human decision making, voting theory, judgment aggregation, prediction markets, economic mechanisms, incentives, organizational modeling, argumentation, contracts, norms, mobility and social context, sociotechnical systems, and software engineering with and for social computing. This course incorporates ideas from diverse disciplines (including sociology, psychology, law, economics, political science, logic, statistics, philosophy, business) to provide essential background for future computer science careers in industry and research.

Typically offered in Fall only

CSC 561 Principles of Computer Graphics (3 credit hours)
Fundamentals of the OpenGL API. 2D and 3D transformations, perspective and orthographic projection, and the mathematical foundations that underlie these concepts. Geometric primitives, clipping, depth buffering, scan conversion, and rasterization. Lighting, shadows, and texture mapping. Curves and surfaces.

Prerequisite: CSC Majors
Typically offered in Fall only

CSC 562 Introduction to Game Engine Design (3 credit hours)
This course offers an advanced discussion of topics in computer graphics, with an emphasis on rendering techniques and GPU shader programming used in computer game engine design. Students are required to implement a medium-size game program that includes modeling and rendering, 2D physics, and animation of dynamic objects. Students will learn about GPU basics, mathematics of transformations, visual appearance properties, texturing, global illumination, and toon shading in computer games.

Prerequisites: CSC 561 or CSC 461 or equivalent course from a previous university
Typically offered in Spring only

CSC 563 Visual Interfaces for Mobile Devices (3 credit hours)
The conception and creation of effective visual interfaces for mobile devices, including ideation and prototyping for useful mobile applications, the industry and architecture of mobile devices, mobile usage context, computer graphics and interfaces for mobiles, and mobile programming.

Prerequisite: CSC 554 or CSC 561
Typically offered in Spring only

CSC 565/MA 565/OR 565 Graph Theory (3 credit hours)
Basic concepts of graph theory. Trees and forests. Vector spaces associated with a graph. Representation of graphs by binary matrices and list structures. Traversability. Connectivity. Matchings and assignment problems. Planar graphs. Colorability. Directed graphs. Applications of graph theory with emphasis on organizing problems in a form suitable for computer solution.

Prerequisite: CSC 226 or MA 351.
Typically offered in Spring only

CSC 568 Enterprise Storage Architecture (3 credit hours)
An introduction to storage systems architecture in an enterprise. Begins with a review of the individual components of a system (eg, hard disk drives, network interfaces), and shows how to aggregate those into storage systems. Tradeoffs involving factors such as cost, complexity, availability, power and performance. Discussion of information management strategies, including data migration. Guest lectures by representatives from local industry. Students work in teams on a semester-long project.

Prerequisite: CSC 246 and CSC 401 and CSC 316
Typically offered in Spring only

CSC 570/ECE 570 Computer Networks (3 credit hours)
General introduction to computer networks. Discussion of protocol principles, local area and wide area networking, OSI stack, TCP/IP and quality of service principles. Detailed discussion of topics in medium access control, error control coding, and flow control mechanisms. Introduction to networking simulation, security, wireless and optical networking.

Prerequisite: ECE 206 or CSC 312, ST 371, CSC 258 and Senior standing or Graduate standing
Typically offered in Fall and Spring

CSC 573/ECE 573 Internet Protocols (3 credit hours)
Principles and issues underlying provision of wide area connectivity through interconnection of autonomous networks. Internet architecture and protocols today and likely evolution in future. Case studies of particular protocols to demonstrate how fundamental principles applied in practice. Selected examples of networked clinet/server applications to motivate the functional requirements of internetworking. Project required.

Prerequisite: CSC/ECE 570
Typically offered in Fall, Spring, and Summer

CSC 574/ECE 574 Computer and Network Security (3 credit hours)
This course presents foundational concepts of computer and network security and privacy. It covers a wide breadth of concepts, including; Fundamentals of computer security and privacy, including security models, policies, and mechanisms; Cryptography for secure systems, including symmetric and asymmetric ciphers, hash functions, and integrity mechanisms; Authentication of users and computers; Network attacks and defenses at the network and application layers; Common software vulnerabilities and mitigation strategies; Secure operating systems and seminal access control models and policies; Principles of intrusion detection; Privacy, including considerations of end-user technologies.

Prerequisite: (CSC 316 or ECE309) and (CSC 401 or ECE407) or equivalent
Typically offered in Fall and Spring

CSC 575/ECE 575 Introduction to Wireless Networking (3 credit hours)
Introduction to cellular communications, wireless local area networks, ad-hoc and IP infrastructures. Topics include: cellular networks, mobility mannagement, connection admission control algorithms, mobility models, wireless IP networks, ad-hoc routing, sensor networks, quality of service, and wireless security.

Prerequisite: ECE/CSC 570
Typically offered in Spring only

CSC 576/ECE 576 Networking Services: QoS, Signaling, Processes (3 credit hours)
Topics related to networking services, signaling for setting up networking services, such as SIP and IMS, networking architectures for providing QoS for networking services, such as MPLS, DiffServ and RAC, signaling protocols for setting up QoS connections in the transport stratum, such as LDP and RSVP-TE, video-based communications, and capacity planning models for dimensioning services.

Prerequisite: CSC/ECE 570
Typically offered in Fall and Spring

CSC 577/ECE 577 Switched Network Management (3 credit hours)
Topics related to design and management of campus enterprise networks, including VLAN design; virtualization and automation methodologies for management; laboratory use of open space source and commercial tools for managing such networks.

Typically offered in Fall only

CSC 579/ECE 579/OR 579 Introduction to Computer Performance Modeling (3 credit hours)
Workload characterization, collection and analysis of performance data, instrumentation, tuning, analytic models including queuing network models and operational analysis, economic considerations.

Prerequisite: CSC 312 or ECE 206 and MA 421
Typically offered in Fall and Spring

CSC 580/MA 580 Numerical Analysis I (3 credit hours)
Algorithm behavior and applicability. Effect of roundoff errors, systems of linear equations and direct methods, least squares via Givens and Householder transformations, stationary and Krylov iterative methods, the conjugate gradient and GMRES methods, convergence of method.

Prerequisite: MA 405; MA 425 or MA 511; high-level computer language
Typically offered in Fall only

CSC 581/CSC 481 Game Engine Foundations (3 credit hours)
In this course we will examine some of the components of a commercial strength game engine. We will survey different genres of games, using some of the unique design challenges each genre provides as a motivation for an in-depth examination of the affordances games engines provide for designing games of that genre. We will cover topics ranging from data structures, resource management, game loops and logical timing systems, scripting, error logging, and networking. A sequence of programming assignments will lead students through the implementation of their own game engine, which they will use to design their own game.

Prerequisite: CSC 316 or ECE 309; Restriction: CSC Majors Only
Typically offered in Fall only

CSC 582 Computer Models of Interactive Narrative (3 credit hours)
A theoretical and practical study of the computational models supporting the creation of interactive narrative systems. Topics include basic introductions to cognitive, linguistic and film theoretic models of narrative; representations and reasoning techniques from artificial intelligence related to the creation of storylines, dialog, camera control and other features of narrative in text-based and/or 3D virtual worlds; mechanisms for controlling character behavior in multi-agent multi-user stories; and applications of these techniques ranging from interactive entertainment to educational software to training simulations.

Typically offered in Fall only

CSC 583/MA 583 Introduction to Parallel Computing (3 credit hours)
Introduction to basic parallel architectures, algorithms and programming paradigms; message passing collectives and communicators; parallel matrix products, domain decomposition with direct and iterative methods for linear systems; analysis of efficiency, complexity and errors; applications such as 2D heat and mass transfer.

Prerequisite: CSC 302 or MA 402 or MA/CSC 428 or MA/CSC 580
Typically offered in Spring only

CSC 584/CSC 484 Building Game AI (3 credit hours)
In this course we will examine Artificial Intelligence (AI) techniques that are used in the design of computer games. We will look at techniques for game playing as well as the design of AI opponents tasked with creating "good experiences" for players. The course will begin with a discussion of general AI, common algorithms, data structures, and representations. From there, we will cover topics in character movement, pathfinding, decision making, strategy, tactics, and learning. In a sequence of programming assignments students will create increasingly sophisticated AI implementations. Students will also critically review the projects conducted by graduate students enrolled in CSC584. CSC majors only. Students cannot get credit for both CSC 484 and CSC 584.

Prerequisite: CSC 316
Typically offered in Spring only

CSC 591 Special Topics In Computer Science (1-6 credit hours)
Topics of current interest in computer science not covered in existing courses.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

CSC 595 Cybersecurity Practicum (3 credit hours)
Application of cybersecurity principles and computer science and engineering to solve a cybersecurity problem. A project with comprehensive written and oral project report is required. Enrollment is open to Graduate Certificate in Cybersecurity (CYS GCP) students and CSC and ECE majors only.

Prerequisite: CSC/ECE 574
Typically offered in Fall only

CSC 600 Computer Science Graduate Orientation (1 credit hours)
Introduction for new graduate students to (a) information about graduate program, department, and university resources, and (b) research projects conducted by CSC faculty.

Typically offered in Fall and Spring

CSC 630 Master's Independent Study (1-3 credit hours)
Individual investigation of topics under the direction of member(s) of the graduate faculty.

Typically offered in Fall, Spring, and Summer

CSC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CSC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CSC 705 Operating Systems Security (3 credit hours)
Fundamentals and advanced topics in operating system (OS) security. Study OS level mechanisms and policies in investigating and defending against real-world attacks on computer systems, such as self-propagating worms, stealthy rootkits and large-scale botnets. OS security techniques such as authentication, system call monitoring, as well as memory protection. Introduce recent advanced techniques such as system-level randomization and hardware virtualization.

Prerequisite: CSC 501
Typically offered in Spring only

CSC 707 Automata, Languages and Computability Theory (3 credit hours)
Formal models of language and computation; finite automata and regular languages, pushdown automata and context-free languages, Turing machines. Relative power of models, Chomsky hierarchy. Inherent complexity of problems: undecidability, computational complexity, intractable problems.

Prerequisite: CSC 226 required, CSC 333 recommended
Typically offered in Fall only

CSC 710 Software Engineering as a Human Activity (3 credit hours)
This course addresses the human aspect of software engineering, by studying the people who practice it. Students will explore software engineering as traditionally defined, and also consider techniques that transform how we understand software engineering, such as methods from psychology and sociology. Students will study the usability of software engineering tools, the psychology of programming, performance of software developers, experimental methods in observing software engineers, distributed development and coordination, and cultural differences between software developers.

Prerequisite: CSC 510
Typically offered in Spring only

CSC 711/GIS 711 Geospatial Data Management (3 credit hours)
Data management principles and technologies for efficient implementation of geospatial applications. This course introduces students to: spatial and temporal data types, data models, geometry models, spatial predicates, spatial access methods, and spatial query processing. In addition, students will be exposed to modern data management systems for geospatial application development and data integration principles. Prior GIS programming knowledge and knowledge of database management systems and SQL is preferred.

Typically offered in Spring only

CSC 712 Software Testing and Reliability (3 credit hours)
An advanced introduction to software testing and reliability. The course is a balanced mixture of theory, practice, and application. Methods, techniques, and tools for testing software and producing reliable and secure software are used and analyzed. Software reliability growth models and techniques for improving and predicting software reliability are examined, and their practical use is demonstrated. Good knowledge of C++ or Java. Knowledge of the basics of statistics, calculus, and linear algebra.

Prerequisite: CSC 510
Typically offered in Fall only

CSC 714 Real Time Computer Systems (3 credit hours)
Design and implementation of computer systems required to provide specific response times. Structure of a real-time kernel, fixed and dynamic priority scheduling algorithms, rate monotonic scheduling theory, priority inheritance protocols, real-timebenchmarks, case study of a real-time kernel.

Prerequisite: CSC 451 or CSC 501
Typically offered in Spring only

CSC 720 Artificial Intelligence II (3 credit hours)
A second course in artificial intelligence emphasizing advanced concepts of AI including logic programming, automatic programming, natural language understanding, visual perception by machine, learning and inference, intelligent computer-aided instruction, knowledge representation, robotics and other topics to be chosen by instructor. Students asked to write programs in AI programming language such as LISP and PROLOG.

Prerequisite: CSC 520
Typically offered in Spring only

CSC 722 Advanced Topics in Machine Learning (3 credit hours)
A broad range of advanced topics in machine learning, the building of computer-based systems that can adapt to their environment and learn from their own experience. Theory of learnability, technical details of various learning methods, combination of multiple methods, evaluation of methods, and related topics (at the discretion of the instructor).

Prerequisite: CSC 520
Typically offered in Fall only

CSC 724 Advanced Distributed Systems (3 credit hours)
Principles in the design and implementation of modern distributed systems; recent techniques used by real-world distributed systems such as peer-to-peer file sharing, enterprise data center, and internet search engines; state-of-the-art architectures, algorithms, and performance evaluation methodologies in distributed systems.

Prerequisite: CSC 501 or equivalent. Programming in C++ or Java in Unix environments
Typically offered in Spring only

CSC 742 Database Management Systems (3 credit hours)
Database concepts. Database design. Data models: entity-relationship and relational. Data manipulation languages including SQL. Data Dictionaries. Query processing. Concurrency. Software development environments using a database system. Expert, object-oriented, multimedia and distributed database systems. Database systems architecture. Use of a commercial database management system.

Prerequisite: CSC 431 or 541
Typically offered in Spring only

CSC 743 Secure Data Management (3 credit hours)
Advanced topics in secure data management with techniques in traditional database management systems as well as in recent advances in emerging areas. Emphasis on new security issues and challenges imposed by the Internet and the Web on cross-organization data sharing and management. Example topics include XML, data management in P2P, trust management, data authorship, and the integration of security and privacy policies with information systems.

Prerequisite: CSC/ECE 574 and (CSC 440 or CSC 540). Background in databases and basic security concepts required.
Typically offered in Fall only

CSC 750 Service-Oriented Computing (3 credit hours)
Concepts, theories, and techniques for computing with services. This course examines architectures for Web applications based on the classical publish, find, and bind triangle, but formulates it at a higher level. It considers sophisticated approaches for the description, discovery, and engagement of services, especially over the Web and the Grid. This course emphasizes service composition. Key topics include semantics, transactions, processes, agents, quality of service, compliance, and trust.

Prerequisite: CSC 540: Database Management Concepts and Systems
Typically offered in Fall only

CSC 761 Advanced Topics in Computer Graphics (3 credit hours)
Understanding and discussing current advances and research topics in computer graphics. Possible topics include nonphotorealistic rendering, modeling natural phenomena, illumination and rendering techniques, model simplification, animation, visualization, graphics hardware. Learning to critique research papers from important venues in the computer graphics field. Learning to read, interpret, and present computer graphics research papers in a conference-type environment.

Prerequisite: Graduate standing in Computer Science
Typically offered in Spring only

CSC 762/OR 762/ISE 762 Computer Simulation Techniques (3 credit hours)
Basic discrete event simulation methodology: random number generators, generating random objects, design of discrete event simulation, validation, analysis of simulation output, variance reduction techniques, Markov chain Monte Carlo, simulation optimization. The course has computer assignments and projects.

Students should have completed a course on stochastic models (similar to ISE 560 or ISE 760) and have a working knowledge of a programming language (e.g., Python, Matlab, R, or others).
Typically offered in Fall and Spring

CSC 766 Code Optimization for Scalar and Parallel Programs (3 credit hours)
Advanced research issues in code optimization for scalar and parallel programs; program analysis, scalar and parallel optimizations as well as various related advanced topics.

Prerequisite: CSC 512, or CSC 548, or CSC 501
Typically offered in Spring only

CSC 772 Survivable Networks (3 credit hours)
Principles of network and service continuity and related metrics; the theory of network availability, survivability, and restoration; a comprehensive coverage of network architectures, protocols, algorithms, and related technology for survivability; advanced topics in network survivability; hands-on experience in the implementation of protocols and software for survivable systems and the operation of survivable networks.

Typically offered in Spring only

CSC 773/ECE 773 Advanced Topics in Internet Protocols (3 credit hours)
Cutting-edge concepts and technologies to support internetworking in general and to optimize the performance of the TCP/IP protocol suite in particular. Challenges facing and likely evolution for next generation intenetworking technologies. This course investigates topics that include, but may be not limited to: Internet traffic measurement, characteriztion and modeling, traffic engineering, network-aware applications, quality of service, peer-to-peer systems, content-distribution networks, sensor networks, reliable multicast, and congestion control.

Prerequisite: CSC/ECE 573
Typically offered in Spring only

CSC 774/ECE 774 Advanced Network Security (3 credit hours)
A study of network security policies, models, and mechanisms. Topics include: network security models; review of cryptographic techniques; internet key management protocols; electronic payments protocols and systems; intrusion detection and correlation; broadcast authentication; group key management; security in mobile ad-hoc networks; security in sensor networks.

Prerequisite: CSC/ECE 570, CSC/ECE 574
Typically offered in Spring only

CSC 775/ECE 775 Advanced Topics in Wireless Networking (3 credit hours)
Reviews the current state of research in wireless networks, network architectures, and applications of wireless technologies; students will design, organize, and implement or simulate systems in a full-semester research project. For students with background in networking and communications who wish to explore research and development topics.

Prerequisite: ECE/CSC 575
Typically offered in Fall only

CSC 776/ECE 776 Design and Performance Evaluation of Network Systems and Services (3 credit hours)
Introduction to the design and performance evaluation of network services. Topics include top-down network design based on requirements, end-to-end services and network system architecture, service level agreements, quantitative performance evaluation techniques. Provides quantitative skills on network service traffic and workload modeling, as well as, service applications such as triple play, internet (IPTV), Peer-to-peer (P2P), voice over IP (VoIP), storage, network management, and access services.

Prerequisite: CSC(ECE) 570 and CSC(ECE) 579
Typically offered in Spring only

CSC 777/ECE 777 Telecommunications Network Design (3 credit hours)
Analytic modeling and topological design of telecommunications networks, including centralized polling networks, packet switched networks, T1 networks, concentrator location problems, routing strategies, teletraffic engineering and network reliability.

Prerequisite: CSC(ECE) 570
Typically offered in Spring only

CSC 780/MA 780 Numerical Analysis II (3 credit hours)
Approximation and interpolation, Fast Fourier Transform, numerical differentiation and integration, numerical solution of initial value problems for ordinary differential equations.

Prerequisite: MA 580
Typically offered in Spring only

CSC 791 Advanced Topics In Computer Science (1-6 credit hours)
Advanced topics of current interest in computer science not covered by existing courses.

Typically offered in Fall and Spring

CSC 801 Seminar in Computer Science (1-3 credit hours)
Faculty and graduate student research presentations and discussions centered around current research problems in Computer Science and advanced theories in these areas. Students are expected to make presentations of published works and, depending onthe course credit received and their academic degree progress, present their own research results. Critical discussions of the various research approaches and results and their relationships based on the presentations and additional readings and research. Departmental Approval Required.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

CSC 830 Doctoral Independent Study (1-3 credit hours)
Individual investigation of advanced topics under the direction of member(s) of the graduate faculty.

Typically offered in Fall, Spring, and Summer

CSC 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CSC 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CSC 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CSC 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CSC 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CSC 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Cooperative Education (COP)

COP 100 Co-Op Work lst Alt (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 101 Co-Op Work lst Par (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 200 Co-Op Work 2nd Alt (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 201 Co-Op Work 2nd Par (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 300 Co-Op Work 3rd Alt (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 301 Co-Op Work 3rd Par (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 400 Co-Op Work 4th Alt (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 401 Co-Op Work 4th Par (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 500 Co-Op Work Graduate Alt (0 credit hours)
Typically offered in Fall, Spring, and Summer

COP 501 Co-Op Work Graduate PAR (0 credit hours)
Typically offered in Fall, Spring, and Summer

Counselor Education (ECD)

ECD 220 College Student Development and Peer Counseling (2 credit hours)
Developmental issues of young adulthood with opportunity for the acquisition of paraprofessional counseling skills and crisis intervention skills. Major consideration is given to self-awareness and values clarification through utilization of personality inventories and self-assessment instruments. Priority will be given to resident advisors and students active in student organizations or volunteer programs.

Typically offered in Spring only

ECD 221 Career Planning and Personal Development (3 credit hours)
Knowledge, attitudes, self-understanding, and skills needed to enhance career planning and foster personal development. Study of self-understanding, self-talk, goal setting, the environment, and decision making as ways to adapt more effectively to the challenges of life.

Typically offered in Fall and Spring

ECD 222 Sexual Violence Prevention for Peer Educators (3 credit hours)
This course trains students to educate their peers about sexual and relationship violence and stalking. Students will explore how this violence impacts people of varying cultures including people of color and the gay, lesbian, bisexual, and transgender community. They are taught to be social activists and learn skills to be confident and active bystanders as well as knowledgeable and effective facilitators. Topics include learning about the objectification of women and men in the media, masculinity and patriarchy, pornography, and how these all contribute to a rape culture. Upon successful completion, students will be ready to be a Movement peer educator. Student must complete application and interview process and have been approved by the instructor prior to registration in the course.

Typically offered in Fall only

ECD 224 Student Development and Peer Mentoring (2 credit hours)
For new student peer mentors of primarily African American freshmen. Relevant student development, psychology and counseling research and theory as well as shared professional experiences are presented. Class discussion, group activities, role playing, relevant readings and video are employed. Reaction papers and project are required.

Prerequisite: Selection as a Peer Mentor
Typically offered in Fall only

ECD 225 Foundations of Cultural Competence (3 credit hours)
This course engages students in the process to work effectively with diverse populations to develop cross-cultural competencies and identify culturally-appropriate strategies in the workplace and life. This course introduces multicultural and international diversity concepts while having students participate in reflective and experiential activities. Students gain an overview of historical and psychological conceptual frameworks and models for understanding cultural differences and similarities within, among, and between groups of people domestically and internationally. Sophomore standing or above.

GEP Global Knowledge, GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

ECD 296 Special Topics in Education: Counselor Education (1-3 credit hours)
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the students.

Typically offered in Fall, Spring, and Summer

ECD 310 Caldwell Fellows Honors Seminar: Foundations in Self-Development (3 credit hours)
Students are selected as Caldwell Fellows on the basis of their potential for effective leadership. The Caldwell seminar is the foundational experience for all Fellows, grounding them the essential gounding of leadership - self-understanding. The course employs theory and practice for psychosocial development, grounding in the servant-leader philosophy of leadership, and practice in engaged social issues leadership through service-learning and reflection.

Requisite: Caldwell Fellows Only
GEP U.S. Diversity
Typically offered in Fall only

ECD 510 Orientation to Professional Counseling, Identity, and Ethics (3 credit hours)
This course examines (1) the purpose of counseling, (2) the historical context for counseling, (3) the basic principles of major counseling theories, and (4) the practice of counseling in various professional settings.

Prerequisite: 6 credits in ED or PSY
Typically offered in Spring and Summer

ECD 524 Career Counseling and Development (3 credit hours)
Knowledge and skills needed to: (a) provide professional career counseling to individuals and (b) design, implement and evaluate career development programs for particular groups. Theories of career development and decision making; career guidance programs in educational, agency and industrial setting; career information sources and delivery systems; and assessment in career counseling.

Prerequisite: 6 credits in ED or PSY
Typically offered in Fall, Spring, and Summer

ECD 525 Multicultural Counseling (3 credit hours)
Theory and practice of counseling culturally diverse clients. Client populations include African Americans, Asian-Americans, American Indians and Hispanics. Cultural assumptions, cultural values, counselor credibility, prejudice and racism in context of counseling.

Prerequisite: Six hrs. in ED or PSY, Corequisite: ECD 530
Typically offered in Fall, Spring, and Summer

ECD 530 Theories and Tech of Counseling (4 credit hours)
Theory, philosophy, roles, professional ethics, and techniques of counseling. Eleven major counseling approaches including behavioral, psychoanalytic, client-centered, existential, family and post-modern approaches, and related counseling strategies are discussed. Students have opportunities to practice related strategies through role-plays.

Prerequisite: 6 credits in ED or PSY
Typically offered in Fall and Spring

ECD 533 Int Sch Counseling (4 credit hours)
An examination of the conceptual framework for the role and functions of school counselors, prevention and treatment strategies, program development and evaluation. Focus is on the school-college-community collaboration model, preparing counselors who can work effectively across different counseling settings by collaborating with other counselors and mental health professionals. Graduate standing required.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ECD 535 Introduction to College Counseling and Student Development (4 credit hours)
College Counseling and student development theory, research and practice as well as overview of profession. Discussion of counselor roles, professional ethics, history, identity, and development. Instruction in and design of structured group work in laboratory.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

ECD 536 Introduction to Clinical Mental Health Counseling (4 credit hours)
Issues, functions and scope of work being done in various clinical mental health programs; overview of helping approaches with selected client populations; related professional concerns. Instruction in and design of structured group work in laboratory.

Prerequisite: Graduate Standing
Typically offered in Fall and Spring

ECD 539 Group Counseling (3 credit hours)
Theory and practice of group counseling. Theoretical positions include client-centered, behavioral and rational-emotive. Aspects of group process include group leadership, group membership, establishing and maintaining a group.

Prerequisite: ECD 530 and one of the following: ECD 510, 534, 535 or 536
Typically offered in Fall, Spring, and Summer

ECD 540/WGS 540 Gender Issues In Counseling (3 credit hours)
Exploration of gender as primary identity and social construct. Emphasis on gender dynamics in counseling, client empowerment and preventive approaches.

Prerequisite: Graduate standing or Six hrs. in ED or PSY
Typically offered in Summer only

ECD 541 Substance Abuse and Counseling (3 credit hours)
This course explores counseling as it relates to working with clients with substance abuse disorders. Ethical and legal issues, theoretical models, assessment and diagnosis, treatment planning, techniques and individual/family/group interventions with diverse populations will be discussed throughout class sessions. This course is distinctively geared towards students who are training to be counselors. Substance abuse issues that clients might present within counseling are addressed by way of assigned readings, class discussions, video segments, case studies, internet resources and assignments.

Prerequisite: 6 hours of Graduate Coursework
Typically offered in Fall and Summer

ECD 542 Research in Counseling (3 credit hours)
This introductory graduate level course in research in counseling is intended to provide students with an overview of the fundamentals of research methods and program evaluations in the field. Students will be able to identify various research approaches and the strengths and limitations associated to them. The course is also designed to give students the basic skills to conduct research in counseling and develop program evaluation skills.

Prerequisite: 6 hours of ECD Graduate Courses
Typically offered in Fall and Summer

ECD 543 Introduction to College Counseling (3 credit hours)
A course designed for investigation of college counseling services and strategies. Assessment and research in student development, and students design and implement a developmental intervention based on Knefelkamp and Wells' Practice-to-Theory-to-Practice model.

Prerequisite: ECD 535 or Doctoral student
Typically offered in Spring only

ECD 545 Counseling Couples and Families (3 credit hours)
This elective course explores counseling as it relates to working with couples and families. Theoretical models, techniques and interventions will be discussed throughout class sessions. This course is distinctively geared towards students who are training to be counselors. Family and couples issues that clients might present within counseling are addressed by way of class discussions, assigned readings, video segments, case studies, role plays and Internet resources.

Prerequisite: 6 hours of ECD Graduate Courses
Typically offered in Spring and Summer

ECD 546 Crisis Interventions in Counseling (3 credit hours)
An overview of crisis intervention and theoretical models. Crisis situations are described across developmental age-span across a variety of service delivery settings. Students will develop conceptual competency for professional counselors to engage in crisis intervention.

Prerequisite: 6 hours of ECD Graduate Courses
Typically offered in Fall and Summer

ECD 547 Counseling Children and Adolescents (7 credit hours)
Counseling children and adolescents can be very different from working with adults. This course will explore some key developmental considerations, as well as creative approaches to working with this population (ages 0-18). Some topics that will be covered include early interventions, developmental milestones, working with parents, transitions, behavioral changes, peer relationships, sexuality, crisis counseling, ethics, advocacy, and collaborating with other professionals. In addition, common diagnoses and disorders corresponding with each stage of development will also be explored, as well as evidence-based interventions for working with each developmental stage (e.g., bibliotherapy, play therapy, music and art as adjunctive tools, behavior interventions, etc.).

Prerequisite: 6 hours of ECD Graduate Courses
Typically offered in Summer only

ECD 561 Strategies for Clinical Assessment in Counseling (3 credit hours)
Exploration of meaning and importance of assessment in the counseling process. The utilization of counseling assessments based on legal and ethical guidelines and cultural considerations. Identify, interpret, and explain assessments in clinical, college, and school counseling settings.

R: Graduate Students Only
Typically offered in Spring and Summer

ECD 562 Techniques in Counseling (4 credit hours)
In this course students work towards mastery of counseling skills, review relevant theories, and prepare for Practicum. Students will practice counseling skills in class and spend their out of class lab hours practicing skills in partnering schools. Students will do some limited video taping of counseling sessions and receive feedback on tapes from Counselor Education doctoral students taking their supervision theory class.

Prerequisite: ECD 530
Typically offered in Fall only

ECD 575/EDP 575 Multicultural Lifespan Development (3 credit hours)
This course surveys theories, principles, and issues of psychological development throughout the lifespan. Emphasis will be placed on understanding current developmental research and its application to the enhancement of development from birth to late adulthood. Implications for helping professionals working in multicultural contexts will be provided.

Prerequisite: Six Hours of Graduate Study
Typically offered in Fall, Spring, and Summer

ECD 590 Special Problems In Guidance (1-6 credit hours)
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

Prerequisite: Six hrs. grad. work in dept.
Typically offered in Fall and Spring

ECD 620 Special Problems In Guidance (1-6 credit hours)
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

Prerequisite: Six hrs. grad. work in dept.
Typically offered in Fall, Spring, and Summer

ECD 642 Practicum In Counseling (3 credit hours)
Student participation in individual and group counseling and consultation experiences under supervision in a school, college or agency setting.
Prerequisite: 1. Completion of all ECD, PSY, and STAT courses with exception of ECD 539 Group Counseling that may be taken concurrently. [Other classes that could be taken concurrently PSY 535,582, 584, 475, 476] 2. Consent of concentration coordin

Prerequisite: ECD 641
Typically offered in Spring only

ECD 651 Internship in School Counseling (6-12 credit hours)
A 600-hour internship for school counselors in training in a school setting under the supervision of qualified professionals. Students perform a variety of activities expected fo school counselors. Weekly meetings with faculty and on-site supervisors.

Prerequisite: ECD 642
Typically offered in Fall and Spring

ECD 652 Internship In College Counseling and Student Development (6-12 credit hours)
A 600-hour internship, Professional experience in student affairs department with on-site supervision from qualified professional. Expectations including employment of broad repertoire of skills in roles of counselor, student development educator and administrator. Weekly student meetings with faculty and on-site supervisors.

Prerequisite: ECD 642
Typically offered in Fall and Spring

ECD 653 Internship In Clinical Mental Health Counseling (6-12 credit hours)
A 600-hour internship for community agency counselors in agency counseling setting under supervision of qualified professional. Employment of broad repertoire of primary and secondary prevention approaches to individual and group techniques, workshop leadership skills, consultation techniques and advocacy methods. Weekly meetings with faculty and on-site supervisors.

Prerequisite: ECD 642
Typically offered in Fall and Spring

ECD 692 Research Projects in Counselor Education (1-3 credit hours)
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 532
Typically offered in Fall, Spring, and Summer

ECD 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECD 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECD 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ECD 699/ECI 699/ELP 699/EMS 699/EOE 699/EAC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECD 731 Career Development Theory and Research (3 credit hours)
Analysis of theory and research in career development and work adjustment as basis for intervention (career counseling, curricular, organizational) as research.

Prerequisite: ECD 524, ELP 532 and PSY 535
Typically offered in Fall and Spring

ECD 732 Advanced Multicultural Counseling (3 credit hours)
Course focuses on the personal and professional development of the students as human beings, global citizens, counselors, and pre-service counselor educators. It is intentionally designed to promote critical self-analysis, cultural understanding, and personal and collective growth and change through honest and respectful discussions, readings, and assignments. The course is grounded in the study of multicultural and counseling theories that emphasize the relevance of social and cultural context and advocacy roles of counselors.

P: ECD 525 or equivalent
Typically offered in Fall only

ECD 735 Counseling Supervision: Theory and Research (3 credit hours)
Examination of conceptual and methodological issues relating to supervision and evaluation of novice counselors. Special emphasis on developmental supervision approaches.

Prerequisite: Doctoral student
Typically offered in Fall only

ECD 736 Advanced Assessment in Counseling (3 credit hours)
Doctoral students will have learning experiences beyond the entry-level master's degree models and methods of assessment. Content focuses on advanced applications of assessment principles in clinical counseling and supervision practice, program evaluation, and outcome and action research studies. Students will demonstrate mastery of foundations of tests and measurement, present advanced assessment content modules during class sessions, and present documented and oral reports on personal quests for advanced knowledge in chosen assessment domains.

Prerequisite: PSY 535 or equivalent
Typically offered in Fall only

ECD 738 Research in Counselor Education (3 credit hours)
Instruction in required skills and knowledge to conduct research in counselor education, including narrative and quantitative integration of research, experimental and quasi-experimental designs, analogue and process research, single subject and descriptive designs, and qualitative research. Preparation of narrative and meta-analytic research review and research proposal with oral presentation.

Prerequisite: Doctoral student : ST 507; PSY 535, Corequisite: ST 508
Typically offered in Spring only

ECD 820 Special Problems In Guidance (1-6 credit hours)
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

Prerequisite: Six hrs. grad. work in dept.
Typically offered in Fall, Spring, and Summer

ECD 843 Advanced Counseling Practicum (4 credit hours)
Participation of doctoral-level students with previous counseling experience in advanced, supervised counseling experience.

Prerequisite: Doctoral student, ECD 642
Typically offered in Fall, Spring, and Summer

ECD 847 Internship in Supervision (4 credit hours)
A supervised internship for doctoral students in assisting with the supervision of first-year students in laboratory and practicum experiences in individual and group counseling and consultation. This is a doctoral-level in-depth internship in the group and individual supervision designed to examine conceptual and methodological issues related to the supervision and evaluation of novice counselors. It is the second part of a two-course sequence devoted to the supervision of counseling. This course has two components: (1) doctoral group supervision sessions, and (2) doctoral individual supervision sessions.

Prerequisite: ECD 735
Typically offered in Spring only

ECD 850 Doctoral Internship (1-9 credit hours)
Utilizing participant-observer role, participation required in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences.

Prerequisite: Nine hrs. in grad. level courses
Typically offered in Fall, Spring, and Summer

ECD 860 Professional Issues In Counseling (1-3 credit hours)
Consideration of contemporary issues, trends and recent research in field of counseling.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

ECD 886 Internship in Teaching in Counselor Education (4 credit hours)
Using the participant-observer role, this course requires participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing counseling and teaching experiences, identifying critical incidents in counseling and teaching, and predicting consequences of counseling and teaching interventions.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECD 892 Doctoral Research Projects (1-3 credit hours)
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Typically offered in Fall, Spring, and Summer

ECD 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECD 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECD 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Crop Science (CS)

CS 101 Field Crop and Turfgrass Management Orientation (1 credit hours)
Introduction to NCSU and the Agricultural Institute with an emphasis on areas related to Field Crops Technology and Turfgrass Management. Students will explore university, college, and departmental resources, academic policies and procedures, career opportunities, and current trends and issues in our related disciplines. Students cannot receive credit for both CS 10 and AGI 10. FCT or TGM only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

CS 111 Field Crop Production (4 credit hours)
Management of field crops, including growth and development, establishment, pest management, environmental considerations, rotations of crops and chemicals, harvesting, storage and marketing. SPEARS

Requisite: Agricultural Institute Only
Typically offered in Fall and Spring

CS 116 Agronomic Crops - Cotton, Peanuts, and Tobacco (3 credit hours)
Fundamental agronomic practices associated with the production of cotton, peanuts, and tobacco. Discussions will include crop growth and development stages, how to choose the best varieties and hybrids, planting strategies, fertility and pest management programs, harvest and storage options, and the use of technologies associated with the production and maintenance of a quality commodity.

Restriction: AGI Only
Typically offered in Fall and Spring

CS 118 Agronomic Crops - Corn, Small Grains and Soybeans (3 credit hours)
Fundamental agronomic practices associated with the production of corn, small grains and soybean. Discussions will include crop growth and development stages, how to choose the best varieties and hybrids, planting strategies, fertility and pest management programs, harvest and storage options, and the use of technologies associated with the production and maintenance of a quality commodity.

Restriction: AGI Only
Typically offered in Fall and Spring

CS 121 Turfgrasses and Their Uses (3 credit hours)
An introduction to turfgrass species and their uses. Emphasis on: size and scope of the turfgrass industry, basic concepts of grass growth and development, characteristics of cool- and warm-season turfgrasses and their use for golf courses, lawns, athletic fields, and other applications. Techniques for successful establishment and maintenance of turfgrass areas.

Requisite: Agricultural Institute Only
Typically offered in Fall only

CS 122 Principles of Turfgrass Management (3 credit hours)
An examination of cultural practices essential for management of high quality turfgrass areas. Topics include: function of plant nutrients, fertilizer characteristics and application techniques, irrigation programming, construction of high use turfgrass areas, calibration of spreaders and sprayers, aerification, pesticide fate and developing effective management systems. ERICKSON

Requisite: Agricultural Institute Only
Typically offered in Spring only

CS 151 Forage Production (3 credit hours)
Characteristics of major forage crops and their response to agronomic and animal management factors. Utilization methods, growth and quality characteristics related to animal performance. GREEN

Requisite: Agricultural Institute Only
Typically offered in Fall only

CS 152 Weed Control in Field Crops (3 credit hours)
Principles involved in development of weed control programs and practical application of weed management techniques for major North Carolina cropping systems. Emphasis on proper use of herbicides. Laboratory includes weed identification and herbicide application methods. JORDAN

Requisite: Agricultural Institute Only
Typically offered in Fall only

CS 154/PP 154 Turf Weed and Disease Management (3 credit hours)
General principles in turfgrass weed and disease development and management programs. Different weeds, their life cycles, management techniques, and factors affecting herbicide application performance will be covered. Students will learn the causes, development, identification and management of turfgrass diseases. Laboratory includes weed identification and herbicide application methods. Certain laboratory exercises will require personal transportation to Lake Wheeler Road Turf Field Lab unless otherwise specified by the lab instructors. The course is restricted to AGI students only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

CS 155 Advanced Turf Management (3 credit hours)
Turfgrass management covering mineral nutrition, water relations, environmental stress responses and management regimes for low maintenance turf, golf courses, athletic fields and other turf settings.

Requisite: Agricultural Institute Only; Prerequisite: CS 121 and CS 122
Typically offered in Fall only

CS 190 Turf Seminar (1 credit hours)
Discussions of the operations, opportunities, and problems existing in various phases of the turf industry by leaders in the various facets of the industry.

Requisite: Agricultural Institute Only
Typically offered in Spring only

CS 191 Field Crops Seminar (2 credit hours)
Guest speakers, students presentations, and outside assignments will address professionalism; professional development; and current challenges, issues, and opportunities facing profitable and sustainable agronomic crop production. A grade of C or better is required. FCT Only.

Requisite: Agricultural Institute Only
Typically offered in Spring only

CS 200 Introduction to Turfgrass Management (4 credit hours)
Turfgrass selection, establishment, maintenance, and pest management in lawns, golf courses, athletic fields, and roadside care; Emphasis on understanding the impact of the environment on management practices and turfgrass performance. Field trips in laboratory.

Prerequisite: BIO 181(preferred) or ZO 160(alternate) BO 200, or CS 213
Typically offered in Fall only

CS 210 Lawns and Sports Turf (3 credit hours)
Utilization of turfgrasses for lawns and recreational areas. Emphasis on: the cultural and environmental benefits of grassed areas, concepts of grass growth and development, selecting adapted grasses for proper use, techniques for successful establishment and management of cool-and-warm-season turfgrasses, fertilization, irrigation, aeration, and pest management. The history and benefit of natural and artificial sports fields will also be discussed. Credit will not be awarded for both CS 200 and CS 210.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CS 211 Plant Genetics (3 credit hours)
Fundaments of plant genetics. Genetic basis for plant improvement. Genetic analysis of Mendelian traits, molecular structure and organization of genetic material, crop biotechnology, distribution and behavior of genes in populations.

Prerequisite: BIO 183 or ZO 160
Typically offered in Spring only

CS 213 Crop Science (3 credit hours)
Our basic premise is that to produce field crops successfully we must know how our crops grow and develop and what they require from the production environment - including the farmer - for satisfactory management of the relevant environment, and finally to successful yield and quality of commercially important product. Especially important is to understand the various ways in which producers must respond to ever-changing circumstances on the farm, at the bank (credit), and in the marketplace. A solid understanding of the impact of cropping history on the soil and entire ecosystem to be used for the next crop also is vitally important.

Prerequisite: BIO 181 or BIO 183 or PB 200 or PB 250
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

CS 214 Crop Science Laboratory (1 credit hours)
The laboratory's intent is to provide students enrolled in the CS 213 lecture course opportunity to apply under field and controlled environmental conditions the crop production principles introduced in the lecture course. Using a hands-on approach targeting a variety of crop management approaches, students will examine the growth and development characteristics that relate most directly to final yield and quality of the marketed product. Students will employ a spectrum of treatment combinations aimed at strengthening understanding of the interaction of genotype, environment, and management, with the goal of identifying influential factors of crop yield and quality.

Prerequisite: BIO 181 or BIO 183 or PB 200 or PB 250; Co-requisite: CS 213
Typically offered in Fall and Spring

CS 216 Southern Row Crop Production - Cotton, Peanuts, and Tobacco (3 credit hours)
Crop production systems comprised of cotton, peanuts, and tobacco are unique to the southern United States, and management practices tailored to a successful harvest are vastly different than those employed in the production of grain crops. CS 216 will introduce students to these production standards and provide a basic foundation for the principles of cotton, peanut, and tobacco management. At the conclusion of the course students will be able to describe growth/development patterns, tillage systems, scouting techniques, proper seed/variety selection and planting populations, provide recommendations for pest management, employ Integrated Pest Management strategies, describe harvesting practices, and give marketing approaches for each crop.

Typically offered in Fall and Spring

CS 218 Southern Row Crop Production - Corn, Small Grains and Soybeans (3 credit hours)
Fundamental agronomic practices associated with the production of corn, small grains and soybean. Discussions will include crop growth and development stages, how to choose the best varieties and hybrids, planting strategies, fertility and pest management programs, harvest and storage options, and the use of technologies associated with the production and maintenance of quality commodity.

Typically offered in Fall and Spring

CS 224 Seeds, Biotechnology and Societies (3 credit hours)
An exploration of seeds, how seeds are the delivery system for crop biotechnology and how a specific culture's perception of science and agriculture influence the acceptance or rejections of modern genetic technologies. Topics include seed germination, survival and preservation; seed industry influence on societies and how societies are influencing the seed industry; seed production - commercially and at home; how our diverse genetic resources are preserved; how biotechnology is applied to agriculture and delivered through seeds; the impact biotech is having on the seed industry and subsequently on us and global agriculture; concerns and potential benefits of biotechnology application to crops.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

CS 230 Introduction to Agroecology (3 credit hours)
This course will examine the biological and physical attributes of farming systems and their associated ecological and social impacts in temperate and tropical regions. It will address the ecological consequences of indigenous food and fiber production systems, conventional agricultural systems and "alternative" systems that incorporate biological pest control and natural nutrient inputs. Students will examine several case studies that integrate their understanding of concepts.

Prerequisite: BIO 105 or BIO 181 or BIO/ZO 160 or BO 200 or BO 250 or HS 201 or CS 213
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

CS 251 Production of Forage Crops (3 credit hours)
Basic principles and practices of production and utilization of pasture and forage crops; impact on developing sustainable systems for livestock feed, soil and water conservation; use of computers to assist in whole farm planning and information retrieval.

Prerequisite: CS 213 and SSC 200
Typically offered in Spring only

CS 400 Turf Cultural Systems (3 credit hours)
Topics include: golf course design considerations, fertilizer characteristics and application techniques, irrigation programming, construction of high use turfgrass areas, calibration of spreaders and sprayers, aerification, pesticide fate and development of effective management systems.

Prerequisite: C- or better in CS 200
Typically offered in Spring only

CS 410/HS 410 Community Food Systems (3 credit hours)
This course explores the economic, socio-cultural, policy and health perspectives of community food systems using a multidisciplinary and systems-level framework. Students will use a systems framework to critically examine local and global food challenges related to food insecurity, food justice and food sovereignty, food waste and sustainable approaches to addressing food challenges. Novel aspects of this course include student experiential learning opportunities that include service learning with community partners addressing local food challenges, team building through group work and in-class discussion and development of personal food ethic provocative proposition.

Prerequisite:Junior or senior standing
Typically offered in Fall only

CS 411 Crop Ecology (3 credit hours)
Ecology and production of major agronomic crops of economic importance. Impact of key environmental stress factors on production processes and management strategies. Environmental issues pertaining to sustainable cropping systems. Manipulation of canopy climate and rooting environment for enhanced crop performance in the context of global climate change. Ecological analysis of abiotic - and biotic-derived crop disorders.

Prerequisite: PB 321 or PB 421
Typically offered in Fall only

CS 413 Plant Breeding (3 credit hours)
Focuses on principles of cultivar development for a diversity of plant species using conventional breeding and selection methodologies, DNA markers, de novo genetic variation, and biotechnological approaches.

Prerequisite: CS 211 or GN 311
Typically offered in Spring only

CS 414 Weed Science (4 credit hours)
History, current status and fundamentals of weed biology and cultural, biological, and chemical weed control; properties and uses of herbicides; weed identification; proper use of herbicide application equipment; current weed management practices incrops and non-cropland situations.

Typically offered in Fall only

CS 415 Integrated Pest Management (3 credit hours)
History, principles, and application of techniques for managing plant pests. Theory and practice of integrating pest control tactics to manage pests within economic, environmental, and sociological constraints. Topics include pest monitoring methodology, economic aesthetic thresholds, biological control, efficient pesticide use, biotechnology, and global positioning systems.

Prerequisite: BIO 181(preferred) or ZO 160(alternate) or BO 200 or BO 250
Typically offered in Spring only

CS 418/CS 518 Introduction to Regulatory Science in Agriculture (3 credit hours)
This course covers laws, regulations and agencies involved in the registration of conventional, biotechnology and biological crops, crop protectants and growth regulators. US and International laws and regulations will be discussed from technical proof of concept through commercial release.

Typically offered in Fall only

CS 424/CS 524 Seed Physiology (3 credit hours)
This course will explore the physiological processes associated with seed formation, development, maturation, germination, and deterioration of agronomic and horticultural species. We will also study the physiological aspects of seed dormancy, how dormancy is manifested and overcome in cultivated and noncultivated systems and dormancy's impact on weed seedbank ecology.

Prerequisite: PB 321 or PB 421 or FOR 303
Typically offered in Fall only

CS 428/CS 528 Advanced Regulatory Science in Agriculture (3 credit hours)
This course goes into additional depth and provides hands-on exercises concerning agriculture regulatory topics covered in CS 418/518. The course will introduce laws, regulations and agencies involved in the fertilizer, animal and waste management as well as the role of public policy in the regulatory process. CS 418/518 is a prerequisite for this class.

Prerequisite: CS 418
Typically offered in Spring only

CS 430/CS 530 Advanced Agroecology (4 credit hours)
This course applies agroecological principles and critical thinking to evaluate various agroecosystems. Students will examine food, fiber, and other commodity production systems for security, productivity, and sustainability and address the simultaneous need to protect natural environments and the biodiversity on which agroecosystems depend. Topics include discussion of national and international government policies, research programs, and education programs that influence the future application of agroecosystem principles.

P: CS 230
Typically offered in Spring only

CS 465/CS 565 Turf Management Systems and Environmental Quality (3 credit hours)
Integration of turfgrass management systems and the use of BMPs and IPM to protect environmental quality. Examination of water quality issues relative to turf. Application of Best Management Practice and Integrated Pest Management strategies. Credit cannot be received for both CS 465 and CS 565. Senior standing.

Prerequisite: CS 400 and Senior standing
Typically offered in Fall only

CS 470/ENT 470/PP 470 Advanced Turfgrass Pest Management (2 credit hours)
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pestmanagement programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

Prerequisite: C- or better in CS 200
Typically offered in Spring only

CS 480/HS 480 Sustainable Food Production (capstone) (1 credit hours)
This course introduces students to the process of developing a project for presentation in the area of sustainable food production and food systems. Students are to synthesize and integrate knowledge acquired in previous course work and other learning experiences and to apply theory and principles in a situation that approximates some aspect of professional practice. Students are expected to present their projects at the end of the semester in a PowerPoint style format to faculty and student peers.

Prerequisites: Senior standing and CS 430
Typically offered in Fall and Spring

CS 502/HS 502/PP 502 Plant Disease: Methods & Diagnosis (2 credit hours)
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips arerequired.

Prerequisite: PP 315
Typically offered in Fall only

CS 518/CS 418 Introduction to Regulatory Science in Agriculture (3 credit hours)
This course covers laws, regulations and agencies involved in the registration of conventional, biotechnology and biological crops, crop protectants and growth regulators. US and International laws and regulations will be discussed from technical proof of concept through commercial release.

Typically offered in Fall only

CS 524/CS 424 Seed Physiology (3 credit hours)
This course will explore the physiological processes associated with seed formation, development, maturation, germination, and deterioration of agronomic and horticultural species. We will also study the physiological aspects of seed dormancy, how dormancy is manifested and overcome in cultivated and noncultivated systems and dormancy's impact on weed seedbank ecology.

Prerequisite: PB 321 or PB 421 or FOR 303
Typically offered in Fall only

CS 528/CS 428 Advanced Regulatory Science in Agriculture (3 credit hours)
This course goes into additional depth and provides hands-on exercises concerning agriculture regulatory topics covered in CS 418/518. The course will introduce laws, regulations and agencies involved in the fertilizer, animal and waste management as well as the role of public policy in the regulatory process. CS 418/518 is a prerequisite for this class.

Prerequisite: CS 418
Typically offered in Spring only

CS 530/CS 430 Advanced Agroecology (4 credit hours)
This course applies agroecological principles and critical thinking to evaluate various agroecosystems. Students will examine food, fiber, and other commodity production systems for security, productivity, and sustainability and address the simultaneous need to protect natural environments and the biodiversity on which agroecosystems depend. Topics include discussion of national and international government policies, research programs, and education programs that influence the future application of agroecosystem principles.

P: CS 230
Typically offered in Spring only

CS 535/SSC 535 Root and Rhizosphere Processes for Plant Nutrition (3 credit hours)
The focus of this course is on the understanding of concepts and principles of plant hydro-mineral acquisition, plant adaptation to nutrient deficiencies, water and nutrient cycles in the soil, and the impact that microbial communities have on these processes. Understanding below ground biological networks and their complexity is crucial for understanding soil fertility and improving the acquisition of nutrients in natural and agroecosystems.

Prerequisite: SSC 200 or PB 321, or consent of instructor
Typically offered in Fall only

CS 541/HS 541 Plant Breeding Methods (3 credit hours)
Overview of plant breeding methods for advanced undergraduate and beginning graduate students. Covers principles and concepts of inheritance, germplasm resources, pollen control, measurement of genetic variances, and heterosis. Special topics include heritability, genotype-environment interaction, disease resistance, and polyploidy. In-depth coverage on methods for breeding cross-pollinated and self-pollinated crops. Prepares students for advanced plant breeding courses.

Prerequisite: ST 511, Corequisite: ST 512
Typically offered in Fall only

CS 565/CS 465 Turf Management Systems and Environmental Quality (3 credit hours)
Integration of turfgrass management systems and the use of BMPs and IPM to protect environmental quality. Examination of water quality issues relative to turf. Application of Best Management Practice and Integrated Pest Management strategies. Credit cannot be received for both CS 465 and CS 565. Senior standing.

Prerequisite: CS 400 and Senior standing
Typically offered in Fall only

CS 590 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in crop science and related fields.

CS 591 Special Problems (1-6 credit hours)
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

CS 601 Seminar (1 credit hours)
Review and discussion of scientific articles, progress reports in research and special problems of interest to agronomists. Maximum of two credits allowed toward master's degree; however, additional credits toward doctorate allowed.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

CS 620 Special Problems (1-6 credit hours)
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

Typically offered in Fall, Spring, and Summer

CS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

CS 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

CS 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

CS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring only

CS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CS 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

CS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

CS 701 Breeding for Insect Resistance and Abiotic Stress (2 credit hours)
This course will cover the basic principles of breeding for insect resistance and abiotic stress. Topics include plant defenses, interactions between pest or stress and plant and environment, types of resistance, methods of breeding and screening.

Prerequisite: CS 413, CS 541, or GN 311; Students who believe to have acquired a similar background through different courses should contact the instructor or the director of the program.
Typically offered in Fall only

CS 714 Crop Physiology: Plant Response to Environment (3 credit hours)
Examines interactions between plants and the environment. Light environment, plant canopy development, photosynthesis, source-sink relations, growth analysis, growth regulation, water relations, and environmental stresses are addressed.

Prerequisite: (PB 321 or PB 421) and CH 223 or CH 227
Typically offered in Fall only

CS 716/HS 716 Weed Biology (3 credit hours)
This course analyzes the interactions between human disturbance and dynamics of weed populations and communities. Emphasis is given to factors that drive weed control actions and the ecological and evolutionary processes by which weeds survive and adapt to these actions. Similarities and differences between weeds and invasive plant species are discussed as well as benefits and limitations of using traditional ecological theory from natural systems to explain weed behavior in highly disturbed environments.

Prerequisite: CS 414
Typically offered in Spring only

CS 717/HS 717 Weed Management Systems (1 credit hours)
Weed management systems including integration of cultural, biological, mechanical and chemical methods for vegetables, fruits, ornamentals, turf, small grains, corn, tobacco, cotton, peanuts, aquatic and non-cropland settings. Taught second 5 weeksof semester. Drop date is by last day of 3rd week of minicourse.

Prerequisite: CS 414
Typically offered in Fall only

CS 720/GN 720/HS 720 Molecular Biology In Plant Breeding (3 credit hours)
Theory and principles of molecular biology applied to plant breeding. Understanding of the relationship between genes and crop traits. Principles and molecular mechanisms of crop traits, and their applications to solve breeding problems and improve crop traits, which include heterosis, male/female sterility, self-incompatibility, polyploidy, double haploid, protoplast fusion, random mutagenesis, plant regeneration, transgenic breeding, advanced genome editing for breeding, gene silencing, gene activation, gene drive, plant synthetic biology, metabolic engineering, epigenetics for trait improvement, gene stacking, decoy and R genes, and bioconfinement.

P: CS 211 or GN 311 or equivalent, and PB 421 or equivalent.
Typically offered in Spring only

CS 725/HS 725/SSC 725/TOX 725 Pesticide Chemistry (1 credit hours)
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taughtduring the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225)
Typically offered in Fall only

CS 726/ANS 726/FOR 726 Advanced Topics In Quantitative Genetics and Breeding (3 credit hours)
Advanced topics in quantitative genetics pertinent to population improvement for quantitative and categorical traits with special applications to plant and animal breeding. DNA markers - phenotype associations. The theory and application of linear mixed models, BLUP and genomic selection using maximum likelihood and Bayesian approaches. Pedigree and construction of genomic relationships matrices from DNA markers and application in breeding.

Prerequisite: ST 511, Corequisite: ST 512
Typically offered in Fall only

CS 727/HS 727/SSC 727/TOX 727 Pesticide Behavior and Fate In the Environment (2 credit hours)
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: CS(HS,SSC,TOX) 725,SSC 200
Typically offered in Fall only

CS 729/HS 729 Herbicide Behavior In Plants (2 credit hours)
Chemical, physiological and biochemical actions of herbicides in plants including uptake, translocation, metabolism and mechanism of action.

Prerequisite: BO 751 and BO 752 and CS(HS,SSC) 725
Typically offered in Spring only

CS 745/GN 745/HS 745 Quantitative Genetics In Plant Breeding (1 credit hours)
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

Prerequisite: CS(GN, HS) 541, ST 712, course in quantitative genetics recommended
Typically offered in Spring only

CS 746/GN 746/HS 746 Cytogenetics in Plant Breeding (2 credit hours)
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

Typically offered in Spring only

CS 755 Applied Research Methods and Analysis for Plant Sciences (3 credit hours)
Students will gain understanding of the common principles of scientific method. They will gain knowledge and experience with planning for research, developing research objectives, methodology considerations, experimental design, statistical analyses, and presentation of data. Class will have a heavy focus on experimental methods in applied plant science research.

Prerequisite: ST 511
Typically offered in Fall only

CS 795 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in crop science and related fields.

CS 801 Seminar (1 credit hours)
Review and discussion of scientific articles, progress reports in research and special problems of interest to agronomists. Maximum of two credits allowed toward master's degree; however, additional credits toward doctorate allowed.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

CS 820 Special Problems (1-6 credit hours)
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

Typically offered in Fall, Spring, and Summer

CS 860/GN 860/HS 860 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Spring only

CS 861/GN 861/HS 861 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Fall only

CS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

CS 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Spring and Summer

CS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Spring only

CS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

CS 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

CS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Curriculum and Instruction (ECI)

ECI 201 Intro to Instructional Technology for Educators (3 credit hours)
Introduction to effective technology integration in teaching practices across the curriculum for pre-service teachers. Exploration of different technology-based tools commonly integrated in instruction, including desktop, Internet/ Web-based, mobile, and cloud applications. Examination of integration challenges using relevant, real-world examples from current teacher practices. Planning for student-centered, project-based lessons that make use of diverse technologies.

Typically offered in Fall and Spring

ECI 204 Intro to Teaching (1-2 credit hours)
For prospective teachers in Middle and Secondary Business and Marketing, English, Foreign Languages, Language Arts, and Social Studies. Emphasis on what it means to be an educator as well as differing aspects and procedures of instruction and analysis of competencies required of teachers. The course has a required fieldwork component in local K-12 school, and students are responsible for their own transportation to and from the schools. students are required to puchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

Prerequisite: Sophomore standing; Corequisite: ED 204
Typically offered in Fall and Spring

ECI 205 Introduction to Teaching Humanities and Social Sciences (3 credit hours)
For prospective teachers in secondary and middle years social studies, English, language arts, and foreign languages. An emphasis on differing aspects and procedures of instruction and analysis of competencies required of teachers. Field work in avariety of education settings including an extended period in one curriculum area.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

ECI 296/ED 296 Special Topics in Education (1-3 credit hours)
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

Typically offered in Fall and Spring

ECI 305 Equity and Education (3 credit hours)
This course examines the intersection of diversity, inclusivity, equity, and P-16 education; specifically by considering multiple identity markers such as: gender, sexuality, race, socioeconomic status, ability, and all aspects of culture. This interdisciplinary course uses a sociological lens to examine educational materials, research studies, memoirs, and media to explore the following essential questions: In what ways do students' cultural identities impact their experiences in schools?; How are social inequalities perpetuated by and within the educational system?; What types of individual and systemic practices can help disrupt the marginalization of students in P-16 schools? How can schools celebrate and sustain students' cultural identities?

Prerequisite: ED 204 or AEE 206 or ELM 250 or Junior Status
GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall and Spring

ECI 306 Middle Years Reading (3 credit hours)
Reading skills in middle years education developed with emphasis on application of the reading process to content area.

Prerequisite: Six hours in ED or PSY
Typically offered in Spring only

ECI 307 Teaching Writing Across the Curriculum (3 credit hours)
For prospective teachers of all disciplines in middle/high school. Practical strategies for writing as a learning tool and for teaching writing. Lesson plans, assignments, experiences appropriate to content areas. Focus on writing, writing instruction, and technology. Separate sections for Middle Grades (MSL) and English (LTN) majors.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ECI 309 Teaching in the Middle Years (3 credit hours)
Nature and purposes of middle grades education. Early adolescent development, curriculum, teaching/learning methods, school organization, and characteristics of effective middle years teachers. Includes field experience.

Prerequisite: Six hours in ED or PSY
Typically offered in Fall and Spring

ECI 332 Health Promotion and Disease Prevention (3 credit hours)
Emphasis on education of the public regarding general health concerns including cancer, cardiovascular disease, accident prevention, nutrition, drugs, alcohol, mental health, sexuality, and environmental hazards.

Prerequisite: For credentialed health professionals only
Typically offered in Spring only

ECI 333 Health Care Delivery (3 credit hours)
The historical basis of health care delivery in the U. S. with emphasis on hospitals, health maintenance organizations, ambulatory care centers, ambulatory surgery, nursing homes, and private care practice. Philosophical issues of funding health care, promoting health care, and the training of health care workers.

ECI 335 Planning Classroom and Clinical Curricula (3 credit hours)
Procedures for planning health occupations curricula for classroom and clinical settings. Practice in writing, updating, and refining health curriculum with emphasis on selection and sequencing. Comparison of styles of writing curricula. Roles and responsibilities of healthy curriculum planner.

Prerequisite: For Certification Majors: EOE 101, 205 ; For Non-Certification Majors: EOE 101. For credentialed health professionals

ECI 336 Strategies for Teaching a Health Occupations Course (3 credit hours)
Planning and implementation of effective instructional strategies for clinical and classroom settings. The nature of the teaching/learning process, psychological and philosophical aspects of teacher choice of various strategies.

Prerequisite: For credentialed health professionals
Typically offered in Spring only

ECI 405/ENG 405 Literature for Adolescents (3 credit hours)
The history, types, and characteristics of literature for adolescents. Emphasizes reading and analyzing the literature by exploring the themes, literary elements, and rationale for teaching literature for adolescents. Addresses ways in which this literature can be integrated and implemented in English/Language Arts curriculum.

Prerequisite: Junior standing.
Typically offered in Fall only

ECI 414 Human Relations and Discipline in the Classroom (3 credit hours)
Designed to help prospective teachers foster positive interpersonal relationships in classrooms, build a sense of community and create a purposive environment for learning. Investigates issues such as group building, active listening, and major approaches to discipline. Uses case studies and problem solving methods.

Prerequisite: PSY 304 or EDP 304 and 6 hours of education

ECI 416 Teaching Exceptional Students in the Mainstreamed Classroom (3 credit hours)
Provides classroom teachers in all disciplines and grade levels with a knowledge of various handicapping conditions, as well as with techniques to assist exceptional students within the mainstreamed classroom. Required for MSL majors.

Prerequisite: Six hours in ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 423 Methods for Teaching Modern Foreign Languages K-12 (5 credit hours)
Methodology and pedagogy of teaching Foreign Languages grades K-12 with an emphasis on lesson and unit planning, second language acquisition, diversity, national and state standards, materials, assessment, proficiency oriented teaching, and demonstrations/practice teaching in micro-lessons. This course provides opportunities for prospective Foreign Language teachers to integrate knowledge of their language with effective materials, strategies, and methods of instruction to prepare students for K-12 Foreign Language teaching. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools.

Restriction: Open to FLL Education majors or by permission
Typically offered in Fall only

ECI 424 Student Teaching in Modern Foreign Languages (12 credit hours)
Teaching experience for prospective teachers of Modern Foreign Languages in a selected elementary, middle or high school under the supervision of a cooperating teacher and a university faculty supervisor. Additional school observations and on campus seminars are a part of this course. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are covered under the General Statute affording liability protection.

Prerequisite: Admission to Professional semester, ECI 423
Typically offered in Spring only

ECI 427/ECI 527/FL 527/FL 427 Methods and Materials in Teaching English as a Second Language (3 credit hours)
Methodologies and current approaches to teaching English as a Second Language. Techniques and strategies for teaching reading, writing, listening, speaking and culture. Selection, adaptation, and creation of instructional materials for various levels of proficiency and teaching situations. Evaluation and assessment of written and oral language proficiency through standardized and non-standardized assessment tools. Students cannot receive credit for both FL/ECI 427 and FL/ECI 527.

Typically offered in Fall and Spring

ECI 430 Methods and Materials for Teaching Language Arts in the Middle Grades (4 credit hours)
Inquiry, activity-oriented course provides opportunities for prospective language arts middle school teachers to integrate knowledge of English with effective materials, strategies, methods of instruction. Students observe middle school classes, plan lessons, and units, practice varied classroom strategies, technologies in micro-lessons. Prepared students for teaching language arts with other content areas in middle schools.

Prerequisite: ECI 205,ELP 344,PSY 304 or EDP 304,ECI 309, ECI 306, ECI 307, Senior standing, candidacy in Middle Grades Teacher Education, Corequisite: ECI 435
Typically offered in Fall only

ECI 435 Methods and Materials for Teaching Social Studies in the Middle Grades (4 credit hours)
For preservice middle school social studies teachers. Focus on: teaching and evaluation skills, adaptation of instruction to individual learner differences, identification and creation of instructional materials appropriate for use in social studies teaching.

Prerequisite: Admission to professional semester
Typically offered in Fall only

ECI 436/FL 536/ECI 536/FL 436 Perspectives on English as a New Language (3 credit hours)
Examination of the complexity of multiculturalism in American society and the challenges faced by immigrant families in adapting to U.S. institutions. Emphasis on understanding historical, legal, cultural and pedagogical issues with respect to learning English as a new language [ENL]. No credit given for both FL/ECI 436 and FL/ECI 536.

GEP U.S. Diversity
Typically offered in Fall and Spring

ECI 438 Medical Law and Ethics (3 credit hours)
Ethical and legal issues involved in delivering health care, such as euthanasia, reproductive technology, organ transplants, patients' rights, and confidentiality. Classical ethical theories and principles. Systematic review procedures and currentmedical law used to examine current case dilemmas in the health professions.

Typically offered in Fall only

ECI 442 Field Experience in Business and Marketing Education (3 credit hours)
Supervised off-campus work experience in an approved business and marketing content related job. The work experience relates on-the-job experiences to the technical competencies taught in the North Carolina Standard Course of Study for business and marketing education. Students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

Prerequisite: Junior standing
Typically offered in Fall and Summer

ECI 444 Administration of Business and Marketing Education (3 credit hours)
Development of successful business and information technology, and marketing education programs. Program promotion, managing cooperative education experiences, managing DECA and FBLA chapters, and determining professional development strategies. Primary roles of the business and information technology and marketing education teachers' classroom instruction. Program management, classroom management, management of career-technical student organizations, cooperative education, and program development.

Prerequisite: ED 204 and ECI 204 and MKE Business and Marketing Education Major
Typically offered in Fall only

ECI 445 New Literacies, Emerging Technologies, and Electronic Portfolios (2 credit hours)
Inquiry, activity-oriented course designed to engage students in theory and practice related to 21st century skills, new literacies, and emerging technologies, as well as focused support for developing the culminating electronic portfolio. Course provides opportunity for pre-service, English Language Arts/ Social Studies middle School teachers to integrate knowledge of English and Social Studies with emerging technologies and digital literacy applications.

Prerequisite: Senior Standing; Corequisite: ECI 430 and ECI 435
Typically offered in Fall only

ECI 446 Curriculum and Methods of Teaching Business and Marketing Education (4 credit hours)
Study of the curriculum common to business and information technology and marketing education and the research behind its development. Methods common to instructional planning, implementation, and evaluation of effective business and information technology and marketing education programs are topics included in this course. Twenty hours of field work are required. Student are expected to provide their own transportation to and from assigned public schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details in acquiring the insurance and the current charge. MKE students only.

Prerequisite: Admission to Teacher Education Candidacy ; MKE Business and Marketing Education Majors
Typically offered in Fall only

ECI 447 Student Teaching in Business and Marketing Education (9 credit hours)
Fifteen weeks full-time student teaching business and marketing subjects in the public schools under the supervision of a cooperating teacher and university supervisor. Students will develop skills in instruction, evaluation, advisement, administration, and observation. Students are expected to provide their own transportation to and from assigned public schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. MKE students only.

Prerequisite: Admission to Professional Semester ; MKE Business and Marketing Education Majors, Corequisite: ECI 494
Typically offered in Spring only

ECI 448/ECI 548 E-Business Applications in Business and Marketing Education (3 credit hours)
Emphasis on design and construction of advanced web pages, business and marketing applications of electronic commerce, as well as economic, social, legal, and ethical issues that are related to conducting business in a virtual environment. Content prepares students to apply principles to the business and marketing education curriculum in the public schools. Credit for both ECI 448 and ECI 548 is not allowed.

Typically offered in Fall only

ECI 449 MSL Senior Student Teaching Seminar (2 credit hours)
ECI 449 is the senior seminar held in conjunction with MSL Student Teaching Internship experiences, ECI 454 and ECI 464, which provide the prospective teacher with experience in the techniques and skills involved in teaching middle grades English Language Arts and/or Social Studies, including 16 weeks in a selected off-campus placement. Student teachers become familiar with the total school program and participate in selected school and community activities while meeting internship and program requirements. The seminar provides an opportunity for students to process and analyze the internship experience with the support of their cohort, university supervisor, instructor, and local school personnel with expertise in middle grades teaching and related topics.

C: Seminar is for MSL senior student teachers enrolled in ECI 454 and ECI 464.
Typically offered in Spring only

ECI 450 Methods and Materials in Teaching English (4 credit hours)
Methods and materials of teaching English in grades 9-12, with an emphasis on lesson planning and demonstrations/practice in teaching literature, study skills, speaking, listening, and writing. Taught during the first seven weeks of the semester.

Prerequisite: ECI 204, ELP 344, PSY 304 or EDP 304; Senior standing and admission to Teacher Education candidacy with a Major in English
Typically offered in Spring only

ECI 451 Teaching Reading Across Disciplines (3 credit hours)
Facilitates study of methods and materials for teaching literacy across disciplines. Develops instructional strategies in the use of print and digital texts and media to support disciplinary learning.

Prerequisite: Six hours in ED or PSY
Typically offered in Fall and Spring

ECI 454 Student Teaching in English/Language Arts (1-12 credit hours)
Provides the prospective teacher with experience in the techniques and skills involved in teaching English in secondary schools or Language Arts in middle schools in a selected off-campus station. Student interns become familiar with the total school program, eventually carrying a full teaching load, and participate in relevant school and community activities. Students are required to provide their own transportation. TED and MSL majors only.

Prerequisite: For TED & MSL students: Admission to Student Teaching Professional Semester; Also for MSL students: ECI 430, ECI 416; Co-requisite: TED students: ECI 450; MSL students: ECI 464 and ECI 449
Typically offered in Spring only

ECI 460 Methods and Materials in Teaching Secondary Social Studies (4 credit hours)
Teaching techniques, innovations, and development of teaching and evaluation skills in the area of secondary school social studies. Adaptation of instruction to individual learner differences, and selection and design of instructional materials. Taught during the first six weeks of the semester. Taught during the first six weeks of the semester.

Prerequisite: ECI 205, ELP 344, Sr. standing and admission to professional semester with a major in either history, sociology, political science
Typically offered in Fall only

ECI 464 Student Teaching in Social Studies (5 credit hours)
Skills and techniques in teaching social studies in secondary and middle schools. Each student spends sixteen weeks in a selected off-campus center. The student demonstrates competencies essential for teaching social studies, becomes familiar with the total school program, and participates in a variety of school and community activities.

Prerequisite: Admission to professional semester, Corequisite: For LTH, LTP, LTS students: ECI 460. For MSL students: ECI 454, ECI 449
Typically offered in Spring only

ECI 471 Educational Implications of Learning and Developmental Theory (3 credit hours)
Topics related to human psychological development. Cognitive, social, physical changes, and their interaction among adolescence. Departmental Approval Required.

Prerequisite: NC TEACH Participants
Typically offered in Spring and Summer

ECI 472 Interaction of Classroom Management and Instruction (3 credit hours)
Topics related to teaching in the content area and classroom management. Lesson planning, principles applied to education, measurement and evaluation procedures, behavior therapy, and student motivation. Departmental Approval Required.

Prerequisite: ECI 471 ; NC TEACH Participants
Typically offered in Spring and Summer

ECI 473 Subject Specific Methods (3 credit hours)
Topics related to cultural factors and how they affect teachers and students in the classroom. Instructional techniques and the development of instructional plans that enhance schooling experiences of culturally diverse students. Departmental Approval Required.

Prerequisite: ECI 472 ; NC TEACH Participants, Corequisite: ECI 474
Typically offered in Fall only

ECI 474 Curriculum and Instruction Practices 1 (3 credit hours)
Topics related to essential skills and concepts needed by beginning teachers. The class focuses on questioning, test preparation, discussion skills, familiarity with national standards, multiple teaching strategies, and assessment + evaluation of students. Departmental Approval Required.

Prerequisite: ECI 472 ; NC TEACH participants, Corequisite: ECI 473
Typically offered in Fall only

ECI 475 Peer Mentoring in Alternative Licensure (3 credit hours)
Topics related to observing and evaluating fellow teachers in relation to the national state teaching competencies. Classroom observations, videotaping, and group evaluations that are shared and discussed with fellow teachers. Departmental Approval Required.

Prerequisite: ECI 474 ; NC TEACH Participants, Corequisite: ECI 476
Typically offered in Spring only

ECI 476 Curriculum and Instruction Practices 2 (3 credit hours)
Topics related to inquiry, activity based instruction, and constructivist principles. Analysis of principles, strategies and application of new teaching approaches. Departmental Approval Required.

Prerequisite: ECE 474 ; NC TEACH Participants, Corequisite: ECI 475
Typically offered in Spring only

ECI 494 Senior Seminar in Business and Marketing Education (3 credit hours)
Discussion and analysis of problems, trends, and issues experienced while student teaching in the public schools.

Prerequisite: Admission to Professional Semester ; MKE Business and Marketing Education Majors, Corequisite: ECI 447
Typically offered in Spring only

ECI 496/ED 496 Special Topics in Education (1-3 credit hours)
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

Prerequisite: Junior standing or Senior standing
Typically offered in Fall and Spring

ECI 500 Theory and Practice In Teaching Diverse Populations (3 credit hours)
Analysis of literature and research in related to impact of cultural factors on teaching and learning in contemporary schools. Exploration of teaching techniques and curricular directions designed to improve school experiences for diverse populations in K-12 settings.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ECI 501 Foundations of Curriculum (3 credit hours)
Origin, development, and current status of elementary and secondary school curriculum and an evaluation of trends and issues likely to influence the curriculum in the future.

Prerequisite: 12 sem. hrs. graduate ED and PSY
Typically offered in Summer only

ECI 502 Technology Program Evaluation (3 credit hours)
This course is about evaluation of instructional technology programs, which is the systematic process of collecting and analyzing data in order to determine whether and to what degree program goals have been or are being achieved.

Prerequisite: Graduate Standing
Typically offered in Fall and Spring

ECI 505/FL 505 Issues and Trends in Foreign Language Education: Theory & Practice (3 credit hours)
An exploration of theory and practice issues related to foreign language teaching. Inquiry into proficiency-oriented instruction, innovative methodological approaches, the National Standards and learning scenarios, integrating culture, options for testing and assessment, content-based instruction, the role of grammar in second language acquisition, teaching foreign language students with learning disabilities, and Foreign Language in the Elementary School (FLES) in North Carolina. Students will examine case studies related to these topics and engage in a classroom action research project.

Prerequisite: Graduate standing
Typically offered in Fall and Summer

ECI 507 Social Justice Education (3 credit hours)
Introduction to principles of social justice education and their centrality in progressive policies and pedagogies that lead to equity in all teaching contexts. Students will develop strategies for successfully incorporating a social justice education framework in scholarship and professional practice.

Prerequisite: ECI 500
Typically offered in Fall only

ECI 508 Teachers as Leaders (3 credit hours)
Examines teacher leadership research, theory, and practice. Prepares teachers to assume leadership roles in classrooms, schools, school systems, and the larger educational community. Independent research projects required.

Prerequisite: Graduate standing
Typically offered in Spring only

ECI 509 Special Problems in Curriculum and Instruction (1-6 credit hours)
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

Prerequisite: Six hours of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 510 Research Applications In Curriculum and Instruction (3 credit hours)
Focus on current issues and research methods used in the areas of curriculum development and supervision, instructional technology, English education, middle grades education, reading education, social studies education and special education.

Prerequisite: ST 507, Doctoral student, C and I Major
Typically offered in Spring and Summer

ECI 511 Introduction to Learning Design and Technology (3 credit hours)
Introduction to the Learning, Design, and Technology master's program at North Carolina State University and to the field of instructional design and educational technology, with an investigation of relevant careers, important theories and models guiding practice, and noteworthy research findings by area.

Restriction: Graduate Standing
Typically offered in Fall and Summer

ECI 512 Emerging Technologies for Teaching and Learning (3 credit hours)
Examination of emerging technologies as applied in educational settings with a focus on related research, case studies, theoretical underpinnings, and strategies for effective integration.

Typically offered in Spring and Summer

ECI 513 Teaching and Learning with Digital Video (3 credit hours)
Development and implementation of digital video within educational contexts and situations. Design of educational watching, analyzing, and creating activities with video. Application of conventions and genres of digital video capture and editing to sample technology projects across curricular areas.

Prerequisite: Graduate standing
Typically offered in Summer only

ECI 514 Developing and Delivering Online Instruction (3 credit hours)
Examination of learning theories and research-based principles to design and apply appropriate digital tools to create maximally effective educational products.

Prerequisite: Graduate Standing
Typically offered in Spring only

ECI 515 Cultural Investigations and Technical Representations in Education (3 credit hours)
Examination of contemporary approaches that educators can use to help their students construct cultural understanding in education settings through investigations and technical representations of culture with emerging tools (e.g., mapped cultural tours, AR/VR heritage exhibition, documentary, social media, games, fabrication, data analytics and visualization).

Typically offered in Fall only

ECI 516 Design and Evaluation Of Instructional Materials (3 credit hours)
Characteristics and selection of various media for instruction and their use in educational settings. Design and production of instructional materials. Analysis of research in the field. Individualized projects and assignments. Application of grounded research and theory concerning learning to design of instructional materials. Structured projects and practical experiences used to transfer design principles and evaluate instructional products.

Prerequisite: Graduate standing
Typically offered in Spring only

ECI 517 Theoretical Foundations of Advanced Learning Environments (3 credit hours)
Examination and application of behavioral, cognitive, and constructivist theoretical frameworks underlying the design and development of advanced technology-enhanced learning environments.

Typically offered in Fall only

ECI 518 Digital Learning Program and Staff Development (3 credit hours)
Study and application of principles related to digital learning program planning, facilities and resource management, and staff development in K-12 settings.

Prerequisite: ECI 511, ECI 514, ECI 515, ECI 642
Typically offered in Spring only

ECI 519 Special Problems in Learning Design and Technology (3 credit hours)
In-depth study of topical problems in Learning Design and Technology selected from areas of current concern to practitioners in education.

Typically offered in Fall, Spring, and Summer

ECI 520 The Teaching Of Composition (3 credit hours)
For classroom teachers. Practical field-tested ideas to help students improve as writers by focusing on composition as a process as well as a product. Activities for teaching prewriting, drafting, revising, proofreading, grammar and evaluating with suggestions for individual and group learning. Writing in content areas and composition research/ theory. To take this course in sum. as part of Capital Area Writing Project, student must apply and be selected

Prerequisite: 9 hrs. of ED, PSY and/or ENG;
Typically offered in Spring only

ECI 521 Teaching Literature For Young Adults (3 credit hours)
Designed to acquaint in-service and pre-service teachers with breadth and diversity of contemporary literature for adolescents, with emphasis on teaching young adult literature. Addresses history and themes of young adult literature, readability of materials, reading preferences, literary merit, skills that can be taught through literature, censorship, motivating students to read and organizing literature units.

Prerequisite: Senior standing or Graduate standing or PBS status
Typically offered in Fall only

ECI 522 Trends and Issues in English Language Arts Education (3 credit hours)
Consideration of past, current, and future trends and issues in English Language arts instruction, standards, and methodologies. Examination of research, theory, and practice in concert with trends, issues, and questions. Independent research projects required.

Prerequisite: Graduate standing

ECI 523 Teacher as Researcher (3 credit hours)
This course is designed to introduce the methods and skills required for designing, conducting, interpreting, and applying action research - the systematic inquiry into curriculum, instruction, teaching, and learning. This course will focus on reflective inquiry and practical applications.

Prerequisite: Graduate standing
Typically offered in Summer only

ECI 524 Theory and Research in Global Learning (3 credit hours)
An examination of theoretical frameworks for global learning and comparative studies of various national approaches to K-12 education. This course provides students with multiple lenses through which to consider how we teach and learn given the demands and opportunities present in our interconnected world.

Typically offered in Spring and Summer

ECI 525 Contemporary Approaches In the Teaching Of Social Studies (3 credit hours)
Analysis of principles, strategies and application of new teaching approaches. Structured projects and practical experiences.

Prerequisite: Advanced Undergraduate standing or Graduate standing
Typically offered in Fall only

ECI 526 Theory and Research On Teaching and Learning Social Studies (3 credit hours)
A critical analysis of the literature relating to the teaching and learning of social studies and the drawing of implications for instructional practices.

Prerequisite: ECI 530 or ECI 525
Typically offered in Summer only

ECI 527/FL 527/FL 427/ECI 427 Methods and Materials in Teaching English as a Second Language (3 credit hours)
Methodologies and current approaches to teaching English as a Second Language. Techniques and strategies for teaching reading, writing, listening, speaking and culture. Selection, adaptation, and creation of instructional materials for various levels of proficiency and teaching situations. Evaluation and assessment of written and oral language proficiency through standardized and non-standardized assessment tools. Students cannot receive credit for both FL/ECI 427 and FL/ ECI 527.

Typically offered in Fall and Spring

ECI 528 Strategies for Teaching English in Secondary Schools (3 credit hours)
Methods and materials of teaching English in grades 9-12, with and emphasis on lesson planning and demonstrations/practice in teaching literature, study skills, speaking, listening, media literacy, and writing. Some classes and assignments will be completed in a field setting.

Typically offered in Fall only

ECI 530 Social Studies In the Elementary School (3 credit hours)
Advanced professional training in teaching of social studies for middle grades and elementary teachers, including in-depth introduction to research-based teaching strategies, instructional resources and literature of the field.

Prerequisite: Six hrs. in ECI

ECI 531 Advanced Writing in Education (3 credit hours)
Appropriate for any specialty area in Education. Focus on writing required in graduate courses, research reviews for educational reports and National Board Certification, writing for educational journals, theses, and dissertations. Opportunities to gain knowledge, tools, and strategies to meet the academic community's standards. Strategies to develop and/or enhance form, style, content, quality of academic writing, and on researching, composing, revising, and editing. Students will compose,self-evaluate and give feedback on the work of their peers. Graduate status.

ECI 535 Methods and Materials for Teaching Social Studies in the Middle Grades (3 credit hours)
For preservice middle school social studies teachers. Focus on: teaching and evaluation skills, adaptation of instruction to individual learner differences, identification and creation of instructional materials appropriate for use in social studies teaching. Cannot earn credit for ECI 435 and ECI 535.

Typically offered in Fall only

ECI 536/FL 436/ECI 436/FL 536 Perspectives on English as a New Language (3 credit hours)
Examination of the complexity of multiculturalism in American society and the challenges faced by immigrant families in adapting to U.S. institutions. Emphasis on understanding historical, legal, cultural and pedagogical issues with respect to learning English as a new language [ENL]. No credit given for both FL/ECI 436 and FL/ECI 536.

GEP U.S. Diversity
Typically offered in Fall and Spring

ECI 537/ELM 537 Teaching Children's Literature (3 credit hours)
Instructions for educators in quality children's literature, specific needs of young reader, genres of children's literature, strategies for instructing children's literature, ways to target reader's interests, and design of literature units.

Typically offered in Summer only

ECI 540 Reading In the Elementary School (3 credit hours)
Theoretical foundations of reading instruction and current methods and materials for teaching reading, with emphasis on planning and implementing reading programs for children in kindergarten through grade six.

Prerequisite: Six hrs. ED or PSY
Typically offered in Fall only

ECI 541 Reading In the Content Areas (3 credit hours)
Methods in instruction for applying reading to content areas, with emphasis on means of improving comprehension, vocabulary and learning strategies in subject matter classrooms.

Prerequisite: Six hours in ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 543 Literacy Assessment and Intensified Instruction I (3 credit hours)
Designed for students to expand their knowledge and skills in diagnostic assessment and instruction in alphabetics and word study needed for K-12 Reading Specialist licensure. Topics include assessment and instruction in word recognition, word analysis, spelling, and early reading skills such as phonological awareness, alphabet knowledge, and concepts of print. Emphasis is placed on critical examination of reading intervention practices in these areas and implementation of innovative research-informed approaches for supporting diverse learners when they have difficulties with literacy in school.

Prerequisite: ECI 540 or ECI 541
Typically offered in Spring only

ECI 544 Literacy Assessment and Intensified Instruction II (3 credit hours)
Designed for students to expand their knowledge and skills in diagnostic assessment and instruction in language, comprehension, and inquiry needed for K-12 Reading Specialist licensure. Topics include assessment and instruction in fluency and print processing, comprehension, vocabulary/language, and text-based inquiry. Emphasis is placed on critical examination of reading intervention practices in these areas and implementation of innovative research-informed approaches for supporting diverse learners when they have difficulties with literacy in school.

Prerequisite: ECI 543
Typically offered in Fall only

ECI 545 Theory and Research in Literacy (3 credit hours)
Advanced study of theoretical models of reading, research issues in reading and in other language processes. In-depth theoretical models of reading. Emphasis on critical examination and analysis of research investigating reading acquisition, maturereading behavior and related language processes.

Prerequisite: ECI 540
Typically offered in Spring only

ECI 546 New Literacies & Media (3 credit hours)
Critical analysis of new literacies that are prompted by emerging technologies and participatory media in K-12. Design and application of new literacies and media instructional practices to literacy curriculum and other discipline areas.

Typically offered in Fall only

ECI 547 Knowledge Construction: Implications for Multicultural Education (3 credit hours)
Exploration of sociopolitical factors involved in the construction of knowledge in education as well as the implications for practitioners and learners in schools and other educational settings. Particular emphasis on critiquing traditional epistemologies that limit the production, dissemination, and validation of progressive discourses in education in order to promote the production of knowledge that affirms the principles of social justice education.

Prerequisite: ECI 500
Typically offered in Fall only

ECI 548/ECI 448 E-Business Applications in Business and Marketing Education (3 credit hours)
Emphasis on design and construction of advanced web pages, business and marketing applications of electronic commerce, as well as economic, social, legal, and ethical issues that are related to conducting business in a virtual environment. Content prepares students to apply principles to the business and marketing education curriculum in the public schools. Credit for both ECI 448 and ECI 548 is not allowed.

Typically offered in Fall and Summer

ECI 549 Special Problems in Reading (1-6 credit hours)
In-depth study of topical problems in reading education selected from areas of current concern to practitioners in education.

Prerequisite: Six hours of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 550 Foundations Of Middle Years Education (3 credit hours)
Examination of five major aspects of middle years education: (a) history and purposes of middle/junior high school, (b) pre- and early adolescent needs, interests and abilities, Â¿ curriculum design and content, (d) teaching methods and (e) school organization. Emphasis on both theoretical understandings and effective classroom strategies.

Prerequisite: 6 hours of ED or PSY
Typically offered in Fall and Spring

ECI 551 Teaching/Learning Approaches For Emerging Adolescents (3 credit hours)
Exploration of teaching/learning approaches appropriate to emerging adolescents. Learning styles; interdisciplinary inquiry; community-based curriculum; simulations and games; learning centers; minicourses; design of physical space; all-school activities.

Prerequisite: ECI 550; Graduate standing
Typically offered in Spring only

ECI 552/AEHS 552 Program Development & Evaluation in Youth & Family Settings (3 credit hours)
Historical and contemporary foundations of program development and evaluation in non-formal, community-based family life and youth development settings are examined including theory, research, and three holistic program development constructs: 1) planning; 2) design and implementation; 3) impact evaluation and accountability.

Typically offered in Spring only

ECI 553/AEHS 553 Applied Concepts in Child and Youth Development (3 credit hours)
This course explores the fundamental concepts of child and youth development (including early childhood through adolescence) as applied to programmatic and organizational contexts. A special focus is placed upon the concepts as applied to Community Youth theories & practice.

Typically offered in Fall only

ECI 557/AEHS 557 Volunteerism in Youth and Family Settings (3 credit hours)
Preparation for current and future community-based youth and family professionals to better manage volunteers in local program service delivery. Specific foci include: volunteerism as a social phenomenon; volunteer resource management; new forms of volunteerism; and future trends in volunteerism. Restricted to graduate and post-baccalaureate students only.

Typically offered in Spring only

ECI 560 Professional Development in Business and Marketing Education (3 credit hours)
Designed to prepare business and marketing educators with the knowledge and skills necessary to design and implement strategies for organizational improvement that will benefit business and marketing education programs. Attendance and participation meaningful, organized professional development activity is an integral component of the course.

Prerequisite: Graduate standing
Typically offered in Summer only

ECI 561 Curriculum and Instruction in Business and Marketing Education (3 credit hours)
Designed to develop competencies needed to be a successful Business and Marketing Education Teacher-Coordinator. Focus primarily on the activities involved in planning and managing the curriculum and instructional skills needed to effectively implement the curriculum and meet educational needs of middle and high school students. For ED & MKZ students. Requires instructor approval.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ECI 562 Program Management in Business and Marketing Education (3 credit hours)
This course includes the administration of middle and secondary business and marketing education programs, including career guidance; the management of DECA or FBLA chapter; supervision of work-based learning strategies; and school program promotion and development. ED & MKZ students only. Requires permission of instructor.

Prerequisite: ECI 561
Typically offered in Fall and Spring

ECI 563 Methods and Materials in Teaching Secondary Social Studies (3 credit hours)
ECI 563 is a course that involves teaching techniques, innovations, development of teaching and evaluation skills, and in-depth subject matter inquiry in the area of secondary school social studies. Adaptation of instruction to individual learner differences, and selection and design of instructional materials will be explored. Must be enrolled in Secondary Social Studies MAT Program.

Typically offered in Fall only

ECI 566 Advanced Instructional Strategies in Business and Marketing (3 credit hours)
Advanced strategies and techniques related to teaching and learning in the business and marketing education curricula, classrooms, work places, and technology environments in middle and secondary education. MKZ students only.

Prerequisite: ECI 561
Typically offered in Spring only

ECI 567 Career and Technical Education Fundamentals and Program Administration (3 credit hours)
Emphasis on assisting various school district personnel in acquiring the knowledge and skills needed to effectively provide quality career and technical education (CTE) programming at the district level. Content includes federal CTE legislation, theory and research on educational reform, local and regional economic development, sources of funding for CTE programming and continuous improvement.

Typically offered in Fall and Spring

ECI 568 Designing College and Career Ready Programs (3 credit hours)
Examination of current school system instructional practices to assist various school district personnel in aligning core academic and career and technical education programming to prepare students for successful post-secondary education, careers, and life-long learning. Content includes an examination of education reform initiatives with an emphasis on foundational theory and research, needed workplace knowledge and skills, innovative education programs/models, and research-based best practices for success in transitioning students to post-secondary success.

Typically offered in Fall and Spring

ECI 569 Special Problems in Business and Marketing Education (1-6 credit hours)
In-depth study of topical problems in business and marketing education selected from areas of current concern to practitioners in education.

Typically offered in Fall only

ECI 570 Learning Disabilities (3 credit hours)
Field of learning disabilities, including definitions, prevalence, etiology, characteristics and current educational trends for educating students with learning disabilities.

Prerequisite: ECI 585
Typically offered in Summer only

ECI 571 Instructional Strategies for Students with Disabilities (3 credit hours)
Methods and materials for teaching students with disabilities in elementary and secondary school. Focus on research-supported instructional strategies for teaching academic skills, Universal Design for Learning, implementation of appropriate academic interventions, and evaluation of instructional outcomes within the context of Response to Intervention and Multi-Tier Systems of Supports.

Prerequisite: Graduate standing
Typically offered in Spring only

ECI 572 Resource Teaching In Special Education (3 credit hours)
Resource teaching in area of special education, with emphasis on resource teaching with students with special needs. Types of resource programs, establishment and maintenance of a program, selection of students, curriculum and materials.

Prerequisite: ECI 585
Typically offered in Summer only

ECI 573 Applied Behavior Analysis & Positive Behavior Intervention and Support in Schools (3 credit hours)
Concepts and procedures involved in design and implementation of techniques for managing the behavior of students in classroom setting. Focus on methods for defining, measuring, increasing, decreasing, maintaining, and generalizing classroom behaviors in all learners. An exploration of Multi-Tiered Systems of Support, and Positive Behavior Intervention and Support in school settings.

Typically offered in Fall only

ECI 574 Intellectual Disabilities (3 credit hours)
Content presented includes definitions, classifications, and assessment of person with intellectual disability from medical , sociological, and educational points of view. Issues related to labeling, etiology, characteristics, levels of severity, litigation, legislation, family and societal issues, history, and controversies are emphasized related to persons with intellectual disability.

Prerequisite: ECI 585
Typically offered in Fall only

ECI 575 Communication Disorders In the Classroom (3 credit hours)
Occurrence of communication disorders in the school-age population, including types of disorders, prevalence, etiology, characteristics and corrective therapy. Focus on communication disorders among exceptional students and classroom teacher's role in working with communication disorders.

Prerequisite: ECI 570

ECI 576 Teaching Functional and Life Skills to Students with Disabilities (3 credit hours)
Methods of instruction and materials related to teaching children and persons with mild-moderate levels of disability are emphasized. Effective general pedagogical approaches are stressed, as well as the teaching of functional academic skills, curricula used in instructions, teaching social and adaptive behavior as well as daily living skills, and transition-related skills necessary for independent adult life. Multi-tiered Systems of Support as well as Positive Behavior Intervention and Support are also discussed.

Typically offered in Spring only

ECI 577 Education Of Severely Handicapped (3 credit hours)
Severe and profound mental retardation and autism, including assessment procedures, educational and social/vocational programs, instructional strategies and evaluation. Legal and ethical issues involved in working with severely handicapped.

Prerequisite: ECI 585 or ECI 574

ECI 579 Organization and Behavioral Management of Inclusive Classrooms (3 credit hours)
To increase students' knowledge of persons with high incidence disabilities (i.e., learning disability, mild intellectual disability, and serious emotional disability), and how to manage the behavior of all pupils in educational environments. Characteristics of students with high incidence disabilities will be emphasized , as well as strategies to reduce the likelihood of problem behavior of all pupils in the classroom.

Typically offered in Fall, Spring, and Summer

ECI 580 Transition Program For Students With Mild Disabilities (3 credit hours)
Educational and other procedures involved in providing transition programming to students with mild disabilities. Examination of secondary-level special education service delivery, as well as post-secondary interventions, from critical, practical, empirical and theoretical perspectives.

Prerequisite: ECI 585
Typically offered in Summer only

ECI 581 Educational Diagnosis and Prescription For Children With Exceptionalities (3 credit hours)
Concept of educational diagnosis of students with exceptionalities, including examination of educational diagnostic procedures in current use in special education. Development of informal diagnostic techniques and procedures for adapting curriculum and instruction for learner with exceptionalities.

Prerequisite: ECI 585
Typically offered in Fall only

ECI 583 Behavior Disorders (3 credit hours)
Definitions, etiology, characteristics, philosophies and approaches to educational programming for children and youth with behavior disorders, including emotionally handicapped, autistic and socially maladjusted.

Prerequisite: ECI 585
Typically offered in Fall only

ECI 584 Intervention for Behavior Problems of Students with Disabilities (3 credit hours)
Curriculum materials, instructional strategies and behavior management techniques related to teaching children and youth with behavioral disorders including individualized instruction, group process, organization and evaluation of classroom programs, parent involvement, community resources and teachers' personal and professional growth and development.

Prerequisite: ECI 583
Typically offered in Spring only

ECI 585 Education of Children with Exceptionalities (3 credit hours)
Introduction to field of special education. Focus on historical overview, definitions and terminology in basic areas of exceptionality; etiological factors in exceptionality; developmental and learning characteristics of each area of exceptionality;and educational settings and strategies employed in special education including Multi-Tiered Systems of Support and Positive Behavior Intervention and Support. Review of current educational laws and policies affecting special education.

Prerequisite: 9 hours of ED or PSY
Typically offered in Fall and Spring

ECI 586 Introduction to Learning Analytics (3 credit hours)
As the use of digital resources continues expand in education, an unprecedented amount of new data is becoming available to educational researchers and practitioners. In response, Learning Analytics (LA) has emerged over the past decade as an interdisciplinary field encompassing Learning (e.g. educational technology, learning and assessment sciences), Analytics (e.g. visualization, computer/data sciences), and Human-Centered Design (e.g. usability, participatory design). This course will provide students with an overview of the field, examples of its use in educational contexts, and applied experience with widely adopted tools and techniques for working with and exploring data. As participants gain experience in the collection, analysis, and reporting of data throughout the course, they will be better prepared help educational organizations understand and improve learning and the contexts in which learning occurs.

Typically offered in Fall only

ECI 587 Machine Learning in Education (3 credit hours)
This class is meant to teach the practical side of machine learning for applications in mining educational data. There will be a heavy project focus, and when you have completed the course, you should be fully prepared to attack new problems using machine learning in the field of education.

Typically offered in Fall only

ECI 588 Text Mining in Education (3 credit hours)
This course will provide students with an overview of text mining as an analytical approach in education research, examples of its use in educational contexts, and applied experience with widely adopted tools and techniques (e.g. topic modeling and sentiment analysis). Students develop practical skills in the collection, analysis, and reporting of text data form sources such as Learning Management Systems, social media, and other online sources. Students can complete projects using a programming approach with R, a popular free open source software program for data science, or using non-programming point-and-click tools (i.e., SAS Visual Text Analytics).

Typically offered in Spring only

ECI 589 Analyzing Learning Networks (3 credit hours)
Although social network analysis and its educational antecedents date back to the early 1900s, the popularity of social networking sites like Twitter and Facebook have raised awareness of and renewed interests in networks and their influence. As the use of digital resources continues expand in education, data collected by these educational technologies has also greatly facilitated the application of network analysis to teaching and learning. This introductory course is designed to prepare researchers and practitioners to apply network analysis in order to better understand and improve student learning and the contexts in which learning occurs. This course will provide students with an overview of social network theory, examples of network analysis in educational contexts, and applied experience with widely adopted tools and techniques. As participants gain experience in the collection, analysis, and reporting of data throughout the course, they will be better prepared help educational organizations understand and improve both

Typically offered in Spring only

ECI 603 Advanced Seminar In Literacy Research (3-6 credit hours)
Critical analyses of research and methodology in reading comprehension processes and strategies for comprehension and retention of written discourse. Opportunity for design and conduct of a research project in reading or related area.

Prerequisite: ECI 648
Typically offered in Spring only

ECI 606 Seminar on Teacher as Learner: Developmental Theory, Research and Practice (3 credit hours)
Analysis of major contemporary theories and research of learning and development as a basis for individual and organizational change and development in educational settings.

Prerequisite: Graduate standing (6 hrs course work at 500-level)
Typically offered in Fall only

ECI 607 Advanced Seminar in Multicultural Education (3 credit hours)
Application and analysis of research and scholarship in multicultural education and topics related to effective schools for contemporary culturally diverse student populations in K-12 settings.

Prerequisite: Graduate standing and ECI 500
Typically offered in Spring only

ECI 620 Special Problems In Curriculum and Instruction (1-6 credit hours)
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

Prerequisite: Six hrs. of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 630 Independent Study in Curriculum and Instruction (1-3 credit hours)
Independent curriculum or research project in curriculum and instruction.

Typically offered in Fall, Spring, and Summer

ECI 640 Practicum In Curriculum and Instruction (1-6 credit hours)
Supervised practical experiences in schools and area agencies concerned with curriculum and instruction or educational supervision.

Prerequisite: Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 641 Practicum In Mentoring and Coaching (1-6 credit hours)
Supervised practical experiences in which participants become mentor to a student teacher or a teacher in a school system.

Prerequisite: ECI 705, Graduate standing in College of ED and PSY
Typically offered in Fall only

ECI 645 Supervised Practicum in Literacy (3 credit hours)
Supervised teaching experience with school-aged children identified as having reading difficulties. Students use diagnostic assessment data to design, implement, and evaluate individualized literacy instruction. Emphasis is placed on research-informed practices of intensified instruction embedded within engaging and authentic literacy experiences.

Prerequisite: ECI 540, ECI 541 and ECI 543; Graduate standing in College of ED
Typically offered in Spring only

ECI 647 Practicum in Business and Marketing Education (3 credit hours)
Supervised practical experiences in schools and area agencies concerned with business and marketing education.

Prerequisite: ECI 569
Typically offered in Spring only

ECI 648 Practicum in Special Education (1-6 credit hours)
Supervised practical experiences in schools and area agencies concerned with teaching children and adolescents with disabilities.

Prerequisite: Graduate standing in College of ED and PSY
Typically offered in Fall, Spring, and Summer

ECI 650 Internship In Curriculum and Instruction (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with curriculum development and/or educational supervision.

Prerequisite: Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 652 Field-Based Applications of Learning Design and Technology (1-6 credit hours)
Supervised opportunities to design, test, and revise learning design and technology solutions in authentic, field-based settings.

Typically offered in Fall and Spring

ECI 654 Internship In Elementary Education (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with elementary grades education.

Prerequisite: 3 hrs. grad.-level elementary education course work, Graduate standing in Col. of ED and PSY
Typically offered in Spring only

ECI 656 Internship In Middle Grades Education (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with the education of young adolescents.

Prerequisite: ECI 550, ECI 551, Graduate standing in College. of ED and PSY
Typically offered in Fall, Spring, and Summer

ECI 657 Internship in Business and Marketing Education (1-6 credit hours)
Supervised opportunities for advance professional development in contexts concerned with business and marketing education. Requires instructor approval.

Prerequisite: ECI 561
Typically offered in Fall and Spring

ECI 658 Internship In Special Education (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with special education.

Prerequisite: Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 681 Seminar in Special Education Literacy (3 credit hours)
A case study approach is used in the seminar that requires the application of assessment techniques and instructional intervention methodologies in literacy for K-12 students with disabilities. Assigned activities require access to and experience in schools and/or related settings. This seminar is designed to be completed during the last half of the graduate program. It is restricted to graduate students in SPE, SPL, SPM, SPB or consent of instructor.

Prerequisite: ECI 540 or ECI 541 and ECI 581, ECI 585

ECI 682 Spe Ed Seminar in Teaching Numerical Concepts (3 credit hours)
This seminar is designed to prepare special education teachers to provide empirically supported instruction in numerical concepts and skills to students with disabilities in special education and general education settings. Particular attention will be paid to student characteristics that impact learning in arithmetic and mathematics and to addressing state and national curriculum standards using instructional organization and strategies that have been shown through research to be effective for this population. Field work in schools and/or related settings is required. Restricted to students in SPE, SPB, SPL, SPM or by consent of instructor.

Prerequisite: ECI 585
Typically offered in Summer only

ECI 683 Seminar in Special Education Learning Strategies (3 credit hours)
This seminar is designed to prepare special education teachers to evaluate and teach empirically supported learning strategies to students with disabilities in special education and collaborative settings. Particular attention will be paid to learning strategies shown to help students with disabilities organize, learn, and apply facts, skills and routines that provide access to and mastery of critical information across the curriculum. Field work in schools and/or related settings is required. Restricted to graduate students in SPE, SPB, SPL, SPM or consent of instructor.

Prerequisite: ECI 585

ECI 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the studnet in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECI 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECI 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall only

ECI 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECI 692 Research Projects In Curriculum and Instruction (1-3 credit hours)
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 532
Typically offered in Fall, Spring, and Summer

ECI 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECI 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECI 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ECI 699/ELP 699/EMS 699/EOE 699/EAC 699/ECD 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECI 700 Curriculum Theory and Development (3 credit hours)
Theory and research in behavioral sciences and education designed to provide theoretical background for development of elementary and secondary curricula. Exploration of knowledge base and skills for critical review of curricula and instructional materials and provision of an application opportunity.

Prerequisite: 9 sem. hrs. graduate PSY, ECI 502, ECI 514
Typically offered in Fall only

ECI 705 Instructional Coaching and Supervision Of Teachers (3 credit hours)
Theory, research and practice of the professional role of a supervisor in the development of the effective and self-analytic teacher: pre-service (student teacher) and in-service (beginning and experienced teacher). For persons with at least two years of teaching experience in K-12 schools.

Typically offered in Spring only

ECI 709 Special Problems In Curriculum and Instruction (1-6 credit hours)
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

Prerequisite: Six hrs. of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 716 Design and Evaluation Of Instructional Materials (3 credit hours)
Characteristics and selection of various media for instruction and their use in educational settings. Design and production of instructional materials. Analysis of research in the field. Individualized projects and assignments. Application of grounded research and theory concerning learning to design of instructional materials. Structured projects and practical experiences used to transfer design principles and evaluate instructional products.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ECI 719 Special Problems in Learning Design and Technology (1-6 credit hours)
In-depth study of topical problems in Learning Design and Technology selected from areas of current concern to practitioners in education.

Typically offered in Fall, Spring, and Summer

ECI 720 The Teaching Of Composition (3 credit hours)
For classroom teachers. Practical field-tested ideas to help students improve as writers by focusing on composition as a process as well as a product. Activities for teaching prewriting, drafting, revising, proofreading, grammar and evaluating with suggestions for individual and group learning. Writing in content areas and composition research/ theory.

Prerequisite: 9 hrs. of ED, PSY and/or ENG; to take this course in sum. as part of Capital Area Writing Project, student must apply and be selected
Typically offered in Spring only

ECI 721 Technology and Informal Learning Environments (3 credit hours)
Survey of theory and research grounding popular informal after-school technology environments, such as computer clubhouses, music studios, video clubs, coding camps, robotics clubs, and makerspaces. Examination of strategies for planning experiential, hands-on activities supportive of informal learning, sourcing necessary materials, outfitting spaces, facilitating student design and collaboration, and engaging the community and other resources to sustain facilities/clubs.

Typically offered in Fall only

ECI 722 Theory and Research in Distance Education (3 credit hours)
Introduction to distance education foundations, models, and underlying theories. Analysis of distance education research findings, research and evaluation methods, and management in varied settings--virtual schools, higher education, continuing education, and corporate e-learning. Application of distance education standards and research-based findings to the design of original course plans and materials prototypes, including appropriate recommendations for online teaching and community building, online student support, and online student assessment.

Typically offered in Spring only

ECI 727 Special Problems in Social Studies Education (1-6 credit hours)
In-depth study of topical problems in social studies education selected from areas of current concern to practitioners in education.

Prerequisite: Six hours of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 729 Special Problems in English Education (1-6 credit hours)
In-depth study of topical problems in English education selected from areas of current concern to practitioners in education.

Prerequisite: Six hours of ED or PSY
Typically offered in Fall, Spring, and Summer

ECI 745 Literacy Theory and Research (3 credit hours)
Advanced study of theoretical models of reading, research issues in reading and in other language processes. In-depth theoretical models of reading. Emphasis on critical examination and analysis of research investigating reading acquisition, matureading behavior and related language processes.

Prerequisite: ECI 540
Typically offered in Spring only

ECI 801 Seminar In Curriculum and Instruction (1-3 credit hours)
Consideration of contemporary issues, trends and recent research and development findings in curriculum and instruction.

Prerequisite: Doctoral student
Typically offered in Fall only

ECI 803 Advanced Seminar In Literacy (3 credit hours)
Critical analyses of research and methodology in reading comprehension processes and strategies for comprehension and retention of written discourse. Opportunity for design and conduct of a research project in reading or related area.

Prerequisite: ECI 545
Typically offered in Spring only

ECI 804 Seminar On Attention Deficit Hyperactivity Disorder, Research and Treatment (3-6 credit hours)
Critical analysis of theory, research and interventions in Attention-Deficit-Hyperactivity-Disorder. Reading and synthesization of literature and student-led class discussions of such topics as characteristics, diagnosis, etiology, long-term outcomes and management of ADHD.

Prerequisite: 9 hrs. grad. credit in PSY or SPE
Typically offered in Spring only

ECI 806 Seminar on Teacher as Learner: Developmental Theory, Research and Practice (3-6 credit hours)
Analysis of major contemporary theories and research of learning and development as a basis for individual and organizational change and development in educational settings.

Prerequisite: Graduate standing (6 hrs course work at 500-level)
Typically offered in Fall only

ECI 807 Advanced Seminar in Multicultural Education (3 credit hours)
Application and analysis of research and scholarship in multicultural education and topics related to effective schools for contemporary culturally diverse student populations in K-12 settings.

Prerequisite: Graduate standing and ECI 500
Typically offered in Spring only

ECI 820 Special Problems In Curriculum and Instruction (1-6 credit hours)
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

Prerequisite: Six hrs. of ED or PSY
Typically offered in Summer only

ECI 830 Independent Study in Curriculum and Instruction (1-3 credit hours)
Independent curriculum or research project in curriculum and instruction.

Typically offered in Fall, Spring, and Summer

ECI 840 Practicum In Curriculum and Instruction (1-6 credit hours)
Supervised practical experiences in schools and area agencies concerned with curriculum and instruction or educational supervision.

Prerequisite: Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 841 Practicum In Mentoring and Coaching (1-6 credit hours)
Supervised practical experiences in which participants become mentor to a student teacher or a teacher in a school system.

Prerequisite: ECI 705, Graduate standing in College of ED and PSY
Typically offered in Fall only

ECI 847 Practicum in Business and Marketing Education (1-6 credit hours)
Supervised practical experiences in schools and area agencies concerned with business and marketing education.

Typically offered in Fall, Spring, and Summer

ECI 850 Internship In Curriculum and Instruction (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with curriculum development and/or educational supervision.

Prerequisite: Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 851 Internship In Mentoring (1-6 credit hours)
Supervised opportunities teaching educational personnel in local school systems how to serve as mentors to their colleagues.

Prerequisite: ECI 845 and ECI 705, Graduate standing in Col. of ED and PSY
Typically offered in Fall and Spring

ECI 880 Directed Study in Curriculum and Instruction (1-6 credit hours)
Curriculum or research project in curriculum and instruction under the direct supervision of a faculty member.

Typically offered in Fall and Spring

ECI 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

ECI 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECI 892 Research Projects In Curriculum and Instruction (1-3 credit hours)
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 732
Typically offered in Spring only

ECI 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECI 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECI 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ECI 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, tull-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Dance (DAN)

DAN 210 Current Trends in Afrocentric and World Dance (1 credit hours)
This course provides direct experience in choreographic and performance processes for members of Panoramic Dance Project, NC State Dance Program's student company dedicated to Afrocentric and other culturally driven dance works. The course includes study of dance technique, choreographic craft, and the examination of content and identity in dance. Choreographic content varies from semester to semester. Permission only; acceptance by formal audition.

Typically offered in Fall and Spring

DAN 227 African Dance I (1 credit hours)
Development of beginning level skill of East and West African dances, including history, culture, and context, emphasizing the central role that dance plays in African cultures.

GEP Global Knowledge, GEP Health and Exercise Studies
Typically offered in Fall only

DAN 228 African Dance II (1 credit hours)
Development of intermediate level skills in traditional and contemporary African dances with clear distinction between different African regions. Emphasis will be placed on culture, history, community and theoretical aspects of each dance.

Corequisite: HESD 227 (African Dance I)
GEP Global Knowledge, GEP Health and Exercise Studies
Typically offered in Fall only

DAN 230 Horton Dance Technique (1 credit hours)
Development of beginning and intermediate-level skills in Horton dance technique, including alignment, vocabulary, performance, and history, with emphasis on strengthening the body for dance. Class format will include warm-up exercises, fortifications, studies, and traveling combinations. Course also includes the study of Lester Horton's influence on American modern dance, particularly in relation to integration in concert dance and the formation of Alvin Ailey American Dance Theater.

GEP Health and Exercise Studies, GEP U.S. Diversity
Typically offered in Fall only

DAN 234 Country Dance (1 credit hours)
This course is the development of beginning-level skills in country dance including vocabulary, technique, history, and performance. A variety of fundamentals for leading and following, combinations, figures, and calls will be emphasized in American Heritage Dance, Texas Two-step, and Western Square Dance.

GEP Health and Exercise Studies
Typically offered in Spring only

DAN 240 Social Dance (1 credit hours)
Development of beginning-level skills in social dance, including vocabulary, technique, history, performance, with emphasis on leading and following in the : Cha-Cha, Foxtrot, Waltz, Rumba, and Shag.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

DAN 241 Social Dance II (1 credit hours)
This course will focus on training students to understand and perform more complex dances in an improvisational environment. Emphasis will be on learning advanced level dance steps and combinations that are more challenging or complex social dances not currently offered in the beginning level class. Dances taught will differ from semester to semester.

Prerequisite: HESD 240 or equivalent skills
GEP Health and Exercise Studies
Typically offered in Fall only

DAN 260 Hip-hop Dance (1 credit hours)
This course introduces students to the physical, social, communal, historical, and cultural aspects of Hip-hop dance. Students might have to provide transportation and/or pay a minimal cost for a performance not to exceed $15.

GEP Health and Exercise Studies, GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall and Spring

DAN 261 Hip-hop Dance II (1 credit hours)
This course provides students with an intermediate level experience with the physical, social, communal, historical, and cultural aspects of Hip-hop dance. Emphasis will be on learning specific styles of Hip-hop, and delving into issues such as appropriation, commercialization, and community. Students might have to provide transportation and/or pay a minimal cost for a performance not to exceed $15.

Prerequisite: DAN 260
GEP Health and Exercise Studies, GEP U.S. Diversity
Typically offered in Spring only

DAN 263 Tap Dance (1 credit hours)
This beginning-level technique class covers basic tap dance skills in warm-up exercises, combinations, and compositions. Emphasis is placed on correct alignment in tap dance steps and the exploration of a variety of rhythms and patterns.

GEP Health and Exercise Studies
Typically offered in Spring only

DAN 264 Ballet I (1 credit hours)
Development of beginning-level technical skills in ballet, including vocabulary, technique, history, performance, alignment, function and access of turnout, with emphasis on safe and efficient body use.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

DAN 265 Ballet II (1 credit hours)
Further development of Ballet technique building on fundamental concepts and vocabulary introduced in Ballet I. Will include increased movement capabilities, rhythmic accuracy, alignment, performance, and access of turnout. A small fee may be required for dance concert attendance.

Prerequisite: HESD 264 or Instructor Permission
GEP Health and Exercise Studies, GEP Visual and Performing Arts
Typically offered in Fall only

DAN 272 Dance Composition - Solo Forms (1 credit hours)
This course introduces principles of dance composition through creative problem solving. Course content includes: movement invention; creation of a thematic phrase; manipulation and development of theme through application of choreographic devices; structure; and content. Student will create and perform a complete solo choreographic work in the course. A small fee of no more than $10 may be required for dance concert attendance.

Prerequisite: HESM 320 or instructor permission
GEP Visual and Performing Arts
Typically offered in Fall only

DAN 273 Jazz Dance I (1 credit hours)
This beginning-level technique class covers basic jazz dance skills in warm-up exercises, combinations, and compositions. A variety of jazz styles are covered including one or more of the following: classical (Luigi/ Giordano), Broadway, contemporary, Afro-jazz, and others.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

DAN 274 Modern Dance I (1 credit hours)
Development of beginning-level technical skills and movement concepts in modern dance, including vocabulary, technique, history, performance, and alignment, with emphasis on safe and efficient body use. Class format will include structured exercises and improvisations. A small fee may be required for dance concert attendance.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

DAN 275 Modern Dance II (1 credit hours)
Further development of modern dance technique, building on fundamental movement concepts and vocabulary introduced in Modern Dance I. Will include increased movement capabilities, rhythmic accuracy, and spatial relationships. A small fee may be required for dance concert attendance.

Prerequisite: HESD/DAN 274 (or permission of instructor)
GEP Health and Exercise Studies
Typically offered in Fall and Spring

DAN 276 Jazz Dance II (1 credit hours)
Further development of jazz dance technique building on fundamental concepts and vocabulary introduced in Jazz Dance I. Will include increased movement capabilities, rhythmic accuracy, alignment, and performance. A small fee may be required for dance concert attendance.

Prerequisite: HESD 273 or Instructor Permission
GEP Health and Exercise Studies, GEP Visual and Performing Arts
Typically offered in Spring only

DAN 279 Yoga I (1 credit hours)
This course will emphasize the practice of the eight limbs of yoga at an introductory level. Coursework will include the study of yoga culture, breathing exercises, meditation techniques, and a variety of yogasanas (postures): standing, twisting, balancing, forward bending, backward bending, and inversions. Students will develop the skills required to perform these postures and maintain a safe yoga practice.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

DAN 280 Yoga II (1 credit hours)
This course will build upon material introduced in Yoga I by emphasizing the practice of yoga at an intermediate level. Coursework will require a deeper level of understanding of a variety of yoga postures, breathing techniques, and meditation practices. Yoga philosophy will also be addressed through the study of historical yogic texts such as The Yoga Sutras of Patanjali.

Prerequisite: HESS 279
GEP Health and Exercise Studies
Typically offered in Spring only

DAN 281 Pilates (1 credit hours)
This course will teach the fundamentals of Pilates which are to improve body awareness, increase breathing capacity and improve postural alignment through simultaneous stretching and strengthening movements. The goal of Pilates exercises is to achieve optimal functional fitness. The knowledge and training gained from Pilates will not only benefit an individual in their daily activities, but also improve their performance in any physical activity they choose to participate in.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

DAN 290 Special Topics in Dance (1-4 credit hours)
Examination of selected topics in dance. May be repeated for credit provided course content is different each time.

DAN 295 Problems of Dance Performance (2 credit hours)
Practical performing experience in a company setting. Rehearsal, performance and production of concert dance.

Prerequisite: Audition
Typically offered in Fall and Spring

DAN 304 Dance Practicum (1 credit hours)
A 30-hour practical experience in the dance field. Assigned internships could include dance teaching, performing, choreographing, research, or other dance-related work dependent upon the student's experiences and interests. Specific placement will be determined by the student and the instructor. Students are required to purchase internship liability insurance to participate in the practicum; the fee is automatically charged upon registration. Contact University Insurance & Risk Management for more details.

Typically offered in Fall, Spring, and Summer

DAN 320 Movement Improvisation (1 credit hours)
Conceptually guided, spontaneous movement generation and invention reached through individual and group experiences.

Typically offered in Fall and Spring

DAN 322 Dance and Society (3 credit hours)
Dance and Society examines dance as an artistic, religious, cultural, and social form, including historic and aesthetic influences, basic dance elements, and relationship to other arts. This course incorporates multiple modalities of dance knowledge - lectures, films, demonstrations, and practical dance experience. A small fee may be required for concert attendance.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

DAN 326 Current Trends in Dance (3 credit hours)
Critical and contextual examination of current trends in dance. While specific readings and video resources will vary by semester as the field of dance continues to change, major course topics will include at least three of the following: the role of dance supporters and presenters, media influences, non-concert and site-specific dance, current movement trends, political significance, and international concerns.

GEP Visual and Performing Arts
Typically offered in Spring only

DAN 328 Dance Composition - Group Forms (2 credit hours)
This course builds on skills and concepts learned in Movement Improvisation. Various approaches to group choreography will be discussed and explored. A student-choreographed group work will be created and performed.

Prerequisite: HESM 320
GEP Visual and Performing Arts
Typically offered in Spring only

DAN 330 Introduction to Laban Movement Analysis and Bartenieff Fundamentals (2 credit hours)
An introduction to Laban Movement Analysis (LMA) and Bartenieff Fundamentals (BF) through movement integration, observation, notation, analysis, and application. LMA is a method and language for describing, visualizing, interpreting, and documenting all varieties of human movement. It consists of the study of four major components: Body, Effort, Shape and Space, the relationships between them, and ways of notating them. BF consists of a set of concepts, principles and exercises developed by Irmgard Bartenieff in applying Laban's movement theory to the physical/kinesiological functioning of the human body. LMA/BF is used by dancers, actors, musicians, and dance therapists, among others.

Typically offered in Spring only

DAN 332 Dance and Technology (2 credit hours)
The exploration of dance creation, performance, documentation, practice, and analysis through existing and emerging practices in technology and interactive media. Coursework will include working with audio, animation, prerecorded video, and live-captured media through Isadora, a real-time media manipulation tool for performance and visual artists.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

DAN 490 Adv Spec Top Dance (1-4 credit hours)

DAN 498 Independent Study in Dance (1-3 credit hours)
Independent study in special choreographic or performance projects approved by and done under the direction of the Dance Program. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: DAN 272, Dan 295, Dance Program approval required.
Typically offered in Fall only

Design (D)

D 100 Design Inquiry I: Methods and Processes (3 credit hours)
Design Inquiry I asks students to think critically about and experiment with expanding their toolkit of process and methods in solving large scale problems with innovative solutions. Through discussion sections, students will also be introduced to methods of critical reading and writing as a reflective practice. Topics students will consider and implement include lateral thinking, metaphorical thinking, abductive reasoning, networked thinking, discourse as thought, systems thinking and more. Students in Design must receive a C- to pass the course.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

D 101 Design Inquiry II: Methods and Processes (3 credit hours)
As an important extension of the first semester, Design Inquiry II asks students to engage in the critical evaluation of the making process and how design and the artifacts that we create contribute to material culture. Lecture topics are both historical and contemporary and include: design in the age of reason, the age of composition, and the age of experience; consumption and material culture; designing the obsolete; human-centered design, and universal design. Student in Design must receive a C- to pass the course.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

D 104 First Year Studio I (6 credit hours)
First Year Studio I provides College of Design freshman with an introduction to foundational design concepts and methods representative of creative activity across design and artistic disciplines. This 6-credit fall semester course encourages entering freshman to think critically and act creatively about and upon design, art and the world around them as they secure a skillful level of craftsmanship in the conception, development, and making of all studio-based work. Semester work focuses on key design issues such as process, method, technique, technology and the production of visual and physical items necessary for the envisioning and development of design. College of Design Studio Majors Only; Students must receive a C- to pass the course.

Co-requisite: D 100; restricted to Design majors only
Typically offered in Fall only

D 105 First Year Studio II (6 credit hours)
First Year Studio II is the continuation of a comprehensive introduction to foundational design concepts and methods begun in First Year Studio I. This 6-credit fall semester course asks freshman to think critically and act creatively about and upon design, art, and the world around them as they apply a skillful level of craftsmanship in the conception, development, and making of all studio-based work. In this discipline specific second semester studio, students acquire further knowledge of design and art through assignments and projects that explore their design major. College of Design Studio Majors Only; Students must receive a C- to pass the course.

Prerequisite: D 100 and D 104; Restricted to Design majors only
Typically offered in Spring only

D 231 Design History for Engineers and Scientists (3 credit hours)
Study of historical connections among various disciplines and across cultures from prehistory to the present, with an emphasis on design. Students develop visual timelines of events to better understand how seemingly disparate disciplines affect one another. Special attention paid to scientific, artistic, and philosophical "revolutions" and their impact upon each other and upon other intellectual and practical endeavors. There are no prerequisites or corequisites for this course. Design Studies students should consult with the Instructor prior to enrollment for their own benefit.

GEP Visual and Performing Arts
Typically offered in Fall only

D 292 Special Topics in Design (1-3 credit hours)
Topics of current interest in the college of Design. Used to develop new courses.

Typically offered in Fall, Spring, and Summer

D 492 Special Topics in Design (1-6 credit hours)
Topics of current interest in the College of Design. Used to develop new courses.

Typically offered in Fall, Spring, and Summer

D 592 Special Topics in Design (1-6 credit hours)
Topics of current interest in the College of Design. Used to develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

D 684 Teaching Design at the College Level (3 credit hours)
Preparation for college level teaching in the design disciplines. Discussion of the history of design education, curriculum development, pedagogical strategies, assessment, and teaching and research demands on college design faculty. Meets partial requirements for the university Certificate of Accomplishment in Teaching. Restricted to students enrolled in College of Design masters and doctoral programs.

Typically offered in Spring only

Design courses for Graduate Students (DDN)

DDN 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's Student
Typically offered in Fall only

DDN 696 Summer Thesis Res (1 credit hours)

DDN 701 Research Methods in Design (3 credit hours)
Survey of research methods in the field of design including overall systems of inquiry, criteria for assessing quality, strategies and tactics. Strengths and weaknesses of various research designs. Experimental and quasi-experimental research, correlational research, qualitative research strategies, simulation and modeling research, action research and design intervention, case study, and combined strategies.

Prerequisite: Graduate standing
Typically offered in Spring only

DDN 702 Research Paradigms in Design (3 credit hours)
Overview of contributions and limitations of various theoretical perspectives that inform the field of design inquiry. Knowledge and theory construction. Nature, scope, and merits of scientific approach. Criticism of the scientific approach and examination of alternative approaches utilized in design research and practice. Linking philosophy, research, and action/practice/application.

Prerequisite: Graduate standing
Typically offered in Fall only

DDN 740 Introduction to Practice-Based Design Research (3 credit hours)
This course presents an introduction and overview of interdisciplinary research theories, strategies, and methods as applied to issues in professional practice of design. Special emphasis is placed on the roles, values, and specific methods related to design practice, including (not limited to) case study analysis and evaluation; design typology; engaged research; research and development (e.g. prototyping); and design process. Course content is adaptable to student needs and interests. Restricted to Doctor of Design (D.Des) students; other advanced post-professional design students may enroll with permission of instructor. Although course content and instruction is predominantly online, the course requires one week of face-to-face intensive on-campus instruction and other activities before Fall term begins (TBA).

Restriction: Doctor of Design Students or other advanced students (PhD or other DDes programs off campus) may be enrolled by permission of instructor only.
Typically offered in Fall only

DDN 741 Case Study Analysis in Design (3 credit hours)
The case study method addresses the importance of learning how to learn as an essential element of professional growth as well as a means toward building a culture of reflective design practice. Case studies provide orientation and perspective on the complexity of design practice, both for novices and seasoned professionals. When closely examined, lessons learned from design processes and decision-making provide opportunities to build a body of professional knowledge. Course content is adaptable to student needs and interests. Restricted to Doctor of Design (D.Des) students; other advanced post-professional design students may enroll with permission of instructor. Although course content and instruction is predominantly online, the Fall course requires one week of face-to-face intensive on-campus instruction and other activities prior to the start of Fall term. The Spring course requires one week of face-to-face intensive on-campus instruction and other activities during Spring term (TBA).

Corequisite: DDN 740
Typically offered in Fall and Spring

DDN 771 Design as Cognitive Artifact (3 credit hours)
Relationship between theories of human cognition and design. Analysis and critique of design objects as cognitive artifacts and extension, transformation, or diminishing of human thought by their form and content. A critical examination of cognitive, linguistic and social science theories shaping design.

Prerequisite: Doctoral student, Design Majors, Corequisite: DDN 830 or 831
Typically offered in Fall and Spring

DDN 772 Design as Cultural Artifact (3 credit hours)
Recent theories in various disciplines concerning a cultural understanding of graphic design. Theories of mass and popular culture, critiques of creativity and authorial intentionality, influences of interpretive criticism, theories of consumption and issues of cultural representation. Emphasis on adaptation of these theories to an understanding of the cultural significance of graphic design. Non-majors by permission only.

Prerequisite: Doctoral student, Design Majors, Corequisite: DDN 830 or 831
Typically offered in Fall only

DDN 773 New Information Environments (3 credit hours)
Changing role of design in new information environments. Implications of new technology on social construction of meaning, impact of electronic media on culture and cognition, and differences in designing artifacts and designing interactions.

Prerequisite: Doctoral student, Design Majors, Corequisite: DDN 830 or 831
Typically offered in Spring only

DDN 779 Human Use of the Urban Landscape (3 credit hours)
Techniques for documenting and analyzing user needs at cite planning scale. Methods of integrating user needs into design programming in design and redesign projects. Community participation methods. Examples of best practice in design of user-intensive settings in residential, health, education and recreation. Principles of Universal Design. Fieldwork-oriented.

Typically offered in Spring only

DDN 795 Special Topics (3-6 credit hours)
Typically offered in Fall and Spring

DDN 809 Dissertation Colloquium (1 credit hours)
Prerequisite: Doctoral student in Design
Typically offered in Spring only

DDN 810 Special Topics (1-6 credit hours)

DDN 830 Independent Study (1-3 credit hours)
Typically offered in Fall and Spring

DDN 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student in Design
Typically offered in Fall, Spring, and Summer

DDN 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student in Design
Typically offered in Fall, Spring, and Summer

DDN 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student in Design
Typically offered in Fall, Spring, and Summer

DDN 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student in Design
Typically offered in Summer only

DDN 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student in Design
Typically offered in Fall, Spring, and Summer

Design Studies (DS)

DS 100 Design in Culture and Context (3 credit hours)
Design in Culture and Context is a first year seminar for Design Studies majors. The course examines design action and the relationships between design and other systems, chiefly the natural and built environment, society and culture, and technology and economics. Recent independent studies, field projects, and special initiatives by artists, designers, and principal investigators will introduce students to the negotiations that take place among the decision-makers, manufacturers, and civic and community patrons in understanding the nature and limits of a variety media, processes of design, and the cultural implications of researching meaningful solutions to current challenges and public needs.

Prerequisite: D 100; Design Studies Majors only
Typically offered in Spring only

DS 200/ADN 200 A Survey of Design Studies (3 credit hours)
This course will introduce students to a variety of perspectives and lenses through which to examine and evaluate design in the world. Students will consider design studies through theory and criticism of design, as well as applied to business administration, museum studies, and environmental studies. In addition, students will be encouraged to find evidence of and define design studies in areas that are uniquely suited to their individual areas of interest. As an advised elective, this course is required for Design Studies majors who are sophomores in their major.

Typically offered in Fall only

DS 481 Design Studies Senior Research Seminar (3 credit hours)
Each student in Design Studies will develop a topic for his or her Senior Capstone Research Paper to be done during the Spring term. During the Research semester, each student will develop a comprehensive bibliography for the topic and an outline ofthe paper. One paper will be written before the end of the term that addresses issues directly related to the Capstone Research paper. Throughout the term, students will share their research with others in the seminar.

Prerequisite: Completion of all course work in DS through junior year ; Design Studies Majors
Typically offered in Fall only

DS 482 Design Studies Capstone Seminar (1 credit hours)
Students will meet on a weekly basis to discuss their individual research papers. Drafts of papers will be due at the end of the eighth week of class. Drafts will be read by the instructor, other instructors of the student's choosing, and by two other members of the class for critical analysis.

Prerequisite: DS 481 ; Design Studies Majors
Typically offered in Spring only

DS 483 Design Studies Capstone Research Paper (3 credit hours)
Course consists of guided independent study resulting in a serious research paper. Students will work on their own, with meetings with faculty advisor(s) at weekly intervals.

Prerequisite: DS 481 ; Design Studies Majors
Typically offered in Spring only

DS 494 Design Studies Internship (1-6 credit hours)
Supervised internships in museums, galleries, schools, or other approved venues, in which students are engaged in activities related to Design Studies. Students are responsible for transportation to and from internship. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior or Senior Standing in Design Studies Program ; Design Studies Majors
Typically offered in Fall, Spring, and Summer

Ecology (ECO)

Economics (EC)

EC 201 Principles of Microeconomics (3 credit hours)
Scarcity, production possibilities, and opportunity cost. Supply and demand analysis, free markets, the price system, and government policy. Microeconomic analysis of business decisions in competitive and noncompetitive markets. Labor markets, capital, and natural resource markets, and externalities. Market breakdown, income redistribution, and role of government. Free trade, tariffs, and gains from international trade. Credit will not be given for both EC 201 and either ARE 201 or EC 205.

Credit is not allowed for both EC 201 and EC 205 or ARE 201.
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

EC 202 Principles of Macroeconomics (3 credit hours)
Aggregate economic analysis emphasizing current public policy issues. Determinants of level and rate of growth of total output. Causes of unemployment and business cycles, inflation, and exchange rate fluctuations. Effects of monetary policy (money supply) and fiscal policy (government spending, taxes, deficits) on these problems. Trade surpluses/deficits and impact of international events and policies on national economies. Credit will not be given for both EC 202 and EC 205.

Prerequisite: EC 201 or ARE 201 or EC 205
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

EC 205 Fundamentals of Economics (3 credit hours)
Fundamental ideas in economics: scarcity, substitution, opportunity cost, marginal analysis, gross domestic product, real and nominal magnitudes. Supply and demand analysis. Microeconomic analysis of pricing in competitive and noncompetitive markets. Macroeconomic analysis of production, employment, the price level, and inflation. Monetary and fiscal policy and the stabilization of the economy. Comparative advantage and international trade. Credit will not be given for both EC 205 and either EC 201 or ARE 201. Credit will not be given for both EC 205 and EC 202.

Credit is not allowed for both EC 205 and EC 201 or ARE 201 or EC 202.
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

EC 301/ARE 301 Intermediate Microeconomics (3 credit hours)
Functioning of the market economy, role of prices in determining the allocation of resources, the functioning of the firm in the economy, forces governing the production and consumption of economic goods.

Prerequisite: MA 121 or MA 131 or MA 141 and EC 201 or EC 205 or ARE 201
Typically offered in Fall, Spring, and Summer

EC 302 Intermediate Macroeconomics (3 credit hours)
Applied, analytical course in aggregate economics: business cycles, stabilization policy, inflation, costs of disinflation, international trade, and economic growth. Interaction of consumers and businesses with government economic policies; unemployment, interest rates, and output growth. Impacts of government deficits, trade deficits, and monetary policies.

Prerequisite: (EC 201 or EC 205 or ARE 201)and (MA 121 or MA 131 or MA 141)
Typically offered in Fall, Spring, and Summer

EC 305 A Closer Look at Capitalism (3 credit hours)
Comparison of market allocation to government allocation. Criteria for evaluating economic systems. How markets create value. Relationship of economic freedom to political freedom and economic growth. Applications to policies such as antitrust policy, education policy, and environmental policy.

Prerequisite: EC 201 or EC 205 or ARE 201.
Typically offered in Fall only

EC 336/ARE 336 Introduction to Resource and Environmental Economics (3 credit hours)
Application of basic economic tools to understand and evaluate environmental/resource policies. Concepts such as property rights, non-market goods, allocation over time, externalities, and public goods. Current policy issues such as global climate change, evaluating natural resource damages from oil spills, reducing the costs of regulations, protecting estuaries, and dealing with non-point source pollution.

Prerequisite: ARE 201 or EC 201 or EC 205
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

EC 348 Introduction to International Economics (3 credit hours)
Application of basic economic analysis to international economic events and policies. Gains from trade, impacts of trade restrictions, international systems of payments, global capital markets, and balancing international with domestic macroeconomic policies. Current policy issues such as economic integration (customs unions and free trade areas), a common European currency, and the role of international trade in economic growth and development.

Prerequisite: EC 201 or EC 205 or ARE 201.
Typically offered in Fall only

EC 351 Econometrics I (3 credit hours)
Tools for describing and analyzing data as used in economics. Probability, random variables, sampling, point and interval estimation. Hypothesis testing and regression analysis with emphasis on economic applications. Statistics majors may not enroll in EC 351. Statistics majors interested in enrolling in EC 451 will satisfy the prerequisite of EC 351 with ST 430.

Prerequisite: BUS/ST 350 or ST 312 or ST 370 or ST 372
Typically offered in Fall and Spring

EC 404 Money, Financial Markets, and the Economy (3 credit hours)
Roles of money, credit, and financial institutions in the modern economy. Determination of level and structure of interest rates and exchange rates, determination of security prices. Management and regulation of financial institutions. Federal Reserve System and monetary policy. Statistical analysis of financial and monetary data.

Prerequisite: EC 302 and (BUS/ST 350, or ST 312, or ST 370, or ST 372)
Typically offered in Spring only

EC 410 Public Finance (3 credit hours)
A micro-economic analysis of the rationale for public expenditure and taxation. Externalities, pollution and public policy, income redistribution and public welfare, public goods, collective choice and political institutions, public budgeting techniques and cost-benefit analysis, taxation and tax policy, state-local finance and fiscal federalism.

Prerequisite: EC/ARE 301
Typically offered in Spring only

EC 413 Industrial Organization (3 credit hours)
An overview of industrial organization, including the study of monopoly, oligopolistic behavior, monopolistic competition, product differentiation and the dynamic behavior of competitive industries under uncertainty.

Prerequisite: EC/ARE 301
Typically offered in Spring only

EC 431 Labor Economics (3 credit hours)
An economic approach to the labor market and its problems including unemployment and the determination of wages, hours and working conditions under various labor market structures. The economic effects of trade unions. Introduction to human capital theory.

Prerequisite: EC/ARE 301
Typically offered in Fall and Spring

EC 449 International Finance (3 credit hours)
Study of international markets and their effects on firms, investors and national economics. Topics include: futures and options in foreign exchange, management of foreign exchange risk, exchange rate determination, and macroeconomic policy in an open economy.

Prerequisite: EC/ARE 301
GEP Global Knowledge
Typically offered in Fall only

EC 451 Econometrics II (3 credit hours)
The measurement, specification, estimation and interpretation of functional relationships through single equation least-square techniques. Applications of simple and multiple regression, curvilinear regression and various transformations to demand, cost, production, consumption and investment relationships.

Prerequisites: EC/ARE 301, EC 302, and EC 351 (or ST 430 for Statistics majors)
Typically offered in Fall and Spring

EC 468 Game Theory (3 credit hours)
Studies the competitive and cooperative behavior that results when several parties with conflicting interests must work together. Learn how to use game theory to analyze situations of potential conflict. Applications are drawn from economics, business, and political science.

Prerequisite: EC 301
Typically offered in Fall and Spring

EC 474 Economics of Financial Institutions and Markets (3 credit hours)
Management, development and regulation of U.S. financial markets and institutions. Management of major financial intermediaries and their historical development. Analysis of major financial assets and their markets. The role and history of the Federal Reserve and other financial regulators.

Prerequisite: (MA 121 or MA 131 or MA 141) and EC 302
Typically offered in Spring only

EC 490 Research Seminar in Economics (3 credit hours)
The final course for students completing the undergraduate programs in economics. Students study a selected economic issue, make classroom presentations related to the seminar topic, and write research papers.

Prerequisite: EC/ARE 301 and EC 302 and (BUS/ST 350 or ST 312 or ST 370 or ST 372)
Typically offered in Fall and Spring

EC 495 Special Topics in Economics (1-6 credit hours)
Examination of special topics in economics not normally treated in other courses, or offering of new courses on a trial basis.

EC 498 Independent Study in Economics (1-6 credit hours)
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction on a tutorial basis. Credits and content determined by faculty member in consultation with Director of Undergraduate Programs. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

Educ Leadership & Program Eval (ELP)

ELP 296 Special Topics in Education: General Studies (1-3 credit hours)
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

Typically offered in Fall, Spring, and Summer

ELP 344 School and Society (3 credit hours)
The interrelationship between the school and other institutions, values, and patterns of thought in American society.

Prerequisite: Junior standing.
Typically offered in Fall and Spring

ELP 496 Special Topics in Education: General Studies (1-3 credit hours)
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

Prerequisite: Junior standing or Senior standing
Typically offered in Fall, Spring, and Summer

ELP 515 Education and Social Diversity (3 credit hours)
Overview of role of education within a culturally diverse society. Major attention to racial, socioeconomic and regional subpopulations. Issues discussed include subcultural influences on public school performances, equality of educational opportunity, social stratification and mobility, and the impact of schooling on intergroup relations.

Typically offered in Fall only

ELP 518 Introduction To Education Law (3 credit hours)
Relationship of constitutional, statutory and case law to elementary and secondary public school settings, particularly in areas of students, teachers and liability. Particular emphasis on N.C. and federal law.

Typically offered in Spring only

ELP 550 Principles of Educational Leadership and Empowerment (3 credit hours)
Examines school organization theories and critical domains of leadership (e.g., school vision, culture, management, collaboration, ethics, and environments). Develops conceptual, managerial and interpersonal leadership skills through analysis of school goals and purpose; organizational design, development and improvement; curricular and instructional leadership; and school-community relationships. Instructional activities will include lecture, seminar discussion, case and problem-based analysis. Graduate standing required.

Typically offered in Fall only

ELP 551 Context and Challenges of School Improvement (3 credit hours)
Examination of social, cultural, political and policy environment of schooling with emphasis on NC. Analysis of major theories of school change and development. critical examination of opportunities and barriers to strategic change efforts. Instructional activities will include lecture, sminar discussion, case and problem-based analysis.

Typically offered in Spring only

ELP 552 School-Based Planning, Management, and Evaluation in Professional Learning Communities (3 credit hours)
Prepares administrators to strategically plan, manage and evaluate core programs and systems for the safe and efficient operation of schools. Operational domains examined will include information systems, management systems, curriculum, instruction, student behavior and school security systems. Instructional activities include lecture, sminar discussions, case, situation and problem-based analysis.

Typically offered in Fall only

ELP 553 Organizational Management I: Human Resource Management in K-12 Education (3 credit hours)
Examination and application of models, theories, and research pertaining to personnel appraisal in education, including recruitment hiring, retention, and dismissal; evaluation models for professional and classified staff; use of effective professional development models to support professional growth and development.

Typically offered in Fall only

ELP 554 Organizational Management II: Resource Support and Sustainability in K-12 Education (3 credit hours)
Theories and practices of funding K-12 education including examination of: political frameworks and policy issues; concepts central to education finance and budgeting; purposes, designs, and uses of school budgets; procedures for generating, analyzing and interpreting issues related to education finance and school budgeting. Construct, manage and analyze school and district-level budgets; address issues of economic efficiency, equity and fiscal adequacy and their fiscal impact on the school community. Understand North Carolina's Uniform Chart of Accounts accounting structure for school budgeting.

Corequisite: ELP 553
Typically offered in Spring only

ELP 595 Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

ELP 620 Special Problems In Education (1-6 credit hours)
Opportunity for graduate students in education to study problem areas in professional education under direction of member of graduate faculty.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

ELP 651 Internship In Educational Leadership and Program Evaluation (1-9 credit hours)
Utilization of participant-observer role and required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Required development of possible alternative courses of action in various situations, selection of one of alternatives and evaluation of consequences of selected course of action.

Prerequisite: Nine hrs. in grad.-level courses
Typically offered in Fall and Spring

ELP 699/EMS 699/EOE 699/EAC 699/ECD 699/ECI 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall and Spring

ELP 724 Contemporary Educational Thought (3 credit hours)
Reading and discussion of 20th-century works in educational philosophy. Consideration of such movements as pragmatism, reconstruction, perennialism and existentialism.

Typically offered in Fall, Spring, and Summer

ELP 728 School Law For the Administrator (3 credit hours)
Comprehensive study of constitutional, statutory and case law as related to elementary and secondary school administration. Emphasis on legal issues associated with governance, finance, property, personnel and curriculum.

Typically offered in Spring only

ELP 729 Educational Finance (3 credit hours)
Historical and sociopolitical contextual analysis of underlying values, methodologies and policies associated with economic and financial planning of K-12 education (e.g., efficiency, equity, and liberty) and the economic and financial mechanisms used to generate, distribute, and expend revenues for educational purposes.

Typically offered in Fall only

ELP 735 Policy Research in Education (3 credit hours)
This course will draw on both classic and contemporary materials in educational policy research and will primarily focus on the substance of policy research rather than methodology. It addresses research pertaining to the foundations, implementation and evaluation of policy in all levels and sectors of the educational system. Major attention will be given to education in the United States, with comparative perspectives included.

Typically offered in Fall, Spring, and Summer

ELP 751 Politics of P-12 Education (3 credit hours)
Analysis of political interactions of individuals and groups in P-12 education, specifically, how politics shapes educational decisions within a federal system of governance. Topics covered include micropolitics and macropolitical systems at the school, district, municipal, state, and federal levels, as well as political culture, interest groups, advocacy coalitions, and institutions. Doctoral standing required.

Typically offered in Fall only

ELP 753 Data Decision Making for School Administrators (3 credit hours)
Understand the purposed and uses of school data for research-based school improvement. Understand different types of assessment needed for school and district-wide improvement. Develop models of administrative decision making incorporating key goals, resources, curriculum alignment, data, assessment, and evaluation. Doctoral student status required.

Typically offered in Spring only

ELP 756 Organizational Leadership & Mangement for School Leaders (3 credit hours)
Prepares district-level administrators to analyze the changing nature of the superintendency, including major management and leadership responsibilities and leadership approaches. Operational domains examined include school governance and organizational theory, school boards, school district policy, collaborative leadership, material and human resource management, systemic and sustainable reform, contemporary challenges, and personal practices management. Doctoral standing required.

ELP 780 Evaluation Theory and Practice In Education (3 credit hours)
Review of educational program evaluation with emphasis on (1) theory and conceptual models of evaluation, (2) evaluation design, and (3) environmental practical factors influencing design and implementation of evaluation studies.

Typically offered in Fall only

ELP 795 Special Topics (1-6 credit hours)
Special Topics in Educational Research and Leadership

ELP 820 Special Problems In Education (1-6 credit hours)
Opportunity for graduate students in education to study problem areas in professional education under direction of member of graduate faculty.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

ELP 851 Internship In Educational Leadership and Program Evaluation (1-9 credit hours)
Utilization of participant-observer role and required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Required development of possible alternative courses of action in various situations, selection of one of alternatives and evaluation of consequences of selected course of action.

Prerequisite: Nine hrs. in grad.-level courses
Typically offered in Fall, Spring, and Summer

ELP 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall only

ELP 891 Problems Of Research Design In Education (1-3 credit hours)
Provision of individualized but structured investigation of alternative problem definitions, research methodologies and statistical analyses for a problem of student's choosing, usually associated with thesis or dissertation. In small groups or individually with instructor, student consideration of research design, measurements and statistical analysis necessary to conduct research.

Prerequisite: ELP 742
Typically offered in Fall, Spring, and Summer

ELP 892 Research Projects In Educational Leadership and Program Evaluation (1-3 credit hours)
A project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Typically offered in Fall, Spring, and Summer

ELP 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ELP 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

Education (ED)

ED 100 Intro to Education (2 credit hours)
This course serves as an introduction to the field of education and as an orientation to the College and University experience. Students will examine the knowledge, skills, and dispositions necessary to become effective educators of diverse populations. Topics include student success strategies, professional standards for teachers, and resources in the College of Education. This course is restricted to College of Education students only.

Restriction: College of Education Students only, others by permission of the College of Education
GEP U.S. Diversity
Typically offered in Fall and Spring

ED 101 Freshman Teaching Fellows Forum I (1 credit hours)
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education.Restricted to Students Admitted to the Teaching Fellows Program

Typically offered in Fall only

ED 103 Intro to University Education (1 credit hours)
Developmental and academic topics to assist students as they make well-informed decisions about majors and careers. Through technology-assisted plenary and small group seminars, students will examine the knowledge, skills and dispositions necessary to become globally aware, ethical, reflective students of diverse populations in the 21st century. Topics include academic skills, student success strategies, community and diversity; major and career decision making; assessment of interests, skills, and values; available university resources; overview of university majors and minors as well as policies and procedures. This course is restricted to Wake STEM Early College students only.

Typically offered in Fall only

ED 104 Intro to University Education II (1 credit hours)
Developmental and academic topics to assist students as they make well-informed decisions about majors and careers. Through technology-assisted plenary and small group seminars, students will examine the knowledge, skills, and dispositions necessary to become globally aware, ethical, reflective students of diverse populations in the 21st century. Topics include academic skills, student success strategies, community, and diversity; major and career decision making; assessment of interests, skills, and values; available university resources; overview of university majors and minors as well as policies and procedures. This course is restricted to Wake STEM Early College students only. Students will be required to provide their own transportation if they choose a co-curricular activity that is off campus.

Restriction: This course is restricted to NC State Wake STEM Early College students.
Typically offered in Spring only

ED 150 Students Advocating for Youth I (1 credit hours)
Building upon a passion for advocacy. Investigating issues related to youth in today's North Carolina. Exploring youth advocacy and ethics. Exploring youth advocacy and diversity. Exploring youth advocacy as a vocation. Practical youth advocacy field work. Participation in field experiences required. Restricted to students admitted to the SAY program.

Typically offered in Fall only

ED 151 Students Advocating for Youth II (1 credit hours)
Continuing to build upon a passion for advocacy. Understanding how legistlation and policy affects youth advocacy and youth organizations. Exploring changes within the career field. Exploring peer influence processes among youth. Practical youthadvocacy field work. Participation in field experiences required. Field experience may extend beyond normal class time. Restricted to students admitted to the SAY program.

Prerequisite: ED 150
Typically offered in Spring only

ED 201 Sophomore Teaching Fellows Forum I (1 credit hours)
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education.

Prerequisite: Students in Teaching Fellows Program
Typically offered in Fall only

ED 204 Introduction to Teaching in Today's Schools (2 credit hours)
Overview of teaching as work and as a profession in today's schools. Course focuses on establishing a respectful environment for a diverse student population, dispositions and practices required for effective teaching, integration of digital technology into K-12 settings, and taking informed action through service learning. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase intern liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge, which typically ranges between $12-50 depending on the year and organization used.

Prerequisite: Sophomore standing; Corequisite: ECI 204, or EMS 204, or EMS 205, or TDE 202
Typically offered in Fall and Spring

ED 296/ECI 296 Special Topics in Education (1-3 credit hours)
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

Typically offered in Fall and Spring

ED 299/FL 299 Field Experience for 21st Century Teaching (1 credit hours)
This course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Foreign Language Education majors.

Prerequisite: ECI 204 and ED 204
Typically offered in Spring only

ED 301 Junior Teaching Fellows Forum I (1 credit hours)
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education.Restricted to Students Admitted to the Teaching Fellows Program

Typically offered in Fall only

ED 302 Junior Teaching Fellows Forum II (1 credit hours)
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education.Restricted to Students Admitted to the Teaching Fellows Program

Typically offered in Spring only

ED 311 Classroom Assessment Principles and Practices (2 credit hours)
This course will enable candidates to understand and use appropriate classroom assessment practices to promote positive student achievement. Candidates will learn to use knowledge of standards, student needs, and data-driven instruction to design and implement formative and summative assessments. ED 311 also examines the rationale for assessment, implications of assessment, and the varied ways assessment data is used by stakeholders both within and outside of the K-12 classroom.

Prerequisite: Admission to Teacher Education Candidacy (gpa 2.75) AND course prerequisite of ED 204, or ELM 250, or AEE 206; Co-requisite: ED 312
Typically offered in Fall and Spring

ED 312 Classroom Assessment Principles and Practices Professional Learning Lab (1 credit hours)
This class is a co-requisite professional learning lab to ED 311, Classroom Assessment Principles and Practices, wherein teacher candidates are exposed to practical applications of the ED 311 course topics. The course has a required fieldwork component in local K-12 schools, and candidates are responsible for their own transportation to and from the schools. Candidates are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors. Course Prerequisite / Co-requisite: P-R: Admission to Candidacy; Co-R: ED 311

Prerequisite: Admission to Teacher Education Candidacy (gpa 2.75) and ED 204, ELM 250, or AEE 206; Co-requisite: ED 311
Typically offered in Fall and Spring

ED 403 Teaching Fellows Senior Seminar (1 credit hours)
A casebook study of first-year teacher experiences and an examination of professional, ethical, and legal issues in education as found in cases dealing with new teachers.

Prerequisite: Senior standing
Typically offered in Fall and Spring

ED 496/ECI 496 Special Topics in Education (1-3 credit hours)
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

Prerequisite: Junior standing or Senior standing
Typically offered in Fall and Spring

ED 507 Principles of Developing and Interpreting Assessment (2 credit hours)
Designed to enable students to understand and use appropriate classroom assessment practices by applying knowledge of pedagogy and development to high-quality strategies for formative and summative assessment. Students will explore best practices using developmentally-appropriate assessment strategies including authentic assessment, portfolios, and electronic portfolios, real-time feedback, open-and closed-ended formal assessments, and standardized testing. Particular attention will be paid to examining the rationale for assessment, and the implications of assessment.

Typically offered in Fall, Spring, and Summer

ED 508 Exploring Diversity in Classroom and Community (3 credit hours)
Students will explore and apply the major philosophical and historical influences to current educational context as they relate to issues of diversity. Focus will be placed on theoretical and practical issues of diversity in classroom settings, especially related to culture, race, gender, ethnicity, language, and socio-economic levels. (Field-based experiences will be required).

Typically offered in Fall, Spring, and Summer

ED 569 Teaching Internship: MAT (4 credit hours)
A supervised teaching experience requiring a minimum of 10 consecutive full-time weeks in an appropriate school classroom. Designed to develop the knowledge, skills, and dispositions necessary for teaching at the elementary, middle and/or secondary level. Includes regularly scheduled clinical observations and conferences. Requires successful completion of at least 21 hrs. in the MAT program and approval by specialty area faculty. Student responsible for transportation to placement site.

Typically offered in Fall and Spring

ED 570 Classroom Action Research (1 credit hours)
Provides a brief introduction to educational research focusing specifically on classroom action research. Requires admission to MAT; completion of 6 hours in the program.

Typically offered in Fall, Spring, and Summer

ED 571 Inquiry and Professional Development (1 credit hours)
Builds on earlier course work (ED 570) preparing students to refine an action research proposal, collect data in a school setting, write a report, and to identify resources and activities that will support their ongoing professional development; requires 9 hours of graduate credit in the MAT curriculum.

Typically offered in Fall, Spring, and Summer

ED 572 Teacher Leadership (1 credit hours)
This course explores the multiple contexts, roles, and approaches to teacher leadership in classrooms, schools, communities, and professional organizations. Requires at least 30 credit hours in the MAT program.

Typically offered in Fall and Spring

ED 590 Special Problems in Teaching and Learning (1-6 credit hours)
In-depth study of topical problems in teaching and learning of current and special interest to K-12 Classroom teachers.

Typically offered in Fall, Spring, and Summer

ED 605 Special Problems in Teaching (1-3 credit hours)
In-depth study of topical problems in teaching selected from areas of current concern to K-12 teachers.

Prerequisite: Graduate standing

ED 700 Introduction to Research Design in Education (3 credit hours)
Survey of the field of educational research specifically with regard to the modes of inquiry, variety of methodologies, and ethical standards for conducting research with human participants. Limited to doctoral students in Education or by permission of instructor.

Typically offered in Fall only

ED 710 Applied Quantitative Methods in Education I (3 credit hours)
This course is designed for educational researchers and leaders to gain experience with designing and evaluating research using a quantitative approach to answer research questions in educational research and policy analysis. Students will examine design issues in research, create data sets, develop research questions from data provided, use a variety of descriptive and inferential procedures to answer formulated research questions, interpret the results and write the results in the language of educational research. Restricted to doctoral students in Education or by permission of instructor.

Prerequisite: ED 700, or ECI 510, or ELP 532, or ST 507
Typically offered in Fall, Spring, and Summer

ED 711 Applied Quantitative Methods in Education II (3 credit hours)
Students will apply and enhance their quantitative skills through analysis of existing datasets. Course goals include practicing and extending Multiple Regression knowledge and skills, generating and testing hypotheses in a multiple regression framework, and appropriately disseminating results. Restricted to doctoral students in Education Research only.

Prerequisite: ED 710
Typically offered in Fall, Spring, and Summer

ED 712 Survey Methods in Educational Research (3 credit hours)
Introduces students to the skills and resources needed to design and conduct a survey in educational settings. Students who take this course will be able to identify and develop specific survey objectives, design survey studies, sample respondents, develop reliable and valid self-administered questionnaires, administer surveys, and process data.

Prerequisite: ED 710
Typically offered in Fall only

ED 714 Workflow of Data Analysis in Education (3 credit hours)
The rule of thumb for a quantitative research project in education is that about 70%-80% of your time will be spent on creating the dataset to be analyzed. The purpose of this course is to provide you with the set of practical skills that you need to successfully design and complete a quantitative research project in education, especially the dissertation. Students will learn how to create, merge, collapse and reshape datasets, create variables, deal with missing data via multiple imputation, and automate statistical output into Excel.

P: ED 710 or the equivalent. Given the nature of this course, you should have some experience with Stata. Please contact me as soon as possible if you have never used Stata.
Typically offered in Spring and Summer

ED 730 Introduction to Qualitative Research in Education (3 credit hours)
Design of qualitative studies, conduct of field work including open-ended interviews and participant observation, analysis of data and understanding of theoretical and philosophical background of this research approach.

Typically offered in Fall, Spring, and Summer

ED 731 Advanced Qualitative Research and Data Analysis in Education (3 credit hours)
Intensive course in the use of field-based and general qualitative research data analysis methods in the social study of education. The course is to help participants acquire skills and gain experience in using various methodological and analytical research techniques. The course emphasis is on the collection, management, analysis, and interpretation of qualitative data.

Prerequisite: ELP 736, EAC 785 or ED 730
Typically offered in Fall and Spring

ED 750/EDP 750 Mixed Methods Research in Education (3 credit hours)
Explores the theoretical and practical issues surrounding the combining of quantitative and qualitative methods in educational research studies. It addresses how to design, implement and write-up mixed methods research as well as how to critically review and interpret mixed methods research studies.

Prerequisite:ED 711,ED 730,ST 507, ELP736 or equivalent and/or permission of the instructor
Typically offered in Fall and Spring

ED 755 Scholar Leader: Diversity and Equity in Schools and Communities (3 credit hours)
The objective of this course is to inform you about the research and theories related to diversity (race/ethnicity, gender, social class, sexuality, ability, intersectionality and more) and equity in schools and communities for application to your own personal and professional experiences. This process will provide you with a foundation from which you may base your own decisions in your profession. As the course proceeds, your role will be to try to understand what you hear and read and to ask questions, to formulate an opinion about the theories/concepts that are presented, and to connect what you read to your own experiences as a human being, graduate student, and professional.

Typically offered in Fall, Spring, and Summer

ED 756 Scholar Leader: Systemic Change in Education (3 credit hours)
This is a required course for students in College of Education PhD programs. It is designed to help prepare students to engage in informed analysis, critique and planning of education policies and programs designed to foster systemic changes in K-16 education. A central focus will be the intersection of research, policy, and practice in efforts to update and improve education systems, and the social and political complexities of educational reform.

Typically offered in Fall and Spring

ED 795 Special Topics in Education Research (3-6 credit hours)
This course provides in-depth instruction and applications in new or emerging areas of educational research, studies or venues. May be repeated for credit if topic changes. Doctoral students in education only.

Typically offered in Fall, Spring, and Summer

Educational Psychology (EDP)

EDP 304 Educational Psychology (3 credit hours)
Psychological principles applied to education, including cognitive and personality development, individual differences, learning and behavior theory, cognitive strategies for learning and remembering, critical thinking and problem-solving strategies, student motivation, classroom management techniques, components of teacher effectiveness, measurement and student evaluation procedures, characteristics of exceptional children, mainstreaming in the classroom, and multicultural education.

Prerequisite: Sophomore standing
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

EDP 370 Applied Child Development (3 credit hours)
Students will explore how biological, cognitive, and social/emotional development affects children's learning and behavior. The course will focus on applying important theories and current findings in development to issues in education such as lesson planning, curriculum design, behavior management, motivation, an appropriate assessment. Students will also apply knowledge of development to issues such as creating actively engaging individuated experiences to deal with gifted students, students with diverse ethnic or cultural backgrounds, and students with exceptionalities or disabilities.

Prerequisite: Sophomore standing
GEP Social Sciences
Typically offered in Fall only

EDP 476/PSY 476 Psychology of Adolescent Development (3 credit hours)
Theories, principles, and issues of human psychological development emphasizing adolescence. Cognitive, social, and physical changes; their interaction. Implications for teaching and parenting adolescents.

Prerequisite: PSY 200 or EDP 304
Typically offered in Summer only

EDP 504 Advanced Educational Psychology (3 credit hours)
A critical appraisal of current psychological findings relevant to educational practice and theory.

Prerequisite: Graduate standing
Typically offered in Spring only

EDP 560 Educational Testing and Measurement (3 credit hours)
The study of principles of educational testing and measurement, particularly classroom assessment, including norm and criterion referenced assessment, classroom testing methods and principles,standardized testing and measurement, item analysis, and an introduction to basic descriptive statistics. A brief introduction to innovative assessment is also included.

Prerequisite: Graduate standing
Typically offered in Spring only

EDP 575/ECD 575 Multicultural Lifespan Development (3 credit hours)
This course surveys theories, principles, and issues of psychological development throughout the lifespan. Emphasis will be placed on understanding current developmental research and its application to the enhancement of development from birth to late adulthood. Implications for helping professionals working in multicultural contexts will be provided.

Prerequisite: Six Hours of Graduate Study
Typically offered in Spring and Summer

EDP 582/PSY 582 Adolescent Development (3 credit hours)
Current theories and research on development during adolescence. Topics include: physical growth, cognitive changes, relationships with peers, parents and teachers, quest for identity and independence, morality and sexuality.

Prerequisite: 6 hours in PSY
Typically offered in Fall only

EDP 590 Special Problems in Educational Psychology (1-6 credit hours)
In-depth study of topical problems in cognition, motivation, assessment, or other educational psychology area of current and special interest to educators.

Typically offered in Fall, Spring, and Summer

EDP 605 Special Problems in Educational Psychology (1-6 credit hours)
In-depth study of topical problems in educational psychology selected from areas of current concern to educators.

Typically offered in Fall, Spring, and Summer

EDP 696 Summer Thesis Res (1 credit hours)

EDP 704 Theories and Research in Educational Psychology (3 credit hours)
Review and synthesis of pertinent literature in specialized topics and areas of research in educational psychology. Topic selection will vary by semester and instructor. Graduate standing or permission of instructor.

Doctoral students only (DR)
Typically offered in Fall only

EDP 723 Motivation in Education (3 credit hours)
The purpose of this course is to inform students about motivation theories and how various concepts from these theories are related to education practice. The course components are designed to provide students with an understanding of research in motivation, as well as the relationships between theoretical perspectives of human motivation and the teaching practice.

P: ED 700 or equivalent
Typically offered in Spring only

EDP 750/ED 750 Mixed Methods Research in Education (3 credit hours)
Explores the theoretical and practical issues surrounding the combining of quantitative and qualitative methods in educational research studies. It addresses how to design, implement and write-up mixed methods research as well as how to critically review and interpret mixed methods research studies.

Prerequisite:ED 711,ED 730,ST 507, ELP736 or equivalent and/or permission of the instructor
Typically offered in Fall and Spring

EDP 896 Summer Dissert Res (1 credit hours)

EGR-Engineering Master's (EGR)

EGR 501 Engineering Leadership and Strategic Change (3 credit hours)
In the current business environment, an understanding of leadership and change management is essential to career success. The objective of this course is to provide practitioners in technical fields the knowledge to lead, align and transform the human element, individuals and teams, to achieve organizational performance excellence. The class includes both individual and collaborative (team) learning. An engineering, technical, or scientific undergraduate degree is required.

Typically offered in Fall and Spring

EGR 503 Statistical Engineering using Six Sigma DMAIC Process (3 credit hours)
Statistical Engineering: systematic approach (Six Sigma DMAIC methodology) for improving manufacturing and business processes and products using advanced graphical and statistical methods. Defining the improvement opportunity, measurement system analysis (MSA), Failure Mode and Effects Analysis (FMEA), data collection, graphical and statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of statistical engineering to business and manufacturing case studies.

ST 361 or ST 370 or Entry Level Statistics
Typically offered in Fall and Spring

EGR 505 Managerial Finance for Engineers (3 credit hours)
In the current business environment, familiarity with and appreciation of finance is essential to career success. Technically competent managers must be able to speak the common language of business and to understand how their work affects the performance of their organization. The objective of this course is to provide practitioners in technical fields the financial know-how to plan, control and make decisions that achieve organizational performance excellence. The class includes both individual and collaborative (team) learning. An engineering, technical or scientific undergraduate degree is required.

Typically offered in Fall and Spring

EGR 506 Managing New Hi Tech Product Launches (3 credit hours)
This course covers new high-tech product development and launch from the perspective of the technical manager responsible for developing and launching new products and new lines of business within the high tech firm. Topics cover the entire spectrum of the new products development and launch process starting from concept generation and ideation and concept evaluation all the way through market testing and product launch. Each phase of the new products management process will be covered and illustrated by case studies. Students will generate a new product development and launch plan as a course project..3 credit hours.

Requirement: Graduate standing in Engineering
Typically offered in Spring and Summer

EGR 507 Product Life Cycle Management (3 credit hours)
This course covers the management of complex technical products during all phases of the product life cycle. It is a broad survey of all the tools needed by the technical product manager throughout the life cycle of a complex product. The course is taught with a systems approach and from the engineering manager's viewpoint. The product life cycle includes all aspects of managing products from launch through maturity.

Requirement: Graduate standing in Engineering
Typically offered in Fall, Spring, and Summer

EGR 590 Special Topics in Engineering (1-6 credit hours)
Discussion of special topics in engineering. Identification of various specific topics and prerequisites for each section from term to term.

Typically offered in Fall, Spring, and Summer

EGR 688 Non-Thesis Masters Continuous Registration-Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

Electrical and Computer Engineering (ECE)

ECE 109 Introduction to Computer Systems (3 credit hours)
Introduction to key concepts in computer systems. Number representations, switching circuits, logic design, microprocessor design, assembly language programming, input/output, interrupts and traps.

Typically offered in Fall, Spring, and Summer

ECE 200 Introduction to Signals, Circuits and Systems (4 credit hours)
Ohm's law and Kirchoff's laws; circuits with resistors, photocells, diodes and LEDs; rectifier circuits; first order RC circuits; periodic signals in time and frequency domains, instantaneous, real and apparent power; DC and RMS value; magnitude andpower spectra, dB, dBW, operational amplifier circuits, analog signal processing systems including amplification, clipping, filtering, addition, multiplication, AM modulation sampling and reconstruction. Weekly hardware laboratory utilizing multimeter, function generator, oscilloscope and spectrum analyzer and custom hardware for experiments on various circuits and systems.

Prerequisite: Cum GPA 2.5 or above (or NTR) , C or better in MA 241 and PY 205
Typically offered in Fall, Spring, and Summer

ECE 209 Computer Systems Programming (3 credit hours)
Computer systems programming using the C language. Translation of C into assembly language. Introduction to fundamental data structures: array, list, tree, hash table.

Prerequisite: Grade of C- or better in ECE 109
Typically offered in Fall, Spring, and Summer

ECE 211 Electric Circuits (4 credit hours)
Introduction to theory, analysis and design of electric circuits. Voltage, current, power, energy, resistance, capacitance, inductance. Kirchhoff's laws node analysis, mesh analysis, Thevenin's theorem, Norton's theorem, steady state and transient analysis, AC, DC, phasors, operational amplifiers, transfer functions.

Prerequisite: C- or better in ECE 200 and Corequisite: ECE 220
Typically offered in Fall, Spring, and Summer

ECE 212 Fundamentals of Logic Design (3 credit hours)
Introduction to digital logic design. Boolean algebra, switching functions, Karnaugh maps, modular combinational circuit design, latches, flip-flops, finite state machines, synchronous sequential circuit design, datapaths, memory technologies, caches, and memory hierarchies. Use of several CAD tools for simulation, logic minimization, synthesis, state assignment, and technology mapping.

Prerequisite: C- or better in ECE 109
Typically offered in Fall, Spring, and Summer

ECE 220 Analytical Foundations of Electrical and Computer Engineering (3 credit hours)
This course is designed to acquaint you with the basic mathematical tools used in electrical and computer engineering. The concepts covered in this course will be used in higher level courses and, more importantly, throughout your career as an engineer. Major topics of the course include complex numbers, real and complex functions, signal representation, elementary matrix algebra, solutions to linear systems of equations, linear differential equations, laplace transforms used for solving linear differential equations, fourier series and transforms and their uses in solving ECE problems. EE and CPE Majors Only.

Prerequisite: C- or better in ECE 200
Typically offered in Fall, Spring, and Summer

ECE 298 Special Projects in ECE (1-4 credit hours)
Faculty-supervised special projects in electrical and/or computer engineering. Projects involve small groups of students, working collaboratively or independently, focused on a single theme, such as the design of a component or system. Requires a "Course Agreement for Students Enrolled in Non-Standard Courses," completed by the student and faculty member prior to registration by the department.

R: EE or CPE majors
Typically offered in Fall, Spring, and Summer

ECE 301 Linear Systems (3 credit hours)
Representation and analysis of linear systems using differential equations: impulse response and convolution, Fourier series, and Fourier and Laplace transformations for discrete time and continuous time signals. Emphasis on interpreting system descriptions in terms of transient and steady-state response. Digital signal processing.

Prerequisite: C- or better in ECE 211 and ECE 220.
Typically offered in Fall, Spring, and Summer

ECE 302 Microelectronics (4 credit hours)
Introduction to the physics of semiconductors, PN Junctions, BJT and MOS field Effect Transistors: Physics of operation, IV characteristics, load line, quiescent point of operation, PSPICE analysis; diode circuit analysis; voltage regulation; Single Stage Transistor Amplifiers: Common Emitter and Common Source configurations, biasing, inverting and non-inverting amplifiers; follower circuits; calculation of small signal voltage gain, current gain, coupling and bypass capacitors; Multistage ac-coupled amplifiers; small signal modeling; input resistance and output resistance; logic inverters.

Prerequisite: A grade of C- or better in ECE 211
Typically offered in Fall, Spring, and Summer

ECE 303 Electromagnetic Fields (3 credit hours)
This course prepared the students to formulate and solve electromagnetic problems relevant to all fields of electrical and computer engineering and that will find application in subsequent courses in RF circuits, photonics, microwaves, wireless networks, computers, bioengineering, and nanoelectronics. Primary topics include static electric and magnetic fields, Maxwell's equations and force laws, wave propagation, reflection and refraction of plane waves, transient and steady-state behavior of waves on transmission lines. Restriction: EE and CPE Majors Only.

Prerequisite: A grade of C- of better in ECE 211 and ECE 220
Typically offered in Fall, Spring, and Summer

ECE 305 Principles of Electromechanical Energy Conversion (3 credit hours)
Three-phase circuits and power flow, analysis of magnetic circuits, performance of single-phase and three-phase transformers, principles of electromechanical energy conversion, steady-state characteristics and performance of alternating current and direct current machinery.

Prerequisite: C- or better in ECE 211 or ECE 331
Typically offered in Fall, Spring, and Summer

ECE 306 Introduction to Embedded Systems (3 credit hours)
Introduction to designing microcontroller-based embedded computer systems using assembly and C programs to control input/output peripherals. Use of embedded operating system.

Prerequisite: C- or better in ECE 209 and ECE 212
Typically offered in Fall and Spring

ECE 308 Elements of Control Systems (3 credit hours)
Analog system dynamics, open and closed loop control, block diagrams and signal flow graphs, input-output relationships, stability analyses using Routh-Hurwitz, root-locus and Nyquist, time and frequency domain analysis and design of analog control systems. Use of computer-aided analysis and design tools. Class project. EE, CPE, BME majors only.

Prerequisite: (ECE 220 and ECE 211) or BME 311; Co-requisite: ECE 301
Typically offered in Fall and Spring

ECE 309 Data Structures and Object-Oriented Programming for Electrical and Computer Engineers (3 credit hours)
Advanced programming topics focusing on data structures and object-oriented programming. Common data structures, including linked lists, hash tables, trees, balanced trees, heaps, graphs, and B-trees, are described, analyzed, and implemented. Object-oriented programming topics, classes, inheritance, polymorphism, abstract types, and generic types are described and applied to program design.

Prerequisite: C- or better in ECE 209
Typically offered in Fall and Spring

ECE 310 Design of Complex Digital Systems (3 credit hours)
Design principles for complex digital systems. Decomposition of functional and interface specifications into block-diagrams and simulation with hardware description languages. Synthesis of gate-level descriptions from register-transfer level descriptions. Design and test of increasingly complex systems.

Prerequisite: A grade of C- or better in ECE 212
Typically offered in Fall and Spring

ECE 331 Principles of Electrical Engineering (3 credit hours)
Concepts, units and methods of analysis in electrical engineering. Analysis of d-c and a-c circuits, characteristics of linear and non-linear electrical devices; principles of operational amplifiers; transformers; motors; and filters.

Prerequisite: PY 208 and a C or better in MA 241
Typically offered in Fall, Spring, and Summer

ECE 380 Engineering Profession for Electrical Engineers (1 credit hours)
Introduction to engineering as a profession including issues surrounding electrical engineering. Topics include professional and ethical responsibilities, risks and liabilities, intellectual property, and privacy. Economic issues including entrepreneurship and globalization.

Pre-requisites: C- or better in ECE 211 and ECE 212 and ECE 220
Typically offered in Fall and Spring

ECE 381 Engineering Profession for Computer Engineers (1 credit hours)
Introduction to engineering as a profession including issues surrounding computer engineering. Topics include professional and ethical responsibilities, risks and liabilities, intellectual property, and privacy. Economic issues including entrepreneurship and globalization.

Pre-requisites: C- or better in ECE 211 and ECE 212 and ECE 220
Typically offered in Fall and Spring

ECE 383 Introduction to Entrepreneurship and New Product Development (1 credit hours)
This course is part of the Engineering Entrepreneurs Program. Students work as team members on projects being led by seniors completing their senior capstone design. Students will be exposed to many areas of product development and will assist in the design and implementation of the prototype product.

Typically offered in Fall and Spring

ECE 384 Practical Engineering Prototyping (3 credit hours)
This course will teach prototyping skills, standard tools, and best practices to convert a project concept into a functioning, verifiable prototype. Course topics include understanding component specifications, system schematics, system functionality verification, power calculations and measurements, driver circuit designs, soldering and wiring procedures, basic MCU programming, Printed Circuit Board design and test, and debugging/test/verification tools/methods and procedures. Quick workshops on sensor interfacing, standard circuits and off-the-shelf systems, mobile app design, prototype packaging, and patent search resources will also be included in this course. Students will be required to complete several prototyping activities outside of class. This course is an open elective recommended to be taken before or at the same time as the capstone classes for Electrical and Computer (ECE) Engineering. Students are expected to have some basic knowledge about what is ac-dc, dc-dc voltage converters, motors, transistors, op-amps, and MOSFETS.

Prerequisites: (ECE 200 and ECE 209 and ECE 211) or their equivalent
Typically offered in Summer only

ECE 398 Special Projects in ECE (1-4 credit hours)
Faculty-supervised special projects in electrical and/or computer engineering. Projects involve small groups of students, working collaboratively or independently, focused on a single theme, such as the design of a component or system. Requires a "Course Agreement for Students Enrolled in Non-Standard Courses," completed by the student and faculty member prior to registration by the department.

C: ECE 301 or ECE 302 or ECE 303 or or E 304 or ECE 305 or ECE 306 or ECE 308 or ECE 309 or ECE 310; R: EE and CPE majors
Typically offered in Fall, Spring, and Summer

ECE 402 Communications Engineering (3 credit hours)
An overview of digital communications for wireline and wireless channels which focuses on reliable data transmission in the presence of bandwidth constraints and noise. The emphasis is on the unifying principles common to all communications systems, examples include digital telephony, compact discs, high-speed modems and satellite communications.

P: ECE 301 and ST 371; R: EE and CPE Majors Only
Typically offered in Fall, Spring, and Summer

ECE 403 Electronics Engineering (3 credit hours)
Design and analysis of CMOS integrated circuits, from single transistor stages to operational amplifiers. Feedback in operational amplifier circuits, compensation and stability. ECE majors only.

Prerequisite: ECE 301, ECE 302
Typically offered in Spring only

ECE 404 Introduction to Solid-State Devices (3 credit hours)
Basic principles required to understand the operation of solid-state devices. Semiconductor device equations developed from fundamental concepts. P-N junction theory developed and applied to the analysis of devices such as varactors, detectors, solar cells, bipolar transistors, field-effect transistors. Emphasis on device physics rather than circuit applications.

P: ECE 302 or E 304; C: EE, CPE, NanoScience and Technology Majors Only
Typically offered in Fall and Spring

ECE 406/CSC 406/CSC 506/ECE 506 Architecture Of Parallel Computers (3 credit hours)
The need for parallel and massively parallel computers. Taxonomy of parallel computer architecture, and programming models for parallel architectures. Example parallel algorithms. Shared-memory vs. distributed-memory architectures. Correctness and performance issues. Cache coherence and memory consistency. Bus-based and scalable directory-based multiprocessors. Interconnection-network topologies and switch design. Brief overview of advanced topics such as multiprocessor prefetching and speculative parallel execution. Credit is not allowed for more than one course in this set: ECE 406, ECE 506, CSC 406.

Typically offered in Fall and Spring

ECE 407 Introduction to Computer Networking (3 credit hours)
This course focuses on engineering principles of computer communications and networking, including layering concepts, overview of protocols, architectures for local, metropolitan, and wide-area networks, routing protocols, internet operations, transport control and applications, emerging issues in computer networks. EE and CPE majors only.

Prerequisite: ECE 301
Typically offered in Fall and Spring

ECE 411 Introduction to Machine Learning (3 credit hours)
Learning from experience is one of the hallmarks of intelligence. Machine learning is the study of computer algorithms that improve automatically through experience. Machine learning, a subfield of artificial intelligence (AI), has achieved remarkable progress over the past decade, especially in deep learning. This course introduces fundamental concepts and algorithms that are vital for understanding state-of-the-art and cutting-edge development toward the next wave of AI. This course also exposes students to real-world applications via well-guided homework programming problems, as well as group projects. Topics include, but are not limited to optimization, linear statistical models, kernel regression, support vector machines, boosting machines, and deep neural networks.

P: (ECE 301 or ISE 361 or MA 341 or CSC 316) and (ST 370 or ST 371)
R: Students may not receive credit for both CSC 422 and ECE 411.
Typically offered in Fall and Spring

ECE 418/BME 418/BME 518/ECE 518 Wearable Biosensors and Microsystems (3 credit hours)
This course surveys the methods and application of wearable electronics and microsystems to monitor human biometrics, physiology, and environmental conditions. Topics covered include wearable electrocardiograms, blood-glucose monitors, electronic tattoos, wearable energy harvesting, "smart" clothing, body area networks, and distributed population networks. Critical comparison of different sensor modalities, quantitative metrics, and how their limitations in realistic applications define the selection, design, and operation criteria of one type of sensor over another will be considered.

Prerequisite: Senior standing
Typically offered in Fall only

ECE 420 Wireless Communication Systems (3 credit hours)
A study of applications of communication theory and signal processing to wireless systems. Topics include an introduction to information theory and coding, basics and channel models for wireless communications, and some important wireless communication techniques including spread-spectrum and OFDM. MATLAB exercises expose students to engineering considerations.

Prerequisite: ECE 402
Typically offered in Fall and Spring

ECE 421 Introduction to Signal Processing (3 credit hours)
Concepts of electrical digital signal processing: Discrete-Time Signals and Systems, Z-Transform, Frequency Analysis of Signals and Systems, Digital Filter Design. Analog-to Digital-to-Analog Conversion, Discrete Fourier Transform.

Prerequisite: ECE 301
Typically offered in Fall, Spring, and Summer

ECE 422 Transmission Lines and Antennas for Wireless (3 credit hours)
Review of time-varying electromagnetic theory. A study of the analytical techniques and the characteristics of several useful transmission lines and antennas. Examples are coaxial lines, waveguides, microstrip, optical fibers and dipole, monopole and array antennas.

Prerequisite: ECE 303
Typically offered in Fall only

ECE 423 Introduction to Photonics and Optical Communications (3 credit hours)
This course investigates photonic devices at the component level and examines the generation, propagation, and detection of light in the context of optical communication systems. Topics include the design of simple optical systems and focuses on the use of lasers, fiber optics, and photodetectors. The labs include building a Michelson interferometer, preparing and coupling light to an optical fiber, characterizing LEDs and laser diodes and making a fiber optical link.

Prerequisite: ECE 303 or Permission of the Instructor
Typically offered in Fall only

ECE 424/ECE 524 Radio System Design (3 credit hours)
Introduction to communication theory and radio system design. Design and analysis of radio systems, such as heterodyne transceivers, and effects of noise and nonlinearity. Design and analysis of radio circuits: amplifiers, filters, mixers, baluns and other transmission line and discrete circuits.

Prerequisite: ECE 302
Typically offered in Spring only

ECE 426 Analog Electronics Laboratory (3 credit hours)
A hands on laboratory based course with two construction projects (dual power supply, high frequency buffer amplifier) and six breadboard based activities with a focus on operational amplifiers and their applications. Student must have a portable computer and 'Digilent Analog Discovery'. Topics include: amplifier performance, integrator/differentiator, filters, converters (I to V, V to I) and audio circuits.

Prerequisite: ECE 302
Typically offered in Fall and Spring

ECE 434 Fundamentals of Power Electronics (3 credit hours)
Design, analysis, modeling and control of DC-DC converters, DC-AC inverters, AC-DC rectifiers/converters, and AC-to-AC converters. power conversion using switched high-voltage high-current semiconductors in combination with inductors and capacitors. Design of DC-DC, DC-AC, AC-DC, and AC-AC power converters as well as an introductions to design of magnetic components for use in power converters, apllications to fuel cells, photovoltaics, motor drives, and uninterruptable power supplies

Prerequisite:ECE 302 or equivalent
Typically offered in Fall only

ECE 436 Digital Control Systems (3 credit hours)
Discrete system dynamics, sampled-data systems, mathematical representations of analog/digital and digital/analog conversions, open- and -closed-loop systems, input-output relationships, state-space and stability analyses, time and frequency domain analysis with emphasis on time domain. Design and implementation of digital controllers. Design project including hardware implementation.

Prerequisite: ECE 308
Typically offered in Spring only

ECE 442 Integrated Circuit Technology and Fabrication (3 credit hours)
Semiconductor device and integrated-circuit processing and technology. Wafer specification and preparation, oxidation, diffusion, ion implantation, photolithography, design rules and measurement techniques.

Prerequisite: ECE 404
Typically offered in Fall only

ECE 451 Power System Analysis (3 credit hours)
Long-distance transmission of electric power with emphasis on load flow, economic dispatch, fault calculations and system stability. Applications of digital computers to power-system problems. Major design project.

Prerequisite: ECE 305
Typically offered in Fall only

ECE 452/ECE 552 Renewable Electric Energy Systems (3 credit hours)
Principles and characteristics of renewable energy based electric power generation technologies such as photovoltaic systems, wind turbines, and fuel cells. Main system design issues. Integration of these energy sources into the power grid. Economics of distributed generation. Credit is not allowed for both ECE 452 and ECE 552.

Prerequisite: ECE 305 or ECE 331
Typically offered in Spring only

ECE 453 Electric Motor Drives (3 credit hours)
Principles of electromechanical energy conversion; analysis, modeling, and control of electric machinery; steady state performance characteristics of direct-current, induction, synchronous and reluctance machines; scalar control of induction machines; introduction to direct- and quadrature-axis theory; dynamic models of induction and synchronous motors; vector control of induction and synchronous motors.

Prerequisite: A grade of C or better in ECE 305.
Typically offered in Spring only

ECE 455 Industrial Robotic Systems (3 credit hours)
Techniques of computer control of industrial robots: interfacing with synchronous hardware including analog/digital and digital/analog converters, interfacing noise problems, control of electric and hydraulic actuators, kinematics and kinetics of robots, path control, force control, sensing including vision. Major design project. EE, CPE, BME, JEM majors only.

Prerequisite: ECE 308
Typically offered in Fall only

ECE 456/ECE 556 Mechatronics (3 credit hours)
The study of electro-mechanical systems controlled by microcomputer technology. The theory, design and construction of smart systems; closely coupled and fully integrated products and systems. The synergistic integration of mechanisms, materials, sensors, interfaces, actuators, microcomputers, controllers, and information technology.

Prerequisite: ECE 308
Typically offered in Fall only

ECE 460/ECE 560 Embedded System Architectures (3 credit hours)
Concepts of architectures for embedded computing systems. Emphasis on hands-on implementation. CPU scheduling approaches to support multithreaded programs, including interrupts, cooperative schedulers, state machines, and preemptive scheduler (real-time kernel). Communication and synchronization between threads. Basic real-time analysis. Using hardware peripherals to replace software. Architectures and design patterns for digital control, streaming data, message parsing, user interfaces, low power, low energy, and dependability. Software engineering concepts for embedded systems. Students may not receive credit for both ECE 460 and ECE 560.

Prerequisite: C- or better in ECE 306
Typically offered in Fall only

ECE 461/ECE 561 Embedded System Design (3 credit hours)
Design and implementation of software for embedded computer systems. The students will learn to design systems using microcontrollers, C and assembly programming, real-time methods,Â computerÂ architecture, interfacing system development and communication networks.Â System performance is measured in terms of power consumption, speed and reliability. Efficient methods for project development and testing are emphasized. Credit will not be awarded for both ECE 461 and ECE 561. Restricted to CPE and EE Majors.

Prerequisite: Grade of C- or better in ECE 460
Typically offered in Spring only

ECE 463/ECE 563 Microprocessor Architecture (3 credit hours)
Architecture of microprocessors. Measuring performance. Instruction-set architectures. Memory hierarchies, including caches, prefetching, program transformations for optimizing caches, and virtual memory. Processor architecture, including pipelining, hazards, branch prediction, static and dynamic scheduling, instruction-level parallelism, superscalar, and VLIW. Major projects.

Prerequisite: ECE 209 and ECE 212
Typically offered in Fall and Spring

ECE 464/ECE 564 ASIC and FPGA Design with Verilog (3 credit hours)
Design of digital application specific integrated circuits (ASICs) and Field Programmable Gate Arrays (FPGAs) based on hardware description languages (Verilog) and CAD tools. Emphasis on design practices and underlying methods. Introduction to ASIC specific design issues including verification, design for test, low power design and interfacing with memories. Required design project. Expected Prior Experience or Background: ECE 310 is useful but not assumed. Functionally, I assume that students are familiar with logic design, including combinational logic gates, sequential logic gates, timing design, Finite State Machines, etc.

P: Grade of C or better in ECE 212 or equivalent.
Typically offered in Fall only

ECE 465/ECE 565 Operating Systems Design (3 credit hours)
The course explores basic concepts and mechanisms related to the design of modern operating systems, including: process scheduling and coordination, memory management, synchronization, storage, file systems, security and protection, and their application to multi-core and many-core processors. The course involves coding projects requiring strong C programming skills.

Prerequisite: ECE306 or CSC246; ECE309; Restrictions: ECE465, ECE565 and CSC501 are mutually exclusive: students may not receive credit for both ECE465 and ECE565, or both ECE465 and CSC501, or both ECE565 and CSC501
Typically offered in Fall only

ECE 466/ECE 566 Compiler Optimization and Scheduling (3 credit hours)
Provide insight into current compiler designs dealing with present and future generations of high performance processors and embedded systems. Introduce basic concepts in scanning and parsing. Investigate in depth program representation, dataflow analysis, scalar optimization, memory disambiguation, and interprocedural optimizations. Examine hardware/software tade-offs in the design of high performance processors, in particular VLIW versus dynamically scheduled architectures. Investigate back-end code generation techniques related to instruction selection, instruction scheduling for local, cyclic and global acyclic code, and register allocation and its interactions with scheduling and optimization.

Prerequisites: ECE 209 or competency in any machine language programming and ECE 309 or CSC 316 or proficiency in either C or C++ programming using advanced data structures, like hash tables and linked lists.P: ECE 209 or competency in an
Typically offered in Spring only

ECE 468/CHE 468/CHE 568/ECE 568 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems (3 credit hours)
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

Prerequisite: E 304
Typically offered in Fall only

ECE 470 Internetworking (3 credit hours)
Introduction, Planning and Managing networking projects, networking elements-hardware, software, protocols, applications; TCP/IP, ATM, LAN emulation. Design and implementation of networks, measuring and assuring network and application performance;metrics, tools, quality of service. Network-based applications, Network management and security.

Prerequisite: ECE 407 or CSC 401
Typically offered in Spring only

ECE 482/MAE 482 Engineering Entrepreneurship and New Product Development I (3 credit hours)
Applications of engineering, mathematics, basic sciences, finance, and business to the design and development of prototype engineering products. This course requires a complete written report and an end-of-course presentation. This is the first course in a two semester sequence. Students taking this course will implement their designed prototype in ECE 483: Senior Design Project in Electrical Engineering and Computer Engineering II-Engineering Entrepreneurs. Departmental approval required.

Typically offered in Fall and Spring

ECE 483/MAE 483 Engineering Entrepreneurship and New Product Development II (3 credit hours)
Applications of engineering, science, management and entrepreneurship to the design, development and prototyping of new product ideas. Based on their own new product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as 'virtual' startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the university that agree to participate as eTeam members. Departmental approval required.

Prerequisite: ECE 482
Typically offered in Fall and Spring

ECE 484 Electrical and Computer Engineering Senior Design I (3 credit hours)
Applications of engineering and basic sciences to the total design of electrical and/or computer engineering circuits and systems. Consideration of the design process including concept and feasibility study, systems design, detailed design, project management, cost-effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Supported with an introduction of key factors impacting the engineering design process including industrial design, finance, operations, etc. EE and CPE Majors only.

CPE major: Prerequisites: (ECE301 or ECE302) and (two of ECE306, ECE309, ECE310); Corequisite: One CPE Elective; EE major: Prerequisites: ECE301 and ECE302 and (one of ECE 303, E 304, ECE 305, 306, 308, 310); Corequisite: One EE Elective.
Typically offered in Fall only

ECE 485 Electrical and Computer Engineering Senior Design II (3 credit hours)
Applications of engineering and basic sciences to the total design of electrical engineering circuits and systems. Consideration of the design process including feasibility study, preliminary design detail, cost-effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required. EE and CPE majors only.

Prerequisite: ECE 484
Typically offered in Spring only

ECE 488/PB 588/ECE 588/PB 488 Systems Biology Modeling of Plant Regulation (3 credit hours)
This course provides an introduction to the field of systems biology with a focus on mathematical modeling, gene regulatory network and metabolic pathway reconstruction in plants. Students will learn how to integrate biological data with mathematical, statistical, and computational approaches to gain new insights into structure and behavior of complex cellular systems. Students are expected to have a minimal background in calculus and basic biology. The course will build on these basic concepts and provide all students, regardless of background or home department, with the fundamental biology, mathematics, and computing knowledge needed to address systems biology problems.

Prerequisite: MA 131 or MA 141
Typically offered in Fall only

ECE 489/ECE 589/MSE 489/MSE 589/PY 489/PY 589 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

ECE 492 Special Topics in Electrical and Computer Engineering (1-4 credit hours)
Offered as needed for development of new courses in electrical and computer engineering.

Typically offered in Fall and Spring

ECE 495 Individual Study in ECE (1-3 credit hours)
Independent investigation of a topic or research problem under faculty supervision. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

P: Appropriate 300-level Course; R: EE and CPE Majors Only. Department Approval Required
Typically offered in Fall, Spring, and Summer

ECE 498 Special Projects in ECE (1-3 credit hours)
Faculty-supervised special projects in electrical and/or computer engineering. Projects involve small groups of students, working collaboratively or independently, focused on a single theme, such as the design of a component or system. Requires a "Course Agreement for Students Enrolled in Non-Standard Courses," completed by the student and faculty member prior to registration by the department.

Prerequisite: At least one 300-level ECE course, 3.0 GPA; Restricted to: EE or CPE majors
Typically offered in Fall, Spring, and Summer

ECE 505 Neural Interface Engineering (3 credit hours)
This course investigates the engineering techniques to understand, repair, replace, or enhance neural systems. The topics to be covered includes the following: the history of bioelectricity phenomena, the basics of modern neuroscience in electrical engineering terms and models, design of functional electrical interfaces with the nervous system for stimulating and recording purposes, basics of electrochemistry development of various systems for neuroprosthetics and neurorobotics applications such as pacemakers, cochlear implants and neuroprosthetic limbs.

Senior or graduate standing.
Typically offered in Fall only

ECE 506/ECE 406/CSC 406/CSC 506 Architecture Of Parallel Computers (3 credit hours)
The need for parallel and massively parallel computers. Taxonomy of parallel computer architecture, and programming models for parallel architectures. Example parallel algorithms. Shared-memory vs. distributed-memory architectures. Correctness and performance issues. Cache coherence and memory consistency. Bus-based and scalable directory-based multiprocessors. Interconnection-network topologies and switch design. Brief overview of advanced topics such as multiprocessor prefetching and speculative parallel execution. Credit is not allowed for more than one course in this set: ECE 406, ECE 506, CSC 406.

Typically offered in Fall, Spring, and Summer

ECE 511 Analog Electronics (3 credit hours)
Analog integrated circuits and analog integrated circuit design techniques. Review of basic device and technology issues Comprehensive coverage of MOS and Bipolar operational amplifiers. Brief coverage of analog-to-digital conversion techniques and switched-capacitor filters. Strong emphasis on use of computer modeling and simulation as design tool. Students required to complete an independent design project.

Prerequisite: ECE403
Typically offered in Fall only

ECE 513 Digital Signal Processing (3 credit hours)
Digital processing of analog signals. Offline and real-time processing for parameter, waveshape and spectrum estimation. Digital filtering and applications in speech, sonar, radar, data processing and two-dimensional filtering and image processing.

Prerequisite: ECE 421, B average in ECE and MA; Signals and Linear Systems
Typically offered in Fall only

ECE 514 Random Processes (3 credit hours)
Probabilistic descriptions of signals and noise, including joint, marginal and conditional densities, autocorrelation, cross-correlation and power spectral density. Linear and nonlinear transformations. Linear least-squares estimation. Signal detection.

Prerequisite: Statistics 371; Signals and Linear Systems; Linear Algebra; Calculus
Typically offered in Fall only

ECE 515 Digital Communications (3 credit hours)
This course is a first graduate-level course in digital communications. Functions and interdependence of various components of digital communication systems will be discussed. Statistical channel modeling, modulation and demodulation techniques, optimal receiver design, performance analysis methods, source coding, quantization, and fundamentals of information theory will be covered in this course.

Prerequisite: ECE 514, ST 371, Signals and Linear Systems; Linear Algebra
Typically offered in Spring and Summer

ECE 516 System Control Engineering (3 credit hours)
Introduction to analysis and design of continuous and discrete-time dynamical control systems. Emphasis on linear, single-input, single-output systems using state variable and transfer function methods. Open and closed-loop representation; analog and digital simulation; time and frequency response; stability by Routh-Hurwitz, Nyquist and Liapunov methods; performance specifications; cascade and state variable compensation. Assignments utilize computer-aided analysis and design programs.

Prerequisite: ECE 435 or ECE 301
Typically offered in Spring only

ECE 517/CSC 517 Object-Oriented Design and Development (3 credit hours)
The design of object-oriented systems, using principles such as the GRASP principles, and methodologies such as CRC cards and the Unified Modeling Language (ULM). Requirements analysis. Design patterns Agile Methods. Static vs. dynamic typing. Metaprogramming. Open-source development practices and tools. Test-first development. Project required, involving contributions to an open-source software project.

Prerequisite: CSC 326 or ECE 309
Typically offered in Fall and Spring

ECE 518/ECE 418/BME 418/BME 518 Wearable Biosensors and Microsystems (3 credit hours)
This course surveys the methods and application of wearable electronics and microsystems to monitor human biometrics, physiology, and environmental conditions. Topics covered include wearable electrocardiograms, blood-glucose monitors, electronic tattoos, wearable energy harvesting, "smart" clothing, body area networks, and distributed population networks. Critical comparison of different sensor modalities, quantitative metrics, and how their limitations in realistic applications define the selection, design, and operation criteria of one type of sensor over another will be considered.

Prerequisite: Senior standing
Typically offered in Fall only

ECE 522/BME 522 Medical Instrumentation (3 credit hours)
Fundamentals of medical instrumentation systems, sensors, and biomedical signal processing. Example instruments for cardiovascular and respiratory assessment. Clinical laboratory measurements, theraputic and prosthetic devices, and electrical safetyrequirements. Students should have background in electronics design using operational amplifiers.

Typically offered in Spring only

ECE 523 Photonics and Optical Communications (3 credit hours)
This course investigates photonic devices at the component level and examines the generation, propagation and detection of light in the context of optical communication systems. Topics include planar and cylindrical optical waveguides, LEDs, lasers,optical amplifiers, integrated optical and photodetectors, design tradeoffs for optical systems, passive optical networks, and wavelength division multiplexed systems.

Prerequisite: Graduate standing or Senior standing ; Engineering Majors or Physics Majors
Typically offered in Spring only

ECE 524/ECE 424 Radio System Design (3 credit hours)
Introduction to communication theory and radio system design. Design and analysis of radio systems, such as heterodyne transceivers, and effects of noise and nonlinearity. Design and analysis of radio circuits: amplifiers, filters, mixers, baluns and other transmission line and discrete circuits.

Prerequisite: ECE 302
Typically offered in Spring only

ECE 530 Physical Electronics (3 credit hours)
Properties of charged particles under influence of fields and in solid materials. Quantum mechanics, particle statistics, semi-conductor properties, fundamental particle transport properties, p-n junctions.

Prerequisite: ECE 303, B average in ECE and MA
Typically offered in Fall only

ECE 531 Principles Of Transistor Devices (3 credit hours)
Analysis of operating principles of transistor structures. Basic semi-conductor physics reviewed and used to provide explanation of transistor characteristics. Development and usage of device-equivalent circuits to interpret semi-conductor-imposed limitations on device performance. Devices analyzed include MISFIT'S, HEMT'S, Bipolar transistors, PBT'S, heterojunction BJT'S and SIT's.

Prerequisite: ECE 404
Typically offered in Fall only

ECE 532 Principles Of Microwave Circuits (3 credit hours)
Principles required to understand behavior of electronic circuits operating at microwave frequencies. Review of elector-magnetic theory and establishing an understanding of techniques required for working with electronic circuits at microwave and millimeter-wave frequencies. Discussion of circuit components operating at these frequencies.

Prerequisite: ECE 422
Typically offered in Spring only

ECE 533 Power Electronics Design & Packaging (3 credit hours)
This course introduces design of high-performance power electronic circuits where the integrated physical topology must be considered as part of the circuit, and provides an understanding of the multitude of parasitic elements created by circuit layout, materials and fabrication techniques. This prepares the student for high-density, high-frequency design of converters, gate drive circuits and resonant topologies. The student is also introduced to a power-electronics packaging lab and primary fabrication processes, such as Direct Bonded Copper (DBC) module construction with heavy-wire bonding, two-sided and 3D power modules in layered polymers, and high-voltage isolation of circuits with encapsulate in modules.

Prerequisite: ECE 434 or with permission of instructor
Typically offered in Spring only

ECE 534 Power Electronics (3 credit hours)
DC and AC analysis of isolated and non-isolated switch mode power supply. Basic converter topologies covered include: buck, boost and buck/boost and their transformer-couples derivatives. Design of close loop of these DC/DC converters. Power devices and their applications in DC/DC converters. Inductor and transformer design.

Prerequisite: ECE 302
Typically offered in Fall only

ECE 535/MAE 535 Design of Electromechanical Systems (3 credit hours)
A practical introduction to electromechanical systems with emphasis on modeling, analysis, design, and control techniques. Provides theory and practical tools for the design of electric machines (standard motors, linear actuators, magnetic bearings, etc). Involves some self-directed laboratory work and culuminates in an industrial design project. Topics include Maxwell's equations, electromechanical energy conversion, finite element analysis, design and control techniques.

Prerequisite: MA 341
Typically offered in Spring and Summer

ECE 536 Digital Control System Projects (3 credit hours)
Discrete system dynamics, sampled-data systems, mathematical representations of analog/digital and digital/analog conversions, open- and -closed-loop systems, input-output relationships, state-space and stability analyses, time and frequency domain analysis with emphasis on time domain. Design and implementation of digital controllers. Case studies. Design project including hardware implementation.

Prerequisite: Graduate standing & ECE 436 or similar or consent of instructor
Typically offered in Fall only

ECE 538 Integrated Circuits Technology and Fabrication (3 credit hours)
Processes used in fabrication of modern integrated circuits. Process steps for crystal growth, oxidation, diffusion, ion implantation, lithography, chemical vapor deposition, etching, metallization, layout and packaging. Process integration for MOS and biopolar processes. Characterization techniques, simulation, yield and reliability.

Prerequisite: ECE 404
Typically offered in Fall only

ECE 540 Electromagnetic Fields (3 credit hours)
Brief review of Maxwell's Equations, constitutive relations and boundary conditions. Reflection and refraction of plane waves; power and energy relations in isotropic media. Potential functions, Green's functions and their applications to radiation and scattering. Antenna fundamentals: linear antennas, uniform linear arrays and aperture antennas, microstrip antennas. Fundamentals of numerical methods for electromagnetic simulation and antenna design.

Prerequisite: ECE 422
Typically offered in Spring only

ECE 541 Antennas and Arrays (3 credit hours)
This course introduces theoretical and practical concepts for antennas and arrays. Students will learn antenna fundamentals and basic parameters, the relationships between radiation and vector potentials, and apply key electromagnetic theorems such as image theory and equivalence principle. The theory and design of linear antennas, aperture antennas, microstrip antennas are discussed. Radiation pattern control via phased arrays, reflectarrays, and periodic structures are studied. Students will learn CAD tools for electromagnetic design. This course assumes familiarity with Maxwell's equations, electromagnetic waves, electromagnetic theorems, and transmission line theory.

Prerequisite: ECE 422 or equivalent
Typically offered in Spring only

ECE 542 Neural Networks (3 credit hours)
Introduction to neural networks and other basic machine learning methods including radial basis functions, kernel methods, support vector machines. The course introduces regularization theory and principle component analysis. The relationships to filtering, pattern recognition and estimation theory are emphasized.

Typically offered in Fall and Spring

ECE 544 Design Of Electronic Packaging and Interconnects (3 credit hours)
A study of the design of digital and mixed signal interconnect and packaging. Topics covered include: Single chip (surface mount and through-hole) and multi-chip module packaging thecnology; packaging techology selection; thermal design; electricaldesign of printed circuit board, backplane and multi-chip module interconnect; receiver and driver selection; EMI control; CAD tools; and measurement issues.

Prerequisite: ECE 302
Typically offered in Spring only

ECE 546 VLSI Systems Design (3 credit hours)
Digital systems design in CMOS VLSI technology: CMOS devise physics, fabrication, primitive components, design and layout methodology, integrated system architectures, timing, testing future trends of VLSI technology.

Prerequisite: ECE 302
Typically offered in Spring only

ECE 547/CSC 547 Cloud Computing Technology (3 credit hours)
Study of cloud computing principles, architectures, and actual implementations. Students will learn how to critically evaluate cloud solutions, how to construct and secure a private cloud computing environment based on open source solutions, and how to federate it with external clouds. Performance, security, cost, usability, and utility of cloud computing solutions will be studied both theoretically and in hands-on exercises. Hardware-, infrastructure-, platform-, software-, security-, - "as-a-service".

Prerequisites: CSC 501 and either ECE/CSC 570 or ECE/CSC 573
Typically offered in Spring only

ECE 549 RF Design for Wireless (3 credit hours)
Design of the hardware aspects of wireless systems with principle emphasis on design of radio frequency (RF) and microwave circuitry. Introduction of system concepts then functional block design of a wireless system. RF and microwave transistors, noise, power ampliefiers, CAE, linearization and antennas.

Prerequisite: ECE 303, ECE 302
Typically offered in Fall only

ECE 550 Power System Operation and Control (3 credit hours)
Fundamental concepts of economic operation and control of power systems. Real and reactive power balance. System components, characteristics and operation. Steady state and dynamic analysis of interconnected systems. Tieline power and load-frequencycontrol with integrated economic dispatch.

Prerequisite: ECE 305, ECE 435
Typically offered in Fall only

ECE 551 Smart Electric Power Distribution Systems (3 credit hours)
Features and components of electric power distribution systems, power flow, short circuit and reliability analysis, basic control and protection, communications and SCADA, new "smart" functionality such as integrated volt/var control, automated fault location isolation and restoration, demand response and advanced metering infrastructure, integration of distributed generation and energy storage.

Prerequisite: ECE 451
Typically offered in Spring only

ECE 552/ECE 452 Renewable Electric Energy Systems (3 credit hours)
Principles and characteristics of renewable energy based electric power generation technologies such as photovoltaic systems, wind turbines, and fuel cells. Main system design issues. Integration of these energy sources into the power grid. Economics of distributed generation. Credit is not allowed for both ECE 452 and ECE 552.

Prerequisite: ECE 305 or ECE 331
Typically offered in Spring only

ECE 553 Semiconductor Power Devices (3 credit hours)
The operational physics and design concepts for power semiconductor devices. Relevant transport properties of semiconductors. Design of breakdown voltage and edge terminations. Analysis of Schottky rectifiers, P-i-N rectifiers, Power MOSFETs, Bipolar Transistors, Thyristors and Insulated Gate Bipolar Transistors.

Prerequisite: ECE 404
Typically offered in Fall only

ECE 554 Electric Motor Drives (3 credit hours)
Topics covered in this course: Principles of Electromechanical energy conversion; analysis, modeling and control of electric machinery; steady state performance characteristics of direct current, induction, synchronous and reluctance machines; scalar control of induction machines; introduction to direct and quadrature axis theory; dynamic models of induction and synchronous machines; vector control of induction and synchronous machines.

Prerequisite: ECE 305 or equivalent
Typically offered in Spring only

ECE 555 Computer Control of Robots (3 credit hours)
An introduction to robotics: history and background, design, industrial applications and usage. Manipulator sensors, actuators and control, linear, non-linear, and force control. Manipulator kinematics: position and orientation, frame assignment, transformations, forward and inverse kinematics. Jacobian: velocities and static forces. Manipulator Kinetics: velocity, acceleration, force. Trajectory generation. Programming languages: manipulator level, task level, and object level. Introduction to advanced robotics. Credit not allowed for both ECE 455 and 555.

Prerequisite: ECE 435; ECE 436; ECE 456
Typically offered in Spring only

ECE 556/ECE 456 Mechatronics (3 credit hours)
The study of electro-mechanical systems controlled by microcomputer technology. The theory, design and construction of smart systems; closely coupled and fully integrated products and systems. The synergistic integration of mechanisms, materials, sensors, interfaces, actuators, microcomputers, controllers, and information technology.

Prerequisite: ECE 308
Typically offered in Fall only

ECE 557 Principles Of MOS Transistors (3 credit hours)
MOS capacitor and transistor regions of operation. Depletion and enhancement mode MOSFETs. MOSFET scaling, short and narrow channel effects. MOSFETs with ion-implanted channels. High field effects in MOSFETs with emphasis on recent advances in design of hit carrier suppressed structures. Small and large signal MOSFET models. State of the art in MOS process integration.

Prerequisite: ECE 404
Typically offered in Fall only

ECE 558 Digital Imaging Systems (3 credit hours)
Foundation for designing and using digital devices to accurately capture and display color images, spatial sampling, frequency analysis, quantization and noise characterization of images. Basics of color science are presented and applied to image capture and output devices.

Prerequisites: ECE 301 and ST 372
Typically offered in Fall only

ECE 560/ECE 460 Embedded System Architectures (3 credit hours)
Concepts of architectures for embedded computing systems. Emphasis on hands-on implementation. CPU scheduling approaches to support multithreaded programs, including interrupts, cooperative schedulers, state machines, and preemptive scheduler (real-time kernel). Communication and synchronization between threads. Basic real-time analysis. Using hardware peripherals to replace software. Architectures and design patterns for digital control, streaming data, message parsing, user interfaces, low power, low energy, and dependability. Software engineering concepts for embedded systems. Students may not receive credit for both ECE 460 and ECE 560.

Prerequisite: C- or better in ECE 306
Typically offered in Fall only

ECE 561/ECE 461 Embedded System Design (3 credit hours)
Design and implementation of software for embedded computer systems. The students will learn to design systems using microcontrollers, C and assembly programming, real-time methods,Â computerÂ architecture, interfacing system development and communication networks.Â System performance is measured in terms of power consumption, speed and reliability. Efficient methods for project development and testing are emphasized. Credit will not be awarded for both ECE 461 and ECE 561. Restricted to CPE and EE Majors.

Prerequisite: Grade of C- or better in ECE 460
Typically offered in Spring only

ECE 563/ECE 463 Microprocessor Architecture (3 credit hours)
Architecture of microprocessors. Measuring performance. Instruction-set architectures. Memory hierarchies, including caches, prefetching, program transformations for optimizing caches, and virtual memory. Processor architecture, including pipelining, hazards, branch prediction, static and dynamic scheduling, instruction-level parallelism, superscalar, and VLIW. Major projects.

Prerequisite: ECE 209 and ECE 212
Typically offered in Fall and Spring

ECE 564/ECE 464 ASIC and FPGA Design with Verilog (3 credit hours)
Design of digital application specific integrated circuits (ASICs) and Field Programmable Gate Arrays (FPGAs) based on hardware description languages (Verilog) and CAD tools. Emphasis on design practices and underlying methods. Introduction to ASIC specific design issues including verification, design for test, low power design and interfacing with memories. Required design project. Expected Prior Experience or Background: ECE 310 is useful but not assumed. Functionally, I assume that students are familiar with logic design, including combinational logic gates, sequential logic gates, timing design, Finite State Machines, etc.

P: Grade of C or better in ECE 212 or equivalent.
Typically offered in Fall and Summer

ECE 565/ECE 465 Operating Systems Design (3 credit hours)
The course explores basic concepts and mechanisms related to the design of modern operating systems, including: process scheduling and coordination, memory management, synchronization, storage, file systems, security and protection, and their application to multi-core and many-core processors. The course involves coding projects requiring strong C programming skills.

Prerequisite: ECE306 or CSC246; ECE309; Restrictions: ECE465, ECE565 and CSC501 are mutually exclusive: students may not receive credit for both ECE465 and ECE565, or both ECE465 and CSC501, or both ECE565 and CSC501
Typically offered in Fall only

ECE 566/ECE 466 Compiler Optimization and Scheduling (3 credit hours)
Provide insight into current compiler designs dealing with present and future generations of high performance processors and embedded systems. Introduce basic concepts in scanning and parsing. Investigate in depth program representation, dataflow analysis, scalar optimization, memory disambiguation, and interprocedural optimizations. Examine hardware/software tade-offs in the design of high performance processors, in particular VLIW versus dynamically scheduled architectures. Investigate back-end code generation techniques related to instruction selection, instruction scheduling for local, cyclic and global acyclic code, and register allocation and its interactions with scheduling and optimization.

Prerequisites: ECE 209 or competency in any machine language programming and ECE 309 or CSC 316 or proficiency in either C or C++ programming using advanced data structures, like hash tables and linked lists.P: ECE 209 or competency in an
Typically offered in Spring only

ECE 568/ECE 468/CHE 468/CHE 568 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems (3 credit hours)
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

Prerequisite: E 304
Typically offered in Fall only

ECE 570/CSC 570 Computer Networks (3 credit hours)
General introduction to computer networks. Discussion of protocol principles, local area and wide area networking, OSI stack, TCP/IP and quality of service principles. Detailed discussion of topics in medium access control, error control coding, and flow control mechanisms. Introduction to networking simulation, security, wireless and optical networking.

Prerequisite: ECE 206 or CSC 312, ST 371, CSC 258 and Senior standing or Graduate standing
Typically offered in Fall and Spring

ECE 573/CSC 573 Internet Protocols (3 credit hours)
Principles and issues underlying provision of wide area connectivity through interconnection of autonomous networks. Internet architecture and protocols today and likely evolution in future. Case studies of particular protocols to demonstrate how fundamental principles applied in practice. Selected examples of networked clinet/server applications to motivate the functional requirements of internetworking. Project required.

Prerequisite: CSC/ECE 570
Typically offered in Fall, Spring, and Summer

ECE 574/CSC 574 Computer and Network Security (3 credit hours)
This course presents foundational concepts of computer and network security and privacy. It covers a wide breadth of concepts, including; Fundamentals of computer security and privacy, including security models, policies, and mechanisms; Cryptography for secure systems, including symmetric and asymmetric ciphers, hash functions, and integrity mechanisms; Authentication of users and computers; Network attacks and defenses at the network and application layers; Common software vulnerabilities and mitigation strategies; Secure operating systems and seminal access control models and policies; Principles of intrusion detection; Privacy, including considerations of end-user technologies.

Prerequisite: (CSC 316 or ECE309) and (CSC 401 or ECE407) or equivalent
Typically offered in Fall and Spring

ECE 575/CSC 575 Introduction to Wireless Networking (3 credit hours)
Introduction to cellular communications, wireless local area networks, ad-hoc and IP infrastructures. Topics include: cellular networks, mobility mannagement, connection admission control algorithms, mobility models, wireless IP networks, ad-hoc routing, sensor networks, quality of service, and wireless security.

Prerequisite: ECE/CSC 570
Typically offered in Spring only

ECE 576/CSC 576 Networking Services: QoS, Signaling, Processes (3 credit hours)
Topics related to networking services, signaling for setting up networking services, such as SIP and IMS, networking architectures for providing QoS for networking services, such as MPLS, DiffServ and RAC, signaling protocols for setting up QoS connections in the transport stratum, such as LDP and RSVP-TE, video-based communications, and capacity planning models for dimensioning services.

Prerequisite: CSC/ECE 570
Typically offered in Fall and Spring

ECE 577/CSC 577 Switched Network Management (3 credit hours)
Topics related to design and management of campus enterprise networks, including VLAN design; virtualization and automation methodologies for management; laboratory use of open space source and commercial tools for managing such networks.

Typically offered in Fall only

ECE 578 LTE and 5G Communications (3 credit hours)
The course provides an introduction to the theoretical fundamentals and practical/experimental aspects of Long Term Evolution (LTE) and 5G systems. A basic understanding of digital communications and radio access networks is required. Following topics will be studied: 1) User and control plane protocols, 2) physical layer for downlink, 3) physical layer for uplink, 4) practical deployment aspects, 5) LTE-Advanced, 6) 5G communications. Fundamental concepts to be covered in the context of LTE/5G systems include OFDMA/SC-FDMA, synchronization, channel estimation, link adaptation, MIMO, scheduling, and millimeter wave systems. Students are recommended to have the prior knowledge gained from ECE 570 or ECE 582 before taking this course. The course will also require using Matlab software for homeworks, including its LTE and 5G toolboxes.

Typically offered in Fall only

ECE 579/OR 579/CSC 579 Introduction to Computer Performance Modeling (3 credit hours)
Workload characterization, collection and analysis of performance data, instrumentation, tuning, analytic models including queuing network models and operational analysis, economic considerations.

Prerequisite: CSC 312 or ECE 206 and MA 421
Typically offered in Fall and Spring

ECE 581 Electric Power System Protection (3 credit hours)
Protection systems used to protect the equipment in an electric power system against faults, fault analysis methods, basic switchgear used for protection, basic protection schemes, such as overcurrent, differential, and distance protection and their application.

Prerequisite: ECE 451
Typically offered in Spring only

ECE 582 Wireless Communication Systems (3 credit hours)
Theory and analysis of wireless portable communication systems. Provides a fundamental understanding of the unique characteristics of these systems. Topics include: Code Division Multiple Access (CDMA), mobile radio propagation, characterization of a Rayleigh fading multipathchannel, diversity techniques, adaptive equalization, channel coding, and modulation/demodulation techniques. Although contemporary cellular and personal communication services(PCS) standards are covered, the course stresses fundamental theoretical concepts that are not tied to a particular standard.

Prerequisite: Senior level digital communications course, e.g., ECE402, Corequisite: ECE 714
Typically offered in Fall only

ECE 583 Electric Power Engineering Practicum I (3 credit hours)
This course introduces fundamentals of project management and system engineering principles in a wide range of electric power applications from concept through termination. The course also provides opportunities for students to adapt technical content to both expert and novice audiences in project management reports and presentations. Restricted to Master of Science in Electric Power Systems Engineering.

Prerequisite: ECE 451
Typically offered in Spring only

ECE 584 Electric Power Engineering Practicum II (3 credit hours)
In this capstone course students will apply electric engineering and science knowledge to an electrical power engineering project. Consideration of the design process including feasibility study, preliminary design detail, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required. Restricted to Master of Science in Electric Power Systems Engineering.

Prerequisite: ECE 583
Typically offered in Fall and Summer

ECE 585 The Business of the Electric Utility Industry (3 credit hours)
Evolution of the electric utility industry, the structure and business models of the industry, the regulatory factors within which the utilities operate, the operations of the utility industry and the current policy and emerging technology issues facing the business. The course includes significant interaction with industry officials and utility business operations.

Prerequisite: ECE 451
Typically offered in Fall only

ECE 586 Communication and SCADA Systems for Smart Grid (3 credit hours)
This is an introductory course on communication technologies and SCADA (supervisory control and data acquisition) systems for smart electric power applications. The fundamental concepts, principles, and practice of how communication systems operate are introduced and the function of main components reviewed. Application of communication systems for electric power, in particular SCADA architecture and protocols are also introduced. The course includes hands-on experience with typical intelligent electronic devices interconnected by a communication system.

R: Graduate Students Only
Typically offered in Fall only

ECE 587 Power System Transients Analysis (3 credit hours)
Review of solutions to first and second order differential equations for electric power circuit transients. Applications to fault current instantaneous, shunt capacitor transients, circuit switching transients and overvoltages, current interruption and transformer transient behavior. Computer solution techniques for transient analysis using PSCAD and Matlab/Simulink. Modeling of utility power electronics circuits including single and three-phase rectifiers and inverters. Applications of power electronics for transmission system control and renewable generation. Distributed line modeling for traveling wave analysis of surge events. Introduction to voltage insulation, surge arrestor operation and lightning stroke analysis.

Typically offered in Fall only

ECE 588/PB 488/ECE 488/PB 588 Systems Biology Modeling of Plant Regulation (3 credit hours)
This course provides an introduction to the field of systems biology with a focus on mathematical modeling, gene regulatory network and metabolic pathway reconstruction in plants. Students will learn how to integrate biological data with mathematical, statistical, and computational approaches to gain new insights into structure and behavior of complex cellular systems. Students are expected to have a minimal background in calculus and basic biology. The course will build on these basic concepts and provide all students, regardless of background or home department, with the fundamental biology, mathematics, and computing knowledge needed to address systems biology problems.

Prerequisite: MA 131 or MA 141
Typically offered in Fall only

ECE 589/MSE 489/MSE 589/PY 489/PY 589/ECE 489 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

ECE 591 Special Topics In Electrical Engineering (1-6 credit hours)
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 592 Special Topics In Electrical Engineering (1-6 credit hours)
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 600 ECE Graduate Orientation (1 credit hours)
Introduction of the Electrical and Computer Engineering Department graduate program. Introduction to computing and library facilities; Review of NC State student code of conduct and ethics. Structure of the ECE department. General information for starting graduate studies. Overview of on-going research projects by faculty members. Must hold graduate standing.

Typically offered in Fall and Spring

ECE 633 Individual Topics In Electrical Engineering (1-3 credit hours)
Provision of opportunity for individual students to explore topics of special interest under direction of a member of faculty.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 634 Individual Studies In Electrical Engineering (1-3 credit hours)
The study of advanced topics of special interest to individual students under direction of faculty members.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ECE 650 Internship (3 credit hours)
This course requires an internship with a company or organization outside the University. The student will secure an internship of a technical nature and complete and submit a Coop report for evaluation.

Restricted: 14EEMS, 14CPEMS, 14CNEMS, 14EPSEMS
Typically offered in Fall and Spring

ECE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Spring only

ECE 690 Master's Exam (1-9 credit hours)

ECE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ECE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall and Spring

ECE 705 Memory Systems (3 credit hours)
Covers recent research on overcoming the problem of memory access and memory speed, two major limitations on the speed of computers. Overview of the current state of memory technologies, novel cache structures and management techniques, prefetching,memory compression, and parallelism at the instruction and thread levels. Research papers required.

Prerequisite: ECE 521, Computer Design and Technology

ECE 706 Advanced Parallel Computer Architecture (3 credit hours)
Advanced topics in parallel computer architecture. Hardware mechanisms for scalable cache coherence, synchronization, and speculation. Scalable systems and interconnection networks. Design or research project required.

Prerequisite: ECE/CSC 506, ECE 521
Typically offered in Spring only

ECE 712 Integrated Circuit Design for Wireless Communications (3 credit hours)
Analysis, simulation, and design of the key building blocks of an integrated radio: amplifiers, mixers, and oscillators. Topics include detailed noise optimization and linearity performance of high frequency integrated circuits for receivers and transmitters. Introduction to several important topics of radio design such as phase-locked loops, filters and large-signal amplifiers. Use of advanced RF integrated circuit simulation tools such as SpectreRF or ADS for class assignments.

Prerequisite: ECE 511
Typically offered in Spring only

ECE 714 Advanced Integrated Circuit Design: Data Converters (3 credit hours)
This course is a graduate level course in Analog-to-digital converters. Students will learn the fundamentals of sampling and the translation of signals form the digital to analog and analog to digital domains. Students will learn the basic circuits unique to data converters and how they impact design. Students will learn to a design digital-to-analog converter as well as 3 ADCs: Pipeline, Sigma-Delta and Successive-approximation. After completion of this course you will have the background to successfully design an ADC and DAC.

Prerequisite: ECE 511
Typically offered in Fall only

ECE 718 Computer-Aided Circuit Analysis (3 credit hours)
Steady state and transient analysis of circuits with emphasis on circuit theory and computer methods. Consideration of many analysis techniques, including linear nodal, signal flow graph, state equation, time-domain and functional simulation and analysis of sampled data systems. Sensitivity and tolerance analysis, macromodeling of large circuits and nonlinear circuit theory.

Prerequisite: ECE 511

ECE 719 Advanced Microwave Design (3 credit hours)
Development and examination of techniques used in the design of microwave and millimeter wave components and systems. Specific topics include frequency planning, system design using modules, and design of microwave amplifiers and oscillators. Design for specified frequency, noise, power, mixer or oscillator performance will be covered. There are three design projects: system planning, amplifier design, and oscillator design all using commercial microwave computer aided design tools.

Prerequisite: ECE 549
Typically offered in Spring only

ECE 720 Electronic System Level and Physical Design (3 credit hours)
Study of transaction-level modeling of digital systems-on-chip using SystemC. Simulation and analysis of performance in systems with distributed control. Synthesis of digital hardware from high-level descriptions. Physical design methodologies, including placement, routing, clock-tree insertion, timing, and power analysis. Significant project to design a core at system and physical levels. Knowledge of object-oriented programming with C and register-transfer-level design with verilog or VHDL is required.

Prerequisite: ECE 520
Typically offered in Fall only

ECE 721 Advanced Microarchitecture (3 credit hours)
Survey of advanced computer microarchitecture concepts. Modern superscalar microarchitecture, complexity-effective processors, multithreading, advanced speculation techniques, fault-tolerant microarchitectures, power and energy management, impact of new technology on microarchitecture. Students build on a complex simulator which is the basis for independent research projects.

Prerequisite: ECE 521
Typically offered in Spring only

ECE 722 Electronic Properties of Solid-State Materials (3 credit hours)
Materials and device-related electronic properties of semiconductors. Included topics: energy band structure, electrical and thermal transport phenomena, scattering processes, localized energy states, equilibrium and non-equilibrium semiconductor statistics.

Prerequisite: ECE 530
Typically offered in Spring only

ECE 723 Optical Properties Of Semiconductors (3 credit hours)
Materials and device-related properties of compound optical semiconductors. Included topics: band structure, heterojunctions and quantum wells, optical constants, waveguides and optical cavities, absorption and emission processes in semiconductors, photodetectors, light emitting diodes, semiconductor lasers.

Prerequisite: ECE 530
Typically offered in Spring only

ECE 724 Electronic Properties Of Solid-State Devices (3 credit hours)
Basic physical phenomena responsible for operation of solids-state devices. Examination and utilization of semiconductor transport equations to explain principles of device operation. Various solid-state electronics devices studied in detail.

Prerequisite: ECE 530
Typically offered in Spring only

ECE 725 Quantum Engineering (3 credit hours)
Development of advanced engineering concepts at the quantum level relevant to nanoscience, nanoelectronics, and quantum photonics. Topics include tunneling phenomena, specifics of time dependent and time independent perturbation methodology for addressing applications under consideration, including the WKB approach, and an introduction to second quantization for engineers. Applications include, but are not limited to, tunneling in a two-level system, molecular rotation through excitation, field emission, van der Waal interactions, optical absorption in quantum wells, and electron transport through model molecules.

Prerequisite: ECE 530, and PY 401
Typically offered in Spring only

ECE 726 Advanced Feedback Control (3 credit hours)
Advanced topics in dynamical systems and multivariable control. Current research and recent developments in the field.

Prerequisite: ECE 516
Typically offered in Fall only

ECE 732 Dynamics and Control of Electric Machines (3 credit hours)
Dynamic behavior of AC electric machines and drive systems; theory of field orientation and vector control for high performance induction and synchronous machines; permanent magnet and reluctance machines and their control; principles of voltage source and current source inverters, and voltage and current regulation methods.

Prerequisite: ECE 453 or ECE 592
Typically offered in Fall only

ECE 733 Digital Electronics (3 credit hours)
In-depth study of digital circuits at the transistor level. Topics include fundamentals; high speed circuit design; low-power design; RAM; digital transceivers; clock distribution; clock and data recovery; circuits based on emergining devices. Project.

Prerequisite: ECE 546
Typically offered in Fall only

ECE 734 Power Management Integrated Circuits (3 credit hours)
Review of modern power management converters and circuits; Review modeling and control of converters; Detail discussion of voltage and current mode controllers; Understanding of power converter losses and optimization method, as well as management of power; Integrated circuit design of various power management chips.

Prerequisite: ECE 511 and ECE 534
Typically offered in Spring only

ECE 735 Wide Band Gap Semiconductor Power Devices (3 credit hours)
This course provides students with an in-depth knowledge of power devices built from wide bandgap semiconductors: the design of high breakdown voltages, the physics of unique power rectifier structures suitable for SiC material, the operating principles for unique SiC power MOSFETs, and GaN HEMT devices, the development of bipolar power devices from SiC to achieve ultra-high voltage performance and the performance of wide bandgap semiconductor power devices as compared to advanced silicon devices.

Prerequisite: ECE 553 or equivalent
Typically offered in Spring only

ECE 736 Power System Stability and Control (3 credit hours)
Principles of FACTS (flexible AC transmission systems) and their applications. Power transmission on an AC system. Power system models for steady-state and dynamic analysis. Power system transient analysis for stability assessment. Voltage phenomena and methods for assessment.

Prerequisite: ECE 451 and ECE 750
Typically offered in Spring only

ECE 739 Integrated Circuits Technology and Fabrication Laboratory (3 credit hours)
An integrated circuit laboratory to serve as a companion to ECE 538. Hands-on experience in semiconductor fabrication laboratory. Topics include: techniques used to fabricate and electrically test discrete semiconductor devices, the effects of process variations on measurable parameters.

Prerequisite: ECE 538
Typically offered in Spring only

ECE 745 ASIC Verification (3 credit hours)
This course covers the verification process used in validating the functional correctness in today's complex ASICs (application specific integrated circuits). Topics include the fundamentals of simulation based functional verification, stimulus generation, results checking, coverage, debug, and formal verification. Provides the students with real world verification problems to allow them to apply what they learn.

Prerequisite: ECE 564
Typically offered in Spring only

ECE 748 Advanced Functional Verification with Universal Verification Methodology (3 credit hours)
The Universal Verification Methodology is the industry standard for functional verification of today's complex ASICs and FPGAs. Students will learn the content and use of UVM to architect and implement complex test benches. The characteristics and architecture of reusable verification components is a major focus of the course. Students will learn and implement verification components which are reusable across projects, from block level simulation to chip level simulation, and from simulation to emulation. The course projects teach and demonstrate advanced verification methodologies that prepare students for careers in functional verification of digital semiconductors.

Prerequisite: ECE 745 or equivalent
Typically offered in Fall only

ECE 751 Detection and Estimation Theory (3 credit hours)
Methods of detection and estimation theory as applied to communications, speech and image processing. Statistical description of signals and representation in time, spatial and frequency domains; Baysian methods, including Wiener, Kalman and MAP filters; performance measures; applications to both continuous and discrete systems.

Prerequisite: ECE 514, ECE 421
Typically offered in Spring only

ECE 752 Information Theory (3 credit hours)
An overview of Shannon's theory of information, which establishes fundamental limits on the performance of data compression and quantization algorithms, communication systems, and detection and estimation algorithms. Topics include information measures and their properties, information source models, lossless data compression, channel coding and capacity, information theory and statistics, and rate-distortion theory. Applications of information theory will also be discussed, including Lempel-Ziv data compression, vector quantization, error-correcting codes, satellite communications and high-speed modems.

Prerequisite: ECE 514: Random Processes

ECE 753 Computational Methods for Power Systems (3 credit hours)
This course is designed to introduce computational methods used for power grid operation and planning. The course will help students understand the various computational methods that form the basis of major commercial software packages used by grid analysts and operators. Students are expected to have some basic understanding of principles of power system analysis including power system models, power flow calculation, economic dispatch, reliable and stability analysis. The course covers the following computational methods commonly used in power grid operation and planning: Locational Marginal Pricing Schemes, Game Theory, Unconstrained Optimization, Linear Programming, Non-linear Constrained Optimization, and Forecasting Methods.

Prerequisite: ECE 451 or ECE 550
Typically offered in Spring only

ECE 755 Advanced Robotics (3 credit hours)
Advanced robotics at its highest level of abstraction; the level of synthesizing human reasoning and behavior. Advanced tobotics deals with the intelligent connection of perception to action. At this level the subject requires knowledge of sensing(computer vision, tactile, sonar), and reasoning (artifical intelligence: machine learning, planning, world modeling). The advanced robotics course will be valuable for students who wish to work in the area.

Prerequisite: ECE 555; MAE 544
Typically offered in Fall only

ECE 756 Advanced Mechatronics (3 credit hours)
A project-oriented course focusin on the design, analysis, and implementation of advanced mechatronics technologies, including large-scale distributed sensors, distributed-actuators, and distributed-controllers connected via communication networks.Will use unmanned vehicles as the project platform, with applications from sensors, actuators, network-based controllers, cameras, and microcontrollers. ECE 516 is recommended.

Prerequisite: ECE 456 or ECE 556 with a Grade B+ and above
Typically offered in Spring only

ECE 759 Pattern Recognition (3 credit hours)
Image pattern recognition techniques and computer-based methods for scene analysis, including discriminate functions, fixture extraction, classification strategies, clustering and discriminant analysis. Coverage of applications and current research results.

Prerequisite: ECE(CSC) 514, ST 371, B average in ECE and MA
Typically offered in Spring only

ECE 762 Advanced Digital Communications Systems (3 credit hours)
An advanced graduate-level course in digital communications. Topics include signal design, equalization methods and synchronization techniques for realistic communication channels. Projects concentrate on literature review and computer simulations.

Prerequisite: ECE 515 or equivalent
Typically offered in Fall only

ECE 763 Computer Vision (3 credit hours)
Analysis of images by computers. Specific attention given to analysis of the geometric features of objects in images, such as region size, connectedness and topology. Topics include: segmentation, template matching, motion analysis, boundary detection, region growing, shape representation, 3-D object recognition including graph matching.

Prerequisite: ECE 558 and ECE 514
Typically offered in Spring only

ECE 765 Probabilistic Graphical Models for Signal Processing and Computer Vision (3 credit hours)
Techniques for machine learning using probabilistic graphical models. Emphasis on Bayesian and Markov networks with applications to signal processing and computer vision.

Prerequisites: Programming experience (MATLAB, C++ or other object oriented language such as Python), linear algebra (MA 405 or equivalent), and probability (ECE 514, equivalent or instructor permission)
Typically offered in Fall only

ECE 766 Signal Processing for Communications & Networking (3 credit hours)
This course deals with the signal processing principles underlying recent advances in communications and networking. Topics include: smart-antenna and multi-input multi-output (MIMO) techniques; multiuser communication techniques (multiple access, power control, multiuser detection, and interference managment); signal processing in current and emerging network applications such as cognitive radio and social networks. Knowledge of linear alegbra and stochastic analysis is required.

Prerequisite: Graduate standing
Typically offered in Fall only

ECE 767 Error-Control Coding (3 credit hours)
An introduction to the theory and practice of codes for detecting and correcting errors in digital data communication and storage systems. Topics include linear block codes, cyclic codes, cyclic redundancy checksums, BCH and Reed-Solomon codes, convolutional codes, trellis-coded modulation, LDPC and turbo codes, Viterbi and sequential decoding, and encoder and decoder architecture. Applications include the design of computer memories, local-area networks, compact disc digital audio, NASA's deepspace network, high-speed modems, communication satellites, and cellular telephony.

Prerequisite: ECE 514 Random Processes; linear algebra at the undergraduate level is strongly recommended

ECE 773/CSC 773 Advanced Topics in Internet Protocols (3 credit hours)
Cutting-edge concepts and technologies to support internetworking in general and to optimize the performance of the TCP/IP protocol suite in particular. Challenges facing and likely evolution for next generation intenetworking technologies. This course investigates topics that include, but may be not limited to: Internet traffic measurement, characteriztion and modeling, traffic engineering, network-aware applications, quality of service, peer-to-peer systems, content-distribution networks, sensor networks, reliable multicast, and congestion control.

Prerequisite: CSC/ECE 573
Typically offered in Spring only

ECE 774/CSC 774 Advanced Network Security (3 credit hours)
A study of network security policies, models, and mechanisms. Topics include: network security models; review of cryptographic techniques; internet key management protocols; electronic payments protocols and systems; intrusion detection and correlation; broadcast authentication; group key management; security in mobile ad-hoc networks; security in sensor networks.

Prerequisite: CSC/ECE 570, CSC/ECE 574
Typically offered in Spring only

ECE 775/CSC 775 Advanced Topics in Wireless Networking (3 credit hours)
Reviews the current state of research in wireless networks, network architectures, and applications of wireless technologies; students will design, organize, and implement or simulate systems in a full-semester research project. For students with background in networking and communications who wish to explore research and development topics.

Prerequisite: ECE/CSC 575
Typically offered in Fall only

ECE 776/CSC 776 Design and Performance Evaluation of Network Systems and Services (3 credit hours)
Introduction to the design and performance evaluation of network services. Topics include top-down network design based on requirements, end-to-end services and network system architecture, service level agreements, quantitative performance evaluation techniques. Provides quantitative skills on network service traffic and workload modeling, as well as, service applications such as triple play, internet (IPTV), Peer-to-peer (P2P), voice over IP (VoIP), storage, network management, and access services.

Prerequisite: CSC(ECE) 570 and CSC(ECE) 579
Typically offered in Spring only

ECE 777/CSC 777 Telecommunications Network Design (3 credit hours)
Analytic modeling and topological design of telecommunications networks, including centralized polling networks, packet switched networks, T1 networks, concentrator location problems, routing strategies, teletraffic engineering and network reliability.

Prerequisite: CSC(ECE) 570
Typically offered in Spring only

ECE 785 Topics in Advanced Computer Design (3 credit hours)
In depth study of topics in computer design; advantages and disadvantages of various designs and design methodologies; technology shifts, trends, and constraints; hardware/software tradeoffs and co-design methodologies.

Prerequisite: ECE 520, ECE 521
Typically offered in Spring only

ECE 786 Advanced Computer Architecture: Data Parallel Processors (3 credit hours)
In-depth study of processor architectures to exploit data-level parallelism, including general computation on graphics processing units (GPGPU, aka GPU computing architecture) and vector processors; memory subsystems; advantages and disadvantages of various architectures; technology shifts, trends, and constraints.

P: ECE 463/563 and CSC/ECE 506
Typically offered in Spring only

ECE 791 Special Topics In Electrical Engineering (3-6 credit hours)
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 792 Special Topics In Electrical Engineering (1-6 credit hours)
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 801 Seminar in Electrical and Computer Engineering (1-3 credit hours)
Typically offered in Fall and Spring

ECE 804 Seminar in Comm/Sig PR (1-3 credit hours)
Typically offered in Fall and Spring

ECE 833 Individual Topics In Electrical Engineering (1-3 credit hours)
Provision of opportunity for individual students to explore topics of special interest under direction of a member of faculty.

Prerequisite: B average in technical subjects
Typically offered in Fall and Spring

ECE 834 Individual Studies In Electrical Engineering (1-3 credit hours)
The study of advanced topics of special interest to individual students under direction of faculty members.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ECE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall only

ECE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking writte and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall only

ECE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall only

ECE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ECE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ECE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

Elementary Education (ELM)

ELM 250 Introduction to Elementary Education in a Global Society (3 credit hours)
Introduction to the major conceptual and intellectual foundations of the teaching profession, the sociology and culture of elementary schools and classrooms, and the world of work of elementary teachers. Fieldwork in schools and related settings maybe required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.Students interested in Elementary Education.

Prerequisite: Sophomore standing
Typically offered in Spring and Summer

ELM 310 Children's Thinking and Additive Reasoning (3 credit hours)
Examination of mathematical reasoning processes in primary grade children and the theory and practice of active teaching strategies designed to motivate and engage children in mathematics learning in grades K-3. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 250, Junior standing, Elementary Education Majors
Typically offered in Fall only

ELM 320 Teaching Science in the Primary Grades (3 credit hours)
Examination of science knowledge and thinking in primary-age children. Development and application of methods for teaching science in the primary grades that leads to active learning of science as a process of inquiry. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 250, Junior standing, Elementary Education Majors
Typically offered in Fall only

ELM 330 Teaching Reading in Elementary School: K-2 (3 credit hours)
ELM 330 is designed to prepare preservice teachers to teach reading and to lead to licensure in the elementary grades. Specific topics that relate to the theory and practice of teaching reading for early and emergent readers, including literature and struggling readers, will be examined. Fieldwork in schools and related settings may be required in lieu of lecture in occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 250, Junior standing, Elementary Education Majors
Typically offered in Fall only

ELM 335 Teaching Reading in the Elementary School: 3-5 (3 credit hours)
ELM 335 is designed to prepare preservice teachers to teach reading and to lead to licensure in the elementary grades. Specific topics that relate to the theory and practice of teaching reading for upper elementary grade readers, including information and media literacy and literature, will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experience.

Prerequisite: ELM 330, Junior standing, Elementary Education Majors
Typically offered in Spring only

ELM 340 Children Design, Create and Invent (3 credit hours)
An active hands-on class where prospective elementary school teachers develop learning activities that children can use to stimulate their imaginations and learn fundamental concepts in science, technology, engineering, and mathematics. Part of a program leading to licensure in Elementary Education.

Prerequisite: ELM 370, Junior standing, Elementary Education Majors
Typically offered in Fall only

ELM 350 Assessment of Learning and Behavior (3 credit hours)
Application of knowledge of pedagogy and development to develop high-quality strategies for formative and summative assessment. Best practices using developmentally-appropriate assessment strategies including authentic assessment, portfolios and electronic portfolios, real-time feedback, open- and closed-ended formal assessments, and standardized testing. Particular attention to examining the rationale for assessment and the implications of assessment.

Prerequisite: ELM 250, Junior standing, Elementary Education Majors
Typically offered in Spring only

ELM 370 Connections Seminar I The Elementary Classroom and School Community (3 credit hours)
The purpose of this course is to introduce preservice teachers to the world of public school classrooms and school communities and to the tasks of teaching. Particular emphasis is placed on building a positive classroom climate and implementing effective classroom management strategies and routines. Weekly fieldwork in schools and related settings is requires 3 hours a week. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 250, Junior standing, Elementary Education Majors
Typically offered in Fall only

ELM 375 Connections Seminar II Cultural Identity, Social Justice and Diverse Learners (3 credit hours)
The purpose of the course is to help prospective elementary grades teachers develop the competencies to provide equitable opportunities to all of their future students. To do this, students will investigate issues of systemic injustice and the role of the school in interrupting cycles of inequality, and develop the capacity to engage in culturally relevant pedagogy. Weekly fieldwork in schools and related settings is required 3 hours a week. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 370;Junior standing. Elementary Education majors.
Typically offered in Fall only

ELM 400 Connections Seminar III Instructional Design and Assessment (3 credit hours)
In this course preservice elementary educators will examine research-verified practices in instructional design and assessment that are designed to meet the needs of diverse K-6 learners. This course will prepare candidates to plan appropriate units of study, learning experiences and assessment methods for use in the elementary classroom. Weekly fieldwork in schools and related settings is required. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 375, Senior standing, Elementary Education Majors
Typically offered in Fall only

ELM 410 Children's Thinking and Multiplicative Reasoning (3 credit hours)
This course is designed to prepare preservice teachers to teach math in the intermediate grades and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching of math will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 310, Junior standing, Elementary Education Majors
Typically offered in Spring only

ELM 420 Teaching Science in the Intermediate Grades (3 credit hours)
This course is designed to prepare preservice teachers to teach science in intermediate grades and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching science will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 320, Senior standing, Elementary Education Majors
Typically offered in Spring only

ELM 430 Teaching Language Arts in the Elementary School (3 credit hours)
This course is designed to prepare preservice teachers to teach language arts and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching language arts will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 335, Senior standing, Elementary Education Majors
Typically offered in Fall only

ELM 440 Teaching Children with Special Needs in the Elementary Classroom (3 credit hours)
This course is designed to prepare preservice teachers to teach students with special needs and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching students with special needs willbe examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 350, ELM 375, Senior standing, Elementary Education Majors, Corequisite: ELM 420
Typically offered in Fall only

ELM 450 The Arts for Elementary Education (3 credit hours)
This course is designed to prepare preservice teachers to integrate the arts; visual music, dance and drama, into the content areas. Successful completion of this course leads to licensure in the elementary grades. Specific methodologies that relateto the theory and practice of teaching the arts will be examined.

Prerequisite: ELM 375, Senior standing, Elementary Education Majors
Typically offered in Fall only

ELM 460 Social Studies for the Young Learner (3 credit hours)
This course is designed to prepare preservice teachers to teach social studies and to lead to licensure in the elementary grades. The course is an examination of curriculum, instruction, and learning in K-6 social studies education. Emphases includedevelopment of the social studies; curricular principles and components; teaching strategies; and learner outcomes. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportationto and from their school based experiences.

Prerequisite: ELM 370, Junior standing, Elementary Education Majors
Typically offered in Spring only

ELM 480 Connections Seminar IV Linking Theory and Practice (3 credit hours)
ELM 480 Linking Theory and Practice is designed as the capstone course in the Elementary Education Program. Teacher candidates will meet regularly to analyze and discuss their student teaching experiences and connect new learning to previous university coursework. In addition, teacher candidates will complete their edTPA Tasks and other culminating activities required by the program.

Prerequisite: ELM 400, Elementary Education Majors, Admission to the Professional Semester, Corequisite: ELM 484
Typically offered in Spring only

ELM 484 Student Teaching in Elementary Education (9 credit hours)
Culminating experience for Elementary Education majors. A minimum of 10 weeks of supervised teaching in an elementary school classroom, demonstrating competent applications of standards-based practices and other required knowledge, skill, and dispositional outcomes. Taken concurrently with ELM 480. Students responsible for transportation to placement site.

Prerequisite: ELM 480, ELM 400, Elementary Education Majors, Admission to the Professional Semester
Typically offered in Spring only

ELM 515 Instructional Practice in Schools I (1 credit hours)
Prepares pre-service teachers to develop competencies in assessment, instructional design, and tutoring and leads to initial licensure in the elementary grades. Includes 15-20 hours of fieldwork; transportation to schools is the responsibility of the students.

Typically offered in Fall and Spring

ELM 516 Instructional Practice in Schools II (2 credit hours)
Prepares pre-service teachers to develop competencies in assessment, instructional design, and teaching in whole class settings and leads to initial licensure in the elementary grades. Includes 30 hours of fieldwork; transportation to the schools is the responsibility of the students.

Corequisite: ELM 572, ELM 573, ELM 575
Typically offered in Fall and Spring

ELM 520 Methods of Teaching Elementary School Science (3 credit hours)
This course is intended for teachers seeking to expand their knowledge and skills in teaching elementary school science. The course examines the purposes, scope, sequences, materials, and methodologies for teaching science in elementary schools to a diverse student body. It develops skill in planning, instructing, and assessing understanding of science content and processes. It links instruction and assessment and addresses relevant content topics in chemistry, biology, physics, and earth and space science.

Typically offered in Spring only

ELM 524 Issues in Elementary School Science Education (3 credit hours)
Analysis of contemporary elementary school environments specific to elementary science content areas: life, Earth/space, and physical science in elementary school as well as science practices of argumentation, discourse, learning progressions, and science for all.

Typically offered in Spring only

ELM 530 Social Studies In the Elementary School (3 credit hours)
Advanced professional training in teaching of social studies for middle grades and elementary teachers, including in-depth introduction to research-based teaching strategies, instructional resources and literature of the field.

ELM 533 Targeted Literacy Assessment and Instruction for Elementary School (3 credit hours)
Intended for teachers seeking to expand their knowledge and skills in assessing and teaching elementary reading, particularly to students with reading difficulties. Exploring the purposes, sequences, and materials for identifying students' instructional strengths and learn methods for providing appropriate evidence-based reading instruction. Closely links reading assessment and reading instruction and addresses relevant content topics in elementary reading development, assessment, and instruction.

Typically offered in Spring only

ELM 537/ECI 537 Teaching Children's Literature (3 credit hours)
Instructions for educators in quality children's literature, specific needs of young reader, genres of children's literature, strategies for instructing children's literature, ways to target reader's interests, and design of literature units.

Typically offered in Summer only

ELM 539 Special Problems in Elementary School Science (3 credit hours)
In this course teachers build their science content knowledge in life, physical, and Earth/space science, examine strategies for effective science instruction to provide students with 21st Century skills with applications to young children's cognitive and affective learning.

Typically offered in Spring only

ELM 540 Reading In the Elementary School (3 credit hours)
Theoretical foundations of reading instruction and current methods and materials for teaching reading, with emphasis on planning and implementing reading programs for children in kindergarten through grade six.

ELM 555 Number Systems and Operations: K-5 Mathematical Tasks (3 credit hours)
Analysis and construction of effective mathematical tasks in teaching number systems and operations at the K-5 level; attention is also given to the expansion of content knowledge.

Typically offered in Fall only

ELM 556 Rational Numbers and Operations: K-5 Learning Trajectories (3 credit hours)
Focus on rational number concepts through learning trajectories at the K-5 level; attention also given to problem solving and content knowledge.

Typically offered in Spring only

ELM 557 Data Analysis and Measurement: K-5 Classroom Interactions (3 credit hours)
Focus on statistical literacy of elementary teachers and the teaching of data analysis and measurement to K-5 students; attention is also given to learning methods which facilitate appropriate classroom interactions.

Typically offered in Summer only

ELM 558 Algebraic Reasoning: K-5 Discourse and Questioning (3 credit hours)
Focus on the early algebra concepts of functional thinking and generalized arithmetic in relationship to pedagogical practices centered on questioning in the mathematics classroom.

Typically offered in Summer only

ELM 559 Geometry and Spatial Visualization: K-5 Assessment (3 credit hours)
Formative and summative assessment strategies of students' geometric thinking in elementary grades; Concept development of 2- and 3-dimensional Geometry. Attention also given to diagnosis of student errors.

Typically offered in Summer only

ELM 560 Mathematical Modeling: K-5 Leadership (3 credit hours)
Generating mathematical representations and making explicit connections between concepts; Pedagogy designed to equip elementary teachers to become mathematics teacher-leaders in school settings; Focus given to topics integrated within mathematical strands.

Typically offered in Summer only

ELM 570 The Foundations of Reading Instruction in the Elementary-School Classroom (3 credit hours)
This course serves as an introductory course for preservice teachers to develop the initial knowledge connected to the pillars of reading instruction needed to teach reading at the elementary-school level. This course builds on evidence-based perspectives on Grades K-6 reading instruction and the "science of reading," and provides candidates with the knowledge needed to teach the foundations of reading. This course serves as a prerequisite for ELM 572 ("The Structures of Reading Instruction in the Elementary-School Classroom").

R: Graduate standing and admission to the Elementary Education Master of Arts in Teaching program or English as a Second Language Master of Arts in Teaching Program, or by permission of instructor
Typically offered in Fall and Spring

ELM 571 Language Arts, New Literacies and Media for Initial License (3 credit hours)
Examine research-based processes for writing instruction, effects of and approaches for use of technology on literacy development, and effects of media and new literacies (non-print literacies, e.g. digital, visual, film) on literacy learning and development in elementary schools. Restricted to ELM MAT students.

Typically offered in Fall and Spring

ELM 572 The Structures of Reading Instruction in the Elementary-School Classroom (3 credit hours)
ELM 572 prepares pre-service teachers to teach reading and leads to licensure in the elementary grades. The course examines specific research-based methodology that relates to the theory and practice of teaching reading for elementary readers. Restricted to ELM, MAT students.

R: Graduate standing and admission to the Master of Arts in Teaching program, or by permission of instructor.; Prerequisite: ELM 570.
Typically offered in Fall and Spring

ELM 573 Methods for Teaching Elementary School Science for Initial License (3 credit hours)
ELM 573 prepares preservice teachers to teach science and leads to licensure in the elementary grades. The course examines specific research verified methodologies that relate to the theory and practice of teaching science to elementary students. Restricted to ELM MAT students.

Typically offered in Fall and Spring

ELM 574 Methods for Teaching Mathematics in the Elementary Classroom for Initial License (3 credit hours)
Prepares preservice teachers to teach mathematics and leads to licensure in the elementary grades. Examines specific research-based methodologies that relate to the theory and practice of teaching mathematics to elementary students. Limited to students enrolled in MAT Elementary Education program.

Typically offered in Fall and Spring

ELM 575 Social Studies in the Elementary School for Initial License (3 credit hours)
Designed to prepare pre-service teachers to teach social studies and to lead to licensure in the elementary grades. The course is an examination of curriculum, instruction, and learning in K-6 social studies education, Emphasis include development of the social studies, curricular principles and components, research verified teaching strategies, and learner outcomes. Restricted to ELM MAT students.

Typically offered in Fall and Spring

ELM 590 Special Problems in Elementary Education (1-6 credit hours)
In-depth study of topical problems in teaching and learning of current and special interest to elementary education practitioners.

Typically offered in Fall, Spring, and Summer

ELM 630 Independent Study in Elementary Education (1-3 credit hours)
Detailed investigation of topics of particular interest to graduate students under faculty direction on a tutorial basis. Determination of credits and content by faculty member in consultation with department head.

Typically offered in Fall and Spring

ELM 644 Practicum in Elementary Education (1-6 credit hours)
Supervised practical experiences in schools and area agencies concerned with education of elementary-age students.

ELM 654 Internship In Elementary Education (1-6 credit hours)
Supervised opportunities for advanced professional development in contexts concerned with elementary grades education.

Typically offered in Fall and Spring

Engineering (E)

E 101 Introduction to Engineering & Problem Solving (1 credit hours)
An introduction to the College of Engineering as a discipline and profession. Emphasis on engineering design, interdisciplinary teamwork, and problem solving from a general engineering perspective. Overview of academic policies affecting undergraduate engineering students. Exposure to College of Engineering and university-wide programs and services.

Prerequisite: Engineering Majors, Freshman standing
Typically offered in Fall only

E 102 Engineering in the 21st Century (2 credit hours)
This interdisciplinary course will provide an overview of the fourteen engineering grand challenges of the 21st century and their relationships to all of the separate engineering disciplines in the College of Engineering. The lectures will incorporate examples, guests, and specific readings on the challenges in sustainability, health, vulnerability, and the joy of living to advance civilization into the next century. Students will gain an appreciation for the methods in which engineers, in each discipline, acquire knowledge and design tools or interdisciplinary solutions essential to meet society's future needs. Course is available to 25% non-engineering students.

Restriction: Freshmen only with completion of a college introductory course, i.e. E101
GEP Interdisciplinary Perspectives
Typically offered in Spring and Summer

E 115 Introduction to Computing Environments (1 credit hours)
Introduction to the NC State computing system, and to student-owned computing resources. Includes topics such as maintaining your own computer, learning about campus-based computing resources and applications (how to access and use them), ethics and professionalism in the use of computing resources, introduction to web development and other campus resources.

Typically offered in Fall, Spring, and Summer

E 122 Engineering Academic Success (1 credit hours)
This 8-week course is designed to teach students a variety of proven strategies for creating greater academic, professional, and personal success. Enrollment is required of students in the College of Engineering who were unsuccessful in completing E101 and/or have an earned GPA less than 2.0 after the first semester of the freshman year. Topics include: time management, goal setting, stress management, study skills, learning styles, and campus resources using a platform of lectures and guest speakers.

Typically offered in Spring only

E 144 Academic and Professional Preparation for Engineering I (1 credit hours)
Assist new freshmen engineering students in the transition from high school to the collegiate environment. Cover critical-thinking; problem solving techniques; academic skills and time management.

Typically offered in Fall only

E 145 Academic and Professional Preparation for Engineering II (1 credit hours)
Engineering as a field of study and profession. Career and professional development, goal setting, decision making and effective communication strategies.

Typically offered in Spring only

E 201 Engineering Transfer to Success (1 credit hours)
This 8-week course will provide an overview of the NC State University policies and procedures, organizations, and resources available for enhancing the academic success of new transfer students in the College of Engineering. Lectures and discussion from departmental representatives will focus on requirements and availability for financial aid, cooperative education, career services, and campus student organizations. Emphasis will be placed on acclimating student through teamwork and academic achievement within the first year of transfer.

Prerequisite: E101 or Introduction to College Course
Typically offered in Fall only

E 298 Special Topics Engineering (1-3 credit hours)
Typically offered in Spring only

E 304 Introduction to Nano Science and Technology (3 credit hours)
Fundamental concepts of Nano-Science and Technology including scaling, nano-scale physics, materials, mechanics, electronics, heat transfer, photonics, fluidics and biology. Applications of nano-technology.

Prerequisite: MA 242 and PY 208 with grade of C- or higher
Typically offered in Fall and Spring

E 480 Namibia Wildlife Aerial Observatory (6 credit hours)
Namibia Wildlife Aerial Observatory (WAO) is restricted to junior-level and above students who participate in Namibia WAO study-abroad. The course is a purpose-driven educational experience of field work and research. The first 10 weeks take place in Namibia; of which during the first two weeks, the students receive lectures on such topics as African landscapes and wildlife, African culture, cross-cultural knowledge and skills, wildlife trade and poaching, data analysis for research, and are trained in the operation and maintenance of unmanned aerial vehicle systems (e.g. vehicles, cameras, communications) and in the following eight weeks are divided into field units that conduct aerial data collection for the purposes of meeting given wildlife missions. Upon returning to NC State, each field unit spends two-weeks (10 days) turning their findings into a research journal article for dissemination.

Junior standing or above
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

E 490 Fundamentals of Engineering(FE) Exam Preparation (1 credit hours)
Preparation for graduating seniors in engineering to take the Fundamentals of Engineering (FE) Examination. Information on how to register for the FE exam, exam strategy, and a review of selected science and engineering topics through active learning exercises directed at working sample examination problems. Credit may not be counted toward graduation

Prerequisite: Engineering Majors, Senior standing, Graduate students, or PBS status
Typically offered in Fall and Spring

E 497 Engineering Research Projects (1-3 credit hours)
Projects in research, design or development in engineering or computer science. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in College of Engineering, Engineering Scholars Program or Engineering Research Center Scholars
Typically offered in Fall, Spring, and Summer

E 531/OR 531/MA 531 Dynamic Systems and Multivariable Control I (3 credit hours)
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

Prerequisite: MA 341, MA 405
Typically offered in Fall only

E 731/MA 731/OR 731 Dynamic Systems and Multivariable Control II (3 credit hours)
Stability of equilibrium points for nonlinear systems. Liapunov functions. Unconstrained and constrained optimal control problems. Pontryagin's maximum principle and dynamic programming. Computation with gradient methods and Newton methods. Multidisciplinary applications.

Prerequisite: OR(E,MA) 531
Typically offered in Spring only

English (ENG)

ENG 1GEP 100 Level English Composition (3 credit hours)
100 Level English Composition. Transfer students with 3 hours of ENG 1GEP credit may receive ENG 101 equivalency by completing ENG 202 with a C- or better.

ENG 100 Reading and Writing Rhetorically (4 credit hours)
Intensive practice in reading and writing critically and rhetorically, with attention to how those change according to purpose and situation. Introduction to rhetorical concepts and elements with application to a variety of academic, professional, or civic texts. Exploration of principles of argument and organization. Guidance in developing flexible, self-aware reading and composing processes. Practice in seeking, providing, and responding to constructive feedback. Practice with making choices about grammar, mechanics, and style appropriate to specific rhetorical situations. Extensive writing practice and individualized coaching to support ongoing development as a writer. Intended as preparation for ENG 101. Departmental consent required.

Typically offered in Fall, Spring, and Summer

ENG 101 Academic Writing and Research (4 credit hours)
Intensive instruction in academic writing and research. Basic principles of rhetoric and strategies for academic inquiry and argument. Instruction and practice in critical reading, including the generative and responsible use of print and electronic sources for academic research. Exploration of literate practices across a range of academic domains, laying the foundation for further writing development in college. Continued attention to grammar and conventions of standard written English. Successful completion of ENG 101 requires a C- or better. Credit for ENG 101 is not allowed if the student has already fulfilled the first-year writing requirement.

Prerequisite: Placement via English Department guidelines
Typically offered in Fall, Spring, and Summer

ENG 202 Disciplinary Perspectives in Writing (3 credit hours)
Examination of the uses of writing and research within academic disciplines; analysis, synthesis, and reflection on what makes effective academic arguments; development of an understanding of the rhetorical demands of disciplinary writing, including attention to audience, purpose, and context; instruction in critical research practices; engagement in reflective activities on writing and research processes to help students gain facility in academic writing across disciplines and within their own discipline. Restricted to transfer students with 3 hours of ENG1** or ENG1GEP transfer credit. Together with approved transfer credit hours, this course satisfies the Introduction to Writing component of the General Education Program. Course Pre-requisite: 3 credits of ENG1** or ENG1GEP transfer credit.

P: 3 hours transferring ENG1** or ENG1GEP transfer credit
Typically offered in Fall, Spring, and Summer

ENG 206 Studies In Drama (3 credit hours)
Selected drama from the classical period to the present. Emphasis on reading for enjoyment as well as understanding theory and development of tragedy, comedy, and other modes of dramatic expression. Writers such as Sophocles, Euripides, Shakespeare, Ibsen, and Shaw, and contemporary playwrights.

GEP Humanities
Typically offered in Fall and Spring

ENG 207 Studies in Poetry (3 credit hours)
Main features of poetry such as tone, voice, form, diction, figurative language, and sound patterns. Reading of poetry from different periods with the goal of learning how to understand, appreciate, and analyze different kinds of poems.

GEP Humanities
Typically offered in Fall and Spring

ENG 208 Studies In Fiction (3 credit hours)
Representative examples of novels and short stories from different periods, emphasizing understanding and appreciation of fiction as a genre, a knowledge of the features and techniques of fiction, and a sense of the development of the genre.

GEP Humanities
Typically offered in Fall and Spring

ENG 209 Introduction to Shakespeare (3 credit hours)
Shakespeare for non-English majors. Seven to ten major plays, including representative comedies, such as The Taming of the Shrew; histories, such as Richard III; tragedies, such as Hamlet; and romances, such as The Tempest. Does not satisfy requirements for English major.

GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 210 Introduction to Language and Linguistics (3 credit hours)
Linguistics theory and method. Topics include the English sound system, morphology, syntactic structure, semantics, and historical and contemporary dialect variation. Language acquisition, language and the brain, and computer processing and human language.

Prerequisite: ENG 101
GEP Social Sciences
Typically offered in Fall and Spring

ENG 214 Introduction to Editing (3 credit hours)
Basic editorial skills with a wide range of publications. Stylistic editing (conventions of written English, consistency, effectiveness of syntax, appropriateness of diction), substantive editing (accuracy, legal issues, ethics), and production editing (layout, typography, electronic publication processing). Introduction to resources such as standard reference works and professional organizations.

Prerequisite: ENG 101
Typically offered in Fall, Spring, and Summer

ENG 216 Technologies for Texts (3 credit hours)
Uses of computers for creating, designing, analyzing, and disseminating texts, both on desktops and on the Internet. Overview of technologies that facilitate reading, writing, and communication; development of skill with various applications and understanding of their capabilities, limitations, and historical analogues. Recommended for students in journalism and technical writing.

Prerequisite: ENG 101
Typically offered in Spring only

ENG 219/FL 219 Studies in Great Works of Non-Western Literature (3 credit hours)
Readings, in English translation, or non-Western literary masterpieces from the beginnings of literacy in the Middle East, Asia, and Africa to the modern period, including excerpts from texts such as the Upanishads, the Ramayana, the Sundiata, Gilgamesh, A Thousand and One Nights, and the Quran and such authors as Confucius, Oe Kenzaburo, Omar Khayyam, Rumi, and Amos Oz.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 220/FL 220 Studies in Great Works of Western Literature (3 credit hours)
Readings, in English translation, of Western literary masterpieces, from the beginnings of literacy in the Middle East and Europe towards the present, including such authors as Homer, Sophocles, Virgil, Ovid, Augustine, Dante, Machiavelli, Shakespeare, Cervantes, Moliere, Voltaire, Goethe, Austen, Flaubert, Dickinson, Tolstoy, Kafka, and Woolf. Credit will not be given for both ENG/FL 220 and either ENG/FL 221 or ENG/FL 222.

Restricton: Credit is not allowed for both ENG 220 and ENG 221 or ENG 222.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 221/FL 221 Literature of the Western World I (3 credit hours)
Readings from English translations of Biblical, Classical, Medieval, and Early Renaissance literature, including works by such authors as Homer, Plato, Virgil, Ovid, St. Paul, St. Augustine, Marie de France, and Dante. Credit is not allowed for both ENG 221 and ENG 220.

Restriction: Credit is not allowed for both ENG 221 and ENG 220.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 222/FL 222 Literature of the Western World II (3 credit hours)
Readings from English translations of Renaissance, Neo-Classical, Romantic, and Early Modern literature, emphasizing the cultures of continental Europe from the Renaissance to 1900, and including such authors as Petrarch, Erasmus, Rabelais, Machiavelli, Shakespeare, Moliere, Voltaire, Rousseau, Goethe, Flaubert, and Tolstoy. Credit is not allowed for both ENG 220 and ENG 222.

Restriction: Credit is not allowed for both ENG 222 and ENG 220.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 223/FL 223 Contemporary World Literature I (3 credit hours)
Twentieth-century literature of some of the following cultures: Russian, Eastern European, Western European, Latin American, Canadian, Australian.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 224/FL 224 Contemporary World Literature II (3 credit hours)
Twentieth-century literature of some of the following cultures: Asian, Middle Eastern, African, Caribbean, Native-American.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 232 Literature and Medicine (3 credit hours)
Literary, cultural, and philosophical perspectives on medical science and practice, illness, epidemics, and related topics. Readings will include fiction, poetry, personal essays, film, and other media.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

ENG 246/FL 246 Literature of the Holocaust (3 credit hours)
Fictional and nonfictional versions of the Holocaust, focusing on themes of survival, justice, theology, and the limits of human endurance.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

ENG 248/AFS 248 Survey of African-American Literature (3 credit hours)
African-American writing and its relationships to American culture and history. Covers such writers as Wheatley, Douglass, Chesnutt, Dunbar, DuBois, Hughes, Hurston, Wright, and Morrison.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

ENG 249 Native American Literature (3 credit hours)
A survey of Native American literatures from before contact with Europeans to contemporary culture. Writers may include: Apess (Pequot), Ridge (Cherokee), Silko (Laguna Pueblo), Momaday (Kiowa), Power (Sioux) Gunn Allen (Laguna-Sioux), Harjo (Creek), and Erdrich (Anishinaabe).

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

ENG 251 Major British Writers (3 credit hours)
Significant British authors chosen from among such figures as Chaucer, Shakespeare, Milton, Swift, Pope, Austen, Wordsworth, Coleridge, Tennyson, Browning, Bronte, Dickens, Joyce, Eliot, Woolf, and Yeats.Credit will not be given for both ENG 251 and either ENG 261 or 262.

Credit is not allowed for ENG 251 and ENG 261 or ENG 262.
GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 252 Major American Writers (3 credit hours)
Significant American authors chosen from among such figures as Franklin, Emerson, Thoreau, Hawthorne, Melville, Douglass, Stowe, Whitman, Dickinson, Twain, James, Frost, Faulkner, Hemingway, and Morrison. Credit will not be given for both ENG 252 and either ENG 265 or 266.

R: Credit will not be given for both ENG 252 and either ENG 265 or ENG 266.
GEP Humanities
Typically offered in Fall and Spring

ENG 255 Beyond Britain: Literature from Colonies of the British Empire (3 credit hours)
This course challenges students to understand the historical, political, and cultural circumstances that gave rise to literary production in 18th- and 19th-century colonial societies. The course will enable students to understand the value of reading 18th- and 19th-century literature from a global perspective, a critical component of literary studies in today's twenty-first-century world.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 260 Reading Literature and Exploring Textuality (3 credit hours)
Introduces fundamental questions in literary history and critical theory. Emphasizes critical reading skills and prepares students for the kinds of courses--surveys, genre courses, author courses, problem-based courses--that are part of the Englishmajor. Papers prepared using standard word processing programs.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ENG 261 English Literature I (3 credit hours)
A survey of English literature to 1660, including Old English, Middle English, and Renaissance writing, focusing on such central authors as Chaucer, Spenser, Marlowe, Shakespeare, Jonson, Donne, and Milton. Credit will not be given for both ENG 261 and ENG 251.

Restriction: Credit is not allowed for both ENG 261 and ENG 251.
GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 262 English Literature II (3 credit hours)
A survey of English literature from 1660 to the present. Poetry, fiction, drama and intellectual prose by such central writers as Dryden, Pope, Swift, Johnson, Wollstonecraft, Wordsworth, Keats, Shelley, Bronte, Carlyle, Tennyson, Browning, Yeats, Woolf, Joyce and Eliot. Credit will not be given for both ENG 262 and ENG 251.

Credit is not allowed for both ENG 262 and ENG 251.
GEP Humanities
Typically offered in Fall, Spring, and Summer

ENG 265 American Literature I (3 credit hours)
A survey of American literature from the beginnings to the Civil War, including such central authors as Edwards, Franklin, Irving, Emerson, Hawthorne, Melville, Poe, Stowe, Douglass, Thoreau, and Whitman. Credit will not be given for both ENG 265 and ENG 252.

Credit is not allowed for ENG 265 and ENG 252.
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

ENG 266 American Literature II (3 credit hours)
A survey of American literature from the Civil War to the present, including such central authors as Whitman, Dickinson, Twain, James, Crane, Wharton, Frost, Eliot, Hemingway, Hurston, Faulkner, Wright, O'Connor, and Morrison. Credit will not be given for both ENG 266 and ENG 252.

Credit is not allowed for both ENG 266 and ENG 252.
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

ENG 267 LGBTQI Literature in the U.S. (3 credit hours)
Chronological survey of works of literature by and about gay, lesbian, bisexual, transgender, questioning, and intersex communities in the U.S. Primary texts will be considered in historical, political, and literary contexts. Brief consideration of early works from colonial period and 19th century with primary focus on 20th and 21st century texts.

GEP Humanities
Typically offered in Spring only

ENG 275/FL 275 Literature and War (3 credit hours)
A geographical and thematic examination of war and questions it raises, as reflected in selected writings from, Homer, Sophocles, Japan's Tale of the Heike, Shakespeare, The Bhagavad-Gita, Keegan, Kipling, Graham Green, Mulden, Michael Herr, Dexter Filkins, Lucius Shepherd as well as writers on Just War and Deterrence Theory, and military science.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 281 Introduction to Creative Nonfiction (3 credit hours)
This is an introductory course that will instruct students in writing, editing and appreciating the professional nonfiction one finds in magazines, on issue-oriented websites, and in general interest publications, from the New Yorker-style long article to the personal columns one finds on online media outlets: writing about an issue or event in a personal, stylish way while obtaining the rigor of journalism in scrupulous research and clarity. In an ever-enlarging media universe, this is the most visible and commercial of all the creative writing genres.

Prerequisite: ENG 101
Typically offered in Fall only

ENG 282 Introduction to Film (3 credit hours)
Examination of basic film techniques and methods of film analysis. Emphasis on understanding and appreciating film as a major US and international art form and industry operating in various national, cultural, and historical contexts.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

ENG 287 Explorations in Creative Writing (3 credit hours)
Introduction to the basic elements and principles of three genres of creative writing: poetry, fiction and drama. Reading and class discussion of student work. Recommended for students with no prior experience in creative writing.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ENG 288 Fiction Writing (3 credit hours)
Experience in writing short prose fiction. Class critiquing of student work and instruction in techniques of fiction.

Prerequisite: ENG 101
Typically offered in Fall, Spring, and Summer

ENG 289 Poetry Writing (3 credit hours)
Experience in writing poetry. Class critiquing of student work and instruction in techniques of poetry.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ENG 292 Writing About Film (3 credit hours)
Comprehensive study of various approaches to writing about film. Primary focus is on the critical and evaluative practice involved in writing film criticism for non-academic audiences. Film screenings, discussion of assigned readings, and in-class writing workshops aid students in preparing a portfolio of film writing that includes film reviews of various lengths.

Prerequisite: ENG 101
GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

ENG 298 Special Projects in English (1-3 credit hours)
Faculty-guided independent study, or courses on special topics determined by departmental interest or need.

Typically offered in Fall, Spring, and Summer

ENG 300 Critical Approaches to Literature (3 credit hours)
This course introduces fundamental questions in literary history and critical theory. It emphasizes critical reading skills and prepares students for the interpretive and analytic work required of them in survey, genre, author, problem-based literature courses that are part of the English major.

P: ENG 101; R: credit will not be given for both, ENG 260 and ENG 300
Typically offered in Fall and Spring

ENG 305/WGS 305 Women and Literature (3 credit hours)
Nineteenth through twenty-first century women's literature, as shaped by the intersecting and competing claims of gender, race, sexuality, and culture. Focus on fiction, accompanied by critical readings from American studies, feminist literary criticism, and postmodern theory.

Prerequisite: Sophomore standing and above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

ENG 308/WGS 308 Contemporary Issues in Ecofeminism (3 credit hours)
Contemporary issues in ecofeminism provides a historical introduction to and global perspectives on women's sociopolitical, ethical, and economic contributions to the 20th and 21st century environmental movement. Theory and political action as they interweave issues of gender, race, and class in western and non-western contexts will be emphasized. Students will read works by and about female scientists/activists/writers and examine their own communities, analyzing the ways that individuals, community values, and dominant institutions impact women's relationships with the environment. Students will formulate questions, responses, and interpretations through critical reading practices, class discussion groups, self-reflective writing, and comparative analyses. Special attention will be paid to the role of literature--memoir, novel, short story, essay--in the dissemination of ecofeminist ideas.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

ENG 314 Technical Document Design and Editing (3 credit hours)
Layout and design principles for written documents; desktop building; legibility, readability testing; conventions of proposals, instructions, and reports; basics of technical editing: usage, vocabulary, style manuals, editing mathematical equations, graphs, tables.

Prerequisite: ENG 214
Typically offered in Fall only

ENG 315 Phonetics (3 credit hours)
This course is an introduction to phonetics: how spoken language is produced and perceived, and the physical properties of speech. An understanding of phonetics is fundamental to scientific and clinical approaches to speech and language. This course is meant to build both skills and knowledge.

Typically offered in Fall only

ENG 316 Introduction to News and Article Writing (3 credit hours)
Techniques of writing news stories and feature articles for print and the Web. Components of newsworthiness, examination of evidence, interview techniques, varied writing styles. Role of print- and Web-based journalism in America.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ENG 317 Designing Networked Communications (3 credit hours)
A course in the layout, design, and composition of digitally-networked communication. Students will learn to analyze audiences and themselves for their uses of information in order to plan, compose, and critically evaluate digitally networked ecologies including web pages, mobile applications, and social media platforms. Students will acquire theories and skills with HTML/CSS coding, rhetorically-centered design, accessibility, and user experience and will apply those skills to the composition of a variety of digital texts. Course work will require students to become proficient with commercially-available and open source content platforms.

Prerequisite: ENG 101
Typically offered in Spring only

ENG 320 Anatomy and Physiology of Speech (3 credit hours)
Students will learn about the anatomy and physiology of the speech mechanism including the muscular, skeletal, and nervous system structures involved in respiration, phonation, and articulation. This knowledge may be applied in clinical fields such as speech-language pathology or serve as the basis for the study of linguistic phonetics.

Typically offered in Fall only

ENG 321/COM 321 Survey of Rhetorical Theory (3 credit hours)
Principles of rhetorical theory from its classical origins through the modern period to the present time. Key concepts and theories that provide a critical understanding of the processes of persuasive symbol use.

Prerequisite: Sophomore standing and above
Typically offered in Fall only

ENG 323 Writing in the Rhetorical Tradition (3 credit hours)
A writing course based on the study of rhetoric. Readings on the principles of invention, arrangement, and style; analysis of written texts; writing of persuasive texts for a variety of audiences and purposes.

Prerequisite: ENG 101
Typically offered in Fall, Spring, and Summer

ENG 324 Modern English Syntax (3 credit hours)
Study of Modern English at the sentence level. Analysis of grammatical structure. Consideration of language variation in English.

Prerequisite: ENG 101
Typically offered in Fall only

ENG 325 Spoken and Written Traditions of American English Dialects (3 credit hours)
Basic issues in the study of language; linguistic terminology and categories; grammatical traditions and topics such as prescriptivism and descriptivism, standard and non-standard, orality and literacy; language acquisition and awareness; language aesthetics and ethics.

Prerequisite: ENG 101
Typically offered in Spring only

ENG 326 History of the English Language (3 credit hours)
Development of the English language from its Indo-European origins to the present. Emphasis on historical and comparative linguistic methodology and on changes in sound, syntax, and meaning.

P: ENG 101
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 327/WGS 327 Language and Gender (3 credit hours)
Introduction to the use of language by men and women. Research in Linguistics and Women's Studies addressing issues such as the acquisition of gender-differentiated language, gender and conversational interaction, sexism in language, gender issues in society, and the relationship between language, gender, and other social constructs (e.g., class, culture, and ethnicity).

Prerequisite: ENG 101
Typically offered in Fall only

ENG 328 Language and Writing (3 credit hours)
Study of language structure; specific attention to differences between spoken and written language; print conventions; error analysis; and the application of linguistics to rhetoric and composition. Analysis of a variety of grammatical approaches; how to evaluate grammar textbooks and compositions. Intended for English Education majors.

Prerequisite: ENG 101
Typically offered in Fall only

ENG 329 Language and Globalization (3 credit hours)
Introduction to the sociolinguistics of globalization. Through linguistic-semiotic practices, examine how mobility, migration, and the global circulation of information and ideologies impact people, places, and practices. Study of the interplay between global flows, (trans)local contexts, and the consequences of intense contact with linguistic and cultural otherness. Topics include: English as a global language; mobility, migration, multilingualism; youth language in mobility; multilingual hip-hop; globalization and social media; multilingual signs and linguistic landscapes in urban settings.

GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

ENG 330 Screenwriting (3 credit hours)
Writing for films, story planning, character development, communicating information, building scenes, relationships between script and cinematic dimensions, working with studios and editors.

Prerequisite: 6 credit hours from courses in writing for media, creative writing, or Film Studies
Typically offered in Fall and Spring

ENG 331 Communication for Engineering and Technology (3 credit hours)
Written communication in industrial and technical organizations, emphasizing internal communication with managers and technical personnel and including external communication with regulators, vendors, and clients. Intensive practice in writing; relationship of writing to oral and visual communication. For students in engineering and other primarily technological curricula.Credit is not allowed for more than one of ENG 331, ENG 332, and ENG 333.

Prerequisite: Junior standing. Credit is not allowed for both ENG 331 and ENG 332 or ENG 333.
Typically offered in Fall, Spring, and Summer

ENG 332 Communication for Business and Management (3 credit hours)
Written communication in business and public organizations, including both internal communication (such as instructions, policies, management reports) and external communication with clients, vendors, and publics. Intensive practice in writing; relationship of writing to oral and visual communication. For students in business and management-related programs.Credit is not allowed for more than one of ENG 331, ENG 332, and ENG 333.

Prerequisite: Junior standing. Credit is not allowed for both ENG 332 and ENG 331 or ENG 333.
Typically offered in Fall, Spring, and Summer

ENG 333 Communication for Science and Research (3 credit hours)
Written communication in scientific and research contexts, emphasizing relationship between research and writing in problem formulation, interpretation of results, and support and acceptance of research. Intensive practice in writing; relationship of writing to oral and visual communication. For students who plan careers in scientific research.Credit is not allowed for more than one of ENG 331, 332, and 333.

Prerequisite: Junior standing. Credit is not allowed for both ENG 333 and ENG 331 or ENG 332.
Typically offered in Fall, Spring, and Summer

ENG 335 Language Development (3 credit hours)
This course addresses syntactic, semantic, morphologic, and pragmatic development from birth through adolescence, explores the influence of cognitive and social development on language development, and contrasts first language acquisition with second language learning.

Typically offered in Spring only

ENG 338 Speech Science (3 credit hours)
Learn about the acoustic properties of speech sounds and the dynamics of speech sound production. Become familiar with and practice the use of basic clinical instrumentation used to measure respiratory, phonatory, and articulatory movements and the acoustic events that result from these movements. Complete assignments requiring the use of basic instrumentation and computer software.

Prerequisite: ENG 320
Typically offered in Spring only

ENG 339 Literature and Technology (3 credit hours)
Introduction to how the interactions among technologies, media, and literature shape the cultural past. The course pursues studies of fictional and non-fictional texts through several disciplinary perspectives including literary criticism, communications, media theory, and history. Technologies and literary and historical eras considered will vary.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

ENG 340 Literature, Art, and Society (3 credit hours)
This course explores the intersection of literature and the arts, including the visual and/or performing arts, and their role as social commentary. It will consider the expressive power of the medium in the arts, whether that of an individual artist working across mediums or a collaboration between artists, and will examine the rich relations that have existed between literature, the arts, and important social movements of the day. Disciplinary perspectives include literary criticism, history, art history, performance studies, and museum studies.

Requisite: Sophomore Standing or Above
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

ENG 341 Literature and Science (3 credit hours)
This course tracks the imaginative potentials, social repercussions, and interdisciplinary mixing of literature and science since the emergence of empiricism in the sixteenth century. Well before literature and science divided into "two cultures." they supplied a fruitful crossover for ideas about how and why the world works and how we gain new knowledge. Even with the development of modern disciplines, literature plays an important role in cultural assessments of scientific discovery and education. Students will read a selection of works from literary as well as scientific writers, analyzing texts and historical contexts and producing written arguments within an interdisciplinary framework.

R: Sophomore Standing or Above
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

ENG 342 Literature of Space and Place (3 credit hours)
This course investigates how various spatial categories (for example, the city, the pastoral, wilderness, region, nation, or the globe) work in and are constructed by literary texts. Humanities fields have increasingly noted the importance of space and place in shaping our lives and as key mechanisms through which ideas of gender, sexuality, race, class, national identity, or nature are shaped. Our spatial analysis of literature will borrow from an interdisciplinary range of methods: cultural and historical geography, cartography, urban studies, and/or environmental studies. The course also addresses the historical and cultural contexts that have shaped ideas of space.

Requisite: Sophomore Standing or Above
GEP Humanities, GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Spring only

ENG 349/AFS 349 African Literature in English (3 credit hours)
Anglophone literature in Africa. Emphasis on the relationship between the African world-view and literary production and the persistent trend by African writers to connect literature with politics. Writers such as Achebe, Ngugi, Soyinka, and Serote.

Prerequisite: Sophomore standing and above
Typically offered in Spring only

ENG 350 Professional Internships (3 credit hours)
Directed work for CHASS majors including work-site mentoring and evaluation. Department supervision includes a course work directed toward designing employment application materials, developing a portfolio of professional work or relevant research paper, considering a variety of career options, and reading literature on workplace socialization. students must provide their own transportation to the internship site. Modest liability insurance fee required. Students must have at least a 2.5 overall GPA and at least a 3.0 GPA in the major, be a junior or senior CHASS major or minor, and must complete the application process outlined on the Internship Program Website or provide the internship coordinator with contact information for your supervisor at an internship you obtained independently.

Typically offered in Fall and Spring

ENG 359 Topics in Film Studies (3 credit hours)
Critical approaches to focused film topics involving film genres, directorial styles, or trends within a national cinema. Topics will vary from semester to semester.

Typically offered in Spring only

ENG 361 Studies in British Poetry (3 credit hours)
Topics in eighteenth- and nineteenth-century British poetry. Focus on a particular theme, issue, poetic genre, or group of poets. Authors studied may include Alexander Pope, Anna Laetitia Barbauld, Charlotte Smith, Olaudah Equiano, William Blake, Dorothy Wordsworth, William Wordsworth, George Gordon, Lord Byron, Mary Shelley, Percy B. Shelley, John Keats, Felicia Hemans, Alfred Lord Tennyson, Matthew Arnold, Elizabeth B. Browning, Robert Browning, Christina Rossetti, Dante G. Rossetti, Oscar Wilde, and Gerard Manley Hopkins.

R: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 362 Studies in the British Novel (3 credit hours)
Topics in 18th and 19th century British fiction. Focus on a particular theme, issue, fictional genre, or group of fiction writers. Authors studied may include Daniel Defoe, Eliza Haywood, Henry Fielding, Samuel Richardson, Charlotte Smith, Mary Wollstonecraft, Mary Shelley, Jane Austen, the Brontes, Charles Dickens, George Eliot, Bram Stoker, Thomas Hardy, and Oscar Wilde.

R: Sophomore standing and above
GEP Humanities
Typically offered in Fall only

ENG 364/COM 364 History of Film to 1940 (3 credit hours)
Technological developments and aesthetic movements that shaped international cinema production from the beginning of the industry to 1940. Formal evolution in camera movement, editing, sound, narrative form, and the documentary. The rise to prominence of Hollywood and international cinemas in historical, economic, and cultural contexts.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

ENG 369 The American Novel of the 19th Century (3 credit hours)
Major novels illustrating the development of American fiction from Romanticism to Realism and Naturalism. Works by such writers as Brown, Cooper, Hawthorne, Stowe, Melville, Twain, Howells, James, Norris, Crane, Chopin, and Dreiser.

Prerequisite: Sophomore standing and above
Typically offered in Fall only

ENG 370 American Fiction, Twentieth Century and Beyond (3 credit hours)
Study of narrative fiction written in the twentieth-century and after by American writers. This course will examine major developments in narrative form and technique, based on developments in important literary traditions such as realism, modernism or postmodernism. The course will situate the fiction in key contexts, whether literary or cultural. Representative writers: Ernest Hemingway, Gertrude Stein, William Faulkner, Toni Morrison and Cormac McCarthy.

Prerequisite: Sophomore standing and above
GEP Humanities
Typically offered in Fall only

ENG 372 American Poetry, Twentieth Century and Beyond (3 credit hours)
Study of poetry written in the twentieth-century and after by American poets. This course will examine major developments in form and technique by poets influenced by transformative movements such as Imagism, Modernism, the Objectivists, Black Mountain poetics, New York School and subsequent developments. The course will situate poetry in key contexts, whether literary or cultural. Representative poets: T.S. Eliot, H.D., Langston Hughes, Frank O?Hara, C.D. Wright and Yusef Komunyakaa.

Prerequisite: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 374/COM 374 History of Film From 1940 (3 credit hours)
Technological developments and aesthetic movements that have shaped international cinema production from 1940 to the present. Evolution in camera movement, editing, sound, narrative form, and the documentary. Post-war Hollywood cinema and international film industries (both established and emerging) in historical, economic and cultural context.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

ENG 375/AFS 375 African American Cinema (3 credit hours)
Survey and analysis of African American film culture from 1900-present. Examination of pre-Hollywood, classical Hollywood, and Independent filmmaking. Particular focus on independent filmmakers' response to dominant industry representations and the work of filmmakers who seek to create a specifically African American cinematic style.

P: ENG 101
GEP U.S. Diversity
Typically offered in Fall and Spring

ENG 376 Science Fiction (3 credit hours)
Representative works of science fiction. Emphasis on works written in the twentieth century, with some attention to the history and development of the genre.

Prerequisite: Sophomore standing and above
GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

ENG 377 Fantasy (3 credit hours)
Representative works in the genre of fantasy. Emphasis on works of 19th and 20th centuries. Authors such as Carroll, Lewis, Tolkien, Borges, LeGuin, and Gardner.

Prerequisite: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 378 Women & Film (3 credit hours)
This course will introduce students to women's participation, as well as their representation, in the history of film and other audiovisual media, including television, music videos, and performance art. The course includes screenings and addresses issues such as: the gendered nature of the gaze; film form and genre; nation and postcoloniality; spectatorship; race, class, and sexuality.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

ENG 380 Modern Drama (3 credit hours)
Major plays and playwrights from Ibsen to Churchill, including at least some of the following: Ibsen, Shaw, Chekhov, Glaspell, O'Neill, Brecht, Hughes, Hellman, Beckett, Williams, Miller, Albee, Hansberry, Walcott, Soyinka, Churchill, Kushner, and Parks.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

ENG 381 Creative Nonfiction Writing Workshop (3 credit hours)
A workshop in creative nonfiction (literary or magazine journalism) for the student with demonstrated understanding of the basic techniques of creative writing and journalism.

Prerequisite: ENG 215, 287, 288, or 289
Typically offered in Spring only

ENG 382 Film and Literature (3 credit hours)
Ways of adapting literary works to film form. Similarities and differences between these two media. Emphasis on the practical art of transforming literature into film. Attention to the impact of film upon literature.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

ENG 384 Introduction to Film Theory (3 credit hours)
Survey of critical approaches to film art. Application of theoretical paradigms--formalist, realist, psychoanalytic, feminist, poststructuralist--to individual films, genres, national cinemas and directors.

Prerequisite: ENG 282
Typically offered in Spring only

ENG 385 Biblical Backgrounds of English Literature (3 credit hours)
Influences of the Bible--principal forms, genres, and texts--on major English and American writers such as Milton, Spenser, Melville, Eliot, and Faulkner.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 388 Intermediate Fiction Writing Workshop (3 credit hours)
An intermediate workshop in creative writing for students with demonstrated understanding of the basic techniques of writing prose fiction.

P: ENG 288; R: Students must have earned a B or better in ENG 288.
Typically offered in Fall and Spring

ENG 389 Intermediate Poetry Writing Workshop (3 credit hours)
An intermediate workshop in creative writing for students with demonstrated understanding of the basic techniques of writing poetry.

Prerequisite: ENG 289;Students must have earned a B or better in ENG 289.
Typically offered in Fall and Spring

ENG 390 Classical Backgrounds of English Literature (3 credit hours)
Literature of the ancient Western world and its influence on English and American writing. Emphasis on the connections between the two bodies of literature. Covers such writers as Plato, Horace, Virgil, and St. Augustine.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 391 Special Topics in Modern Drama (3 credit hours)
Various topics in modern drama covering different cultures, issues, and theatrical practices within the last 100 years. Modern American drama, modern British drama, modern World Drama, and European theatre from World War II to the present.

Prerequisite: Sophomore standing and above
Typically offered in Fall only

ENG 392/FL 392 Major World Author (3 credit hours)
Intensive study in English, of the writings of one (or two) author(s) from outside the English and American traditions. Sample subjects: Homer, Virgil and Ovid, Lady Murasaki, Marie de France and Christine de Pizan, Dante, Cervantes, Goethe, Balzacand Flaubert, Kafka, Proust, Lessing and Gordimer, Borges and Marquez, Neruda, Achebe, Soyinka, Calvino, Walcott and Naipaul. Topics will vary from semester to semester. May be repeated for credit with new topic.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 393/FL 393 Studies in Literary Genre (3 credit hours)
Concentrated treatment of one literary genre, such as the epic, the lyric, the drama, satire, romance, autobiography, the essay, the novel, or the short story. Treatment of materials from several national or ethnic cultures and several periods. All readings in English. Course may be taken three times for credit. Course may be taken 3 times in different genres.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 394/FL 394 Studies in World Literature (3 credit hours)
Study of a subject in world literature: for example, African literature, Asian literature, Hispanic literature, East European literature, Comedy, the Epic, the Lyric, Autobiography, the Faust legend, or Metamorphosis. Subjects vary according to availability of faculty. Readings in English translation.

Restriction: Sophomore Standing and Above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 395/COM 395 Studies in Rhetoric and Digital Media (3 credit hours)
Study of the influence of emerging technologies on rhetorical theory and practice. Rhetorical analysis of texts, including visual and audio texts. Invention and construction of digital media texts as a means of engaging rhetorical theory and analysis. Topics vary to adapt to emerging technologies and changing vernacular practices.

Prerequisite: ENG 101
GEP Humanities
Typically offered in Fall and Spring

ENG 399 Contemporary Literature (3 credit hours)
Literature from the twentieth-century and twenty-first century. Readings may be from various genres including fiction, non-fiction, drama, and poetry. Writers will be from the English-speaking world, but also reading may include writers outside it, that is, writers whose work has been translated into English. This course will track important developments, whether literary or cultural, in contemporary literature. Representative writers: Jean Rhys, James Baldwin, W.G. Sebald, Leslie Marmon Silko, August Wilson, Salman Rushdie and Wislawa Szymborska.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

ENG 400 Applied Criticism (3 credit hours)
Types and methods of literary criticism designed specifically for students intending to teach English in high school.

Prerequisite: TED Majors, Senior standing.
Typically offered in Fall only

ENG 405/ECI 405 Literature for Adolescents (3 credit hours)
The history, types, and characteristics of literature for adolescents. Emphasizes reading and analyzing the literature by exploring the themes, literary elements, and rationale for teaching literature for adolescents. Addresses ways in which this literature can be integrated and implemented in English/Language Arts curriculum.

Prerequisite: Junior standing.
Typically offered in Spring only

ENG 406/FL 406 Modernism (3 credit hours)
Review and discuss the International Modernist movement in literature, from its nineteenth-century origins to its culmination in the early twentieth century. Identify and discuss definitions of modernity, as embodied in a variety of genres. Discuss Modernist texts within a variety of cultures that produced them.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

ENG 407/FL 407 Postmodernism (3 credit hours)
Study literary expressions of postmodernism, from its origins in the Modernist movement through its culmination in the later decades of the twentieth century and after. Examine post modernity, as embodied in a variety of genres. Situate postmodernist texts within a variety of cultures that have produced them.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 410/WGS 410 Studies in Gender and Genre (3 credit hours)
This course examines the ways in which women writers from diverse backgrounds have revised the literary genres to include the varied experiences of women. It will focus on a different generic area, such as poetry, fiction, drama or autobiography, depending on its instructor.

Requisite: Sophomore Standing or Above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

ENG 411/COM 411 Rhetorical Criticism (3 credit hours)
Rhetorical analysis of public speeches, social movements, political campaigns, popular music, advertising, and religious communication. Neo-Aristotelian criticism, movement studies, genre criticism, dramatistic analysis, content analysis, fantasy theme analysis.

Prerequisite: Junior standing

ENG 416 Advanced News and Article Writing (3 credit hours)
Advanced work in writing news stories, profiles, features, and investigative stories. Includes analysis and critical reading of print media. Assumes thorough knowledge of AP style and rudiments of news and feature writing.

Prerequisite: ENG 316
Typically offered in Fall and Spring

ENG 417 Editorial and Opinion Writing (3 credit hours)
Discussing and writing newspaper and magazine editorials, with added attention to other forms of opinion in print, such as columns and books and music reviews.

Prerequisite: ENG 214, ENG 316
Typically offered in Spring only

ENG 420 Major American Author (3 credit hours)
Intensive study of the writings of one (or two) American author(s). Developments across the career, relationships between the writing and the life, the writer's participation in a culture and an historical moment. Sample subjects: Emerson and Thoreau, Melville, Whitman, Stowe and Douglass, Dickinson, Twain, James and Wharton, Frost, O'Neill, Fitzgerald and Hemingway, Faulkner, Hurston and Wright, O'Conner, Morrison.

Prerequisite: Sophomore standing and above
GEP Humanities
Typically offered in Fall only

ENG 421 Computer Documentation Design (3 credit hours)
Theory and design of documentation for computer hardware and software, including user guides, reference manuals, quick reference guides, tutorials, online documentation, and CD-based media delivery. Training in alternative documentation testing procedures, usability testing, and collaborative revision.

Prerequisite: ENG 214 or ENG 331 or ENG 332 or ENG 333
Typically offered in Spring only

ENG 422 Writing Theory and the Writing Process (3 credit hours)
Theory and research on the processes and contexts of written discourse; cognitive, socio-cultural, educational perspectives; reflective and research-based accounts of the writing process; analysis of discourse contexts and communities.

Prerequisite: ENG 101
Typically offered in Spring only

ENG 425 Analysis of Scientific and Technical Writing (3 credit hours)
The role of communication in the creation of scientific knowledge and technical designs and artifacts; methods of analyzing texts and of studying their creation and use; relationships between writing and other forms of communication. Field research in a scientific or technological setting.

Prerequisite: Junior standing
GEP Interdisciplinary Perspectives
Typically offered in Spring only

ENG 426 Analyzing Style (3 credit hours)
Development of a greater understanding of and facility with style in written discourse. Theories of style, stylistic features; methods of analysis, imitation.

Prerequisite: ENG 101
Typically offered in Fall and Spring

ENG 430 Advanced Screenwriting (3 credit hours)
Advanced Screenwriting students will complete ready-to-sell screenplays over the course of the semester. Workload includes taking home two 100-page scripts each week and giving a thorough critique both in writing and in class discussion. Course included pitch sessions, opening scene workshops, intensive reading and writing.

Prerequisite: ENG 330
Typically offered in Spring only

ENG 439 Studies in English Renaissance Literature (3 credit hours)
Works of non-dramatic literature written in English or circulated in England from the sixteenth and seventeenth centuries. The course puts the English Renaissance in both a European and colonial context. Genres include, but are not limited to: poetry, political and fictional prose, masques, travel writing, proto-ethnographies, and popular writing (conduct books, ballads, emblems, polemical texts). Authors may include Thomas Wyatt, Henry Howard, Isabella Whitney, Philip Sidney, Edmund Spenser, Louise Labe, Gaspara Stampa, Sor Juana Della Cruz, Castiglione, Mary Sidney, Ben Jonson, Mary Wroth, Aemilia Lanyer, John Donne, George Herbert, Margaret Cavendish, and Aphra Behn.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

ENG 448/AFS 448/ENG 548/AFS 548 African-American Literature (3 credit hours)
Survey of African-American literature and its relationships to American culture, with an emphasis on fiction and poetry since 1945. Writers such as Bontemps, Morrison, Hurston, Baldwin, Hayden, Brooks, Naylor, Harper, and Dove.

Requirement: Junior Standing
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Summer

ENG 451/ENG 551 Chaucer (3 credit hours)
Introduction to the study of Chaucer through an intensive reading of The Canterbury Tales.

R: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 452 Medieval British Literature (3 credit hours)
Readings in the rich poetic, thematic, and generic diversity of Medieval British literature. Representative selections from romance, dream-vision, allegory, fabliau, lyric, chronicle, saint's life, satire, in historical and cultural contexts. Priorknowledge of Middle English unnecessary.

Prerequisite: Sophomore standing and above
Typically offered in Fall only

ENG 453 Studies in Nineteenth-Century British Literature (3 credit hours)
Topics in nineteenth-century British literature, including the novel, development of poetry, etc. Focus on special areas of interest, which will vary from year to year, with attention to cultural and historical contexts.

R: Sophomore standing or above
GEP Humanities
Typically offered in Fall only

ENG 455 Literacy in the U.S. (3 credit hours)
Academic study of the nature, functions, acquisition, institutionalization, and present state of literacy in the U.S., with special focus on issues of cultural diversity and social inequity. Three contexts for literacy - personal, academic, and home/community - provide a range of readings, investigations, and opportunities for reflection and further study.

Prerequisite: ENG 101; Junior or senior standing.
Typically offered in Fall only

ENG 460 Major British Author (3 credit hours)
In-depth study of the works of one (or two) British author(s) within their historical and literary-historical context. Sample authors might include; Spencer and Sidney, Swift and Pope, Austen, Wordsworth and Coleridge, Keats and Shelley, the Brontes, the Brownings, Dickens, George Eliot, Hardy, Joyce, Woolf.

Prerequisite: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 462 18th-Century English Literature (3 credit hours)
Major figures in English literature between 1660 and 1790. Works studied in relation to social, cultural, political, and religious developments. Emphasis on writers such as Dryden, Swift, Pope, Johnson.

Prerequisite: Sophomore standing and above
Typically offered in Spring only

ENG 463 The Victorian Period (3 credit hours)
Significant British poets, writers of prose non-fiction, and novelists studied in the social, economic, scientific, intellectual, and theological contexts of the Victorian era.

Prerequisite: Sophomore standing and above
Typically offered in Spring only

ENG 464 British Literature and the Founding of Empire (3 credit hours)
This course uses literature to understand rapid shifts in making and breaking empire. Reading novels, newspapers, essays, and autobiographies, we will study liberty in colonial North America, the orientalism of British India, and adventure writing of nineteenth-century Africa. In 1773, George McCartney, a British imperial officer, looked out from India and saw a "vast empire on which the sun never sets." Ten years later the thirteen American colonies that had founded that empire were gone. We will use this sentiment to determine how empire shaped the world and to consider how it contributed to Britain's literary and cultural traditions.

Requisite: Sophomore Standing or Above
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 465 British Literature and the Dissolution of Empire (3 credit hours)
This course examines the role of British literature in the dissolution of empire and the reshaping of Britain as a multicultural society. As poet Louise Bennett wryly comments, the 20th century British experience is one of "colonization in reverse." From the departure of the colonies, to the impact of American expatriates and Caribbean, African and South Asian immigrants, to the Scottish nationalist critique, this period is one of radical change in British national identity. At the center of that change are the global writers who create a heterogeneous literature that represents both a "new" British literature and a post-empire reality.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

ENG 466 Transatlantic Literatures (3 credit hours)
This course will investigate notable literary exchanges in the literatures of the Atlantic Rim, long linked by trade (including slavery) as well as by commerce of many other kinds. Examples of these exchanges include Great Britain and the U.S., the U.S. and the Caribbean, and very importantly, between African cultures on the Atlantic and Atlantic cultures in the U.S. The course will explore the literary and cultural hybridity brought about by these exchanges. Representative writers: William Shakespeare and Aimee Cesaire, Joseph Conrad and Chinua Achebe; Charlotte Bronte and Jean Rhys; William Faulkner and Edouard Glissant.

Requisite: Sophomore Standing or Above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

ENG 467 American Colonial Literature (3 credit hours)
Survey of American literature and thought from its beginnings to the adoption of the Constitution. Representative works such as travel and exploration reports, Indian captivity narratives, diaries, journals, autobiographies, sermons, and poetry.

R: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 468 Studies in Nineteenth-Century American Literature (3 credit hours)
Topics in nineteenth-century American literature, such as Romanticism, the nineteenth-century novel, Realism & Naturalism, etc. Focus on special areas of interest, which will vary from year to year, with attention to cultural and historical contexts.

Restriction: Sophomore Standing and Above
GEP Humanities
Typically offered in Spring only

ENG 470 American Literature, Twentieth Century and Beyond (3 credit hours)
American Literature from the twentieth century until the present day. Readings from various genres such as fiction, non-fiction, drama and poetry. Emphasis will be on key literary developments in relation to important critical/cultural contexts. Representative writers: F. Scott Fitzgerald, Gwendolyn Brooks, Zora Neale Hurston, James Baldwin, David Mamet, and Maxine Hong Kingston.

P: Sophomore Standing or Above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

ENG 476 Southern Literature (3 credit hours)
Literary traditions of the Southeastern United States from colonization through the present, including study of such major writers as Byrd, Jefferson, Simms, Poe, Douglass, Twain, Chesnutt, Glasgow, Hurston, Tate, Wolfe, Faulkner, Warren, Wright, Welty, Williams, O'Conner, Percy, and Lee Smith.

Prerequisite: Sophomore standing and above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

ENG 480 Modern Drama (3 credit hours)

ENG 481 History of the Book (3 credit hours)
This course provides an overview of book history from the invention of the hand-written codex through the printing press and current digital manifestations, including electronic texts and Google Books. Students will examine rare materials in hands-on settings and during field trips to special collections libraries; try out historical techniques of writing, printing, and manufacture; and investigate the many social roles involved in creating and using books, including those of author, editor, printer, publisher, reader, and seller.

Restriction: Junior standing or above
Typically offered in Spring only

ENG 482 Reading in the Digital Age (3 credit hours)
This capstone questions how textual, reading, and interpretive practices are changing in a digital age. Using a diverse sample of literature, the course explores the consequences of digital remediation for texts and literary studies. Students will learn concepts in mediation, analyze works of literature on different reading platforms, and experiment with computational methods for literary curation, quantitative analysis, and data visualization. Students of all technical levels are welcomed; no special skills are required beyond basic familiarity with a computer.

Junior standing or above
Typically offered in Spring only

ENG 483 Literature and Media (3 credit hours)
This course will explore how shifts in media technologies have influenced the creation, transmission, and reception of literature. Topics might include: investigations of how the spread of printing presses led to the first newspapers in eighteenth-century London, with comparison to how newspapers look today; study of the importance of serial publication in magazines for nineteenth-century authors like Charles Dickens; and examinations of spy novels, detective fiction, and the rise of the paperback in the twentieth century before turning to the explosion of graphic novels in the twenty-first century.

Restriction: Junior standing or above
Typically offered in Spring only

ENG 485 Shakespeare: Revisions and Resources (3 credit hours)
A study in the plays of Shakespeare and ways to teach them, using multi-media presentations and textual exegesis, concentrating on each performance as an unique interpretation. The play choices are chosen by examining the plays that students in the English Ed program will likely find themselves teaching in area high schools.

P: 6 credit hours of English above the 100-level
GEP Humanities
Typically offered in Fall only

ENG 486 Shakespeare, The Earlier Plays (3 credit hours)
Study a selection of Shakespeare's major works before 1603 with an emphasis on his cultural context and development as a playwright.

Restriction: Sophomore Standing and Above
GEP Humanities
Typically offered in Fall only

ENG 487 Shakespeare, The Later Plays (3 credit hours)
Study a selection of Shakespeare's major works after 1603 with an emphasis on his cultural context and development as a playwright.

R: Sophomore standing and above
GEP Humanities
Typically offered in Spring only

ENG 488 Advanced Fiction Writing Workshop (3 credit hours)
An advanced workshop in creative writing for students with demonstrated understanding and accomplishment in the techniques of writing prose fiction.This course is restricted to juniors and seniors. Departmental approval required.

Prerequisite: ENG 388
Typically offered in Fall and Spring

ENG 489 Advanced Poetry Writing Workshop (3 credit hours)
An advanced workshop in creative writing for the students with demonstrated understanding and accomplishment in the techniques of writing poetry.This course is restricted to juniors and seniors. Departmental approval required.

Prerequisite: ENG 389
Typically offered in Fall and Spring

ENG 490 Studies in Medieval Literature (3 credit hours)
Topics (in rotation) in medieval English and continental literature, such as Arthurian legend and literature; women in medieval society and literature; the self in the late Middle Ages. Focus on special areas of interest, with attention to culturaland historical backgrounds and contemporary scholarship. Some texts in Middle English, some in translation; no prior knowledge of Middle English needed.

Prerequisite: Sophomore standing and above
Typically offered in Spring only

ENG 491 Honors in English (3 credit hours)
Intensive course or independent study project designed as one portion of the Honors Program in English. Subject varies.

Requisite: English Majors Only
Typically offered in Fall and Spring

ENG 492 Special Topics in Film Styles and Genres (3 credit hours)
Critical approaches to focused film topics involving film genres, directorial styles, or trends within a national cinema. Topics will vary from semester to semester.

Typically offered in Fall and Spring

ENG 494 Special Topics in Linguistics (3 credit hours)
Methodology and analysis within various branches of linguistics, e.g. syntax, semantics, computational linguistics, phonology, dialectology, historical linguistics, discourse analysis. Examination of the topic's basic methods, controversial issues, analysis of linguistic data. Projects may include novel analyses of English constructions, parsing programs, or field work reports. (May be repeated for credit with a new topic.)

Prerequisite: ENG 101 & Junior standing
Typically offered in Spring only

ENG 495 Studies in Literature (3 credit hours)
Intensive exploration of selected topics or issues in the area of literature/ English studies with a wide variation in content that sometimes includes materials from several national or ethnic cultures and periods. Course may be used to meet the capstone requirement in the English literature concentration.

Junior standing or above
Typically offered in Spring only

ENG 496 Seminar in Literary Criticism (3 credit hours)
Introduction to theoretical and applied criticism of literature, primarily for English majors and minors. May include traditional theory from Plato and Aristotle to New Criticism, as well as contemporary psychoanalytical, social, historical, and linguistic approaches to literature.

Prerequisite: 9 hours of literature at the 300 level or above
Typically offered in Fall and Spring

ENG 498 Special Topics in English (1-6 credit hours)
Directed individual study or experimental course offerings in language or literature. Individual study arranged through consultation with faculty member and Director of Undergraduate Studies.

Prerequisite: Six hours in ENG above the 100 level
Typically offered in Fall, Spring, and Summer

ENG 499 Special Topics in Creative Writing (3 credit hours)
Techniques and practice in writing a particular form within the traditional genres of poetry, prose, or drama, such as "Creative Non-Fiction," "Science Fiction," "The Novella," or "The Satirical Poem." Topics vary from semester to semester.

Prerequisite: ENG 288 or ENG 289 ; Students must have earned a grade of B or better in 288 or 289 or they must have demonstrated competence in creative writing as determined by instructor.
Typically offered in Fall and Spring

ENG 505 Writing Program Administration: Theory, Practice, and Research (3 credit hours)
Seminar designed to focus on current theories, research, and practices of writing program administration, including curricular design and assessment, faculty development, assessment of student achievement, budget oversight, the politics of administration in higher education, and historical studies of writing program administration. Designed for all interested MA, MFA and PhD students, but particularly valuable for those considering administrative work in first-year writing programs, writing centers, or WAC/WID/CAC programs at a range of institutions (community colleges, small liberal arts colleges, and large research universities). Course involves the study of an existing program through contact with its director(s).

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 506/COM 506 Verbal Data Analysis (3 credit hours)
Research strategies for understanding how spoken and written language shapes activities (e.g., design, instruction, counseling, gaming interactions, e-commerce, etc.). Tracking patterned uses of language as verbal data (e.g., grammatically topically, thematically), formulating research questions, and designing studies to answer those questions through quantitative descriptive means. Sampling, collecting and managing data, developing coding schemes, achieving reliability, using descriptive statistical measures, and reporting the results.

Typically offered in Fall only

ENG 507 Writing for Health and Environmental Sciences (3 credit hours)
Readings, on-site research, document gathering, and analysis of writing in health and environmental science fields. Students study, practice, and present major forms of writing in their profession. Professional portfolio due at the end of the semester. Intended for students interested in exploring or pursuing writing careers in medicine, pharmaceuticals, nutrition, agriculture, ecology, or other health and environmental science-related industries, or professionals who wish to improve knowledge and skills.

Prerequisite: Graduate standing, Doctoral student, Master's student
Typically offered in Fall only

ENG 508 Usability Studies for Technical Communication (3 credit hours)
Advanced study of usability inspection, inquiry, and testing theories and practices related to instrumental and instructive texts (i.e., computer-related, legal, medical, pharmaceutical, financial, etc.). Practical experience testing a variety of texts using several testing methods, including completion of a substantial, lab-based usability test. For students planning careers in technical communication, human factors, software design, and multimedia design.

Prerequisite: ENG 517
Typically offered in Fall only

ENG 509 Old English Literature (3 credit hours)
Study of Old English language with selections from important poems including Beowulf. Examination of the poetry in the light of various modern critical approaches.

Typically offered in Spring only

ENG 510 Middle English Literature (3 credit hours)
Study of major works of medieval English literature (exclusive of Chaucer's Canterbury Tales) in historical context, as reflections of and influences on social and cultural change. Includes works such as Sir Gawain and the Green Knight, Pearl, Langland's Piers Plowman and Malory's Morte d'Arthur.

Typically offered in Spring only

ENG 511 Theory and Research In Composition (3 credit hours)
Research and scholarship in composition and the teaching of writing. Major theoretical perspectives (such as expressive, social, cognitive, feminist), current issues (such as audience, invention, revision, evaluation) and various research methods.

Typically offered in Fall and Spring

ENG 512 Theory and Research In Professional Writing (3 credit hours)
Introduction to research and scholarship in professional writing and writing in the workplace. Major theoretical perspectives for studying writing; current issues (such as usability, readability, collaboration, gender, authorship); and various research methods.

Typically offered in Fall only

ENG 513 Empirical Research In Composition (3 credit hours)
Reading and evaluation of empirical research in written composition; guided practice in qualitative and quantitative methods. Basic principles of research; problem definition, research design and statistical analysis, description and assessment of written products and processes.

Typically offered in Spring only

ENG 514/COM 514 History Of Rhetoric (3 credit hours)
Historical development of rhetorical theory with attention to contemporaneous rhetorical practice and philosophical trends. Major focus on the classical period with briefer coverage of medieval, Renaissance, 18th-century, and 19th-century developments. Implications for contemporary theory and practice, including pedagogical practice.

Typically offered in Fall only

ENG 515 Rhetoric Of Science and Technology (3 credit hours)
The relationships among rhetoric, scientific knowledge and technological development and of changes in how these relationships understood historically. Practice in critical analysis of scientific and technical discourse. Consideration of scientific and technical language and of public controversy concerning science and technology.

Typically offered in Fall only

ENG 516/COM 516 Rhetorical Criticism: Theory and Practice (3 credit hours)
Development, achievements, limitation of major critical methods in the 20th century, including neo-Aristotelian, generic, metaphoric, dramatistic, feminist, social-movement, fantasy-theme and postmodern approaches. Criticism of political discourse,institutional discourse, discourses of law, medicine, religion, education, science, the media. Relations between rhetorical and literary criticism and other forms of cultural analysis.

Prerequisite: Graduate Standing or the equivalent of COM/ENG 321 or COM/ENG 411
Typically offered in Spring only

ENG 517 Advanced Technical Writing, Editing and Document Design (3 credit hours)
Advanced study of technical communication practice, including content management, document design, and technical editing and usability. For students planning careers as technical communicators.

P: ENG 314 or graduate standing
Typically offered in Fall only

ENG 518 Publication Management for Technical Communicators (3 credit hours)
Advanced study of publication and team management issues such as staffing, scheduling, cost-reduction and subcontracting. For students planning careers as technical communicators.

Prerequisite: ENG 517
Typically offered in Spring only

ENG 519 Online Information Design and Evaluation (3 credit hours)
Concepts and practices related to multimedia information design, information architectures, human-computer interaction, and genre for complex websites.

Prerequisite: ENG 517
Typically offered in Spring only

ENG 520 Science Writing for the Media (3 credit hours)
Coverage of three areas: how to write science articles for a variety of mass media, how to think critically about how mass media cover science, and how to think critically about science itself. Preparation for careers not only in mass media, but also in scientific and technological organizations.

Typically offered in Fall only

ENG 522 Writing in Nonacademic Settings (3 credit hours)
Directed work experience for English Department graduate students including work-site mentoring and evaluation and concurrent academic assignments. Academic component includes reading and discussing articles relevant to the day-to-day practice of writing in nonacademic settings and completion of a project that connects academic and nonacademic components. Graduate Standing in an English Department graduate program required. Modest liability insurance fee required. Students must provide their own transportation to the practicum site.

Typically offered in Spring only

ENG 523 Language Variation Research Seminar (3 credit hours)
Field-initiated research. Group and individual research topics focused on current sociolinguistic issues related to language variation and changes. Ethnographic and quantitative methods of analysis.

Prerequisite: ENG 525
Typically offered in Spring only

ENG 524 Introduction to Linguistics (3 credit hours)
Introduction to theoretical linguistics, especially for students in language, writing and literature curricula. Phonology, syntax, semantics, history of linguistics; relation of linguistics to philosophy, sociology and psychology; application of theory to analysis of texts.

Prerequisite: Graduate standing or 12 hrs. in ENG
Typically offered in Fall only

ENG 525 Variety In Language (3 credit hours)
Language variation description, theory, method and application; focus on regional, social, ethnic and gender varieties; sociolinguistic analysis, basic discourse analysis.

Prerequisite: Graduate standing or 12 hrs. in ENG
Typically offered in Fall only

ENG 527/ENG 727 Discourse Analysis (3 credit hours)
Overview of major issues, theories, and research methods in contemporary discourse analysis. It explores how language as a form of social practice regulates social actions, relations and identities; how ways of speaking construct and are constructed by social order, cultural practice, and individual agency. Texts/discourses are analyzed to examine how speakers create meaning through formal linguistic choices; what the micro-organization of talk reveals about social order; how critical understanding of discourse helps to interpret complex processes of social life.

Prerequisite: Graduate standing
Typically offered in Fall only

ENG 528 Sociophonetics (3 credit hours)
A survey of sociophonetics: the study of language variation using modern phonetic techniques. Acoustic analysis of consonants, vowels, prosody, voice quality. Speech perception experiments and how they can be applied to a variety of issues. Applications to theoretical issues in sound change, sociolinguistics, phonetics and phonology, and cognition of language. Graduate standing required.

Typically offered in Fall only

ENG 529 16th-Century Non-Dramatic English Literature (3 credit hours)
Prose and poetry of the English Renaissance, excluding drama. Special attention to major authors, including Spenser and Sidney, and to intellectual, cultural and literary backgrounds and developments. Introduction to pertinent methods and issues of scholarly inquiry and critical interpretation.

Typically offered in Fall only

ENG 530 17th-Century English Literature (3 credit hours)
A close examination of the literature of England from 1600 to 1660 with emphasis on major literary figures and movements, development of important literary forms and genres and relationship between literary texts of this period and their philosophical, political and theological contexts. Some bibliographical and textural assignments. Content and focus varies according to instructor's emphasis, but writers covered usually include Donne, Herbert, Crashaw, Marvell and Browne.

Typically offered in Spring only

ENG 531 American Colonial Literature (3 credit hours)
Survey of American literature and thought from the beginning to adoption of the constitution. Representative works such as travel and exploration reports, Indian captivity narratives, diaries, journals, auto biographies, sermons and poetry.

Typically offered in Spring only

ENG 532 Narrative Analysis (3 credit hours)
Introduction to theories concerning the structure, use, and interpretation of narratively organized discourse; application of methods of narrative analysis to both spoken and written narratives.

Prerequisite: Graduate standing
Typically offered in Fall only

ENG 533 Bilingualism and Language Contact (3 credit hours)
Linguistic, cultural and socio-political aspects of bi- and mulitlingualism in a global context. Issues and implications of bilingualism from both theoretical and practical perspectives. Topics inlcude: language maintenance and shift; child and adult bilingualism; relationship between language, culture and identity in bi- and multilingual situations; psycholinguistic aspects and lingustic outcomes of bilingual contact, such as code-switching, convergence and language attrition; language ideology, the politics of language choice and language policy; globalization and intercultural communication. Must hold graduate standing or get consent of instructor for advanced undergraduate students.

Typically offered in Spring only

ENG 534 Quantitative Analysis in Sociolinguistics (3 credit hours)
The quantitative methods specific to sociolinguistic variation are examined in detail, focusing both on gaining experience using quantitative analysis software and on understanding fundamental concepts underlying the quantitative analysis of language variation. This course takes students beyond the basic familiarity with quantitative analysis gained in ENG 523, both in depth of investigation and in attention to the link between method and theory.

Typically offered in Fall only

ENG 536 Research Methods in Phonology (3 credit hours)
This course explores laboratory and computational tools for investigating linguistic sound systems (e.g., speech perception experiments, speech production tools such as ultrasound imaging, and computational tools such as automated transcription and acoustic measurement). Requires enrollment in the Sociolinguistics MA or PhD program or permission of instructor.

Requisite: Enrollment in the Sociolinguistics concentrations of the MA English or PhD Sociology programs or permission of instructor.
Typically offered in Fall only

ENG 539/FL 539 Seminar In World Literature (3 credit hours)
Rotating topics in world literature, including treatment of the subject's theoretical or methodological framework. Possible subjects: colonialism and literature; orality and literature; the Renaissance; the Enlightenment; translation; comparison ofNorth and South American literatures; African literary traditions; post-modernism and gender. Readings in English (original languages encouraged but not required).

Typically offered in Spring only

ENG 540 History Of Literary Criticism (3 credit hours)
Survey of the history of literary criticism from Antiquity to early Modern period. Introduction to major theoretical definitions of literature and modes of practical criticism. Close study of Aristotle's Poetics, Sidney's Apology for Poetry, Pope's Essay on Criticism, Coleridge's Biographia Literaria, Eliot's essays and other landmark works in development of literary criticism.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

ENG 541 Literary and Cultural Theory (3 credit hours)
A survey of literary theory in the 20th century from New Criticism to postmodernism. Examines the virtues and pitfalls of these approaches to the study of culture and literature. A course on issues, concepts, theorists and the sociohistorical and political context in which the theorists are writing. Taught in English. No formal pre-requisites. However, students who have not had advanced literature will be disadvantaged.

Typically offered in Fall only

ENG 543 Introduction to Digital Humanities (3 credit hours)
This course invites students of all technical abilities to explore the ongoing digital transformation of resources, tools, and methods in the humanities. As an introduction, this course is a gateway into a variety of representative subfields in digital humanities. It is designed to generate curiosity about how this emerging arena of scholarly activity might intersect with students' own disciplines, research interests, and pedagogies. It aims to provide a working knowledge of: 1) backgrounds of new media and humanities computing, 2) debates and outlooks for the digital humanities today, as well as 3) hands-on experience collaborating on, creating, and critiquing digital humanities projects.

Prerequisite: Graduate standing
Typically offered in Fall only

ENG 548/AFS 548/ENG 448/AFS 448 African-American Literature (3 credit hours)
Survey of African-American literature and its relationships to American culture, with an emphasis on fiction and poetry since 1945. Writers such as Bontemps, Morrison, Hurston, Baldwin, Hayden, Brooks, Naylor, Harper, and Dove.

Requirement: Junior Standing
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Summer

ENG 549 Modern African Literature (3 credit hours)
The works of the most important writers shaping modern African literature in English (and English translation). Selections from East, West, North and South Africa, spanning colonial through post-colonial Africa--from literature of protest and culture conflict to that of disillusionment, reappraisal and feminism.

Typically offered in Spring only

ENG 550 British Romantic Period (3 credit hours)
A study of British literature during the Romantic era (1780s-1830s), including poetry, periodicals, novels, drama, and criticism as well as their political and cultural contexts.

Typically offered in Fall only

ENG 551/ENG 451 Chaucer (3 credit hours)
Introduction to the study of Chaucer through an intensive reading of The Canterbury Tales.

R: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

ENG 554/COM 554 Contemporary Rhetorical Theory (3 credit hours)
Contemporary rhetorical theory covering the 20th and 21st centuries. Conceptual connections with and disruptions of the classical tradition and its, successors; relationship between rhetorical theory and philosophical trends, institutional histories, socioeconomic circumstances, and pedagogical needs. Attention to current issues such as the revival of invention, rhetorical agency, and ethics.

Typically offered in Spring only

ENG 555 American Romantic Period (3 credit hours)
The literary culture of the United States from 1820s through 1860s, setting works of transcendentalists and other romantic writers within sociohistorical contexts. Consideration of writing by women, slave narratives and popular fiction as well as such major figures as Emerson, Hawthorne, Thoreau and Melville.

Typically offered in Fall only

ENG 558 Studies In Shakespeare (3 credit hours)
An intensive study of a particular phase of the Shakespeare canon. Emphasis will normally be on one dramatic genre (tragedy, comedy, history), but occasionally the focus may be more limited.

Typically offered in Fall and Summer

ENG 560 British Victorian Period (3 credit hours)
Explore how writers represented the tumultuous Victorian era (1837-1901), spanning responses to industrialization, political reform, religion, colonialism, class, gender, and race at home and abroad. The course covers an array of literary forms and seeks to include perspectives from within the British Isles as well as from across the British empire.

Typically offered in Fall and Spring

ENG 561 Milton (3 credit hours)
An intensive reading of Milton with attention to background materials in history and culture of seventeenth-century England.

Typically offered in Spring only

ENG 562 18TH-Century English Literature (3 credit hours)
British writers of the period 1600-1790 studied in historical and cultural contexts. Usually includes works by Dryden, Swift, Pope, Defoe, Mandeville, Boswell and Johnson, but addition of other significant writers possible.

Typically offered in Fall only

ENG 563 18TH-Century English Novel (3 credit hours)
Selected British novels of the Restoration and eighteenth century from a variety of contemporary critical perspectives. Such writers as Fielding, Richardson, Sterne, Burney, Smollett and Austen.

Typically offered in Spring only

ENG 564 Victorian Novel (3 credit hours)
Study of selected British novels published between 1837 and 1901 in contexts of the development of the genre, historical period and current literary theory. Such writers as Dickens, Thackeray, Bronte, Trollope, Eliot, Meredith and Hardy.

Typically offered in Spring only

ENG 565 American Realism and Naturalism (3 credit hours)
Study of literary culture of United States from 1860s to early 1900s with emphasis on fiction by such realists and naturalists as Twain, Howells, Chesnutt, James, Crane, Wharton, Dreiser and Norris. Inclusion of prose of writers such as Adams and DuBois possible.

Typically offered in Spring only

ENG 570 20TH-Century British Prose (3 credit hours)
Examination of British fiction of this century and relationship of significant intellectual, historical and political issues. Inclusion of such writers as Joyce, Conrad, Woolf, Lawrence, Beckett and Murdoch possible but also post-colonial novelists as well.

Typically offered in Fall only

ENG 571 20TH-Century British Poetry (3 credit hours)
Development of English poetry from its late Victorian phase through Modernism to present post-war scene. Inclusion of such writers as Hardy, Yeats, Eliot, Smith, Auden, Larkin, Heaney, Wolcott and Hill possible.

Typically offered in Spring only

ENG 572 Modern British Drama (3 credit hours)
Survey of modern British drama from its beginnings at turn of the century to present.

Typically offered in Fall only

ENG 573 Modern American Drama (3 credit hours)
A survey of modern American drama centering on major figures.

Typically offered in Fall only

ENG 575 Southern Writers (3 credit hours)
Introduction to literary culture of "the South," tracing the roots of the twentieth-century "Southern Renaissance" in such ante-bellum genres as plantation fiction, Southwestern humor, fugitive-slave narration and pastoral elegy. Examination of persistence of "Southern" writing within increasingly standardized culture of the United States.

Typically offered in Spring only

ENG 576 20TH-Century American Poetry (3 credit hours)
Development of modern American poetry from rebellion against the romantic and genteel verse of the 1890's; special attention to Robinson, Frost, Pound, Williams, Stevens and Ransom.

Typically offered in Spring only

ENG 577 20th-Century American Prose (3 credit hours)
An examination of representative American writers of novel and short fiction.

Typically offered in Spring only

ENG 578 English Drama To 1642 (3 credit hours)
Elizabethan and Jacobean drama from 1580 to 1642, excluding Shakespeare. Coverage of such writers as Marlowe, Jonson, Webster, Beaumont and Fletcher, Heywood, Tourneur and Ford.

Prerequisite: ENG 261 and upper division or Graduate standing
Typically offered in Fall only

ENG 579 Restoration and 18th-Century Drama (3 credit hours)
Representative British plays of the period 1660-1780 studied in cultural, social and ethical contexts. Usually includes works by Etherege, Wycherley, Behn, Dry-den, Otway, Vanburgh, Farquhar, Congreve, Lillo, Gay, Goldsmith and Sheridan.

Typically offered in Spring only

ENG 580 Literary Postmodernism (3 credit hours)
Post-1945 literary theory in relationship with representative avant-garde writers. Theoretical and argumentative essays in such areas as chaos theory, deconstruction, feminism and the limits of fiction. Fiction readings by Calvino, Pynchon, Barthelme, Cortazar and others.

Prerequisite: Graduate standing
Typically offered in Spring only

ENG 581/COM 581 Visual Rhetoric: Theory and Criticism (3 credit hours)
Application of visual theory to rhetoric and of rhetorical theory to visual forms of communication. Discussion and analysis may include advertising, photography, news and informational media, political communication, instructional material, scientific visualization, visual arts, public commemorative artifacts, internet and other digital media.

R: Graduate Students Only
Typically offered in Spring only

ENG 582 Studies in Literature (3 credit hours)
Variation in content. Selected problems and issues in literature.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 583 Studies In Rhetoric and Writing (3 credit hours)
Variation in content. Selected problems and issues in rhetoric and writing.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 584 Studies In Linguistics (3 credit hours)
Variation in content. Selected problems and issues in linguistics.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 585 Studies In Film (3 credit hours)
Variation in content. Selected problems and issues in film.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 586 Studies In Theory (3 credit hours)
Variation in content. Selected problems and issues in theory.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENG 587 Interdisciplinary Studies in English (3 credit hours)
Content varies. Selected topics and issues that cross disciplinary boundaries in English Studies. May be repeated for credit with different topics. Graduate standing is required.

Typically offered in Fall and Spring

ENG 588 Fiction Writing Workshop (3 credit hours)
Advanced work in techniques of writing fiction for students with substantial experience in writing. Workshop sessions with students commenting on each other's work.

Prerequisite: ENG 488 or ENG 489
Typically offered in Fall and Spring

ENG 589 Poetry Writing Workshop (3 credit hours)
Advanced work in techniques of writing poetry for students with substantial experience in writing. Workshop sessions with students commenting on each other's work.

Prerequisite: ENG 488 or ENG 489
Typically offered in Fall and Spring

ENG 590 Studies In Creative Writing (3 credit hours)
Techniques special to a particular kind of writing within the traditional genres of prose, poetry or drama, such as "Speculative Fiction" or "The Long Poem or Poetic Sequence." Various subjects.

Prerequisite: ENG 588 or 589
Typically offered in Spring only

ENG 591 Studies in National Cinemas (3 credit hours)
Aesthetic develpments and historical importance of national cinema traditions in specific cultural contexts. Focus on the relation between cinema and linguistic, literary and artistic develpments within a national setting or in regional or international contexts. Topics, which change each year, may include Italian Neorealism, French New Wave, and British Social Realism.

Typically offered in Spring only

ENG 592 Special Topics in Film Styles and Genres (1-6 credit hours)
Critical approaches to focused film topics involving film genres, directorial styles, or trends within a national cinema. Topics will vary from semester to semester. Students cannot obtain credit for both ENG 492 and ENG 592.

Typically offered in Fall and Spring

ENG 610 Special Topics English (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

ENG 624 Teaching College Composition (3 credit hours)
Preparation for teaching college composition. Introduction to pedagogical principles and practices. Practice in setting course goals, designing writing assignments to meet those goals, developing instructional activities to support assignments, andevaluating student writing. The course is scheduled as a 5-day workshop before classes begin, followed by weekly meetings and mentoring during the fall semester.

Prerequisite: ENG 511 and mentored assistantship in ENG 101
Typically offered in Fall only

ENG 626 Advanced Writing for Empirical Research (3 credit hours)
A seminar and workshop for graduate students in empirical research fields working on grant proposals, theses and dissertations, papers for professional journals, conference proposals, and other significant research texts. Intensive practice and feedback on writing, grounded in an introduction to theory and research on writing processes, products, and contexts. Requirements include three major writing projects designed by the student, review and discussion of drafts written by other workshop members, analysis and presentation of discipline-specific communication patterns and practices.

Prerequisite: Graduate standing
Typically offered in Fall only

ENG 636 Directed Readings (1-6 credit hours)
Intensive study of a specific topic from various specializations of the English faculty. Negotiation between the student and the director for variable credit and approved by Director of Graduate Studies.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ENG 669 Literature, Methods, and the Profession (3 credit hours)
This course initiates students into ways of thinking and practicing in English literary studies. We will explore critical traditions, research methods, and emerging approaches, including literary criticism and theory, globalization, transnationalism, and postcolonialism in literature, together with introductions to cultural studies, rhetoric, composition, film studies, and media studies as they influenced literary criticism and theories. The course also prepares students to begin formulating their own academic and professional pathways with attention to practical considerations of how to become a professional in graduate school. You will become familiar with faculty from the department, develop research plans, and discover resources to start trajectories that include careers in writing, media, and teaching.

Typically offered in Fall only

ENG 675 Projects in Technical Communication (3 credit hours)
Capstone course for M.S. in Technical Communication. Students engage in major semester-long individual project under direction of instructor.

Prerequisite: ENG 518
Typically offered in Spring only

ENG 676 Master's Project in English (3 credit hours)
Individual capstone project in English Studies. Topic and mode of study determined in consultation with faculty project advisor. For students in the final semester of the English MA program.

Typically offered in Fall and Spring

ENG 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

ENG 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall only

ENG 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ENG 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

ENG 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ENG 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ENG 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Summer only

ENG 722 Linguistics and Literacy (3 credit hours)
Focus on two-way relationship between linguistic theory and literacy. Metalinguistic awareness and acquisition of literacy, orthography and phonology, oral vs. written language, oral vs. literate cultures, and metalinguistic assumptions in linguistic theory.

Prerequisite: ENG 525
Typically offered in Spring only

ENG 727/ENG 527 Discourse Analysis (3 credit hours)
Overview of major issues, theories, and research methods in contemporary discourse analysis. It explores how language as a form of social practice regulates social actions, relations and identities; how ways of speaking construct and are constructed by social order, cultural practice, and individual agency. Texts/discourses are analyzed to examine how speakers create meaning through formal linguistic choices; what the micro-organization of talk reveals about social order; how critical understanding of discourse helps to interpret complex processes of social life.

Prerequisite: Graduate standing
Typically offered in Spring only

ENG 729 Language Variation and Social Theory (3 credit hours)
Although the field of sociolinguistic variation has developed its own body of theory, its central questions continue to call for engagement with theory in related socio-cultural disciplines. This course examines sociolinguists' explicit and implicit incorporation of social theory into the analysis of language variation; it also explores the many ways in which social theory could yet enrich, and be enriched by, empirical sociolinguistic analysis.

Prerequisite: ENG 523
Typically offered in Spring only

ENG 730 Ethnolinguistic Variation (3 credit hours)
This course examines the nature of ethnolinguistic variation in the English-speaking diaspora, with particular attention to the ethnic varieties in the United States, including African American English, Hispanic English, and Native American English.

Prerequisite: ENG 525
Typically offered in Spring only

ENG 731 Applied Sociolinguistics (3 credit hours)
This course will introduce the main research concentrations and methods in Applied Sociolinguistics, including first language acquisition and teaching, second language learning, bilingualism, and clinical assessment and treatment of communication disorders. Students will be introduced to the basic foundations of language variation from linguistic and sociocultural/historical perspectives and learn how sociolinguistic variation affects clinical and educational processes and organizations.

Prerequisite: ENG 525
Typically offered in Spring only

ENG 798 Special Topics in English Studies (3-6 credit hours)
Intensive exploration of specialized or emerging topics in an area of language, literature, rhetoric, film, or other aspect of English studies. Emphasis on student research and writing. May be used to test and develop new courses. May be repeated for credit.

Typically offered in Fall and Spring

ENG 810 Directed Readings in English Studies (1-6 credit hours)
Intensive study of a specific topic from various specializations of the English faculty. Negotiation between the student and the director for the variable credit and approved by the director of Graduate Studies. May be repeated for credit.

Typically offered in Fall and Spring

ENG 896 Summer Dissert Res (1 credit hours)

Entomology (ENT)

ENT 110 General Entomology (3 credit hours)
Considers how insects live, their internal and external structures and their functions, classification and identification and control when desirable. Recognition of economically important beneficial and destructive insects and mites occurring in North Carolina and neighboring states, stressing information on their life histories , damage and control.

Requisite: Agricultural Institute Only
Typically offered in Fall only

ENT 121 Pesticides and Their Utilization (3 credit hours)
Basic characterization, classification, chemical and physical properties of pesticides. Use of pesticides including environmental effects; Federal and State laws and regulations relating to their manufacture, distribution and use; safety procedures including handling and storage; and application equipment including types, calibration, use and maintenance. TOTH

Requisite: Agricultural Institute Only
Typically offered in Fall only

ENT 132 Urban Pest Management (3 credit hours)
Insects and related arthropods found in residential and industrial buildings, nature of damage, and their control. Identification and life history of the different pest species, methods to detect their presence, and integrated pest management strategies. Hands-on learning of species in laboratory with emphasis on current control techniques. Field trips required. Agricultural Institute Students only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

ENT 163 Ornamental & Turf Insects (3 credit hours)
Practical course in the biology, recognition, and management of common insect and related arthropod pests that attack ornamentals and turf. WALDVOGEL

Requisite: Agricultural Institute Only
Typically offered in Spring only

ENT 190 Current Topics in Pest Management (1 credit hours)
Discussions of current topics of pest management. Topics selected by the students and instructors to include different phases of pest management. Discussions led by leaders in the various facets of the industry.

Requisite: Agricultural Institute Only
Typically offered in Spring only

ENT 201 Insects and People (3 credit hours)
An introduction to the fascinating world of insects and how they interact with people. Included is a brief survey of insect history, diversity, structure and function, and behavior. This is followed by examples of beneficial and harmful insects in a variety of human activities including some sampling of the profound impacts insects have had on history, society and culture.

GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

ENT 207 Insects and Human Disease (3 credit hours)
This course is an introduction to the many interactions between insects, other arthropods and humans that result in disease, ranging from simple anxiety, phobias, discomfort and pain, to transmission of pathogenic organisms causing sickness and even death. Included will be an understanding of the special physical and chemical adaptations of insects that enable them to cause us harm. The major groups of insects, mites, ticks and related arthropods associated with human suffering and disease as well as an introduction to the diseases transmitted by them will be presented. Finally, the course will present information on how major outbreaks of disease transmitted by the insects have influenced human populations, demographics, warfare, religion, and societal structure throughout recorded history.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Spring only

ENT 212 Basic Entomology (1 credit hours)
This course offers a brief and basic introduction to the world of insects and the discipline of entomology. It is intended as a primer for several other more specialized entomology classes such as forensic entomology and forest entomology.

Typically offered in Fall and Spring

ENT 305 Introduction to Forensic Entomology (3 credit hours)
This course provides a broad overview of forensic entomology- a specialized field of entomology employed in medicocriminal investigations. Forensic entomology relies on knowledge of insect ecology, biology, taxonomy, physiology and development to elucidate the circumstances surrounding death. The role of arthropods associated with decomposed human remains is one of several valued disciplines in forensic sciences. Understanding the general principles of forensic entomology and their application will be the focus of this course.

GEP Natural Sciences
Typically offered in Fall only

ENT 401 Honey Bee Biology and Management (3 credit hours)
A hands-on course in honey bee management including bee pollination of selected crops based on an understanding of bee biology, bee behavior, bee pathology, and bee botany. Students must be able to provide their transportation to field sites or arrange to work with a beekeeping mentor. Students may choose, but are not required, to purchase their own beekeeping equipment and hive.

Prerequisite: (ENT 201, ENT 203, ENT 425, BIO 105 or PB 200)
Typically offered in Spring only

ENT 402/FOR 402 Forest Entomology (3 credit hours)
Fundamentals of morphology, classification, biology, ecology and control of insects attacking trees, with emphasis on silvicultural practices.

Prerequisite: Junior standing.
GEP Natural Sciences
Typically offered in Spring only

ENT 425 General Entomology (3 credit hours)
This course explores the science of entomology by focusing on the basic principles of systematics, morphology, physiology, development, behavior, ecology, and management of insects. Field trips provide opportunities to collect insects and study their adaptations to a wide variety of natural environments.

Prerequisite: BIO 181 or BIO 140 or BIO 350
GEP Natural Sciences
Typically offered in Fall only

ENT 470/PP 470/CS 470 Advanced Turfgrass Pest Management (2 credit hours)
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pestmanagement programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

Prerequisite: C- or better in CS 200
Typically offered in Spring only

ENT 492 External Learning Experience (1-6 credit hours)
A learning experience within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

ENT 493 Special Problems in Entomology (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

ENT 495 Special Topics in Entomology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

ENT 502 Insect Diversity (4 credit hours)
Diversity of insect biology and structure with emphasis upon identification of adults; includes speciation, evolutionary relationships, approaches to classification, nomenclature, zoogeography and techniques of collection.

Prerequisite: ENT 425 or Graduate Standing
Typically offered in Fall only

ENT 503 Insect Morphology and Physiology (3 credit hours)
The objectives are to acquaint students with the internal morphology, histology, and ultra-structure and system functions of insects. The laboratory will assist in recognizing the internal anatomy and associated external structure of insects and provide practical experience in the study of insect function.

Prerequisite: (CH 221 or CH 225) and (CH 223 or CH 227) and ENT 425 or Graduate Standing
Typically offered in Spring only

ENT 504 Professional Development for Agriculture and the Life Sciences (2 credit hours)
A successful professional career in agriculture and the life sciences is not limited to understanding just the science of these disciplines. Also required is an understanding of career paths, professional ethics, written and verbal communication, safety, how to work with animals and human subjects, personal interactions, vita preparation, networking, and future directions of the discipline. These skills are essential to taking the knowledge obtained in our science and applying them to a career in the discipline. Graduate Standing required.

Typically offered in Fall only

ENT 506/GES 506 Principles of Genetic Pest Management (3 credit hours)
Introduction to the biological aspects of genetic pest management (GPM). Genetic techniques for GPM, including historical uses (such as the sterile insect technique) and approaches that are currently in development. Practical issues relating to the deployment of GPM, including ecological and economic considerations.

Typically offered in Fall only

ENT 510 Writing Proposals in Agriculture, Biology, and Ecology (2 credit hours)
Participants will be guided through the process of writing, with the intention to submit, a fellowship or grant proposal to an appropriate program of their selection and effective peer review of grant or fellowship proposals. The course includes a combination of lectures, in class activities, and direct practice. Students will also interact with a wide variety of experts in grant writing and evaluation who serve as weekly guest reviewers.

Typically offered in Fall only

ENT 520 Insect Behavior (3 credit hours)
This course stresses comprehensive coverage of the principles of animal behavior using insects as models and examples. Physiology, genetics, mechanisms, behavioral ecology, and evolution of insect behavior will be covered.

Typically offered in Spring only

ENT 526 Organic Agriculture: Principles and Practices (3 credit hours)
This is a multidisciplinary class, and lectures cover many aspects of organic production given by a number of experts from both on and off campus. Classes also include discussions of issues and controversies surrounding organic production, as well as field trips to selected farms. This course is restricted to upper level undergraduate, graduate, or post-baccalaureate continuing education students.

Typically offered in Spring only

ENT 550 Fundamentals of Arthropod Management (3 credit hours)
The principles underlying modern methods for protecting food, clothing, shelter and health from insect attack.

Prerequisite: ENT 425 or Graduate Standing
Typically offered in Fall only

ENT 582/ZO 582 Medical and Veterinary Entomology (3 credit hours)
The morphology, taxonomy, biology and control of the arthropod parasites and disease vectors of man and animals. The ecology and behavior of vectors in relation to disease transmission and control.

Prerequisite: ENT 425 and ZO 315
Typically offered in Spring only

ENT 591 Special Topics In Entomology (1-6 credit hours)
A variable credit lecture and laboratory series offering topics such as advanced beekeeping, morphology, physiology, systematics, behavior, biological control, nursery and ornamental pests, host plant resistance, information retrieval, biological monitoring and sampling, population modeling, extension entomology, computer methods and urban, forest and stored product pests.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENT 601 Seminar (1 credit hours)
Discussion of entomological topics selected and assigned by seminar chair.

Prerequisite: Graduate standing in ENT or closely allied fields
Typically offered in Fall and Spring

ENT 604 Insect Natural History and Field Ecology (1 credit hours)
Diversity of ecological roles and lifestyles of insects and related arthropods using techniques in field ecology. Two week-long field trips to Coastal Plain and Mountains with orientation walks, evening lectures, and field projects.Taught during the two weeks prior to the Fall semester.

Prerequisite: Graduate standing in Entomology
Typically offered in Fall only

ENT 620 Special Problems (1-6 credit hours)
Original research on special problems in entomology not related to a thesis problem. Provides experience and training in research. Credits Arranged.

Typically offered in Spring only

ENT 641 Agricultural Entomology Practicum (3 credit hours)
Practical experience in research, extension and commercial aspects of insect pest management on a broad range of agricultural crops under actual field conditions. Class meets 9 hours each Friday for 10 weeks from early June to mid-August. Students should register for Fall term.

Prerequisite: Economic entomology (ENT 762 recommended)
Typically offered in Fall only

ENT 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Spring only

ENT 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring only

ENT 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ENT 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ENT 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ENT 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ENT 726 Biological Control of Insects and Weeds (3 credit hours)
Overview of the field of biological control and its role in Integrated Pest Management programs. Emphasis on the diversity and sometimes unusual interactions of insect parasitoids and predators with their hosts/prey, controversies in biological control, critical analysis of selected projects, and basic conceptual and "hands-on" tools for approaching biological control research and implementing projects.

Prerequisite: ENT 425 or Graduate Standing
Typically offered in Fall only

ENT 727/PP 727 Ecology of Soil Ecosystems (3 credit hours)
This course will focus on the interactions between soil organisms and their environment, and the ecological consequences of these diverse complex interactions. In particular, it will explore the scientific evidence that illustrates links between soil organisms, ecosystem functioning and the quality of air and water systems, and examine why and how the related research was conducted. This course will bring together theory and research trends from distinct subject areas: soil microbiology, entomology and ecosystem ecology.

Prerequisite: One course in: (SSC 332, SSC 511, SSC 521, or SSC 532), or ecology (BO 360 or CS 430), or microbiology (MB 351), or consent of instructor.
Typically offered in Spring only

ENT 731 Insect Ecology (3 credit hours)
The interrelationships among insects and components of their effective environments which result in dynamic spatial and temporal patterns of particular species. Also, the diverse roles of insects in structure and function of communities and ecosystems.

Prerequisite: ENT 425 or Graduate standing
Typically offered in Spring only

ENT 762 Insect Pest Management In Agricultural Crops (3 credit hours)
Critical review of the biology and ecology of representative beneficial and injurious insects and arachnids of agricultural crops and the advantages and limitations of advanced concepts of their management in selected agroecosystems.

Prerequisite: Graduate Standing
Typically offered in Spring only

ENT 791 Special Topics In Entomology (1-6 credit hours)
A variable credit lecture and laboratory series offering topics such as advanced beekeeping, morphology, physiology, systematics, behavior, biological control, nursery and ornamental pests, host plant resistance, information retrieval, biological monitoring and sampling, population modelling, extension entomology, computer methods and urban, forest and stored product pests.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ENT 801 Seminar (1 credit hours)
Discussion of entomological topics selected and assigned by seminar chair.

Prerequisite: Graduate standing in ENT or closely allied fields
Typically offered in Fall and Spring

ENT 804 Insect Natural History and Field Ecology (1 credit hours)
Diversity of ecological roles and lifestyles of insects and related arthropods using techniques in field ecology. Two week-long field trips to Coastal Plain and Mountains with orientation walks, evening lectures, and field projects.Taught during the two weeks prior to the Fall semester.

Prerequisite: Graduate standing in Entomology
Typically offered in Fall only

ENT 820 Special Problems (1-6 credit hours)
Original research on special problems in entomology not related to a thesis problem. Provides experience and training in research.

Typically offered in Spring only

ENT 841 Agricultural Entomology Practicum (3 credit hours)
Practical experience in research, extension and commercial aspects of insect pest management on a broad range of agricultural crops under actual field conditions. Class meets 9 hours each Friday for 10 weeks from early June to mid-August. Students should register for fall semester.

Prerequisite: Economic entomology (ENT 762 recommended)
Typically offered in Fall only

ENT 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

ENT 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Summer only

ENT 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ENT 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ENT 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ENT 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Entrepreneurship in Music and the Arts (EMA)

EMA 110 Introduction to Arts Entrepreneurship (3 credit hours)
This course introduces students to the basic components of an entrepreneurial lifestyle in the arts for those interested in starting an arts business. Students explore fundamental issues arts entrepreneurs encounter and how they can be addressed before the startup process reaches the launch cycle. Students are required to provide their own transportation to and cover the admission costs of off-campus events.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

EMA 293 Independent Study in Arts Entrepreneurship (1-3 credit hours)
Independent study offering under the direction of a faculty member. Requirements for the independent study will be determined by the student and faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

EMA 295 Special Topics in Arts Entrepreneurship (1-3 credit hours)
Timely topical courses or experimental course offerings in Arts Entrepreneurship.

Typically offered in Fall and Spring

EMA 365 Foundations in Arts Entrepreneurship (3 credit hours)
This course will introduce and outline the role, purpose, and perception of "art" in various marketplaces and contexts for the emerging arts entrepreneur. Topics include: issues in marketing aesthetic products, consumer identification through art, models of consumer behavior, art and technology, macro-economic issues that affect the arts industries, arts policy and access.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

EMA 370 Practical Arts Entrepreneurship (3 credit hours)
This course will introduce and outline the cultural and economic environment of the arts in the United States. Topics include: the start-up process of for- and non-profit entities, economic and social impact of art and artists in communities, public and private arts support, non-profit culture and basic grantsmanship, arts policy, creative economy efforts, the role of geography, demand and infrastructure considerations in entrepreneurial decision-making, competition analysis and marketing.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

EMA 375 Understanding the Arts Economies (3 credit hours)
This course explores arts and arts-related economies of critical importance to the emerging arts entrepreneur. Topics include: creative, experimental and hybrid economies, Arts infrastructure in urban and rural areas, arts clusters, patronage, broader economic conditions effecting arts economies, the relationship of "art" to segmented technology economies.

Prerequisite: EMA 370
Typically offered in Fall only

EMA 430 Capstone Experience in Arts Entrepreneurship (3 credit hours)
Students analyze arts and arts-related businesses through the use of case studies in addition to executing an entrepreneurial project concerning the arts in a Raleigh community. This class introduces students to the decision-making skills necessary to sustain arts ventures and focuses on constructing innovative solutions to common problems arts and arts-related entrepreneurs encounter. Information gained from the prerequisite courses will be put to authentic use in either a non- or for-profit setting. Transportation and some costs may be required for project work.

Prerequisite: EMA 375
Typically offered in Spring only

EMA 493 Advanced Independent Study in Arts Entrepreneurship (1-3 credit hours)
Advanced Independent Study offering under the direction of a faculty member. Requirements for the independent study will be determined by the student and faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

Entrepreneurship Initiative (EI)

EI 100 Entrepreneurial Thinking in the Albright Entrepreneurs Village (1 credit hours)
Course involves active discussion about current events, case studies and assigned reading to evaluate strategies needed to think like an entrepreneur. Our students will think critically and apply basic skills needed when joining or forming teams to launch ideas or ventures. This course will host only residents of the Albright Entrepreneurs Village to discuss these ideas and build upon the living and learning community's learning outcomes.

R: Albright Entrepreneurs Village
Typically offered in Fall only

EI 201 Exploring Interdisciplinary Entrepreneurial Thinking (3 credit hours)
Course covers the perspectives of entrepreneurial thinking from an interdisciplinary perspective including: expectations and understanding of successful entrepreneurs as well as entrepreneurial opportunities in a variety of disciplines and entities including sciences, technology, humanities and social sciences. Primary focus will be on developing the student's entrepreneurial mindset.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

EI 202/SLC 202 CREATE: Carolina Regional Entrepreneurship Albright Team Experience I (2 credit hours)
The purpose of this course is to equip students with the skills and competencies to guide high school students through the Carolina Regional Albright Team Experience (CREATE). Students will think critically and apply skills related to leadership, entrepreneurial concepts, teaching and facilitation while working with high school students. This course prepares students to design their own interactive curriculum which they will facilitate in the spring semester. Instructor approval required for registration.

Corequisite: Must also enroll in SLC/EI 203, instructor approval required
GEP Interdisciplinary Perspectives
Typically offered in Fall only

EI 203/SLC 203 CREATE: Carolina Regional Entrepreneurship Albright Team Experience II (1 credit hours)
This course builds upon the foundation set in SLE/EI 202 CREATE I. Students will continue to think critically and apply skills related to leadership, entrepreneurial concepts, teaching and facilitation while preparing students for the spring competition. This semester is focused on facilitation and mentorship and helping the high school students finish their group projects.

Prerequisite: SLC/EI 202 or approval from instructor
Typically offered in Spring only

EI 331 Interdisciplinary Entrepreneurial Thinking I: Skills and Planning Basics (3 credit hours)
Course covers the development and application of critical skills in entrepreneurship as well as the fundamentals of entrepreneurial planning including interdisciplinary opportunity identification and feasibility analysis. Some individual off campus travel might be required. Students are responsible for their own transportation to off campus activities. Students will not receive credit for both EI 331 and MIE 412.

Prerequisite: EI 201
GEP Interdisciplinary Perspectives
Typically offered in Spring only

EI 495 Independent Study in Entrepreneurship (3 credit hours)
The Independent Study in Entrepreneurship (EI 495) is designed to give students the opportunity to create their own experiential learning activity within the scope of an academic environment. EI 495 projects should be designed to meet the criteria for a 3 credit hour course. Before moving forward with the request to enroll in EI 495, the student should first work with their Independent Study sponsor to define the Independent Study contract. This course is restricted to students who have obtained faculty permission to enroll.

Typically offered in Fall, Spring, and Summer

Environmental Assessment (EA)

EA 501 Environmental Stressors (3 credit hours)
Introduces students to how organisms are affected by and respond to changes or stressors - both natural and human-induced - in the environment. With a focus on the concepts most significant to the field of environmental assessment, the course emphasizes the fundamental processes and effects of pollutants and naturally-occurring substances in the environment, including emerging issues and historically significant cases.

Prerequisite: Graduate standing
Typically offered in Fall only

EA 502 Environmental Risk Assessment (3 credit hours)
This course provides students with an appreciation and understanding of the principles of environmental risk assessment including: Hazard Identification, Toxicity Assessment, Exposure Assessment, and Risk Characterization. Emphasis is placed on contemporary problems in human health and the environment, and it will be based on the most current methodologies described in the "Risk Assessment Guidance for Superfund." Enrollment in the course requires graduate standing or consent of the instructor. Two semester sequence of college biology & college chemistry.

Prerequisite: Two semester sequence of college biology & college chemistry.
Typically offered in Spring only

EA 503 Environmental Exposure Assessment (3 credit hours)
Provides students with an appreciation and understanding of the principles of environmental exposure assessment including the sources, transport and fate of chemicals in the environment. Emphasis is on contemporary problems in human health and the environment, covering topics such as: transformation and degradation processes, classes of contaminants a well as predicting environmental fate and exposure. Enrollment in the course requires graduate standing or consent of the instructor. Two semester sequence of college biology & college chemistry.

Prerequisite: Two semester sequence of college biology & college chemistry.
Typically offered in Fall only

EA 504 Environmental Monitoring and Analysis (3 credit hours)
Monitoring and analysis of chemical and biological impacts to the environment. Theory of chemical, physical, biological, and ecological monitoring. Planning and conducting environmental sampling and monitoring programs. Management, analysis, and quality assurance and control. Enrollment in the course requires graduate standing or consent of the instructor.

Prerequisite: One Year College Biology and One Year College Chemistry
Typically offered in Summer only

EA 505 Environmental Assessment Law & Policy (3 credit hours)
This course provides students with an appreciation and understanding of the principles of environmental law and policy. Emphasis is on the US legal system and litigation process relevant to environmental law, covering topics such as: the National Environmental Policy Act (NEPA), the Pollution Prevention Act (PPA), the Clean Water Act, and the Clean Air Act. Throughout the course, a case study is integrated into the conceptual lecture material with the intent of providing practical examples to conceptual material.

Graduate standing and EA 501 and EA 502 or EA 503
Typically offered in Spring only

EA 506 Water Quality Assessment (3 credit hours)
Introduces students to topics fundamental to the understanding of aquatic systems and the processes that influence water quality. Covered topics include the hydrologic cycle, water chemistry, aquatic ecology, aquatic toxicology, water quality laws and standards, water quality assessment and techniques, and water pollution control and treatment. Emphasis is on contemporary water quality issues such as nutrient enrichment, introduced species, contaminants, and climate change.

Prerequisite: Graduate standing
Typically offered in Spring only

EA 507 National Environmental Policy Act Procedures (3 credit hours)
Procedures and requirements for implementing the National Environmental Policy Act (NEPA) when projects involve a federal nexus, including permitting and consultation among agencies in the planning process. Illustrating the five NEPA mandates and examining implications for data generation and monitoring that result from responsibilities vested in the Council of Environmental Quality.

Typically offered in Fall only

EA 508 Data Analysis in Environmental Assessment (3 credit hours)
This course provides students with an appreciation and broad understanding of environmental data, their analysis, and use in exposure and risk assessments. Topic areas include sources and types of environmental data and exposure/risk models; environmental data processing, cleansing, and visualization techniques; and a refresher to basic environmental data analyses useful for comparisons and evaluation. Numerous case-study activities are used to demonstrate learned concepts using publicly available data from environmental research publications and databases. Emphasis is placed on practical applications commonly used in environmental and health analyses and will be focused on data tools available in spreadsheet programs (e.g., Microsoft Excel(TM), Google sheets).

P: Graduate Standing
Typically offered in Fall only

EA 509 Air Quality for Environmental Assessment and Fire Science (3 credit hours)
Students will learn about assessment of air quality and will examine specific air pollutant problems induced by wildfire. The course will begin with a review of the criteria air pollutants, including sources, chemistry, transport, and dispersion. The majority of the course will focus on environmental assessment of the criteria pollutants. Units will include requirements of the National Ambient Air Quality Standards (NAAQS), monitoring methods and their biases, air pollution monitoring networks, compliance, permitting, and air pollution effects on health, ecology, climate, and equity. Throughout the semester, we will examine these topics through cases pertaining to wildfires.

P: Graduate Standing
Typically offered in Fall only

EA 520 Renewable Energy Policy and Economics (3 credit hours)
This course will cover global frameworks, as well as local, utility, state and federal policy and incentives that foster renewable energy implementation. It will also cover fundamental concepts of finance and economics to build a renewable energy project model that show how these policies affect the economics of a renewable energy project.

Prerequisite: Graduate standing
Typically offered in Fall only

EA 521 Fundamentals of Renewable Energy Site Assessment (3 credit hours)
This course will cover solar site assessment, wind assessment, and bioenergy with required exercises using current industry tools to assess the viability of the resource. Overview of the historical and current role of wind, solar, and bioenergy power technologies globally and the direction of each sector's evolution for the future, particularly in the USA. The course emphasizes the technology behind power generation for wind, solar, and bioenergy sectors. Students will evaluate policy and permitting issues and, consequently, determine if a site is appropriate for implementation of either or all of these technologies.

Prerequisite: Graduate Standing
Typically offered in Spring only

EA 522 Photovoltaic Design and Assessment (3 credit hours)
This course covers fundamental principles of the application, design, installation, and operation & maintenance of Photovoltaic (PV) systems in order to properly assess the best system options for a specific project or application. The course will begin with some background on electric energy and its use and delivery. In addition, the course will cover economic implications of the site and PV system considerations. Building on this foundation we will then take an in-depth look at solar photovoltaic function and design to aide students in assessing the environmental, and financial, sustainability of the project. This interdisciplinary approach allows the student to gain a comprehensive understanding of photovoltaics beyond the technical, and caters to individuals across a range of experience and expertise.

Prerequisite: Graduate Standing
Typically offered in Fall only

EA 523 Assessment of Renewable Energy Storage Systems (3 credit hours)
Energy Storage and operations and maintenance have become two areas in clean energy, particularly in the PV industry that have been rapidly evolving. This course will offer the basics of battery technology, as well as current market trends and incentives, to provide students timeless tools to assess the best possible option for a specific renewable energy + storage project. Meanwhile, the operations and maintenance portion will go through industry best practices that not only deal with technical management of a solar asset, but also understanding financial implications of the project. This interdisciplinary approach allows students of diverse STEM and non-STEM professional experience and expertise to gain a comprehensive understanding of this aspect of the solar industry.

Prerequisite: Graduate Standing and EA 522
Typically offered in Spring only

EA 590 Special Topics in Environmental Assessment (1-6 credit hours)

EA 665 Professional Project (1-6 credit hours)
Environmental assessment project conducted under the mentorship of a member of the graduate faculty.

Prerequisite: EA 502, EA 503, and EA 504
Typically offered in Fall, Spring, and Summer

Environmental Science (ES)

ES 100 Introduction to Environmental Sciences (3 credit hours)
Interrelationships between human populations and the natural environment. Human population trends, agriculture, air and water pollution, biological diversity, forest and land use, energyand mineral resources, and toxic substances. Consideration of related economic factors, laws, politics, political behavior, and ethical questions.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

ES 111 Applications of Environmental Sciences (1 credit hours)
Applications of Environmental Sciences provides Environmental Sciences majors deeper exploration of topics presented in Introduction to Environmental Sciences (ES 100) through hands-on activities, small-group discussion, and interaction with environmental professionals. Students build skills in data analysis, collaboration, and communication; learn more about Environmental Sciences focal areas and how to select theirs; and begin developing peer networks and mentor relationships with others in the field. Course is restricted to Environmental Sciences majors.

Corequisite: ES 100 or student has received transfer or AP credit for ES100; Environmental Sciences majors only
Typically offered in Spring only

ES 113 Earth from Space (3 credit hours)
This course takes an orbital perspective on Earth and its natural resources. Particular attention is paid to how humans are changing Earth, challenges to sustainably managing natural resources, and how satellite Earth observation has enabled these discoveries. Students will gain a fundamental understanding of how satellite sensor systems work, how they enable us to understand the dynamic Earth, and the role that remote sensing plays in natural resource challenges.

GEP Global Knowledge, GEP Natural Sciences
Typically offered in Fall only

ES 150 Water and the Environment (3 credit hours)
This interdisciplinary course focuses on the essential role of water in supporting all life on earth, and the expected impacts of rapidly changing water resources. Aspects of water issues will include physical sciences and engineering, life sciences, and social sciences. Case studies outline the importance of water in the global context and in specific settings, including North Carolina. The course will help prepare students for living in a rapidly changing world.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Spring only

ES 200 Climate Change and Sustainability (3 credit hours)
This course explores the relationships between humans and the environment with interdisciplinary content. Focus is on past impacts of climate change on human activities and future prospects. Course content is based on lectures with students also responsible for developing and presenting seminars.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

ES 295 Special Topics in Environmental Science (1-4 credit hours)
Provides instruction on rapidly emerging curriculum. Also provides courses on an experimental basis before incorporation into the curriculum. See specific course offering for course details.

Typically offered in Fall and Spring

ES 300 Energy and Environment (3 credit hours)
This course explores relationships between humans, energy, and the environment with interdisciplinary context. Themes include environmental impacts of energy production, distribution and use with discussion of new technologies. Half of the course content is from subject lectures and half from self-selected student projects. Student projects emphasize analytical approaches to solving environmental problems, and enhance skills in writing, seminars, and team work.

Prerequisite: CH 101 or PY 212 or PY 208
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

ES 400 Analysis of Environmental Issues (3 credit hours)
A capstone course for students in environmental sciences or related majors. The course teaches use of analytical approaches for solving environmental problems, and for communicating results. The course emphasizes development of student projects that lead to environmental decision-making, such as devising a resource management plan, developing a predictive model, prioritizing risk, identifying tipping points, designing new software or technologies, or predicting outcomes of environmental polices. Individual student projects fit within a team framework to simulate a work environment. Students enhance writing and seminar skills. Student may incur extra expenses with projects for this course.

Prerequisite: ES 100, ES 200, ES 300 and Senior standing
Typically offered in Fall and Spring

ES 449/PRT 449 Human Dimensions of Natural Resources in Australia/New Zealand (3 credit hours)
This 3.5 week study abroad program examines human dimensions of natural and environmental conservation in Australia. The course will involve an orientation and lectures from faculty at James Cook University. Students wills explore the natural environments in Australia including Great Barrier Reed, Tropical Rainforest and Outback and be introduced to Australian culture and history through interactions with communities. Educational travel, active participation, lectures, seminars, and reflective exercises facilitate learning to improve understanding of relationships between human societies and the natural environment. Students must pay program fees, airfare, some meals, and incidentals.

Corequisite: PRT 450
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Summer only

ES 450/PRT 450 Sustaining Natural Resources in Australia/New Zealand (3 credit hours)
This 3.5 week study abroad program will examine issues related to natural history and environmental conservation in Australia. This course will involve an orientation and lectures from Australian university faculty. Students will explore natural environments in Australia including the Great Barrier Reef, Tropical Rainforest and Outback; learn about sustainable development and protection of the natural environment through educational travel, field trips, active participation, lecture presentations and seminars, written assignments, research projects and reflective exercises. Students must apply through NCSU Study Abroad Office. Students must pay program fees, airfare, some meals and incidentals.

Corequisite: PRT 449
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Summer only

ES 495 Special Topics in Environmental Science (1-6 credit hours)
This course provides instruction on rapidly emerging environmental themes not currently covered in the undergraduate curriculum. Also provides courses on an experimental basis. See specific course offering for course detail.

Prerequisite: Junior standing
Typically offered in Fall and Spring

ES 496 Environmental Science Internship (1-3 credit hours)
Students can earn 1-3 credits for completing internships in the public or private sectors. Emphasis is placed on gaining work experience needed to explore and plan careers in the environmental field. Students must prepare an internship proposal. Students must provide own transportation for internship. Students are required to purchase internship liability insurance. Contact university insurance & risk management for details an acquiring the insurance and the current charge. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ES 497 Professional Development in Environmental Science (1-3 credit hours)
The course provides 1-3 credits for students who develop skills necessary to organize, promote, and participate in an event such as a workshop, conference or a seminar. Examples of acceptable events include organizing a panel of speakers on a specific topic. A speaker series, a career fair, or a workshop. The formats and topics of events are determined by the organizing student(s). Each student prepares an event proposal before the student can register for ED 497. Students must provide own transportation for professional development in environmental sciences. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ES 498 Research in Environmental Science (1-3 credit hours)
Students can earn 1 credit in ES 498 for every 50 hours of research during a semester up to a total of 3 credits for 150 of research in a semester. A student cannot complete more than 3 credits of ES 498 research in a single semester, or more than 6 credits in their program of study. Research can be traditional laboratory and/or fieldwork, or other creative activity. The student must produce a final report, seminar, or product that can be evaluated. Typically, the work for 1-3 credit of ES 498 research will be completed in one semester. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ES 499 Thesis in Environmental Science (3 credit hours)
ES 499 thesis provides academic credit for students who participate in original, inquiry-based learning and discovery in environmental sciences. Students present the thesis to a community of peers and experts for evaluation. ES 499 thesis requires a thesis proposal signed by the student, ES faculty advisor, a thesis host, and a supporting faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

Environmental Technology (ET)

ET 105 Introduction to Environmental Regulations (1 credit hours)
ET 105 is a 1 hour lecture/discussion class, required of all environmental technology majors. The course reviews all the major federal and state regulations and laws addressing, water air and soil pollution; solid, toxic and hazardous waste, occupational safety/health and environmental management systems. For ET majors only.

Typically offered in Spring only

ET 120 Introduction to Renewable Energy Technologies and Assessments (3 credit hours)
Overview of the various renewable energy assessment technologies. Students will learn what assessments and measurements can be taken to determine if renewable energy technologies will be effective in a particular location. Topics include biomass and biofuels, geothermal systems, solar thermal systems, photovoltaics, wind energy, and hydroelectric.

Typically offered in Spring only

ET 201 Environmental Technology Laboratory I (1 credit hours)
Use of field and laboratory instrumentation for monitoring water quantity and quality. Management, analysis, interpretation, and oral and written reporting of complex environmental data sets. Hands-on, real-world experience in water quality monitoring and maintenance. Required field trips may extend beyond class time.

Typically offered in Fall only

ET 202 Environmental Technology Laboratory II (1 credit hours)
Use of field and laboratory instrumentation for monitoring plants, soils, and natural systems. Management, analysis, interpretation, and oral and written reporting of complex environmental datasets. Hands-on, real-world experience in plant and soil quality monitoring and maintenance. Required field trips may extend beyond class time.

Typically offered in Spring only

ET 203 Pollution Prevention (1 credit hours)
This course studies the prevention of the pollution of air, water, and terrestrial ecosystems. State of the art technological solutions are discussed. The social, economic, legal and ethical dimensions of pollution prevention are integrated into the scientific and technological challenges facing developed and developing economies.

Prerequisite: ES 100
Typically offered in Fall only

ET 220 Solar Photovoltaics Assessment (3 credit hours)
This course introduces specific elements in photovoltaic (PV) systems technologies including efficiency, modules, inverters, charge controllers, batteries, and system installation. Topics include National Electric Code (NEC), electrical specifications, photovoltaic system components, array design and power integration requirements that combine to form a unified structure. upon completion, students should be able to demonstrate an understanding of various photovoltaic designs and proper installation of NEC compliant solar electric power systems.

Prerequisite: ET 120
Typically offered in Fall only

ET 255 Hydro, Wind, and Bioenergy Assessment (3 credit hours)
Overview of the historical and current role of wind, hydro-electric, and bioenergy power technologies globally and the direction of each sector's evolution for the future particularly in the USA. The course emphasizes the technology behind power generation for wind, hydro, and bioenergy sectors. Students will evaluate policy and permitting issues and, consequently, determine if a site is appropriate for implementation of either or all of these technologies.

Prerequisite: ET 120
Typically offered in Spring only

ET 262 Renewable Energy Adoption: Barriers and Incentives (3 credit hours)
The understanding of the economic, social, and legal barriers and incentives to renewable energy adoption is an important facet to helping renewable energies reach their potential. This course explores mechanisms that can be used and that have been used successfully in the US and in other parts of the world to remove those barriers and to promote greater use of renewable resources, particularly in rural areas and on agricultural and forested lands.

Typically offered in Fall only

ET 293 Independent Study in Environmental Technology & Management (1-6 credit hours)
Independent Study for Environmental Technology & Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ET 294 Independent Study in Environmental Technology & Management (1-6 credit hours)
Independent Study for Environmental Technology & Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ET 295 Special Topics in Environmental Technology & Management (1-6 credit hours)
Special Topics in Environmental Technology & Management at the 200 Level for offering courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

ET 301 Environmental Technology Laboratory III (1 credit hours)
Assessment of and response to environmental hazards caused by hazardous materials releases. Regulatory requirements associated with hazardous materials releases. Utilization of chemical protective clothing and respiratory protection. Students passing the class receive Occupational Safety and Health Administration (OSHA) 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) certification. Required field trips may extend beyond lab time.

Typically offered in Fall only

ET 302 Environmental Technology Laboratory IV (1 credit hours)
Use of field and laboratory instrumentation for monitoring outdoor and indoor air quality. Management, analysis, interpretation, and oral and written reporting of complex environmental data sets. Hands-on, real-world experience in air quality monitoring and maintenance. Required field trips may extend beyond class time.

Typically offered in Spring only

ET 303 Laboratory Safety Systems and Management (1 credit hours)
Theory and practice of regulation, management, and auditing of laboratory safety. Laboratory field trips may extend beyond class time.

Typically offered in Spring only

ET 310 Environmental Monitoring and Analysis (3 credit hours)
Monitoring and analysis of chemical, biological, and radiation impacts to the environment. Theory of chemical, physical, biological, and ecological monitoring. Planning and conducting environmental sampling and monitoring programs. Management, analysis, and quality assurance and control. Risk assessment in environmental technology. Laboratory practice and safety.

Prerequisites:CH 101 or 100; BIO 181; ET students only
Typically offered in Spring only

ET 320/MEA 320 Fundamentals of Air Pollution (3 credit hours)
Students will learn fundamental concepts in air pollution and the application of those concepts for compliance with air quality regulations. Topics include air pollutants, their properties, how they are emitted, and relevant atmospheric chemistry and physics processes, National Ambient Air Quality Standards (NAAQS) and how compliance with those regulations is maintained.

Prerequisite: MA 121 or MA 131 or MA 141, CH 101/102, PY 131 or PY 201 or PY 205 or PY 211; Recommended: CH 220/222 or CH 221/222
Typically offered in Spring only

ET 330 Environmental Technology Practicum (3 credit hours)
Preparation for practicum, including resume writing, interviewing skills, cover letters, and practicum search techniques and resources. Professional practice as an environmental technologist. Written and oral communications of the practicum experience.

Typically offered in Fall, Spring, and Summer

ET 401 Environmental Technology Laboratory V (1 credit hours)
Scientific and legal definitions of brownfield and EPA Superfund sites. Physical, chemical, and biological methods for remediating contaminated sites. Impacts of hazardous waste management on public and private sector organizations. Field trips to public and private brownfield and Superfund remediation sites to examine real-world applications of principles. Required field trips may extend beyond class time.

Typically offered in Fall only

ET 455 Adaptive Management and Governance (3 credit hours)
Some environmental and natural resource problems are more difficult to resolve than others. The purpose of this course is to understand the factors that condition intractable or "wicked" environmental and natural resources conflicts. These factors include narrow conceptions of science, rigid bureaucratic structures and narrow policy targets. We also explore some of the alternatives for addressing intractable environmental and natural resource problems- including adaptive management and governance.

Junior standing or above
Typically offered in Fall only

ET 460 Practice of Environmental Technology (3 credit hours)
This capstone course will provide the opportunity to actively learn and apply the theory and practice of environmental project management and monitoring in order to perform a baseline Environmental Management System (EMS) assessment. EMS requires data collection, data analysis, report preparation, and professional recommendations to organizations on how to structure an EMS that conforms to internationally recognized guidelines and standards. Environmental Management Systems are proven tools specifically designed to help organizations manage their activities to meet their environmental policies and goals. Project management and EMS work skills are transferable across private industry, government, and not-for-profit organizations. This course will provide participants opportunities to advance work skills in project planning, stakeholder engagement, budgeting, and resource management when developing EMS initiatives. Course participants, as teams, will create and execute an EMS project work plan through practical hands-on experiences, local field-site visits, class exercises, and relevant case studies.

Prerequisite: ET 310 or SSC 442; and ET Senior Only
Typically offered in Spring only

ET 493 Independent Study in Environmental Technology & Management (1-6 credit hours)
Independent Study for Environmental Technology & Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ET 494 Independent Study in Environmental Technology & Management (1-6 credit hours)
Independent Study for Environmental Technology & Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

ET 495 Special Topics in Environmental Technology & Management (1-6 credit hours)
Special Topics in Environmental Technology & Management at the 400 level for offering courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

Fashion and Textile Design (FTD)

FTD 104 Fashion and Textile Design First Year Studio I (6 credit hours)
This course provides Fashion and Textile Design freshman with a comprehensive introduction to foundational design concepts and methods representative of the creative thought and processes of fashion and textile design disciplines. The coursework encourages entering freshmen to think creatively through design and art, and the world around them, as they secure a skillful level of craftsmanship in the design and making of textile products. Design language, design elements and principles, and design communication and theory will be studied through readings and applications and will be experienced in person through field trips. Additional costs may be incurred for field trips.

Co-requisite: D 100
Typically offered in Fall only

FTD 105 Fashion and Textile Design First Year Studio II (6 credit hours)
This course is the continuation of the comprehensive introduction to foundational design concepts and methods representative of creative thought and activity across design and artistic disciplines, started in FTD FY Studio I. The course work encourages first year students to think critically and in depth about concept, context, material, and design process, for textile and fashion product development. There will be readings and applications in advanced design theory, including processes, methods, philosophies and related concepts. The class will involve field trips to experience these advanced design principles in person. Additional costs may be incurred.

Prerequisites: D 100 and FTD 104; Co-requisites: D 101 and FTD 200
Typically offered in Spring only

FTD 200 Design Skills Workshop (3 credit hours)
First course in developing student's use of design tools for the production of prototype products from textile materials, beginning with the selection of appropriate fabric and other raw materials and extending through critiquing the product. Concepts of ethical and sustainable design are built into the analysis and design of the product. A variety of techniques for designing sewn textile products are explored, as well as methods and safe practices for using equipment in the studio. FTD Majors Only.

Prerequisite: TT 105 and Corequisite: D 105
Typically offered in Spring only

FTD 201 Computer-Aided Textile Design and Color Studio (6 credit hours)
Application of industry textile design and visualization software to conception, design, development and presentation of creative textiles and textile products. Essential creative skills for textile design, such as motif and repeat development, will be introduced. Textile design solutions will be sampled using industrial technologies such as a digital printing, electronic knitting and computer-driven weaving. Color will be explored as a primary designer's tool including use in textile design, sensitivity and skills in communicating color, color perception and color theories, and color forecasting, creative projects will build skills in CAD for textiles and color. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: D101, D103, FTD 105, and a grade of C or better in FTD 200
Typically offered in Fall only

FTD 215 Fashion Design 1 (3 credit hours)
Studio course which introduces students to the basic rules and principles of flat pattern-making for apparel products. Advanced applications will be demonstrated through workshops utilizing concept-driven problems and follow-up critiques. Concurrent practices with computer-aided design will be presented where applicable. FTD majors only.

Prerequisite: Grade of C or better in FTD 200 and Corequisite: FTD 201
Typically offered in Fall only

FTD 216 Fashion Workroom Practices (3 credit hours)
Studio course introducing the basic concepts and practices for the creation of final garments and extending through quality analysis of the final product. Incorporates workroom techniques for production of a variety of sewn product applications using various fabrications. FTD majors only. Additional costs may be incurred for course materials/equipment.

Prerequisite: (Grade of C or better in FTD 200) or (Grade of C or better in FTM 219)
Typically offered in Spring only

FTD 218 Fashion Illustration (3 credit hours)
Concepts and practices for the fashion figure and fashion illustration, including the analysis of fashion figure structure details, proportion, and fashion figures clothed with different apparel and materials. The training of effective drawing of different fashion styles, wearing status and occasions, and the study of applying multiple illustration approaches to enhance fashion design and presentation. Additional costs may be incurred for course materials/equipment. FTD and FTM majors only.

Prerequisite: ADN 281
Typically offered in Spring only

FTD 321 Fashion Design by Draping (3 credit hours)
Exploration of three-dimensional methods of apparel design using textile substrates. Design and execution of draped garment structures will be explored in a studio setting. Additional costs may be incurred for course materials/equipment. FTD and FTM majors only.

Prerequisite: (C or better in FTD 215 and FTD 216) or (C or better in FTM 219 and FTM 315)
Typically offered in Fall only

FTD 373 Yarn Design Studio (3 credit hours)
Design of yarns and sample production, including the creation of novelty yarns, fancy yarns, and innovative effects in spun and plied fibers. Exploration of color, luster, twist, and slub variations in yarns to address both functional and aesthetic challenges. Studio experiences in creating innovative yarns appropriate for use in different fabric formation technologies. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: TT 221 or TTM 106 and a grade of C or better in FTD 201
Typically offered in Spring only

FTD 374 Surface Design and Texture (3 credit hours)
Exploration of innovative surface design and texture techniques for commercial and art applications. Embroidery, applique, stitching, fabric manipulation and aesthetic finishing processes for creative and functional design will be taught in state of the art facilities including digital printing, screen printing, cad embroidery, and industrial cad software for print design. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: TT 105 and a grade of C or better in FTD 200 and FTD 201
Typically offered in Spring only

FTD 375 Woven Textile Design Studio I (3 credit hours)
Design and sample production of woven fabrics. Exploration of basic structures, color and textural effects. Development of design abilities through creative projects executed using hand production methods, including an introduction to computer-integrated woven textile design systems and industrial processes. Study of actual fabrics and digital images, presentations will be made. Studio experience will be augmented, when possible, through outside speakers and field trips to mills. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: Grade of C or better in both TT252 and FTD 373
Typically offered in Fall only

FTD 376 Knitted Textile Design Studio I (3 credit hours)
Design and sample production of hand and machine knitted textiles. Exploration of basic structures, terms and definitions, including knitting notation and terminology. Development of creative knitted products utilizing design abilities and appropriate yarns through hand and machine production methods. Introduction to computer integrated knit design system and industrial knitting products and processes. Additional costs may be incurred for course material/equipment. FTD majors only.

Prerequisite: Grade of C or better in both TT252 and FTD 373
Typically offered in Fall only

FTD 419 Fashion Design 2 (3 credit hours)
Studio course which poses fashion problems to be solved with an emphasis on elements of design. Explores use of experimentation and development of "studies" as an aid in developing design ideas. Uses combination of flat pattern and CAD. Introduction to grading, marker making, and computer-controlled cutting. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: Grade of C or better in FTD 215, FTD 216, FTM 317, and FTD 321
Typically offered in Fall only

FTD 420 Fashion Collection Preparation (3 credit hours)
Studio course exploring sources of inspiration requiring students to research, develop and translate ideas into a line plan for a collection of garments. Stresses the extension and elaboration of ideas within a specific market. Integrates knowledge across the curriculum. Student may work with a firm, contest, or current theme to develop a fashion design statement. Additional costs may be incurred for course materials/equipment. FTD and FTM majors: Fashion Design and Fashion Development concentrations only.

Prerequisite: Grade of C or better in FTM 318 or (FTD 321 and co-requisite of FTD 419)
Typically offered in Fall only

FTD 475 Woven Textile Design Studio II (3 credit hours)
Design and sample production of specialized jacquard woven structures. Jacquard design for diverse end uses is addressed from art fabrics to unique specialty products. Exploration of advanced structures, color and textural effects. Development of design abilities through electronic production methods, including expanded use of computer-integrated design systems and exposure to industrial processes. Students will be required to complete creative design projects from concept to sample production and proposed finishing. Study of actual fabrics, digital images and presentations. Studio experiences will be augmented, when possible, through outside speakers and field trips to museum, markets, and mills. Additional costs may be incurred for course materials/equipment. FTD majors only.

Prerequisite: Grade of C or better in FTD 375
Typically offered in Fall only

FTD 476 Knitted Textile Design Studio II (3 credit hours)
Further development of knit design beyond basic design concepts and knit structures to product application. Development of creative knitted products utilizing design abilities through hand and machine production methods, including advanced methods of utilizing computer-integrated design system for both technical structures of knits and designing of garments and shaped panels. Exploration in yarn, color, and pattern design using electronic jacquard, fully fashion and seamless knitting equipment and cad systems. Consideration of other knit technologies such as warp knitting, terry, and crochet. Students will develop specifications for knitted products, and enhance understanding of industrial products and processes. Additional costs may be incurred for course material/equipment. FTD majors only.

Prerequisite: Grade of C or better in FTD 376
Typically offered in Fall only

FTD 479 Senior Textile Design Studio (6 credit hours)
Design and execution of creative projects integrating learning within curriculum, solution of textile design problems through synthesis of knowledge and skills gained through previous courses, preparation of work for portfolio, exhibition and participation in industry focused design competitions. Professional textile design practices and methods including advanced portfolio development concepts and presentation, development of textile collections suited to specified end use with emphasis on ideation, refinement, and design development, presentation and visual communication. The student will be expected to work with design, science, engineering, technology, and management disciplines. Additional costs may be incurred for course materials/equipment. Senior Standing, BS Fashion and Textile Design, Textile Design majors ONLY.

Prerequisite: FTD 374, FTD 475, FTD 476
Typically offered in Spring only

FTD 498 Senior Fashion Design Studio (6 credit hours)
Capstone for the FTD Fashion Design concentration. Design and production of a unique fashion collection applying various methods of generating patterns for garments, such as flat pattern design, draping, and CAD techniques. Relationships of body configuration and fabrication to garment design. Emphasis on ideation, creativity, communication, theme development, fit, quality, planning and execution of a fashion collection, as well as a documentary fashion portfolio. Work culminates in a Fashion show or Static exhibition format, which may be physical or virtual in format.

Prerequisite: Grade C or better in FTD419
Typically offered in Spring only

Fashion and Textile Management (FTM)

FTM 217 The Textile Industry (3 credit hours)
Study of the structure and organization of the integrated textile complex and its strategic functions. Critical stages involved in the manufacture of textile and apparel products. Fundamental aspects of cost management and finance as related to the integrated Textile Complex. One Saturday attendance during the semester is required.

Prerequisite: TT 105
Typically offered in Fall, Spring, and Summer

FTM 219 Fashion Product Analysis (3 credit hours)
Concepts and practices for the production and evaluation of fashion goods, beginning with selection of fabric and other raw materials and extending through quality analysis of the final product. Provide techniques for creating a variety of garment or sewn product applications, as well as methods for evaluation.

Prerequisite: TATM Student and FTM 217
Typically offered in Fall and Spring

FTM 220 Principles of Retailing and Supply Chain Management in Textiles (3 credit hours)
Introduction to theories and principles in fashion and textiles retailing and supply chain management including: the framework of textile retailing, textile retail strategies, textile supply chains and investigation of the strategic planning process. Emphasis placed on conducting an environmental scan, identifying and targeting the consumer, analyzing the trade area, site selection and textile product merchandise planning.

Prerequisite: FTM 217
Typically offered in Fall, Spring, and Summer

FTM 271 Computer-Aided Textile Design (3 credit hours)
Introduction to the operation of design software for woven, knitted and printed textiles. Adobe Photoshop, Pointcarre' and Monarch programs will be taught. Peripheral equipment essential to the design process will be included. Field trips to areatextile design centers. Credit not allowed for students enrolled in TT curriculum with the exception of the dual degree in the Bachelor of Art and Design and BS in Textile Technology.

Typically offered in Fall and Spring

FTM 282 Marketing Fundamentals in Textiles and Apparel (3 credit hours)
An introduction to the essential elements of brand management and marketing with specific reference to the marketing of textile and apparel goods with the integrated textile complex (from fiber to retail). The course covers both the principles and practice of marketing, in general, and provides an introduction of major concepts of brand management and marketing with a focus on branding activities used in by major textile and apparel firms within the integrated textile supply chain.

Prerequisite: FTM 217
Typically offered in Fall and Spring

FTM 310 Entrepreneurship & New Product Development in Textiles (3 credit hours)
Academic dimensions of the entrepreneurship body of knowledge. Integration of new product development (NPD) process and entrepreneurship in textiles. Critical thinking skills for the textile entrepreneurial mindset. Teams exercise entrepreneurial skills to develop innovative textile products. Write a business plan to take the textile product to market. Multidisciplinary and experiential learning environment is cultivated through in-class activities and online collaboration.

Prerequisite: Junior standing
Typically offered in Fall and Spring

FTM 315 Fashion Product Design (3 credit hours)
Concepts and practices for the design and development of fashion apparel items, beginning with selection of fabric and other raw materials and extending through flat pattern development, pattern engineering, and generation of final garments. Provide techniques for development of styled patterns, which address issues of body measurements, body shape, comfort and fit.

Prerequisite: FTM 217 and FTM 219
Typically offered in Fall and Spring

FTM 317 Computer-Aided-Design for Apparel (3 credit hours)
Introduction to the operation of industry design software for apparel & other sewn products. Euphoria and/or Artworks visual design programs, Gerber Accumark or Lectra pattern design programs, and other programs used by the industry to create, market and/or visualize products will be taught. Peripheral equipment essential to the design process will be included.

Prerequisite: FTD 215 or Corequisite: FTM 315
Typically offered in Fall and Spring

FTM 318 Fashion Development Processes (3 credit hours)
The principles of apparel manufacturing including computerization of the design; marker making and production areas; spreading and cutting technology; apparel assembly systems; production systems evaluations; fusing and pressing; production capacity; and quality evaluations.

Prerequisite: FTM 317
Typically offered in Fall and Spring

FTM 320 Retail Merchandising in Fashion and Textiles (3 credit hours)
An in-depth study of textile product merchandising and its functions, focusing on a comprehensive approach to textile product merchandising that links manufacturing and retailing to the consumer through the merchandising process. Textile merchandising as a process is studied in newly restructured consumer-centric businesses and textile product strategy needed for employees to function successfully in today's global, integrated world of merchandising.

Prerequisite: FTM 220
Typically offered in Fall only

FTM 380/TT 380 Management and Control of Textile and Apparel Systems (3 credit hours)
Management approaches, practices and basic economic considerations in the development, production and distribution of industrial and consumer textile and apparel products.

Prerequisite: FTM 217
Typically offered in Fall only

FTM 382 Brand Management in Textiles and Apparel (3 credit hours)
This course builds on the introduction of the basic concepts introduced in FTM 282 by providing an in-depth examination of the major theories and concepts associated with brand management and brand marketing. Included is the identification and analysis of major strategic tools used for brand management and marketing activities by firms across the integrated textile complex. Students will be assigned practical application projects that require utilization of academic knowledge with industry application.

Prerequisite: FTM 282 and (EC 201 or ARE 201)
Typically offered in Fall and Spring

FTM 384 Visual Merchandising Principles and Management (3 credit hours)
Study and application of techniques in the effective display of merchandise, from fiber to finished product. The focus of the course placed on the integration of textile and apparel product characteristics, target market characteristics and the latest merchandising technology and concepts.

Prerequisite: Junior standing or higher, FTM 217, Corequisite: FTM 382
Typically offered in Spring only

FTM 385 Fashion and the Consumer (3 credit hours)
This course focuses on consumer decision process for textile products, including the study of environmental, individual, psychological and marketing influences on behavior of consumers in the textile consumption process. Further examination will include influences on the process, including fashion theories, the mass media, demographics and psychographics, and societal trends. Current development and research in the textile consumer decision process are reviewed.

Prerequisite: FTM 217, FTM 282
Typically offered in Fall, Spring, and Summer

FTM 387 Textile Brand Communications & Promotions (3 credit hours)
Examines the utilization of textile brand marketing communication and promotion tools to build, maintain or expand a brand's value in the textile complex marketplace. Includes examination of principles and theories for Integrated Brand Marketing (IBMC) and how these strategies and tactics are used within the textile complex advance brand positioning. Knowledge of IBMC will be demonstrated via case studies, examination and textile industry-related application projects. FTM Majors Only

Prerequisite: FTM 382
Typically offered in Fall and Spring

FTM 400 Major Fashion Designers (3 credit hours)
Study of fashion designers from the early 1800s to the present. Emphasis will be placed on historical and cultural events that may have influenced the work of fashion designers during the time and trends that have emerged. Of specific interest will be major historical and current fashion designers that have had an international influence on US fashion merchandise. An additional focus of the course will be on the career path of major fashion designers. A study of haute couture and pret-a-porter will be conducted to provide insight into special management issues.

GEP Visual and Performing Arts
Typically offered in Spring and Summer

FTM 415 Fashion Product Development (3 credit hours)
Fashion product development for specific target markets. Line production using various methods of generating patterns for mass-produced apparel with emphasis on "flat pattern" design techniques. Relationship of body configuration to pattern shape, specifications to garment size and fit, standards for judging fit, distinctions between ease and style fullness, and design analysis procedures are included.

Prerequisite: FTM 318
Typically offered in Fall and Spring

FTM 416 The Fashion Industry (3 credit hours)
Planning and sourcing of fashion apparel products to meet the needs of the consumer. Emphasis is placed on the role of the merchandiser and merchandising function together with the measures of performance required by the fashion businesses. The interactions of the merchandiser with the functions of marketing, design, development and sourcing during pre-production are studied with respect to successful sourcing. Sourcing is studied from the requirements of compliance, product quality, cost, and manufacturing capability.

Prerequisite: FTM220, FTM282, and Senior standing
Typically offered in Fall and Spring

FTM 420 Retail Buying in Fashion and Textiles (3 credit hours)
Overview and analysis of the components of buying and selling products at he retail level. Management of profit factors to improve performance in textile merchandising driven organizations. Analysis of the practices, procedures and systems that track textile merchandising decisions and aid in meeting profit goals. The course consists of an integrated framework that applies merchandising theory and mathematical processes to textile retail problems.

Prerequisite: FTM 220 and FTM 282 and Junior Standing
Typically offered in Fall and Spring

FTM 431 Quality Management and Control In Textile Manufacturing (3 credit hours)
Principles of quality and process management and control in textile/apparel manufacturing with emphases in quality management systems, quality costs, statistical control chart procedures, process capability, acceptance sampling, and optimal process and product design and improvement methods.

Prerequisite: TT 221, TT 252, TT 331, and ST 361 or BUS 350

FTM 460 Textile Market Research (3 credit hours)
Data from textile and apparel industry firms are utilized to explore the role of marketing research in managerial decision-making within the textile and apparel industry, and allow students to develop basic skills in the market research process (problem identification to final reporting). Topics included are problem formulation, research design, data collection (instruments and sampling), and data analysis techniques (qualitative and quantitative).

Prerequisites: FTM 382 and (ST 311, ST 361, or ST 370)
Typically offered in Spring and Summer

FTM 480/TT 480 Operations Management Decisions for Textiles (3 credit hours)
Quantitative techniques for decision making and management in the textile complex. Applications include vendor selection, plant location, retail inventory management, forcasting demand, project management, and logistics planning. Techniques covered include simulation, PERT/CPM, mathematical modeling.

Prerequisite: TT/FTM 380 and ACC 210 and ST 311 or ST 370 and ((MA 131 and 132) or MA 141)
Typically offered in Fall only

FTM 481 Product Costing in the Textile and Apparel Industry (3 credit hours)
Capstone course covering cost issues in yarn manufacturing, fabric formation, finishing, apparel production and retail operations. Traditional and activity-based costing systems will be addressed. Relevance of costing to managerial decisions as well as cost reduction strategies will be emphasized.

Typically offered in Spring and Summer

FTM 482 Global Brand Management in Textiles and Apparel (3 credit hours)
An applied textile marketing course that integrates textile product development, brand management, and global marketing. This course provides an overview of the global textile and apparel industries, their distribution channels and markets---with positioning the US textile, apparel, and retail industries in the global competitive environment. The course includes diverse textile end uses, including apparel, nonwovens, home textiles, transportation textiles and medical textiles. Development and implementation strategies of launching textile products in the global marketplace are analyzed.

Prerequisite: FTM 382
Typically offered in Fall, Spring, and Summer

FTM 483 Global Trade & Sourcing (3 credit hours)
This course provides students with an understanding and appreciation of the global textile and apparel market. Included is the explanation and guidance in understanding the uniqueness of textile and apparel regulations in global trade. Students willlearn global sourcing strategies and the identification and analysis of major strategic decisions used in global sourcing, as impacted by global trade dynamics. Students will be assigned practical application projects that require utilization of academic knowledge with industry application.

Prerequisite: FTM 282 and EC 201 or ARE 201 or EC 205
Typically offered in Fall and Spring

FTM 484 Strategic Planning and Decision Making in the Textile and Fashion Industries (3 credit hours)
The course provides a framework for understanding and analyzing strategic planning and decision making in the textile and apparel supply chain, from fiber through retail. It integrates theory and practice through lectures, case studies, and exercises to provide students an understanding of the competitive dynamics in the textile industry, including structural and behavioral components and the role of entrepreneurship.

Prerequisite:BUS 320 or FTM/TT 380, and TT 221 or equivalent
Typically offered in Fall and Summer

FTM 485/TT 485 Textile Computer Integrated Enterprise (3 credit hours)
Survey of information technology in textile and apparel industries. Topics discussed include: computer aided design (CAD); computer aided manufacturing (CAM); computer aided engineering (CAE); material handling systems; automation and robotics; logistics and warehousing systems; retail product tracking, and Internet resources.

Prerequisite: TT/FTM 380
Typically offered in Fall only

FTM 486/TT 486 Supply Chain Management in the Textile Industry (3 credit hours)
Study of the operations necessary to produce and distribute a product, starting with the procurement of the raw material used in making the goods and ending with the delivery of the finished product. Topics covered include approaches to solving problems in manufacturing, sourcing, transportation logistics, and retail operations within the Integrated Textile Complex. Credit cannot be given for both TAM486 and MT386.

Prerequisite: TT/FTM 380
Typically offered in Spring only

FTM 487 Human Resource Management and Leadership in the Textile and Fashion Industries (3 credit hours)
This course will cover strategic human resource management topics as they apply to the integrated textile industry complex. Principles of situational leadership applicable to the textile and fashion industries will be discussed as well.

Prerequisite: Senior standing
Typically offered in Fall and Spring

FTM 490 Development Projects in Textile and Apparel Management (1-3 credit hours)
Directed research in Textile and Apparel Management through experimental, theoretical and literature studies in textile and apparel-related problems. Courses may be taken twice provided projects are different subject matter.

Prerequisite: Junior standing and 2.75 GPA
Typically offered in Fall, Spring, and Summer

FTM 491 Special Topics in Textile and Apparel Management (1-4 credit hours)
Special topics related to textile and apparel management.

Prerequisite: Senior standing

FTM 494 International Industrial Internship in Textile Management (3 credit hours)
Professional level work experience in textile management abroad, relating academic training, international textile management and technology to industrial practice under professional guidance. Grading based on written report and oral presentation. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: At least FL 202 for internships in non-English speaking countries, Minimum GPA 2.5, Junior standing
Typically offered in Fall and Spring

FTM 497 Senior Fashion Collection Studio (6 credit hours)
Advanced fashion product design. Design and production of a "collection" using various methods of generating patterns for garments, such as flat pattern, draping, and CAD techniques. Relationships of body configuration and fabrication to garment design. Emphasis on ideation, creativity, communication, theme development, fit, quality, and exhibition of a fashion collection. Work culminates in a Fashion show or Static exhibition format.

Prerequisite: FTM 318
Typically offered in Fall and Spring

FTM 499 Textile Senior Project (4 credit hours)
This is a project based course to be taken in the last semester of the Senior year. In this capstone course the students work in cross-functional teams to research and solve applied problems in textile related fields. The results of the projects will be presented formally at the end of the semester. Course should be taken in the last semester of the Senior year. It cannot be substituted by other project courses.

Prerequisite: Senior standing

Feed Mill (FM)

FM 272 Swine Feed Mill Management (1 credit hours)
Principles of feed manufacturing, equipment operation, feed and ingredient quality assurance and regulatory compliance in a modern feed milling operation. Overview of feed mill regulations and safety.

Prerequisite: ANS 150 or ANS 260 or Equivalent Restriction: Restricted to non-ANS (Animal Science) students. ANS students cannot take the course for credit.
Typically offered in Fall only

FM 425/PO 425/NTR 525/FM 525/ANS 525/PO 525/NTR 425/ ANS 425 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall and Spring

FM 426/PO 426 Feed Manufacturing Technology Laboratory (1 credit hours)
Laboratory associated with feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture. PO/ANS/FM 425 is a required course for the Poultry Science Technology Concentration (TPS); the Feed Milling Minor (FEM); and the Feed Mill Certificate.

Corequisite: PO 425 or ANS 425 or FM 425 and FEM minor or 11PLTRYBS
Typically offered in Spring only

FM 460/FM 560 Feed Mill Operations and Leadership (3 credit hours)
Principles and current practices of modern feed mill operations. Topics include managing employees, team building, safety, budgets, regulations, and key performance indicators.

Prerequisite: ANS 425 or FM 425 or PO 425
Typically offered in Spring only

FM 480 Feed Quality Assurance & Formulation (3 credit hours)
Introduction to the principles of ingredient and feed quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of approved suppliers, ingredient specifications, feed manufacturing procedures, and formulation based on dynamic ingredient matrices.

Prerequisite: PO(ANS) 425
Typically offered in Fall only

FM 490 Feed Science Seminar (1 credit hours)
Exploration of topics related with current and future potential to influence the feed industry. Guest lectures from feed industry leaders and university representatives will include: vertically integrated and commercial feed production, current research topics, government regulations, trade organizations, and quality assurance.

Typically offered in Fall only

FM 494 Feed Mill Learning Experience (1 credit hours)
Hands-on laboratory teaching students how to safely operate feed mill equipment and manufacture feed using a computer system.

Prerequisite: PO(ANS) 425
Typically offered in Fall, Spring, and Summer

FM 525/ANS 525/PO 525/NTR 425/ANS 425/FM 425/PO 425/ NTR 525 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall and Spring

FM 560/FM 460 Feed Mill Operations and Leadership (3 credit hours)
Principles and current practices of modern feed mill operations. Topics include managing employees, team building, safety, budgets, regulations, and key performance indicators.

Prerequisite: ANS 425 or FM 425 or PO 425
Typically offered in Spring only

FM 580/PO 580 Feed and Ingrdient Quality Assurance (3 credit hours)
The course will teach students the principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

Prerequisite: NTR(FM) 525
Typically offered in Fall only

FM 594 Advanced Feed Mill Practicum (1 credit hours)
This course will teach students the principles of operating a modern feed mill. Students will receive ingredients, grind grain, manufacture feed, and perform quality checks on finished feed products. Students will complete safety, quality assurance, and feed processing training units as part of their training.

Prerequisite: NTR(FM) 525
Typically offered in Fall and Spring

FM 706/NTR 706 Vitamin Metabolism (3 credit hours)
Structures, chemical and physical properties, functions, distribution, absorption, transport, metabolism, storage, excretion, deficiencies, and toxicity of vitamins in humans and domestic animals. Interactions between vitamins and other factors affecting vitamin metabolism or bioavailability as well as the nutritional significance of essential fatty acids and metabolism of prostaglandins, prostacyclins and leukotrienes. Application of knowledge will include critical review of scientific literature, experimental design, and formulation of vitamin supplements.

Prerequisite: ANS(NTR,PO) 415 and BCH 453
Typically offered in Fall only

FM 790/NTR 790 Advanced Feed Formulation (3 credit hours)
Principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

Prerequisite: NTR(FM) 525
Typically offered in Fall only

Fiber and Polymer Science (FPS)

FPS 696 Summer Thesis Res (1 credit hours)

FPS 710/TC 710 Science of Dye Chemistry, Dyeing, Printing and Finishing (3 credit hours)
The primary course purpose is to gain a strong fundamental understanding of the chemistry and technology of preparation, dyes, dyeing and finishes. Emphasis will be on the chemistry of different bleach activators, surfactants, photophysics and photochemistry of FWAs, modulations of dyes structures to influence color, tinctorial strength, light fastness, wash fastness and aggregation. Chemistry of different dye classes will be studied with emphasis on structure-property relationships and dye-fiber interactions. Dyeing isotherms (Nernst and Langmuir), kinetics of dyeing with emphasis on derivation of Nernst and Langmuir based on thermodynamics and kinetics principles will be covered with practical examples of dyeing at different temperature and how to calculate thermodynamic parameters of dyeing (entropy, standard affinity and isotherm constants of Nernst and Langmuir). Chemistry of different finishes, including soil release, chemistry of flame retardants and mechanisms of flame retardancy, antimicrobial and water and oil repellency, will be covered with emphasis on structure-property relationships.

Prerequisite: Graduate Standing and C or better in CH221 or CH225 and CH223 or CH227
Typically offered in Fall and Spring

FPS 750/TTM 750 Advances in Fabric Formation, Structure, and Properties (3 credit hours)
The course covers different aspects of the processing of yarns to products (braided, knitted, woven, and their composites) and the interrelation between the production mechanics and structure, geometry and properties of fiber assembly. Topics in the field are assigned and each student is expected to thoroughly study the topics and write critical papers based on structured assignments and specific questions. Conduct projects from concept to fabric formation, analyses, and evaluation.

Prerequisite: TT 550 or TT 551 (or TT 451) or equivalent
Typically offered in Spring only

FPS 770 Advances in Polymer Science (3 credit hours)
This course provides an overview of the unique features of polymer materials that distinguish them from those composed of small-molecules or atoms (Polymer Physics) and the connections between their detailed molecular structures and their properties which produce distinctions between them (Polymer Chemistry).

Restriction: Graduate Standing in Fiber and Polymer Science, Textile Chemistry, Textile Engineering, Material Science and Engineering, Chemical Engineering, Chemistry and Physics, or by permission of the instructor.
Typically offered in Fall only

FPS 792 Special Topics in Fiber Science (1-6 credit hours)

FPS 801 Seminar (1 credit hours)
Typically offered in Fall and Spring

FPS 830 Independent Study (1-3 credit hours)
Typically offered in Fall and Spring

FPS 876 Special Project in Fiber and Polymer Sciences (1-12 credit hours)
Typically offered in Fall only

FPS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FPS 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FPS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

FPS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FPS 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

FPS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

Financial Mathematics (FIM)

FIM 500 Career Development for Quants (3 credit hours)
Enhance your professional and career development skills while you are in the Financial Math program with seminar topics on networking, LinkedIn, resumes, interviews, presentations and business writing tips. Learn about workplace etiquette and business ethics. You will also gain resources and important industry information from guest speakers and alumni. Become Base SAS Certified and Bloomberg Certified, and gain hands-on experience with these tools by participating in group and individual projects.Course includes one or more projects that expose students to applications in the area of financial mathematics. Students that wish to develop SAS programming skills are encouraged to take ST 555/556.

Must be in the Masters of Financial Mathematics program.
Typically offered in Fall only

FIM 528/MA 528/ECG 528 Options and Derivatives Pricing (3 credit hours)
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

Prerequisites: MA 341 and MA 405 and MA 421
Typically offered in Fall only

FIM 547/MA 547 Stochastic Calculus for Finance (3 credit hours)
This course explores stochastics calculus with its applications in pricing and hedging problems for financial derivatives such as options. Topics to be covered in the course include 1) discrete and continuous martingales, 2) Brownian motions and Ito's stochastic calculus, and 3) Black-Scholas framework for financial derivatives pricing and hedging.

Prerequisite: FIM 528 and MA(ST) 546
Typically offered in Spring only

FIM 548/MA 548 Monte Carlo Methods for Financial Math (3 credit hours)
Monte Carlo (MC) methods for accurate option pricing, hedging and risk management. Modeling using stochastic asset models (e.g. geometric Brownian motion) and parameter estimation. Stochastic models, including use of random number generators, random paths and discretization methods (e.g. Euler-Maruyama method), and variance reduction. Implementation using Matlab. Incorporation of the latest developments regarding MC methods and their uses in Finance.

Prerequisites: (MA 421 or ST 421), MA 341, and MA 405
Typically offered in Spring only

FIM 549/MA 549 Financial Risk Analysis (3 credit hours)
This course focuses on mathematical methods to analyze and manage risks associated with financial derivatives. Topics covered include aggregate loss distributions, extreme value theory, default probabilities, Value-at-Risk and expected shortfall, coherent risk measures, correlation and copula, applications of principle component analysis and Monte Carlo simulations in financial risk management, how to use stochastic differential equations to price financial risk derivatives, and how to back-test and stress-test models.

Prerequisites: MA 405 and (MA 421 or ST 421) and (MA/ST 412 or MA/ST 413)
Typically offered in Spring only

FIM 590 Special Topics in FIM (1-6 credit hours)
Special Topics in FIM

FIM 601 Seminar in Financial Mathematics (1 credit hours)
Seminar in Financial Mathematics

Prerequisite: FIM 500
Typically offered in Fall and Spring

FIM 610 Special Topics in Financial Mathematics (1-6 credit hours)
Special Topics in Financial Mathematics

FIM 620 Special Problems in FIM (1-6 credit hours)
Special Problems in FIM

FIM 650 Internship in Financial Mathematics (1-9 credit hours)
The internship experience provides the students the opportunity to use quantitative financial mathematics in a workplace under the supervision of a practitioner. Links academic theory to practice. Develop a heightened awareness of workplace issues as they relate to the student's chosen career path. Clarify and/or confirm professional direction. An internship or project is required of all students in the Masters of Financial Mathematics Program. Restricted to students in the Masters of Financial Mathematics.

Must be a student registered in the Masters of Financial Mathematics program.
Typically offered in Fall, Spring, and Summer

FIM 675 Project in Financial Mathematics (1-3 credit hours)
The project provides the students the opportunity to apply quantitative financial mathematics to a problem of practical interest under the supervision of faculty and/or practitioners. Links academic theory to applications. Examine a practical problem from financial mathematics using marketplace data. Approach solutions to the problem considering aspects of quantitative risk and/or optimal returns. Methods and models will be drawn from academic courses and other sources. Restricted to students in the Masters of Financial Mathematics.

Must be a student registered in the Masters of Financial Mathematics program.
Typically offered in Fall, Spring, and Summer

FIM 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
Non-Thesis Masters Continuous Registration - Half Time Registration

Typically offered in Spring only

FIM 689 Non-Thesis Masters Continuous Registration - Full Time Registration (3 credit hours)
Non-Thesis Masters Continuous Registration - Full Time Registration

Typically offered in Fall and Spring

FIM 693 Master's Supervised Research (1-9 credit hours)
Master's Supervised Research

Typically offered in Fall, Spring, and Summer

Fisheries & Wildlife Sciences (FW)

FW 221 Conservation of Natural Resources (3 credit hours)
This course examines the importance of natural resources and their role in the progress of human civilization. Physical, biological and ecological principles are described that underlie sustainability of natural resources, particularly as these relate to the consequence of human impacts as resources are used to meet societal needs. The course emphasizes renewable natural resources, the importance of habitat, and a broadly-international context. The course has an optimistic perspective that life on Earth can and will be better in the future if we learn and practice good resource management today.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall and Spring

FW 293 Independent Study in Fisheries, Wildlife, and Conservation Biology (1-6 credit hours)
Independent Study for Fisheries, Wildlife, and Conservation Biology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FW 294 Independent Study in Fisheries, Wildlife, and Conservation Biology (1-6 credit hours)
Independent Study for Fisheries, Wildlife, and Conservation Biology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FW 311 Piedmont Wildlife Ecology and Management (3 credit hours)
This 3-week course will involve relationships of wildlife and habitat, the use of GIS and GPS, use of new technology (PIT tags, radio telemetry), and field identification of habitats and animals. This course is taught off-campus at Hill Forest. It is a 3 week residential camps with side trips and overnight trips. Class meets all day for 3 weeks. Additional charge for room and board. Students must provide their own transportation to Hill Forest. Junior standing in one of the following: FOM, NRE, SFW, SFF, SZO, ESC.

Typically offered in Summer only

FW 312 Fisheries Techniques and Management (1 credit hours)
Field exercises in aquatic environments emphasizing assessment of habitat, fish, invertebrates, plants, and ecological relationships to form the basis of describing and solving management dilemmas. Taught off-campus at Hill Forest. 5 day residential camp. Local travel required to various aquatic ecosystems. Additional charges for room and board.

Corequisite: FW 311 and FW 313
Typically offered in Summer only

FW 313 Mountain Wildlife Ecology and Management (1 credit hours)
Visit different mountain communities along an elevation gradient from 2,000 to 6,000 feet and observe changes in plant and animal communities. Discuss wildlife and fisheries management issues, interact with agency personnel responsible for managingmountain fisheries and wildlife. One-week field trip to the North Carolina mountains. Additional charges for room and board.

Corequisite: FW 311 and FW 312
Typically offered in Summer only

FW 314 Coastal Ecology and Management (1 credit hours)
Hands-on study of the fishery and wildlife resources associated with North Carolina coastal plain habitats. These habitats will include estuarine, ocean, longleaf pine savanna, pocosin, and Carolina bays. Common techniques and concepts used in terrestrial, marine, and estuarine ecology and management will be taught. Field identification of habitats, animals, and plants. Use of multiple sampling gear including bottom trawl, beam trawl, beach seine, gill nets, and coverboards. Use of water quality measurement equipment. This course meets all day for 1 week off-campus at CMAST in Morehead City, NC. Additional charge for room and board and boat rental. Students must provide their own transportation to CMAST.

Prerequisite: BIO 181
Typically offered in Summer only

FW 333 Conservation Biology in Practice (3 credit hours)
An introductory course designed to focus on the scientific fundamentals of conservation biology, including population dynamics, extinction and its causes, metapopulations, modeling, population viability analysis, the design and management of protected areas, rare species management, and captive breeding and release programs. Students will participate in active learning exercises, projects, and debates. Projects will require students to make their own arrangements for transportation to field locations within Wake County.

Prerequisite: FW 221 or PB 360 or BIO 360 or FOR 260
Typically offered in Fall only

FW 353 Wildlife Management (3 credit hours)
Historical development of Wildlife Management from anecdotal, observational practices to modern, scientific approaches used around the world. Principles of population analysis, management, protection and conservation of animals, particularly those of conservation, aesthetic, sport or food values in urban, rural and wilderness areas. Ethics of hunting and trapping. Contradictory objectives challenging modern wildlife managers.

R: Sophomore Standing
Typically offered in Fall only

FW 373 Vertebrate Natural History (3 credit hours)
This course provides an introduction to the natural history of vertebrates, including fish, amphibians, reptiles, birds, and mammals. The emphasis is on systematics, identification, and natural history of each vertebrate group.

Prerequisite: BIO 360 or PB 360
Typically offered in Spring only

FW 403 Urban Wildlife Management (3 credit hours)
Issues facing wildlife in urbanizing landscapes and the general courses of action to minimize the negative effects of urbanization on native wildlife. Large-scale planning and zoning for roads, developments and open space; meso-scale planning and landscaping of new neighborhoods and other developments; and small-scale landscaping for backyard habitats. Coexistence between wildlife and humans in urban environments and management of wildlife damage to human property.

Prerequisite: Junior standing.
GEP Natural Sciences
Typically offered in Fall only

FW 404 Wildlife Habitat Management (3 credit hours)
Relationships between forest and wildlife management and the effects of silvicultural systems on wildlife. Species-habitat requirements, forest wildlife management techniques, and forest-wildlife policies and economics.

Prerequisite: Junior standing
Typically offered in Fall only

FW 405 Tropical Wildlife Ecology (3 credit hours)
This course provides an overview of tropical wildlife ecology and management, sustainable land use, and local culture. The course addresses the challenges of natural resource conservation in a developing country and the sustainable approaches that may be used to conserve natural resources there. Various methods to sample wildlife will be employed during the visit to a tropical country (Ecuador, Nicaragua, etc.), but emphasis will be on the use of mist nets in long-term bird monitoring program. Expenses associated with this course are the responsibility of the student. Requires instructor approval. Students register for this course through the Study Abroad Office.

Typically offered in Spring only

FW 411/FW 511 Human Dimensions of Wildlife and Fisheries (3 credit hours)
Study of human interactions with wildlife and fisheries, including principles important for understanding and addressing wildlife management and conservation challenges. Discussions of wildlife at the urban fringe, human attitudes towards hunting and fishing, and the public trust approach to wildlife management are included.

Juniors and Seniors Only
Typically offered in Spring only

FW 415 Professional Development in Fisheries, Wildlife, and Conservation Biology (1 credit hours)
This course provides guidance for students in the fall semester of their senior year in preparation for graduate school or a career in the field of Fisheries, Wildlife, and Conservation Biology. Junior or Senior standing.

Typically offered in Fall only

FW 444/FW 544 Mammalogy (3 credit hours)
The biology of mammals: evolution, functional morphology, reproduction, behavior, ecology, population biology, classification and identification. One weekend field trip planned. One independent field research project is required. Graduate students will prepare a full written report of their research projects, which will not be required of the undergraduates.

Prerequisite: PB 360 or BIO 360 or FOR 260
Typically offered in Fall only

FW 445 Human Dimensions of Conservation Biology in the Bahamas (3 credit hours)
This course examines the fundamental concepts, problems, and methods regarding human dimensions of conservation biology in The Bahamas. Combining lecture, lab, and fieldwork, students directly experience the process of science, with students conducting semester-long, group research projects tackling important unanswered questions involving conservation biology in The Bahamas. Gaining first-hand experience at the interface of basic and applied sciences, students will spend eight weeks on campus and two weeks in the largely undeveloped Andros Island in The Bahamas, home to the third largest coral reef in the world and over 1.5 million acres of national parks.

Prerequisite: One 200-level or higher course in BIO, ES, ET, FOR, FW, NR, PB, PRT, or ZO.
Typically offered in Summer only

FW 453 Principles of Wildlife Science (4 credit hours)
Principles and applications of population dynamics and biology to the management of terrestrial vertebrates. Predicting population levels, composition and growth rates with and without management constraints. Strategies for wildlife conservation, utilization, and enhancement. Laboratories stress the collection and analysis of data, and often meet in outdoor environments.

Prerequisite: FW 353 and ST 311
Typically offered in Spring only

FW 460/FW 560 International Wildlife Management and Conservation (3 credit hours)
An international perspective on wildlife management and conservation through investigation and comparison of historical events, policies, international conservation organizations and transfrontier conservation areas. Fundamental principles necessaryin managing the African savannah ecosystem, protected areas and game ranches. Identifying global biomes, zoogeography and the impacts of ecotourism.Cannot receive credit for both FW 460/560.

Prerequisite: Junior standing and above.
Typically offered in Spring only

FW 465/FW 565 African Ecology and Conservation (4 credit hours)
This course provides an international perspective on desert ecology, the African savanna ecosystem, African wildlife ecology and management. In addition, the management of a large national park of international importance, conservation of predators and their conflict with humans, and international tourism are discussed. Various sampling techniques are practiced during field work. A combination of lectures, field lectures, field work, field excursions, data analyses and home work form an integral part of the course.

Prerequisite: One 200-level or higher course in ES, ET FOR, FW, NR, PB, PRT, or ZO
GEP Global Knowledge, GEP Natural Sciences
Typically offered in Summer only

FW 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

FW 493 Independent Study in Fisheries, Wildlife, and Conservation Biology (1-6 credit hours)
Independent Study for Fisheries, Wildlife, and Conservation Biology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FW 494 Independent Study in Fisheries, Wildlife, and Conservation Biology (1-6 credit hours)
Independent Study for Fisheries, Wildlife, and Conservation Biology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FW 495 Special Topics in Fisheries and Wildlife Science (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

FW 511/FW 411 Human Dimensions of Wildlife and Fisheries (3 credit hours)
Study of human interactions with wildlife and fisheries, including principles important for understanding and addressing wildlife management and conservation challenges. Discussions of wildlife at the urban fringe, human attitudes towards hunting and fishing, and the public trust approach to wildlife management are included.

Juniors and Seniors Only
Typically offered in Spring only

FW 515/AEC 515 Fish Physiology (3 credit hours)
The biology of fishes: physiology, anatomy, endocrinology, behavior and genetics. Designed especially for graduate students in fisheries. Several trips to research laboratories taken.

Typically offered in Fall only

FW 544/FW 444 Mammalogy (3 credit hours)
The biology of mammals: evolution, functional morphology, reproduction, behavior, ecology, population biology, classification and identification. One weekend field trip planned. One independent field research project is required. Graduate students will prepare a full written report of their research projects, which will not be required of the undergraduates.

Prerequisite: PB 360 or BIO 360 or FOR 260
Typically offered in Fall only

FW 553 Principles Of Wildlife Science (3 credit hours)
The principles of wildlife management and their application studied in the laboratory and in the field.

Prerequisite: BO 360 or ZO 260
Typically offered in Spring only

FW 560/FW 460 International Wildlife Management and Conservation (3 credit hours)
An international perspective on wildlife management and conservation through investigation and comparison of historical events, policies, international conservation organizations and transfrontier conservation areas. Fundamental principles necessaryin managing the African savannah ecosystem, protected areas and game ranches. Identifying global biomes, zoogeography and the impacts of ecotourism.Cannot receive credit for both FW 460/560.

Prerequisite: Junior standing and above.
Typically offered in Spring only

FW 565/FW 465 African Ecology and Conservation (4 credit hours)
This course provides an international perspective on desert ecology, the African savanna ecosystem, African wildlife ecology and management. In addition, the management of a large national park of international importance, conservation of predators and their conflict with humans, and international tourism are discussed. Various sampling techniques are practiced during field work. A combination of lectures, field lectures, field work, field excursions, data analyses and home work form an integral part of the course.

Prerequisite: One 200-level or higher course in ES, ET FOR, FW, NR, PB, PRT, or ZO
GEP Global Knowledge, GEP Natural Sciences
Typically offered in Summer only

FW 586/AEC 586 Aquaculture (3 credit hours)
Biological and general principles of aquaculture. Emphasis on the present status of aquaculture, species involved, techniques employed, and problems encountered. Discussion of recent advances in research and development and identification of areas of future research and development.

Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing
Typically offered in Spring only

FW 587/AEC 587 Aquaculture Laboratory (1 credit hours)
Methods and techniques of cultivating aquatic organisms. Field trips and reports on local hatcheries and facilities required. (Three to four overnight field trips taken on week days to coastal areas, state hatcheries, and private hatcheries; students responsible for shared room costs and their meals. Four field trips also taken on laboratory day within driving range of Raleigh.)

Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing, Corequisite: ZO 586
Typically offered in Fall only

FW 595 Special Topics in Fisheries and Wildlife Sciences (1-6 credit hours)
Special topics in various aspects fisheries and wildlife sciences are developed under the direction of a graduate faculty member. Also used to test and develop new courses.

Typically offered in Fall, Spring, and Summer

FW 602 Seminar In Wildlife Management (1 credit hours)
Current topics and issues in wildlife biology and management. Students select and research topics, give seminars and lead group discussions.

Typically offered in Fall only

FW 610 Special Topics in Fisheries and Wildlife Sciences (1-6 credit hours)
Special topics in various aspects of fisheries and wildlife science are developed under the direction of a graduate faculty member. Also used to develop new courses.

Typically offered in Fall, Spring, and Summer

FW 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FW 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FW 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FW 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

FW 720 Epidemiology of Wildlife Diseases (3 credit hours)
Concepts related to infectious disease outbreaks in free-ranging species of wildlife. Numerous examples of wildlife diseases will be used to illustrate factors affecting host-agent-environment interactions in fish, amphibians, birds, and both aquatic and terrestrial mammals. Enrollment in the Fisheries and Wildlife graduate program or Masters of Veterinary Public Health program; clinical residents or veterinary students at the College of Veterinary Medicine.

FW 726/AEC 726 Quantitative Fisheries Management (3 credit hours)
Current methods for assessment and management of exploited fish populations, including sampling methods, data analysis and modeling. A required research paper or project.

Typically offered in Fall only

FW 730 Ethics in Fisheries and Wildlife Sciences (2 credit hours)
Students will explore historical and current thinking concerning the search for truth about natural systems, and the complex ethics scientists and practitioners who operate in the public sector must consider. Standards of professional and ethical behavior specific to Fisheries and Wildlife Sciences will be addressed. Faculty will introduce topics and guide discussions; students will give seminars and lead some discussions. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Fall only

FW 801 Issues in Fisheries and Wildlife Sciences Doctoral Seminar (2 credit hours)
Current topics and issues in Fisheries and Wildlife Sciences Research. Students select and research topics, give seminars on Ph.D. proposals, and lead group discussions. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Spring only

FW 802 Seminar in Fisheries and Wildlife (1 credit hours)
Current topics and issues in fisheries and wildlife biology and management. Students select and research topics, give seminars, and lead group discussions. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Fall only

FW 810 Special Topics in Fisheries and Wildlife (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, will explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to dissertation. Also used to develop and test new 800-level courses. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Spring and Summer

FW 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Fall and Spring

FW 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Fall, Spring, and Summer

FW 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Fall, Spring, and Summer

FW 896 Summer Doctoral Dissertation Research (1 credit hours)
Summer Dissertation Research. For doctoral students in Fisheries and Wildlife Sciences.

Typically offered in Summer only

Food Science (FS)

FS 201 Introduction to Food Science (3 credit hours)
Food science is an exciting, multidisciplinary career that draws on chemistry, microbiology, and engineering principles to produce, preserve, and protect the foods that we eat every day. This course is designed to help you understand the journey of foods from "farm to fork", the effect of diet on human health, and the laws governing food labeling and marketing. It's science you can eat!

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

FS 231 Principles of Food and Bioprocess Engineering (4 credit hours)
Engineering concepts and their applications to the food and bioprocessing industries. Mass and energy balances and principles related to fluid flow, heat transfer, refrigeration and freezing, psychrometrics, and selected unit operations found in these industries.

Prerequisite: PY 211 or PY 205 and PY 206
Typically offered in Spring only

FS 250 Basics of Food Safety & Quality (3 credit hours)
This course examines the programs that maintain food safety and quality in food processing environments. It is based on international standards for food safety prerequisite programs in food manufacturing. Students will learn how to evaluate and manage pre-requisite programs for food safety. Examples include Good Manufacturing Practices (GMPs), Sanitation Standard Operating Procedures (SSOPs), Sanitation Control Procedures, and Preventive Controls.

Typically offered in Fall and Summer

FS 290 Careers in Food and Bioprocessing Sciences (1 credit hours)
Careers and opportunities related to food and bioprocessing industries and regulatory agencies. Development of professional enhancement skills. Resume preparation, interviewing techniques, leadership development, oral and written communication, and team building. Benefits of undergraduate research, internships, and graduate education.

Typically offered in Fall only

FS 295 Special Topics in Food Science (1-4 credit hours)
Offerings of new or experimental courses in Food Science at the early undergraduate level.

Typically offered in Fall, Spring, and Summer

FS 301/NTR 301 Introduction to Human Nutrition (3 credit hours)
Functions, dietary sources, digestion and absorption, deficiencies and excesses of essential nutrients in humans; dietary guidelines; food labels; the study of diet-disease relationships; the role of diet in heart disease, diabetes, hypertension, osteoporosis; energy balance and weight control; dietary supplement regulation; diet and athletic performance.

Prerequisite: Sophomore standing
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

FS 322/PO 322/ANS 322 Muscle Foods and Eggs (3 credit hours)
Processing and preserving fresh poultry, red meats, seafood, and eggs. Ante- and post-mortem events as they affect quality, yield, and compositional characteristics of muscle foods. Principles and procedures involved in the production of processedmeat items.

Prerequisite: ZO 160, BIO 181 or BIO 183
Typically offered in Fall only

FS 324/ANS 324 Milk and Dairy Products (3 credit hours)
Introduction to the manufacture of dairy products. Dairy processing procedures from the farm, through the dairy plant, and to the consumer are studied. The course consists of 15 learning modules, three exams, and a project.

Prerequisite: BIO 181 or 183, CH 101
Typically offered in Fall only

FS 325/BBS 325 Introduction to Brewing Science and Technology (3 credit hours)
For centuries brewing has been and remains a vitally important application of fermentation science, both economically and socially. This course will provide a detailed description of the fundamental chemical and biological processes involved in brewing beer, as well as the physical and hygienic aspects of modern beer production. Successful completion of this course will provide students with the understanding of the science and technology underlying the key steps in a commercial brewing process and provide the basic knowledge necessary for an entry level position in a commercial brewery.

Prerequisite: CH 101 and BIO 183 or BIO 181
Typically offered in Spring only

FS 326/BBS 326 Brewing Practices and Analyses (3 credit hours)
This course will provide a hands on learning experience to both complement the classroom lectures offered in BBS/FS 325 and acquaint the student with the equipment and practices encountered in real-world analytical labs of breweries of all scales. The laboratory experience will replicate the sequence of events encountered in actual beer production and illustrate the relevant evaluations and analyses which are concurrent with those processing steps, stressing at each stage not only the execution of the appropriate analytical or testing techniques, but also corrective action that may be taken should undesirable results be obtained.

Prerequisite: BBS/FS 325 Introduction to Brewing Science and Technology
Typically offered in Fall only

FS 330 Science of Food Preparation (3 credit hours)
Basic elements of culinary practices are taught in conjunction with the scientific basis for how flavor, texture, and appearance of foods are created or maintained during food preparation.

Prerequisite: FS 201 and CH 101
Typically offered in Spring only

FS 352 Introduction to Microbiological Food Safety Hazards (3 credit hours)
For non-science students. The course is designed to provide an introduction to the more prominent microbial foodborne safety hazards and their control. Lessons are provided on specific pathogens, their pathogenesis and transmission and the scientific basis for specific control options. In addition, the course provides up-to-date information on current "hot-topics" in food microbiology, including food safety regulations and emerging food safety issues.Course is offered to non-science majors. Students may not receive credit for both FS 352 and FS 405.

Typically offered in Fall and Spring

FS 354 Food Sanitation (3 credit hours)
Discussion of hygienic practices, requirements for sanitation programs, and modern sanitation practices in food processing facilities. At the end of this course, students will have the knowledge to develop and maintain a sanitation program.

Prerequisite: FS/ANS/PO 350 or equivalent HACCP industry experience
Typically offered in Fall and Spring

FS 401/NTR 501/FS 501/NTR 401 Advanced Nutrition and Metabolism (3 credit hours)
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225)
Typically offered in Fall only

FS 402/FS 502 Chemistry of Food and Bioprocessed Materials (4 credit hours)
The course focuses on the properties of biological molecules (e.g., proteins, enzymes lipids, carbohydrates and pigments) found in foods and pharmaceuticals. Basic elements of molecules, such as structure and reactive groups, are presented in regard to how they affect the properties of foods and pharmaceuticals. Reactions such as Maillard browning and lipid oxidation are discussed regarding mechanisms, products and controlling processes. Laboratory experiments emphasize basic concepts discussed in lecture and provide a practical working knowledge of select analytical equipment.

Prerequisite: CH 220 or 221 or 225
Typically offered in Fall only

FS 403 Analytical Techniques in Food & Bioprocessing Science (4 credit hours)
Principles, methods and techniques for quantitative physical and chemical analyses of food, nutraceutical, and pharmaceutical products. Results of analyses evaluated in terms of quality standards and governing regulations.

Prerequisite: FS 402
Typically offered in Spring only

FS 405/MB 405/FS 505/MB 505 Food Microbiology (3 credit hours)
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

Prerequisite: MB 351
Typically offered in Spring only

FS 406/MB 406/FS 506/MB 506 Food Microbiology Lab (1 credit hours)
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

Prerequisite: MB 351 and Corequisite: FS 405 or FS 505
Typically offered in Spring only

FS 416/FS 516 Quality Control in Food and Bioprocessing (3 credit hours)
This course provides an overview of the principles of quality management, assurance and control in the food and bioprocessing industries. The objectives are for students to be able to identify government regulations, private industry standards, and customer expectations that are relevant to food and bioprocessing, apply root cause analysis methodologies, apply and evaluate control charts for monitoring process control for variables and attributes, conduct process capability analyses, apply statistical hypothesis testing, and design producer and/or customer-centered sampling plans. Lab activities alternate between guest speakers from industry and exercises in which students develop their abilities to apply computer programs to solve quality problems. Note: students may not earn credit for taking both FS 416 and FS 516.

Restriction: FS, Bioprocessing, PSC, ANS, and NT students. Others may enroll with permission from the instructor. Section 601 is restricted to true distance education students (not regular term students).
Typically offered in Fall only

FS 421/FS 521 Food Preservation (3 credit hours)
Food preservation methods. Emphasis on thermal, freezing, drying and fermentation processes and corresponding physical, chemical and organoleptic changes to products. Application of preservation schemes to the development of an overall processing operation.

Prerequisite: FS 231 and FS 405
Typically offered in Fall only

FS 426/BEC 426/BBS 526/FS 526/BEC 526/BBS 426 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

FS 427/BBS 427 Brewing Equipment, Controls and Operations (3 credit hours)
Modern commercial brewing is an equipment and utility intensive endeavor. Emphasis on efficiency, flexibility and sanitation has led to equipment and controls which have vastly improved the volume and consistency of brewery output while also improving safety and the quality of the working environment. In order to manage the transfer of material and energy in the brewing process, individual components within the brewing system, as well holistic function of the brewery environment have been adapted to maximize efficiency. Knowledge of the specific design and operation of these components within the overall system is crucial to the proper functioning of a brewery. The operation of individual components and processes within the brewery will be examined in terms of the physics and engineering principles driving their function. On completion, this course will provide sufficient knowledge of brewery equipment and operations to function successfully in an entry to mid-level position.

Corequisite: BBS 325 or FS 325
Typically offered in Spring only

FS 435/FS 535 Food Safety Management Systems (3 credit hours)
This course teaches students how to develop and implement food safety management systems. It begins with the Hazard Analysis and Critical Control Points (HACCP) system and then teaches the Hazard Analysis and Risk-Based Preventive Controls (HARPC) system. Students will learn the step-by-step process for developing and implementing food safety plans to ensure food products are safe and wholesome. Students will apply theoretical knowledge as they engage with case studies through interactive videos and virtual reality tours as they practice developing and auditing food safety plans.

Prerequisite: FS 250
Typically offered in Spring only

FS 453/FS 553 Food Laws and Regulations (3 credit hours)
Federal and state laws and regulations, and case law history affecting food production, processing, packaging, marketing, and distribution of food and food products. History of food law, enactment of laws and regulations, legal research, and regulatory agencies.Credit will not be given for both FS 453 and FS 553.

Prerequisite: Junior standing.

FS 462/HS 462/HS 562/FS 562 Postharvest Physiology (3 credit hours)
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

Typically offered in Spring only

FS 471 Professionalism & Project Preparation in Food & Bioprocessing Science (1 credit hours)
Discipline-specific professional development: teamwork, problem-solving and communication skills. Resume and interview preparation. Experimental design, literature review, budgeting and planning in preparation for the FS 475 Problems and Design in Food and Bioprocessing Science capstone course.

P: FS 201 and FS 231 and Senior Standing in Food Science or Bioprocessing Science
Typically offered in Fall only

FS 475 Problems and Design in Food and Bioprocessing Science (3 credit hours)
Team approach to problem solving and product/process design and development. Ingredient functionality; formulation, safety, processing, packaging, sensory evaluation, regulatory issues, hazard analysis, critical control points (HACCP), nutritional labeling and other pertinent scientific, technical, marketing and financial aspects. Oral and written presentations are required.

Prerequisite: FS 231, FS 402, FS 405 or BAE(BBS) 425
Typically offered in Spring only

FS 481 Research Experience in Food and Bioprocessing Sciences (3 credit hours)
Students actively engage in a research initiative at the USDA-Agriculture Research Service Food Science Research Unit. Students become familiar with the settings of food science laboratories, conduct literature reviews, manage the basic scientific structure applied to problem solving, are introduced to experimental design and data processing and synthesis to solve complex problems, and understand the unpredictable nature of scientific research. At the end of the course, students will be able to structure an informative public presentation on the results of the study and present their findings to diverse audiences. As part of the learning process students will acquire and/or further develop selected laboratory techniques associated with basic microbiology and chemistry. Course limited to rising juniors and seniors in good standing. Sophomores would need instructor approval to join the course.

Restriction: Juniors and Seniors Only
Typically offered in Summer only

FS 492 Professional Internship Experience in Food Science (1-3 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by the student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

FS 493 Research Experience in Food Science (1-3 credit hours)
This course provides an opportunity for students to gain real-world experience in a scientific research program. A minimum of 42 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Undergraduate Teaching Coordinator for Food Science prior to the start of the experience. To gain approval, a student must submit the completed FS 493 contract and have it approved by his/her research supervisor, academic advisor and the FS 493 coordinator. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

FS 494 Teaching Experience in Food Science (1-3 credit hours)
This course provides an opportunity for students to gain teaching experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Undergraduate Teaching Coordinator for Food Science prior to the start of the experience. To gain approval, a student must submit the completed FS 494 contract and have it approved by his/her experience supervisor, academic advisor and the undergraduate teaching coordinator/course instructor. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

FS 495 Special Topics in Food Science (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

FS 501/NTR 401/FS 401/NTR 501 Advanced Nutrition and Metabolism (3 credit hours)
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225)
Typically offered in Fall and Summer

FS 502/FS 402 Chemistry of Food and Bioprocessed Materials (4 credit hours)
The course focuses on the properties of biological molecules (e.g., proteins, enzymes lipids, carbohydrates and pigments) found in foods and pharmaceuticals. Basic elements of molecules, such as structure and reactive groups, are presented in regard to how they affect the properties of foods and pharmaceuticals. Reactions such as Maillard browning and lipid oxidation are discussed regarding mechanisms, products and controlling processes. Laboratory experiments emphasize basic concepts discussed in lecture and provide a practical working knowledge of select analytical equipment.

Prerequisite: CH 220 or 221 or 225
Typically offered in Fall only

FS 505/MB 505/FS 405/MB 405 Food Microbiology (3 credit hours)
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

Prerequisite: MB 351
Typically offered in Spring only

FS 506/MB 506/FS 406/MB 406 Food Microbiology Lab (1 credit hours)
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

Prerequisite: MB 351 and Corequisite: FS 405 or FS 505
Typically offered in Spring only

FS 516/FS 416 Quality Control in Food and Bioprocessing (3 credit hours)
This course provides an overview of the principles of quality management, assurance and control in the food and bioprocessing industries. The objectives are for students to be able to identify government regulations, private industry standards, and customer expectations that are relevant to food and bioprocessing, apply root cause analysis methodologies, apply and evaluate control charts for monitoring process control for variables and attributes, conduct process capability analyses, apply statistical hypothesis testing, and design producer and/or customer-centered sampling plans. Lab activities alternate between guest speakers from industry and exercises in which students develop their abilities to apply computer programs to solve quality problems. Note: students may not earn credit for taking both FS 416 and FS 516.

Restriction: FS, Bioprocessing, PSC, ANS, and NT students. Others may enroll with permission from the instructor. Section 601 is restricted to true distance education students (not regular term students).
Typically offered in Fall only

FS 520/FSA 520 Pre-Harvest Food Safety (3 credit hours)
Dairy, beef, swine, poultry, and seafood modules: production, government regulation of products, use of antimicrobials in production, and the emergence of resistant human pathogens. Field fruit and vegetable crops section: hazards in food includingpesticide residues and philosophy and practice of organic farming and public's perception of food and biotechnology.

Typically offered in Fall only

FS 521/FS 421 Food Preservation (3 credit hours)
Food preservation methods. Emphasis on thermal, freezing, drying and fermentation processes and corresponding physical, chemical and organoleptic changes to products. Application of preservation schemes to the development of an overall processing operation.

Prerequisite: FS 231 and FS 405
Typically offered in Fall only

FS 522 Food Packaging (3 credit hours)
This course deals with the history of packaging, types of packages, and packaging equipment, factors involved in choice of package, aseptic packaging, shelf-life studies, modified atmospheric packaging, active packaging, packaging for e-commerce, automatic identification and data capture, closures, seal integrity, tamper evidence, graphic design & printing, distribution, labeling, environmental issues, regulatory agencies and stipulations, new frontiers in packaging, and packaging resources. Restricted to students enrolled in (or degree received) in the Food Bioprocessing and Nutrition Sciences Program or a closely related program such as the Biological & Agricultural Engineering Program.

Typically offered in Spring only

FS 526/BEC 526/BBS 426/FS 426/BEC 426/BBS 526 Upstream Biomanufacturing Laboratory (2 credit hours)
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

Prerequisite: (MB 351 and FS 231) CHE/BEC 463
Typically offered in Fall and Spring

FS 530/FSA 530 Post-Harvest Food Safety (3 credit hours)
Background on the current issues and developments associated with post-harvest food safety, including biological, chemical, and physical food safety hazards. Additionally, regulations governing food safety and consumer perceptions.

Prerequisite: MB 351/352
Typically offered in Fall only

FS 535/FS 435 Food Safety Management Systems (3 credit hours)
This course teaches students how to develop and implement food safety management systems. It begins with the Hazard Analysis and Critical Control Points (HACCP) system and then teaches the Hazard Analysis and Risk-Based Preventive Controls (HARPC) system. Students will learn the step-by-step process for developing and implementing food safety plans to ensure food products are safe and wholesome. Students will apply theoretical knowledge as they engage with case studies through interactive videos and virtual reality tours as they practice developing and auditing food safety plans.

Prerequisite: FS 250
Typically offered in Spring only

FS 540/FSA 540 Food Safety and Public Health (3 credit hours)
Issues and developments related to the relationship between food safety and public health, including emerging foodborne pathogens; virulence and pathogenicity; foodborne toxins; epidemiological techniques used in the investigation of foodborne disease; rapid detection methods; and quantitative microbial risk assessment in food safety.

Prerequisite: MB 351/352
Typically offered in Spring only

FS 550 Food Industry Study Tour (2 credit hours)
The Food Industry Study Tour is designed to give students a behind the scenes look into the food processing industry. This week-long trip, will allow students to travel throughout North Carolina and the Southeast region, touring various meat, dairy, seafood, produce, cereal, snack food, beverage, and candy production facilities. The class trip will run 5-6 days during the week of Spring Break holiday. Enrollment is limited and subject to the permission of the instructor.

Typically offered in Spring only

FS 553/FS 453 Food Laws and Regulations (3 credit hours)
Federal and state laws and regulations, and case law history affecting food production, processing, packaging, marketing, and distribution of food and food products. History of food law, enactment of laws and regulations, legal research, and regulatory agencies.Credit will not be given for both FS 453 and FS 553.

Prerequisite: Junior standing.

FS 554/NTR 554 Lactation, Milk, and Nutrition (3 credit hours)
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421
Typically offered in Spring only

FS 555/NTR 555 Exercise Nutrition (3 credit hours)
Metabolism of macro- and micronutrients as affected by exercise and physical activity. Effects of dietary patterns, specific foods, dietary supplements and ergogenic aids on sports performance. Reading and discussion of current literature and individual or group projects.

Prerequisite: NTR 400/500
Typically offered in Spring only

FS 557/NTR 557 Nutraceuticals and Functional Foods (3 credit hours)
This course evaluates the weight of evidence from peer-reviewed scientific literature relating food bioactives, whole foods, and diets to disease prevention, athletic performance, and cognitive development/enhancement. Data are viewed in the context of processing effects, global food and supplement regulations, as well as commercial marketing claims. Key concepts include dose-response, signal transduction, and the use of advanced technologies such as genomics, proteomics and metabolomics. Students will work in teams to develop and write a critical review manuscript suitable for publication.

Typically offered in Fall only

FS 562/FS 462/HS 462/HS 562 Postharvest Physiology (3 credit hours)
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

Typically offered in Spring only

FS 567 Sensory Analysis of Foods (3 credit hours)
Techniques of sensory analysis and data interpretation, a crucial aspect of food science research and marketing both at the academic and industrial levels. Fundamental and applied aspects of sensory analysis of foods, including human senses, descriptive analysis, scaling, consumer testing and sensory-instrumental relationships.

Prerequisite: Statistics 511
Typically offered in Spring only

FS 580/FSA 580 Professional Development and Ethics in Food Safety (1 credit hours)
Professional development and thics related to food safety. Foof safety communications to lay-audiences and the media; the ethical frontier between science/policy and science/profit. Planned student and faculty presentations as well as guest lectures on current topical issues.

Prerequisite: FSA 520 or FSA 530 or FS 540
Typically offered in Spring only

FS 591 Special Problems In Food Science (1-6 credit hours)
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

Prerequisite: Graduate standing or Senior standing
Typically offered in Fall, Spring, and Summer

FS 592 Special Research Projects in Food Science (1-6 credit hours)
Typically offered in Spring only

FS 620 Special Problems In Food Science (1-6 credit hours)
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

Prerequisite: Graduate standing or Senior standing
Typically offered in Fall, Spring, and Summer

FS 623 Special Research Problems In Food Science (1-6 credit hours)
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy.

Typically offered in Spring only

FS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

FS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

FS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FS 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

FS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FS 725/MB 725 Fermentation Microbiology (3 credit hours)
Fermentation bioprocessing and characteristics, function and ecology of responsible microorganisms. Fermentative activities, growth responses and culture interactions related to metabolism, physiology and genetics of lactic acid bacteria and selected yeasts and molds. Current developments in starter culture technology and genetics; application to food and industrial fermentations.

Prerequisite: BCH 451, MB 351
Typically offered in Spring only

FS 741 Thermal Processing of Foods (3 credit hours)
Fluid flow, heat transfer, food preservation, kinetics of chemical, microbiological, and enzymatic reactions, decimal reduction time, pasteurization, sterilization, cook value, process lethality, canning of foods, thermal process evaluation, qualityconsiderations, optimization, shelf-life studies, thermal processing equipment, hot-fill, extended shelf-life products, heat exchanger design, pumps, sanitation, aseptic processing, minimal processing, NFPA bulletins, alternative processing technologies, regulatory issues, HACCP.

Prerequisite: FS 231
Typically offered in Spring only

FS 780 Seminar In Food Science (1 credit hours)
Preparation and presentation of scientific papers, progress reports and research and special topics of interest in foods.

Typically offered in Fall and Spring

FS 785/BAE 785 Food Rheology (3 credit hours)
Principles and methods for measuring rheological properties. Theories of elastic, viscous, viscoelastic and viscoplastic behavior and relationships to food texture and commodity damage during harvest, handling and processing. Influence of time, composition and processing.

Prerequisite: FS 231 or MAE 314
Typically offered in Fall only

FS 791 Special Problems in Food Science (1-6 credit hours)
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy.Credits Arranged.

Typically offered in Fall, Spring, and Summer

FS 792 Special Research Projects in Food Science (1-6 credit hours)
Credits Arranged

Typically offered in Fall only

FS 820 Special Problems In Food Science (1-6 credit hours)
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

Prerequisite: Graduate standing or Senior standing
Typically offered in Fall, Spring, and Summer

FS 823 Special Research Problems In Food Science (1-6 credit hours)
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy.

Typically offered in Spring only

FS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FS 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking wirtten and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

FS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

FS 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

FS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Food Science (FSA)

FSA 520/FS 520 Pre-Harvest Food Safety (3 credit hours)
Dairy, beef, swine, poultry, and seafood modules: production, government regulation of products, use of antimicrobials in production, and the emergence of resistant human pathogens. Field fruit and vegetable crops section: hazards in food includingpesticide residues and philosophy and practice of organic farming and public's perception of food and biotechnology.

Typically offered in Fall only

FSA 530/FS 530 Post-Harvest Food Safety (3 credit hours)
Background on the current issues and developments associated with post-harvest food safety, including biological, chemical, and physical food safety hazards. Additionally, regulations governing food safety and consumer perceptions.

Prerequisite: MB 351/352
Typically offered in Fall only

FSA 540/FS 540 Food Safety and Public Health (3 credit hours)
Issues and developments related to the relationship between food safety and public health, including emerging foodborne pathogens; virulence and pathogenicity; foodborne toxins; epidemiological techniques used in the investigation of foodborne disease; rapid detection methods; and quantitative microbial risk assessment in food safety.

Prerequisite: MB 351/352
Typically offered in Spring only

FSA 580/FS 580 Professional Development and Ethics in Food Safety (1 credit hours)
Professional development and thics related to food safety. Foof safety communications to lay-audiences and the media; the ethical frontier between science/policy and science/profit. Planned student and faculty presentations as well as guest lectures on current topical issues.

Prerequisite: FSA 520 or FSA 530 or FS 540
Typically offered in Spring only

Foreign Language - Chinese (FLC)

FLC 101 Elementary Chinese I (3 credit hours)
Introduction to Modern Standard Chinese. Emphasis on speaking and listening with an introduction to reading, writing and Chinese culture.

Corequisite: FLC 103
Typically offered in Fall only

FLC 102 Elementary Chinese II (3 credit hours)
Continuation of basic skills. Emphasis on speaking and listening with some reading, writing and Chinese culture.

Corequisite: FLC 104
Typically offered in Spring only

FLC 103 Elementary Chinese I Conversation (1 credit hours)
Supplements conversational practice and handwriting skills for FLC 101. Students will gain practice at using their speaking skills in a variety of basic social situations.

Corequisite: FLC 101
Typically offered in Fall only

FLC 104 Elementary Chinese II Conversation (1 credit hours)
Supplements conversational practice and handwriting skills for FLC 102. Students are encouraged to use their speaking skills in a variety of typical social situations. Special attention is given to naturalness of speech.

Prerequisite: FLC 101 and FLC 103; Corequisite: FLC 102
Typically offered in Spring only

FLC 201 Intermediate Chinese I (3 credit hours)
Continuation of basic skills. Greater emphasis on reading, writing and Chinese cultural traditions.

Prerequisite: FLC 102; Corequisite: FLC 203
Typically offered in Fall only

FLC 202 Intermediate Chinese II (3 credit hours)
Continuation of basic skills. Focus on reading, writing, Chinese cultural traditions and patterns of behavior.

Corequisite: FLC 204
GEP Global Knowledge
Typically offered in Spring only

FLC 203 Intermediate Chinese I Conversation (1 credit hours)
Supplements conversational practice and handwriting skills for FLC 201. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to naturalness of speech and intonation.

Prerequisite: FLC 102 and FLC 104; Corequisite: FLC 201
Typically offered in Fall only

FLC 204 Intermediate Chinese II Conversation (1 credit hours)
Supplements conversational practice and handwriting skills for FLC 202. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to naturalness of speech and intonation.

Prerequisite: FLC 201 and FLC 203; Corequisite: FLC 202
Typically offered in Spring only

FLC 301 Intermediate Chinese III (3 credit hours)
Last of the foundation courses in Chinese. Continued practice in speaking and understanding Chinese with new emphasis on writing and on the reading of cultural and literary texts.

Prerequisite: FLC 202
Typically offered in Fall only

FLC 302 Intermediate Chinese IV (3 credit hours)
Continued practice in speaking and understanding Chinese with greater emphasis on reading and writing. Continued study of cultural and literary texts.

Prerequisite: FLC 301
Typically offered in Spring only

FLC 351 Modern Chinese Popular Culture (3 credit hours)
Introduction to basic aspects of cultural practices and production in Chinese society, including consumer culture, education, work life, family relationships, everyday religious practices, aesthetic traditions, national identity, and gender. Reading and analysis of representative works of modern Chinese visual and print culture including literature, film, advertising, digital media and consumer products with attention to cultural analysis as well as to historical and cultural background.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLC 401 Advanced Chinese: Readings in Literature and Social Sciences (3 credit hours)
Continued training in the foundations of Chinese language, with emphasis on nuances of written Chinese. This course introduces advanced Chinese language students to modern literature and social science texts. Students read and analyze some of the finest works of 20th c. Chinese intellectuals, authors and social critics. The class explores a wide range of prose forms, styles, and subject matter. Emphasis will be placed on developing advanced-level proficiency in reading & writing, and on literary analysis & discussion of cultural & historical contexts.

Prerequisite:FLC 302
Typically offered in Fall only

FLC 402 Advanced Chinese: Readings in Literature and Science (3 credit hours)
Continued training in the foundations of Chinese language, with emphasis on nuances of written Chinese. This course introduces advanced Chinese language students to modern literature and science texts. Students read and analyze some of the finest works of 20th c. Chinese intellectuals, authors and proponents of scientific advancement as well as original scientific research in Chinese. The class explores a wide range of prose forms, styles, and subject matter. Emphasis will be placed on developing advanced-level proficiency in reading & writing, and on literary analysis & discussion of cultural & historical contexts.

Prerequisite:FLC 302
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

Foreign Language - English (FLE)

FLE 100 Introduction to Academic Writing (4 credit hours)
For non-native speakers of English. Intensive introduction to critical writing and reading in academic contexts. Exploration of writing processes and academic literacy skills: interpreting assignments; comprehending, analyzing, and evaluating college-level texts; inventing, drafting, and revising; seeking, providing, and responding to constructive feedback; collaborating effectively under varied learning models. Extensive writing practice and individualized coaching. Attention to grammar and conventions of standard written English. Intended as preparation for FLE 101.Only for non-native speakers of English. Requires C- or better. Credit for FLE 100 is not allowed if student has prior credit for FLE 101

Typically offered in Fall and Spring

FLE 101 Academic Writing and Research (4 credit hours)
For non-native speakers of English intensive instruction in academic writing and research. Basic principles of rhetoric and strategies for academic inquiry and argument. Instruction and practice in critical reading, including the generative and responsible use of print and electronic sources for academic research, adapted for non-native speakers. Exploration of literate practices across a range of academic domains, laying the foundation for further writing development in college. Continued attention to grammar and conventions of standard written English. Satisfies freshman English requirements. Successful completion of FLE 101 requires a C- or better. Credit for FLE 101 is not allowed if the student has already fulfilled the first-year writing requirement.

Typically offered in Fall and Spring

FLE 201 Oral Communication in English for International Students (3 credit hours)
Oral communication in English; active and interactive speaking skills, listening comprehension and reading. Specific tasks in spoken English such as communicating information, making inquiries, requests and complaints. Individual and group work inthe form of oral reports, role play, presentations, etc. Listening to lectures and note taking skills.

Typically offered in Fall and Spring

FLE 400 American English Pronunciation for International Students (3 credit hours)
Intensive pronunciation practice for non-native speakers of English. Emphasis on improved intelligibility through practice on English rhythm, stress and intonation. Individual and class work on vowel and consonant difficulties.

Typically offered in Fall and Spring

FLE 401 Advanced Oral Communication in English for International Students (3 credit hours)
Oral communication in English; pronunciation skills, reading, aural comprehension and oral skills; communication strategies and cross-cultural communication; individual and group activities such as presenting information, teaching a class, fielding questions and leading a discussion.

Typically offered in Fall and Spring

FLE 402 Advanced Written Communication in English for International Students (3 credit hours)
Written communication skills for graduate students; integrated writing tasks focusing on writing, reading, grammar and comprehension, specifically geared to the needs of research students and teaching assistants. Reading, critical analysis and synthesis of written material such as journal articles, research reports, etc.

Typically offered in Fall and Spring

Foreign Language - French (FLF)

FLF 101 Elementary French I (3 credit hours)
First in a four-course sequence to develop language skills. Oral and written practice in classroom and language laboratory. Readings in French culture and civilization.

Typically offered in Fall, Spring, and Summer

FLF 102 Elementary French II (3 credit hours)
Continuation of FLF 101 with intensive practice in spoken French. Readings in French culture and civilization.

Prerequisite: FLF 101
Typically offered in Fall, Spring, and Summer

FLF 110 Accelerated Elementary French (3 credit hours)
Content of FLF 101 and 102, at an accelerated pace, for students with previous study of French (1-2 years in high school) who placed into the course based on results of the NC State French Placement Test. Includes a refresher of 101 material beforecovering 102 material. Development of skills in listening, speaking, reading, writing and understanding Francophone cultures. Significant amount of work outside of class. Fulfills the FL 102 requirement.

Prerequisite: Placement into this course determined by The Department of Foreign Languages and Literatures Placement Test: http://sasw.chass.ncsu.edu/fl/place.htm
Typically offered in Fall and Spring

FLF 201 Intermediate French I (3 credit hours)
Third of four consecutive courses to develop skills of speaking, listening, reading and writing. Readings and discussions of French culture, civilization and literature.

Prerequisite: FLF 102 or FLF 110
Typically offered in Fall, Spring, and Summer

FLF 202 Intermediate French II (3 credit hours)
Last of four sequential language courses. Increased emphasis on reading and writing. Readings in the literature, culture, and civilization of France and the Francophone world.

Prerequisite: FLF 201 or FLF 212
GEP Global Knowledge
Typically offered in Fall and Spring

FLF 212 French: Language, Culture, and Technology (3 credit hours)
A study of the language structures and vocabulary necessary for an intermediate level of communication in French together with cultural and technological issues of our global society, in the context of the French-speaking world and the European Union. Students are responsible for providing their own transportation for required field trip. Fulfills the FLF 201 requirement.

Prerequisite: FLF 102 or FLF 110
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

FLF 301 Survey of French Literature from the Middle Ages through the Enlightenment (3 credit hours)
Reading and discussion of representative works with attention to literary analysis as well as to historical and cultural background.

Prerequisite: An advanced language skills course (FLF 308 or FLF 310 or FLF 315) or FLF 202 with permission of instructor.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLF 302 Survey of French Literature from Romanticism to the Contemporary Period (3 credit hours)
Reading and discussion of representative works with attention to literary analysis as well as to historical and cultural background.

Prerequisite: An advanced language skills course (FLF 308, 310, 315) or FLF 202 with consent of instructor.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLF 306 French Business Communication (3 credit hours)
Study of major forms of written and oral business communication used in the French-speaking world. Extensive work with current, culturally authentic materials. Emphasis on development of practical communicative skills, with special attention to cross-cultural comparisons of French and American business practices and modes of communication.

Prerequisite: FLF 202

FLF 307 Business French (3 credit hours)
Business French vocabulary and concepts with emphasis on cultural differences and their importance in the new global village business world.

Prerequisite: FLF 202
Typically offered in Fall only

FLF 308 Advanced Conversation: Contemporary French Cultures (3 credit hours)
Conversation and reading emphasizing idiomatic and practical usage with attention to contemporary civilization and cultures of the French speaking world. Emphasis on social structures, political features, events, world views and modes of communication.

Prerequisite: FLF 202
Typically offered in Fall and Spring

FLF 309 French Phonetics and Pronunciation (3 credit hours)
A study of the oral production of standard French with the aim of improving pronunciation, fluency and skill in communication. Extensive oral practice through conversation and phonetics.

Prerequisite: FLF 202
Typically offered in Fall and Spring

FLF 310 Advanced Written Communication (3 credit hours)
An in-depth study of French written communication at the advanced level, including the more advanced aspects of the French grammar with extensive writing practice serving a variety of practical communicative needs.

Prerequisite: FLF 202
Typically offered in Fall only

FLF 315 French Civilization and Culture (3 credit hours)
French civilization and culture from its origins to the modern period. Reading and discussion of the social, cultural, economic and political structures of France, including its geography, history, music, art and national consciousness.

Prerequisite: FLF 202
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FLF 318 The Heritage of French Cinema (3 credit hours)
Survey of the major contributions of French cinema from its origins to the present. Attention to film as an artistic medium and to the cinematic representation of French history and culture. Reading, discussion, and viewing of films including Un Chien Andalou, La Passion de Jeanne d'Arc, Le Retour de Martin Guerre, La Marseillaise, Les 400 Coups, and Diva.

Prerequisite: 3 hrs. in French at 300 level
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

FLF 321 French Cultures and Contexts (3 credit hours)
An approach to important periods in the history of French culture through the reading of texts by several important writers. Films, slides, painting, music, and the Internet will be included to put the readings in a cultural context.

Prerequisites: FLF 308 and FLF 310
Typically offered in Fall and Spring

FLF 401 French Graduate Reading (3 credit hours)
Basic French grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

Typically offered in Fall only

FLF 411 Approaches to French Translation (3 credit hours)
Intensive practice of translating to and from French a variety of texts selected from the areas of business, law, technology and science, as well as literature and the arts. Focus on Documentation, Research and Translation techniques and ethics.

Prerequisite: at least two French (FLF) 300 level courses

FLF 425/FLF 525 Literature, Cinema and Culture of the Francophone World (3 credit hours)
A study of a number of literary texts and films from across the spectrum of the Francophone world - West Africa, the Maghreb, and the Caribbean. Through these texts and films we will study the diversity of the French colonial empire as well as the different historical, political and cultural effects of colonialism and postcolonialism. Films, videos, internet sites will be used. Course taught in French.

Prerequisite: Junior Standing and one course in French literature.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLF 492 Seminar in French Studies (3 credit hours)
A small-group study of a topic in literature resulting in either a substantial essay or series of essays by each student. Topics vary each semester.

Prerequisite: Junior standing and 6 hrs in French literature
Typically offered in Fall and Spring

FLF 502 Variety in Language: French (3 credit hours)
Structure and evolution of the French language. A study of language variety in the French-speaking world. Attention to the historical evolution of the language through time, and an analysis of the phonological, morphological and syntactic featuresof modern French. Use of the World Wide Web will enable students to access material from many parts of the Globe.Course taught in French.

Prerequisite: Graduate standing
Typically offered in Spring only

FLF 511 Approaches to French Translation (3 credit hours)
Intensive practice of translating to and from French a variety of texts selected from the areas of business, law, technology and science, as well as literature and the arts. Focus on Documentation, Research and Translation techniques and ethics.Course taught in French. Credit not allowed for both 411 & 511.

Prerequisite: Graduate standing
Typically offered in Fall only

FLF 516 Art and Society in France (3 credit hours)
An overview of the visual arts in France, defined broadly, and their relationship to French society and culture: painting, architecture, photography, cinema, book production, gardens, fashion, cuisine, television, popular culture, and mass media will be studied.Course taught in French.

Typically offered in Spring only

FLF 520 Approaches to Literary Theory and Culture (3 credit hours)
A survey of literary theory in the 20th century with a particular focus on French thought and culture and French literary history. Examines the virtues and pitfalls of these approaches to the study of culture and literature. A course on issues, concepts, theorists and the social, historical and political context in which the theorists are writing. Taught in French. No formal pre-requisites. However, some advanced literature background is recommended.

Restriction: Graduate Standing
Typically offered in Fall only

FLF 521 French Cultures and Contexts (3 credit hours)
Study of important periods in the history of French culture through the reading of key literary texts. Films, slides, painting, music, and the Internet will be included to put the readings in a cultural context. Topics vary. Students cannot get credit for both 421/521.

Prerequisite: Graduate status required for FLF 521
Typically offered in Fall only

FLF 525/FLF 425 Literature, Cinema and Culture of the Francophone World (3 credit hours)
A study of a number of literary texts and films from across the spectrum of the Francophone world - West Africa, the Maghreb, and the Caribbean. Through these texts and films we will study the diversity of the French colonial empire as well as the different historical, political and cultural effects of colonialism and postcolonialism. Films, videos, internet sites will be used. Course taught in French.

Prerequisite: Junior Standing and one course in French literature.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLF 592 Seminar in French Studies (3 credit hours)
Seminar on literary, linguistic, or cultural topic in French studies. Research paper and oral presentation required. Conducted entirely in French. Rotating topics. Credit allowed for both 492 and 592 if topics are distinct.

Prerequisite: At least one 400-level French class or Graduate standing
Typically offered in Fall and Spring

FLF 595 Special Topics in French (3-6 credit hours)
In depth exploration of specialized topics in French literature, culture or language. Also used to test and develop new courses.Course taught in French

Prerequisite: Graduate standing
Typically offered in Fall and Spring

FLF 630 Independent Study in French (1-3 credit hours)
Individualized study in French language or literature at the graduate level. Topic and mode of study to be determined in consultation with the faculty member supervising work.

Typically offered in Spring only

FLF 675 Special Project in French (1-3 credit hours)
Individual project in French language or literature at the graduate level. Topic and mode of study to be determined in consultation with student's project advisory committee within the parameters of specific options.

Prerequisite: Student must be in final semester of his or her program.
Typically offered in Fall and Spring

FLF 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall only

Foreign Language - German (FLG)

FLG 101 Elementary German I (3 credit hours)
The first in a four-course sequence to develop the language skills of listening, speaking, reading, and writing. Emphasis on the acquisition of everyday German and cultural awareness. Active class participation, practice in the language lab and computer lab, and written assignments.

Typically offered in Fall, Spring, and Summer

FLG 102 Elementary German II (3 credit hours)
Second in a four-course sequence to develop the language skills of listening, speaking, reading, and writing. Emphasis on the acquisition of everyday German and cultural awareness. Active class participation, practice in the language lab and computer lab, and written assignments.

Prerequisite: FLG 101
Typically offered in Fall, Spring, and Summer

FLG 201 Intermediate German I (3 credit hours)
The third of four consecutive courses in German. Intensive conversational practice to develop proficiency in speaking and listening, advanced reading and writing skills by learning complex grammatical structures and through the use of authentic texts. Acquisition of cultural knowledge about the German-speaking countries.

Prerequisite: FLG 102
Typically offered in Fall, Spring, and Summer

FLG 202 Intermediate German II (3 credit hours)
Last of four consecutive courses in German. Continued conversational practice to develop proficiency in speaking and listening. Development of advanced writing skills by refining grammatical structures and style through assignments, and of advancedreading skills through the use of cultural and literary texts from the German-speaking countries.

Prerequisite: FLG 201
GEP Global Knowledge
Typically offered in Fall and Spring

FLG 212 German Language, Culture, Science, and Technology (3 credit hours)
Discussion of German, Austrian and Swiss scientific discoveries and technological inventions as well as their impact on global society, such as aspirin, x-rays, printing technology, diesel engine, computer, microchip, television, mp3 format, genetics, and environmental technologies. Also a fourth semester German course, with intensive practice to develop proficiency in intermediate speaking and listening, reading and writing, using materials from scientific and technological disciplines.

Prerequisite: FLG 201
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Spring only

FLG 301 Advanced German (3 credit hours)
Review and consolidation of aspects of German grammar and development of writing skills. Listening and speaking practice through group activities and oral reports. Class discussions on topics from the cultures of Germany, Austria, and Switzerland, such as film, history, and the fine arts. FLG 301 and 302 can be taken in random order.

Prerequisite: FLG 202 or FLG 212 or a score of 688 on the NC State placement test.
Typically offered in Fall only

FLG 302 German Oral and Written Expression (3 credit hours)
Review and practice of spoken and written German using authentic texts and materials from contemporary Germany (short stories, films, and online media). Review of German grammar through conversation, writing, and vocabulary building exercises. Oral reports by students. FLG 301 and 302 can be taken in random order.

Prerequisite: FLG 202 or FLG 212 or a score of 688 on the NC State placement test.
Typically offered in Spring only

FLG 307 Business German (3 credit hours)
Business German vocabulary and terminology. Readings and discussions on current business topics. Special consideration to intercultural communication relative to international business operations.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
Typically offered in Fall only

FLG 311 Introduction to German Translation (3 credit hours)
Introduction to theory, methods, and techniques in translation applied to materials of various fields and professions. Emphasis on written translation.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
Typically offered in Fall only

FLG 315 Germanic Civilization and Culture (3 credit hours)
Culture and civilization of the German-speaking countries. Analysis of the social, economic and political structures of Germany, Austria, and Switzerland. Lectures, reports, conversation. Taught in German.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLG 318 New German Cinema and Beyond (3 credit hours)
Survey of the major contributions to German Cinema from the 1960's to the present day. Attention to film as an artistic medium and to the cinematic representation of German history and culture. Topics covered include Nazism, German Terrorism, former East Germany, debates on the position of minorities in Germany, and German Jewish relations. Taught in German.

Prerequisite: FLG 202 or FLG 212
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

FLG 320 Introduction to German Literature (3 credit hours)
An introduction to reading and analyzing German, Austrian, and Swiss literary texts in their cultural and historical contexts. Discussion of various genres (short story, novel, drama, poetry) formal aspects, literary periods, and a variety of critical approaches. Lectures and much discussion. Oral and written assignments.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLG 323 Twentieth Century German Literature (3 credit hours)
Twentieth century literature from German-speaking countries. Readings of Mann, Kafka, Rilke, Hesse, Durrenmatt, Frisch, Grass, and a variety of poets, or concentration on one or two of these world authors. Lectures and discussions. Oral and written assignments.

Prerequisite: FLG 202 or FLG 212 or equivalent.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLG 325 German Lyric Poetry (3 credit hours)
A historical and interpretative study of the German lyric from the fifteenth into the twentieth century with special attention to the poet's choice of theme, the ways in which that theme is treated, and the relevance of the poem to the human experience.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLG 390 German Studies Topics (3 credit hours)
Presentation of material not available in regular course offerings, or offering of new courses on a trial basis. Course may be offered through videoconferencing with other UNC campuses as an offering of the German Studies Consortium. Content determined by faculty member in consultation with the department's German section coordinator. May be repeated.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.

FLG 398 Independent Study in German (1-6 credit hours)
Individualized study in German language, culture, or literature. Topic, mode of study, and credit hours to be determined in consultation with the faculty member supervising work. Departmental approval required. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: FLG 202 or FLG 212 or placement at 300 level.
Typically offered in Fall, Spring, and Summer

FLG 401 German Graduate Reading (3 credit hours)
Basic German grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

Typically offered in Fall only

FLG 420 Current Issues in German-Language Media (3 credit hours)
Using the internet and a textbook, the course will be constructed from current topics circulated in the German, Austrian and Swiss media, e.g. newspaper websites, radio programs and TV news in streaming video format. Overview of the different news genres, the German-language media scape, and major political, economic, social and cultural issues in the German-speaking countries. Discussion, oral presentations, written assignments.

Prerequisite: Two courses at the FLG 300 level
Typically offered in Fall only

FLG 430 Cultural Artifacts in the German-Speaking Countries (3 credit hours)
Focuse on major cultural achievements in Germany, Austria and Switzerland, including literature, film, art, and music. Topics will vary. Examples are: "Kafka and Modernism", "German/Austrian/Swiss Literature and Film-Adaptations", "German-LanguageOpera", "German Art and Society in the 20th Century", or "The Faust Theme in Literature, Art, and Music". This course is repeatable so long as a different topic is covered each time.

Prerequisite: One FLG 300-level course and one from this list: FLG 315, 316, 318, 320, 323, 325, 390.
Typically offered in Fall only

FLG 440 Green Germany: Nature and Environment in German Speaking Cultures (3 credit hours)
Survey of the long "Green" tradition in German-speaking cultures as reflected in the arts, in literature, and in scientific discoveries that have made Germany, Austria, and Switzerland leaders in development of alternative environmental technologies. Discussion in German of issues such as Romantic nature poetry, industrialization, Nazi attitudes towards nature, deforestation, the Green Party, air and water pollution, waste management, energy production, climate change, transportation systems, green architecture, sustainability, and the latest environmental technologies. Practice and assessment through class debates, group work, writing tasks, student presentations, and a portfolio.

Prerequisite: 3 Hours of 300-Level German
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

FLG 492 Senior Seminar in German Studies (3 credit hours)
Capstone seminar in German literature or culture. Student presentations and either a substantial essay or a series of essays. Topics vary each semester.

Prerequisite: Two 300 level FLG courses on literature or culture or film
Typically offered in Spring only

FLG 499 Internship in Germany, Austria, or German-Speaking Switzerland (1-6 credit hours)
Professional internship in a company or organization in Germany, Austria, or German-speaking Switzerland, with German as the main language of daily operations. Contract between the student, department, and company or organization about content, scope, and requirements. 1-6 credits for an approved internship. Essay describing and evaluating the internship experience in the conext of student's professional development. Students are responsible for their own travel and living expenses. Departmental approval required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Two courses at the FLG 300 level
Typically offered in Fall, Spring, and Summer

Foreign Language - Greek (GRK)

GRK 101 Elementary Greek I (3 credit hours)
Introduction to Classical Greek. Greek alphabet, basic grammar and syntax. Readings based on Greek mythology, philosophy, and literature.

Typically offered in Fall only

GRK 102 Elementary Greek II (3 credit hours)
A second course in Classical Greek, continuing and expanding the work of GRK 101, and completing the study of grammar. Readings from major authors including Herodotus, Thucydides, and Xenophon.

Prerequisite: GRK 101
Typically offered in Spring only

GRK 201 Intermediate Greek I (3 credit hours)
Introduction to Greek prose. Emphasis upon improvement of reading skill through vocabulary acquisition and study of complex grammar. Introduction to Attic dialect through reading Plato, and Koine Greek through reading the New Testament. Examination of the importance of these works to Western literature and culture.

Prerequisite: GRK 102
Typically offered in Fall only

GRK 202 Intermediate Greek II (3 credit hours)
Reading in Homer's Iliad and the New Testament. Techniques of oral poetry. Study of the use of myth, and of the literary and historical significance of the Iliad. Analysis of differences between classical and Koine Greek in the New Testament.

Prerequisite: GRK 201
GEP Global Knowledge
Typically offered in Spring only

GRK 399 Directed Readings in Greek (3 credit hours)
Advanced Greek language course introducing students to research methods in classical studies. Readings may include Plato, Homer, Sophocles, New Testament, or others. May be taken up to two times with different readings for credit.

Prerequisite:GRK 202

Foreign Language - Hindi (FLN)

FLN 101 Elementary Hindi-Urdu I (3 credit hours)
Introduction to standard Hindi-Urdu. Emphasis on speaking and listening, and on reading and writing in the Hindi writing system (Devanagari). Readings in South Asian culture and civilization.

Corequisite: FLN 103
Typically offered in Fall only

FLN 102 Elementary Hindi-Urdu II (3 credit hours)
Continuation of FLN 101. Emphasis on oral communication and reading and writing in the Hindi writing system (Devanagari). Further readings in South Asian culture and civilization.

Prerequisite: FLN 101, Corequisite: FLN 104
Typically offered in Spring only

FLN 103 Elementary Hindi-Urdu I Conversation (1 credit hours)
Required conversational practice for FLN 101. Special attention to individual pronunciation and intonation. Introduction of formal and informal speech. Use of audiovisual materials.

Corequisite: FLN 101
Typically offered in Fall only

FLN 104 Elementary Hindi-Urdu II Conversation (1 credit hours)
Required conversational practice for FLN 102. Extensive use of speaking skills in variety of situations. Attention to supplemental non-verbal communication. Use of audiovisual materials.

Prerequisite: FLN 101, Corequisite: FLN 102
Typically offered in Spring only

FLN 201 Intermediate Hindi-Urdu I (3 credit hours)
Continuation of basic language skills. Further practice of Urdu/Hindi writing systems. Introduction to grammatical divergence of Hindi and Urdu. Readings in South Asian culture and civilization.

Prerequisite: FLN 102, Corequisite: FLN 203
Typically offered in Fall only

FLN 202 Intermediate Hindi-Urdu II (3 credit hours)
Continuation of FLN 201. Further practice of both Hindi/Urdu writing systems. Further distinction of spoken and literary Urdu and Hindi. Further readings in South Asian culture and civilization.

Prerequisite: FLN 201, Corequisite: FLN 204
GEP Global Knowledge
Typically offered in Spring only

FLN 203 Intermediate Hindi-Urdu I Conversation (1 credit hours)
Required conversational practice for FLN 201. Advancement of speaking skills through role playing, interviews, debates. Further Hindi and Urdu non-verbal communication. Use of audiovisual materials, including responses to commercial television and movies.

Prerequisite: FLN 102, Corequisite: FLN 201
Typically offered in Fall only

FLN 204 Intermediate Hindi-Urdu II Conversation (1 credit hours)
Required conversational practice for FLN 202. Refinement of speaking skills through role playing, interviews, debates. Further Hindi and Urdu non-verbal communication. Use of audiovisual materials, including responses to commercial television andmovies.

Prerequisite: FLN 201, Corequisite: FLN 202
Typically offered in Spring only

FLN 301 Twentieth Century Hindi & Urdu Fiction (3 credit hours)
Introduces advanced Hindi-Urdu students to the prose fiction of major Hindi and Urdu literary figures including Munshi Premchand, Saadat Hasan Manto and others. Texts will be provided in both Hindi and Urdu scripts and/or English translation as available.

Prerequisite: FLN 202
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLN 302 Modern Hindi & Urdu Poetry (3 credit hours)
Introduces advanced Hindi-Urdu students to representative works of 19th and 20th century Hindi and Urdu poets and poetic forms. Texts will be provided in both Hindi and Urdu scripts and/or English translation as available.

Prerequisite: FLN 202
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLN 401 Hindi Literature and South Asian Cultural Contexts (3 credit hours)
Selected topics in Hindi literature and/or South Asian literature in Hindi, such as drama in modern South Asia, the twentieth-century novel, literature and the nation, narratives of pain and resistance, gender and social reform. Readings and discussion in Hindi, with emphasis on the examination of formal literary characteristics and the interconnections of texts and relevant South Asian cultural contexts. Topics will be rotated so that students can take this course for credit up to three times.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

Foreign Language - Italian (FLI)

FLI 101 Elementary Italian I (3 credit hours)
Begins the development of a balanced foundation in all four language skills. Concentrates on listening and speaking, emphasizing idiomatic Italian. Short readings in Italian culture and civilization. Class and laboratory practice, written homework.

Typically offered in Fall, Spring, and Summer

FLI 102 Elementary Italian II (3 credit hours)
Continuation of FLI 101 with emphasis on acquisition of oral skills through class practice and use of audio aids. Readings in Italian culture, civilization and literature.

Prerequisite: FLI 101
Typically offered in Fall, Spring, and Summer

FLI 201 Intermediate Italian I (3 credit hours)
Third of four consecutive courses to develop skills of speaking, listening, reading and writing. Readings and discussion of Italian culture, civilization and literature.

Prerequisite: FLI 102
Typically offered in Fall and Spring

FLI 202 Intermediate Italian II (3 credit hours)
Last of four sequential language courses. Increased emphasis on reading and writing. Readings in the literature, culture, and civilization of Italy.

Prerequisite: FLI 201
GEP Global Knowledge
Typically offered in Spring only

FLI 208 Intermediate Italian Conversation (3 credit hours)
Intensive practice in speaking and understanding Italian through role playing, discussion, interviews, and use of audio-visual materials.

Corequisite: FLI 202
Typically offered in Fall and Summer

FLI 308 Italian Reading and Conversation (3 credit hours)
Advanced readings and intensive conversational practice in Italian for students beyond the intermediate level.

Prerequisite: FLI 202
Typically offered in Spring only

FLI 315 Italian Civilization and Culture (3 credit hours)
Italian culture and society from its origins to modern times, including its history, geography and national and regional identities, social images, political and economic structures, and technological and scientific development of the Italian society. As an extension of the classroom students participate in educational experiences such as excursions and Italian cooking classes. Taught in English and as NC State Study Abroad Program in Perugia, Italy.

GEP Global Knowledge, GEP Humanities
Typically offered in Summer only

FLI 318 Italian Society Through Cinema (3 credit hours)
Italian culture and society through cinema from the fascist era to the present. A study of selected films representative of major social-political, ideological, and artistic developments. Weekly film viewings. Taught in Italian.

Prerequisite: FLI 202
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

Foreign Language - Japanese (FLJ)

FLJ 101 Elementary Japanese I (3 credit hours)
Introduction to standard, formal Japanese. Emphasis on speaking and listening skills. Exposure to Japanese culture, reading, and writing.

Corequisite: FLJ 103
Typically offered in Fall only

FLJ 102 Elementary Japanese II (3 credit hours)
Continuation of basic skills. Emphasis on speaking and listening skills; inclusion of Japanese cultural factors in communication. Some reading and writing.

Prerequisite: FLJ 101, Corequisite: FLJ 104
Typically offered in Spring only

FLJ 103 Elementary Japanese I Conversation (1 credit hours)
Supplements conversational practice in FLJ 101. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to correcting and improving pronunciation and intonation.

Corequisite: FLJ 101
Typically offered in Fall only

FLJ 104 Elementary Japanese II Conversation (1 credit hours)
Supplements conversational practice in FLJ 102. Extensive use of speaking skills in a variety of situations. Special attention given to correcting and improving pronunciation and intonation.

Prerequisite: FLJ 101, Corequisite: FLJ 102
Typically offered in Spring only

FLJ 201 Intermediate Japanese I (3 credit hours)
Continuation of basic skills. Greater emphasis on reading and writing. More exposure to Japanese cultural traditions.

Prerequisite: FLJ 102 or FLJ 105, Corequisite: FLJ 203
Typically offered in Fall only

FLJ 202 Intermediate Japanese II (3 credit hours)
Continuation of the learning of the basic skills. Emphasis on reading and writing as well as on spoken Japanese and on cultural patterns of behavior.

Prerequisite: FLJ 201, Corequisite: FLJ 204
GEP Global Knowledge
Typically offered in Spring only

FLJ 203 Intermediate Japanese Conversation (1 credit hours)
Practice in spoken Japanese through use of the language in a variety of situations. Increase vocabulary and develop fluency and ease in the structural patterns of the language.May be repeated for a maximum of three credit hours.

Prerequisite: FLJ 102, Corequisite: FLJ 201, FLJ 202 or FLJ 301
Typically offered in Fall only

FLJ 204 Intermediate Japanese II Conversation (1 credit hours)
Supplemental intermediate conversational practice. Drills and situational exercises to build oral proficiency with patterns introduced in FLJ 202.

Corequisite: FLJ 202
Typically offered in Spring only

FLJ 301 Intermediate Japanese III (3 credit hours)
Continued study of Japanese language. Primary emphasis on spoken Japanese, but attention also given to reading, writing and culture.

Prerequisite: FLJ 202
Typically offered in Fall only

FLJ 302 Intermediate Japanese IV (3 credit hours)
Continued training in the foundations of Japanese language. Primary emphasis on spoken Japanese, with increased attention to reading and writing.

Prerequisite: FLJ 301
Typically offered in Spring only

FLJ 342 Classical Japanese Literature in Translation (3 credit hours)
A survey of literature in Japan from earliest recorded times through the sixteenth century. Examples from major eras and genres (folktales, poetry, philosophy, fictional narrative, theater, etc.) will be considered, with attention to historical and cultural contexts, as well as to contemporary scholarship and approaches toward traditional literature. Examples from literature outside Japan will be included for comparative purposes. No prior knowledge of Japanese required: Readings and discussions in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 344 Early Modern Japanese Literature in Translation (3 credit hours)
A survey of literature in Japan from 1600 to late Nineteenth Century. Examples from major periods and genres (novels, poetry, philosophy, dram, miscellaneous narrative, etc.) will be considered, with attention to historical and cultural contexts, as well as to contemporary scholarship and approaches toward the literature. Examples from literature outside Japan will be included for comparative purposed. No prior knowledge of Japanese required: Readings and discussions in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 345 Modern Japanese Literature in Translation (3 credit hours)
A survey in literature in Japan from the Meiji Era through World War Two. Examples from major periods and genres (novels, poetry, philosophy, drama, miscellaneous narrative, etc.) will be considered, with attention to historical and cultural contexts, as well as to contemporary scholarship and approaches toward the literature. Examples from literature outside Japan will be included for comparative purposes. No prior knowledge of Japanese required: Readings and discussions in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 351/ANT 351 Contemporary Culture in Japan (3 credit hours)
Introduction to basic aspects of cultural practices in Japanese society, including education, work life, family relationships, everyday religious practices, aesthetic traditions, national identity, and gender. Students will develop an understanding of the interrelationships between language and culture.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 401 Advanced Japanese I (3 credit hours)
Continued training in the foundations of Japanese language, with emphasis on complex verb forms. Increased attention to reading and writing.

Prerequisite: FLJ 302
Typically offered in Fall only

FLJ 402 Advanced Japanese II (3 credit hours)
Elaboration on grammatical forms learned in the previous courses with applications in reading and writing, combined with more sophisticated vocabulary and idioms and attention to development of natural reading skills.

Prerequisite: FLJ 401
Typically offered in Spring only

Foreign Language - Japanese (FLJ)

FLJ 101 Elementary Japanese I (3 credit hours)
Introduction to standard, formal Japanese. Emphasis on speaking and listening skills. Exposure to Japanese culture, reading, and writing.

Corequisite: FLJ 103
Typically offered in Fall only

FLJ 102 Elementary Japanese II (3 credit hours)
Continuation of basic skills. Emphasis on speaking and listening skills; inclusion of Japanese cultural factors in communication. Some reading and writing.

Prerequisite: FLJ 101, Corequisite: FLJ 104
Typically offered in Spring only

FLJ 103 Elementary Japanese I Conversation (1 credit hours)
Supplements conversational practice in FLJ 101. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to correcting and improving pronunciation and intonation.

Corequisite: FLJ 101
Typically offered in Fall only

FLJ 104 Elementary Japanese II Conversation (1 credit hours)
Supplements conversational practice in FLJ 102. Extensive use of speaking skills in a variety of situations. Special attention given to correcting and improving pronunciation and intonation.

Prerequisite: FLJ 101, Corequisite: FLJ 102
Typically offered in Spring only

FLJ 201 Intermediate Japanese I (3 credit hours)
Continuation of basic skills. Greater emphasis on reading and writing. More exposure to Japanese cultural traditions.

Prerequisite: FLJ 102 or FLJ 105, Corequisite: FLJ 203
Typically offered in Fall only

FLJ 202 Intermediate Japanese II (3 credit hours)
Continuation of the learning of the basic skills. Emphasis on reading and writing as well as on spoken Japanese and on cultural patterns of behavior.

Prerequisite: FLJ 201, Corequisite: FLJ 204
GEP Global Knowledge
Typically offered in Spring only

FLJ 203 Intermediate Japanese Conversation (1 credit hours)
Practice in spoken Japanese through use of the language in a variety of situations. Increase vocabulary and develop fluency and ease in the structural patterns of the language.May be repeated for a maximum of three credit hours.

Prerequisite: FLJ 102, Corequisite: FLJ 201, FLJ 202 or FLJ 301
Typically offered in Fall only

FLJ 204 Intermediate Japanese II Conversation (1 credit hours)
Supplemental intermediate conversational practice. Drills and situational exercises to build oral proficiency with patterns introduced in FLJ 202.

Corequisite: FLJ 202
Typically offered in Spring only

FLJ 301 Intermediate Japanese III (3 credit hours)
Continued study of Japanese language. Primary emphasis on spoken Japanese, but attention also given to reading, writing and culture.

Prerequisite: FLJ 202
Typically offered in Fall only

FLJ 302 Intermediate Japanese IV (3 credit hours)
Continued training in the foundations of Japanese language. Primary emphasis on spoken Japanese, with increased attention to reading and writing.

Prerequisite: FLJ 301
Typically offered in Spring only

FLJ 342 Classical Japanese Literature in Translation (3 credit hours)
A survey of literature in Japan from earliest recorded times through the sixteenth century. Examples from major eras and genres (folktales, poetry, philosophy, fictional narrative, theater, etc.) will be considered, with attention to historical and cultural contexts, as well as to contemporary scholarship and approaches toward traditional literature. GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 351/ANT 351 Contemporary Culture in Japan (3 credit hours)
Introduction to basic aspects of cultural practices in Japanese society, including education, work life, family relationships, everyday religious practices, aesthetic traditions, national identity, and gender. Students will develop an understanding of the interrelationships between language and culture.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLJ 401 Advanced Japanese I (3 credit hours)
Continued training in the foundations of Japanese language, with emphasis on complex verb forms. Increased attention to reading and writing.

Prerequisite: FLJ 302
Typically offered in Fall only

FLJ 402 Advanced Japanese II (3 credit hours)
Elaboration on grammatical forms learned in the previous courses with applications in reading and writing, combined with more sophisticated vocabulary and idioms and attention to development of natural reading skills.

Prerequisite: FLJ 401
Typically offered in Spring only

Foreign Language - Latin (LAT)

LAT 101 Elementary Latin I (3 credit hours)
Beginning course in Classical Latin, emphasizing elementary grammatical form and basic syntax. Readings based on brief selections from Roman authors, including Cicero and Catullus.

Typically offered in Fall only

LAT 102 Elementary Latin II (3 credit hours)
Continuation of Latin 101. Completion of the study of elementary grammar. Readings from a variety of Latin authors, including texts on mythological themes.

Typically offered in Spring only

LAT 201 Intermediate Latin I (3 credit hours)
Introduction to Latin prose and poetry. Emphasis on increased reading skill. Review of grammar fundamentals and exposure to new and more complex syntax. Examination of cultural significance of readings.

Prerequisite: LAT 102
Typically offered in Fall and Summer

LAT 202 Intermediate Latin II (3 credit hours)
Lyric poetry of Catullus and Horace emphasizing vocabulary, syntax, and techniques of Latin verse. Traditions and the evolution of lyric poetry and the social role of the Roman poet.

Prerequisite: LAT 201
Typically offered in Spring only

LAT 399 Directed Readings in Latin (3 credit hours)
Advanced Latin language course introducing students to research methods in classical studies. Readings may include Vergil, Ovid, Livy, Cicero, or others. May be taken up to two times with different readings for credit.

Prerequisite:LAT 202
Typically offered in Spring only

Foreign Language - Persian (PER)

PER 101 Elementary Persian I (3 credit hours)
This is the first Persian course in the sequence and is intended for students with little or no knowledge of the language. The course uses an integrated-skills approach (speaking, listening, reading, writing and culture) and a 300-word vocabulary level.

C: PER 103
Typically offered in Fall only

PER 102 Elementary Persian II (3 credit hours)
In this second course of Persian, students learn how to talk about their daily routines and spare time activities, likes and dislikes, and build a more complex language form. They are expected to ask and answer questions on the same topics as well. Throughout the course they learn common phrases and cultural perspectives which help them create a more natural interaction with speakers of Persian. Persian-Farsi is the language base, with Tehrani accent. This is an 800-word level class and ACTFL level of ILR 0+.

P: PER 101/103; C: PER 104
Typically offered in Spring only

PER 103 Elementary Persian I Conversation (1 credit hours)
Required conversational and cultural practice for PER 101. Students will gain practice at using their speaking skills in a variety of basic social situations.

C: PER 101
Typically offered in Fall only

PER 104 Elementary Persian II Conversation (1 credit hours)
Required conversational and cultural practice for PER 102. Students will develop their speaking skills in a variety of basic social situations.

C: PER 102; P: PER 101/103
Typically offered in Spring only

PER 201 Intermediate Persian I (3 credit hours)
Persian 201 is the third semester (beginning of second-year) in Persian. It deepens the students' familiarity with the syntax of the literary language of Persia and expands their command of the spoken vernacular of Iran through exposure to more varied and sophisticated communicational contexts. An intermediate textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

Prerequisite: Elementary Persian 102, or instructor's permission
Typically offered in Fall only

PER 202 Intermediate Persian II (3 credit hours)
Persian 202 is the fourth semester, which completes the intermediate level (second year) in Persian. It further deepens the students' familiarity with the syntax of the literary language of Persia and expands their command of the spoken vernacular of Iran through exposure to more varied and sophisticated communicational contexts. It deals principally with the acquisition of the conversation register of the language, which differs considerably from the formal written style. An intermediate textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

Prerequisite: Elementary Persian (PER 201) or instructor's permission
GEP Global Knowledge
Typically offered in Spring only

Foreign Language - Portuguese (FLP)

FLP 101 Elementary Portuguese I (3 credit hours)
Introduction to the fundamentals of Brazilian Portuguese: pronunciation, comprehension, and spoken syntax and grammar.

Typically offered in Fall only

FLP 102 Elementary Portuguese II (3 credit hours)
Continuation of the essentials of Brazilian Portuguese. Further stress on pronunciation and comprehension and introduction of reading and writing skills.

Prerequisite: FLP 101
Typically offered in Spring only

FLP 201 Intermediate Portuguese I (3 credit hours)
The third level of Portuguese with special attention to speaking, reading, writing and developing a cultural awareness of the cultural heritage of the Portuguese-speaking peoples of Portugal, Brazil and Portuguese-speaking Africa.

Prerequisite: FLP 102 or placement in course
Typically offered in Fall only

FLP 401 Brazilian Portuguese for Spanish Speakers (3 credit hours)
A one semester on-line intensive introductory course to Brazilian Portuguese for Spanish speakers taught in Spanish focusing on the development of: 1) Reading Comprehension in Brazilian Portuguese; 2) Basic translation skills: Spanish>Portuguese>Spanish; 3) Colloquial writing skills in Brazilian Portuguese; 4) Basic speaking ability in Brazilian Portuguese. This course is open to undergraduate, graduate and extension students with a formal knowledge of Spanish who fulfill the prerequisite. Instructor approval required.

Prerequisite: Native/Heritage Spanish Speaker or FLS 202 or Equivalent and Instructor's Approval
Typically offered in Fall and Spring

Foreign Language - Russian (FLR)

FLR 101 Elementary Russian I (3 credit hours)
First in a four-course sequence to develop language skills in Russian. Oral and written practice in the classroom and language laboratory and attention to Russian cultural heritage.

Typically offered in Fall only

FLR 102 Elementary Russian II (3 credit hours)
Emphasis on acquisition of basic oral skills, with complementary reading and writing exercises and attention to Russian cultural heritage.

Prerequisite: FLR 101
Typically offered in Spring only

FLR 201 Intermediate Russian I (3 credit hours)
Basic Russian language skills continued. More emphasis given to writing and essential conversational practice. Intermediate level readings in Russian literature and culture. Class and laboratory practice; written assignments.

Prerequisite: FLR 102
Typically offered in Fall only

FLR 202 Intermediate Russian II (3 credit hours)
Advanced aspects of Russian syntax through study of text. Continued attention to conversational practice and vocabulary building.

Prerequisite: FLR 201
GEP Global Knowledge
Typically offered in Spring only

FLR 303 Russian Literature in Translation: The Nineteenth Century (3 credit hours)
A study of the great Russian writers of the nineteenth century. Examination of peculiarly Russian as well as the universal aspects of this literature. All readings, lectures and discussions in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLR 304 Russian Literature in Translation: The Twentieth Century (3 credit hours)
A study of major Russian writers of the twentieth century. Examination of peculiarly Russian as well as the universal aspects of this literature. All readings, lectures and discussions in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLR 318 Russian Cinema and Society (3 credit hours)
Russian culture and society through cinema. A study of selected films representative of major social-political, ideological, and artistic developments. Weekly film screenings. No knowledge of Russian required.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

Foreign Language - Spanish (FLS)

FLS 101 Elementary Spanish I (3 credit hours)
For students with little or no background or previous study of Spanish or those who place into course via Spanish placement exam. Development of communicative abilities within an integrated skill approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Typically offered in Fall, Spring, and Summer

FLS 102 Elementary Spanish II (3 credit hours)
Continuation of FLS 101. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Prerequisite: FLS 101
Typically offered in Fall, Spring, and Summer

FLS 105 Intensive Elementary Spanish (6 credit hours)
An intensive course equivalent to FLS 101 plus FLS 102. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Typically offered in Fall and Spring

FLS 110 Accelerated Elementary Spanish (3 credit hours)
Contents of FLS 101 and FLS 102 at an accelerated pace, for students placed into the course based on results of the Spanish placement test. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes extensive written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Prerequisite: A score of 167 or better on the Spanish placement exam is required for matriculation in this course
Typically offered in Fall and Spring

FLS 201 Intermediate Spanish I (3 credit hours)
Continued development of communicative abilities for students with previous study of elementary level Spanish. Integrated skills approach (speaking, listening, reading, writing). Students will learn to function in everyday situations, expressing opinions and doubts, and narrating and describing in present, past, and future time, and will explore cultural issues through literary and other types of readings. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Prerequisite: FLS 102,105 or 110
Typically offered in Fall, Spring, and Summer

FLS 202 Intermediate Spanish II (3 credit hours)
Development of communicative abilities at the intermediate level of the American Council on the Teaching of Foreign Language proficiency scale, with an integrated skills approach (reading, writing, speaking, listening) and additional emphasis on knowledge and competence in the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

Prerequisite: FLS 201 or FLS 212
GEP Global Knowledge
Typically offered in Fall, Spring, and Summer

FLS 212 Spanish: Language, Technology, Culture (3 credit hours)
A study of the language structures and vocabulary necessary for an intermediate level of communication in Spanish together with cultural and technical issues of our global society in the context of the Spanish-speaking world. Fulfills the FLS 201 requirement.

Prerequisite: FLS 102 or FLS 110 or FLS 105
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

FLS 295 Intermediate Special Topics in Spanish (3 credit hours)
Special Topics in language and cultures of the Spanish speaking world for students at the intermediate (200) level. Includes courses taught in Spanish study abroad programs. Course may be taken up to three times.

Prerequisite: FLS 201
Typically offered in Fall, Spring, and Summer

FLS 331 Spanish Oral and Written Expression I (3 credit hours)
Development of speaking and writing skills at the Intermediate Mid to Intermediate High levels of the American Council on the Teaching of Foreign Languages proficiency scale, as well as listening/viewing and reading skills. Focus on sentence and paragraph-length discourse, narration and description in present, past, and future time frames within a variety of topics and contexts, and communication skills such as circumlocution. Course readings, video and discussion content center upon culturalaspects of the Spanish speaking world.

Prerequisite: FLS 202
Typically offered in Fall, Spring, and Summer

FLS 332 Spanish Oral and Written Expression II (3 credit hours)
Development of speaking and writing skills at the Intermediate High levels of the American Council on the Teaching of Foreign Languages proficiency scale, as well as listening/viewing and reading skills. Focus on paragraph-length discourse, narration and detailed description in present, past, and future time frames within a variety of topics and contexts, and communication skills such as circumlocution. Course readings, video and discussion content center upon cultural aspects of the Spanish speaking world.

Prerequisite: FLS 202
Typically offered in Fall and Spring

FLS 333 The Sounds of Spanish (3 credit hours)
A study of the pronunciation and phonological system of Spanish, with the goals of improving student pronunciation and analyzing native Spanish pronunciation. Extensive practice in phonetic transcription and pronunciation, as well as phonetic/phonological dialect variation.

Prerequisite: FLS 202
Typically offered in Fall and Spring

FLS 335 Spanish for Native and Heritage Speakers (3 credit hours)
This course is designed to meet the needs of native and heritage speakers of Spanish whose linguistic level is above that of our 200-level courses. Development of oral and writing skills at the Advanced-Mid through Superior levels of the American Council on the Teaching of Foreign Languages proficiency scale.

R: Native or heritage speaker of Spanish
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLS 336 Spanish for Business (3 credit hours)
Business Spanish vocabulary and terminology. Emphasis on everyday spoken and written Spanish. Readings and discussions of business topics. Cross-cultural considerations relative to international business operations.

P: FLS 331 or FLS 335
Typically offered in Fall only

FLS 337 Spanish for Tourism in the Hispanic World (3 credit hours)
Exploration of the tourism industry in the Spanish speaking world from cultural-historical, geographic, and linguistic perspectives. Course can lead to Tourism Certificate in Spanish from the Chamber of Commerce and Industry of Spain.

Prerequisite: FLS 202

FLS 340 Introduction to Hispanic Literatures and Cultures (3 credit hours)
Exploration of what literature is; what it means to read literature; and why one might be interested in analyzing literature. Introduction to literary terminology, as well as literary genres and movements in the Spanish language. Examination of social-cultural-historical contexts of Spain and Latin America, particularly matters of race, class, gender, and political ideas as they relate to literatures of the Spanish speaking world. Interpretation and analysis of literary texts, cultural institutions, and objects of national, mass, and popular cultures.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FLS 341 Literature and Culture of Spain I (3 credit hours)
Survey of literary and cultural contexts of medieval and early modern Spain (12th to 17th centuries). Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLS 342 Literature and Culture of Spain II (3 credit hours)
Survey of literary and cultural contexts of 18th and 19th century Spain. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLS 343 Literature and Culture of Spain III (3 credit hours)
Survey of literary and cultural contexts of 20th and 21st century Spain. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FLS 351 Literature and Culture of Latin America I (3 credit hours)
Survey of literary and cultural contexts of Latin America from the pre-conquest, colonial and early-independence periods (15th to mid 19th centuries). Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLS 352 Literature and Culture of Latin America II (3 credit hours)
Survey of literary and cultural contexts of Latin America from the Mid 19th to the Mid 20th centuries. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLS 353 Literature and Culture of Latin America III (3 credit hours)
Survey of literary and cultural contexts of Latin America since 1960. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FLS 360 Hispanic Cinema (3 credit hours)
Survey of the major contributions of Hispanic cinema from its origins to the present. Analysis of film as an artistic medium and as the cinematic representation of Hispanic histories and cultures. Reading, discussions, and viewing of films by representative directors.

Prerequisite: FLS 331 or FLS 332 or FLS 335
GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Spring only

FLS 395 Study Abroad Programs in Spanish (3 credit hours)
Specific category of courses in Spanish involving language and/or culture taught in Spanish-speaking countries through the Department Study Abroad Program.

Prerequisite: FLS 202
Typically offered in Fall, Spring, and Summer

FLS 399 Intensive Spanish Oral Proficiency Workshop (1 credit hours)
Extensive conversation centered upon the communicative functions of the intermediate high to advanced levels of the American Council on the Teaching of Foreign Languages (ACTFL) Oral Proficiency Scale. Assignments will include listening/viewing and speaking tasks to support in class activities. Designed to help Spanish majors to achieve the intermediate high oral proficiency level required for graduation. This is a 5-week course. Departmental permission is required.

Prerequisite: 3 Hours of 300-level Spanish
Typically offered in Fall, Spring, and Summer

FLS 400 Methods and Techniques in Spanish Translation and Interpretation (3 credit hours)
Study and practical application of theory, methods and techniques of translation based on materials relevant to various fields and professions.

Prerequisite: 12 credits of 300 level Spanish or higher
Typically offered in Spring only

FLS 401 Spanish Graduate Reading (3 credit hours)
Basic Spanish grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

Typically offered in Fall only

FLS 402 Introduction to Spanish Linguistics (3 credit hours)
Introduction to fundamental terminology and concepts in the study of linguistics. Overview of the Spanish phonetics and phonology, morphology, syntax, semantics, pragmatics, sociolinguistics and historical linguistics.

Prerequisite: 12 credits of 300 level Spanish or higher
Typically offered in Fall only

FLS 405 Spanish-English Comparative Grammar (3 credit hours)
Analysis of the linguistic and grammatical structure (phonology, morphology, syntax, and discourse) of English and Spanish in order to develop a deeper understanding of how both linguistic systems function in similar and different ways.

Prerequisite: 12 credits of 300 level Spanish or higher
Typically offered in Spring only

FLS 411 Topics in the Culture of Spain (3 credit hours)
Exploration of particular themes related to the culture of Spain, with culture broadly defined as history, social and political aspects of society, as well as human and artistic expression including use of language, literary production, performance,print, and electronic media. Themes in this course expand upon those introduced in the 300 level of the Spanish curriculum. Class discussion and assignments require greater depth and sophistication than introduction to literature and culture courses of the 300 level.

Prerequisite: 12 credits of 300-level Spanish
Typically offered in Fall and Spring

FLS 412 Topics in the Culture of Latin America and the Caribbean (3 credit hours)
Exploration of particular themes related to the culture of Latin America and the Caribbean, with culture broadly defined as history, social and political aspects of society, as well as human and artistic expression including use of language, literary production, performance, print, and electronic media. Themes in this course expand upon those introduced in the 300 level of the Spanish curriculum. Class discussion and assignments require greater depth and sophistication than introduction to literature and culture courses of the 300 level.

Prerequisite: 12 credits of 300-level Spanish

FLS 413 Spain and the Americas in Transatlantic Perspective (3 credit hours)
Exploration of key moments of communication, exchange and conflict between the different parts of the Spanish speaking world, from the point of contact between imperial Spain and the indigenous civilizations of the "New World". Examination of the commonalities and distinctions of the quest for independence, modernity and democracy. Analysis of immigration across national frontiers in the present day Hispanic World and greater American continent.

Prerequisite: 12 credits of 300-level Spanish

FLS 445/FLS 545 Spanish Environmental Cultural Studies (3 credit hours)
This seminar will serve as an exploration of environmental cultural studies in contemporary Spain. It will examine questions such as climate change, industrial agriculture, animal rights, sustainability, environmental justice, eco-feminism and others in the context of contemporary Spanish culture. The course will also serve as an introduction to environmental activism and environmental politics in Spain and at the planetary level. It will make use of theoretical and critical readings, films, literary works, and other cultural products. Students cannot receive credit for both FLS 445 and FLS 545.

P: 12 hours of 300-level Spanish
Typically offered in Fall and Spring

FLS 492/FLS 592 Seminar in Hispanic Studies (3 credit hours)
Advanced seminar on a specific area of Hispanic studies (topics vary), leading to a major term paper and/or a series of essays by the student.

Prerequisite: 12 credits of 300 level Spanish or higher
Typically offered in Spring only

FLS 495 Advanced Study Abroad Programs in Spanish (3 credit hours)
Specific category of courses in Spanish at the 400-level involving language and/or culture taught in Spanish-speaking countries through the Department Study Abroad Program.

Prerequisite: 12 credits of 300-level Spanish
Typically offered in Fall, Spring, and Summer

FLS 502 Linguistic Structure of Spanish (3 credit hours)
Introduction to fundamental terminology and concepts in the study of linguistics. Overview of the Spanish sound system (phonology), principles of word formation such as derivation and inflection (morphology), structure and grammatical relations of phrases and sentences (syntax), as well as the relationship between linguistic levels. Graduate standing required.

Typically offered in Fall only

FLS 503 Spanish Applied Linguistics (3 credit hours)
Overview of prominent theoretical perspectives in the acquisition of Spanish as a second language. Application of theory to the learning and teaching of the Spanish language. Analysis of issues in the acquisition of Spanish phonology, morphosyntax, semantics, and pragmatics. Graduate standing required.

Prerequisite: FLS 502 (Linguistic Structure of Spanish)
Typically offered in Spring only

FLS 504 Spanish Language Change and Variation (3 credit hours)
Overview of phonological and morphosyntactic change from Latin to modern Spanish. Linguistic exploration of social and geographical dimensions Spanish language variation. Examination of issues of Spanish/English contact in the United States, including bilingualism and bilingual education. Graduate standing required.

Prerequisite: FLS 502 (Linguistic Structure of Spanish)
Typically offered in Fall only

FLS 509 Spanish Phonetics and Phonology (3 credit hours)
A theoretical introduction to the phonetics and phonological system of Spanish. Topics covered include articulatory phonetics, narrow and broad transcription, and the analysis of linguistic data with the goal of understanding the underlying system of Spanish sounds. Current topics in Spanish phonology are included. Graduate standing required.

Prerequisite: FLS 502 (Linguistic Structure of Spanish)
Typically offered in Fall, Spring, and Summer

FLS 512 Spanish in the United States (3 credit hours)
A study of the varieties of Spanish spoken in the United States from the linguistic perspective. The course examines the historical and socio-political motives for distinct waves of immigration as a means to understand the development of unique dialects and sociolects that are emerging across the country. Readings and lectures explore topics such as phonetic, morphosyntactic, geographic, and social variation; bilingualism and language contact; language acquisition and education; and language in the media and public space.

Prerequisite: FLS 502 or Permission of Instructor
Typically offered in Spring only

FLS 515 History of Spanish Language (3 credit hours)
Overview of historical evolution of modern Spanish from spoken Latin. Focus on theories of language change as applied to the historical development of Spanish. Graduate status or instructor permission required.

Prerequisite: FLS 502 or equivalent; or permission of instructor
Typically offered in Spring only

FLS 520 Survey of Hispanic Literature and Culture (3 credit hours)
This course covers literature from the 8th century on in the Peninsular context and/or from the times of the pre-Conquest in Latin America to the present. It focuses on short stories, poetry, essays and films as well as different critical and theoretical analyses of culture. Its purpose is to familiarize graduate students with Latin American and/or Peninsular literature and culture and to provide a foundation for the other course offerings in literature/culture in the graduate program. It can be taught as a survey of Peninsular or Latin American literature or both.

Prerequisite: Graduate standing
Typically offered in Fall only

FLS 528 Don Quixote (3 credit hours)
This course studies the historical and political contexts of Cervante's writing, his place in Renaissance culture, and the role of Don Quixote in the formation of the modern novel. Taught in Spanish. Graduate status or permission of the instructor.

Typically offered in Fall only

FLS 530 The Cultural Production of Spanish Democracy (3 credit hours)
Challenges, contradictions, accomplishments, and shortcomings in the political, social, economic, cultural, and literary dimensions of Spain in the last quarter of the 20th century. Treatment of literary texts, historical and journalistic documents, critical and theoretical essays, as well as fiction and non-fiction films, music, and other products of popular and mass culture since 1975. Particular attention to significant cultural events such as the 1992 Barcelona Olympics, and the celebration of the 500th anniversary of the "Discovery" of America. Must hold graduate standing.

Typically offered in Fall only

FLS 545/FLS 445 Spanish Environmental Cultural Studies (3 credit hours)
This seminar will serve as an exploration of environmental cultural studies in contemporary Spain. It will examine questions such as climate change, industrial agriculture, animal rights, sustainability, environmental justice, eco-feminism and others in the context of contemporary Spanish culture. The course will also serve as an introduction to environmental activism and environmental politics in Spain and at the planetary level. It will make use of theoretical and critical readings, films, literary works, and other cultural products. Students cannot receive credit for both FLS 445 and FLS 545.

P: 12 hours of 300-level Spanish
Typically offered in Fall and Spring

FLS 550 Latin America, Inc: Legacies of Extraction Economies and Resource Exploitation in Art and Literature (3 credit hours)
From the diaries of Christopher Columbus to the implementation and maturation of NAFTA-era trade policies, the area of Latin America has consistently been perceived as a type of raw material available for the extraction, production and enrichment of individuals, nations and multinational corporations that are based outside of the region's boundaries and hold positions of economic hegemony. Beginning with the colonial-era European production and consumption of tobacco, chocolate and precious metals and moving through 19th-century industrialization, world's fairs, 20th-century food, drink and film industries and the impact of late 20th-century neoliberal trade policies and tourism, we will explore the impact of external economic exploitation in Latin American contexts through a variety of texts, films, historic and contemporary publicity campaigns and cultural representations.

P: FLS 520
Typically offered in Spring only

FLS 553 The Latin American Avant-Garde (3 credit hours)
An in-depth analysis of the cultural avant-garde in Latin America at the beginning of the twentieth century (1905-1939). Students will study European and Latin American theories of the avant-garde, literature, art, music, and manifestation from the period in several Latin American countries. Graduate standing required. Taught in Spanish.

Typically offered in Spring only

FLS 554 The Sixties in Latin America (3 credit hours)
An in-depth analysis of the cultural production during the 60s in Latin America. Students will study novels, short stories, poetry, music, and film from several Latin American countries. Graduate standing required.

Typically offered in Fall only

FLS 563 The Latin American Novel (3 credit hours)
The course offers a comprehensive view of Latin America novel (from the 19th Century until the present). It centers its attention foremost on canonical works (Isaacs, Gallegos, Vargas Llosa, Puig, etc.). Besides familiarizing students with the political, social and cultural contexts that gave rise to these texts, it also provides, through the reading of various theoretical articles, a basic introduction to narrative theory (Genette, Booth, Bal, Brooks, etc.). Graduate standing required.

Typically offered in Spring only

FLS 592/FLS 492 Seminar in Hispanic Studies (3 credit hours)
Advanced seminar on a specific area of Hispanic studies (topics vary), leading to a major term paper and/or a series of essays by the student.

Prerequisite: 12 credits of 300 level Spanish or higher
Typically offered in Spring only

FLS 595 Special Topics in Spanish (1-3 credit hours)
In depth exploration of specialized topics in Spanish literature, culture or language. Also used to test and develop new courses.Course taught in Spanish.

Prerequisite: Graduate Standing or Permission of the Instructor
Typically offered in Fall and Spring

FLS 630 Independent Study in Spanish (1-3 credit hours)
Individualized study in Spanish language or literature at the graduate level. Topic and mode of study to be determined in consultation with the faculty member supervising work.

Typically offered in Fall only

FLS 675 Special Project in Spanish (1-3 credit hours)
Individual project in Spanish language or literature at the graduate level. Topic and mode of study to be determined in consultation with student's project advisory committee within the parameters of specific options.

Prerequisite: Student must be in final semester of his or her program
Typically offered in Fall and Spring

FLS 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

Foreign Language-Classical Studies (CLA)

CLA 110 Greek and Latin Roots of English (3 credit hours)
Study of the formation of English words from Greek and Latin roots, designed to build English vocabulary and word power (Students who plan to enter medical professions should take CLA 115. Students may not receive credit for both CLA 110 and CLA 115.)

Typically offered in Spring only

CLA 115 Medical Terminology (3 credit hours)
Study of the formation of medical terms from their Greek and Latin roots designed both to build vocabulary and to teach the uses of a medical dictionary. Students may not receive credit for both CLA 110 and CLA 115.

Typically offered in Fall and Spring

CLA 210 Classical Mythology (3 credit hours)
Greek and Roman mythology through the writings and art of the Classical period. Discussion of creation stories, the major gods and heroes, the underworld and afterlife, intellectual, religious and educational role of myth, and the most important theories of interpretation and classification. All readings and discussion in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Summer

CLA 215 The Ancient World in Modern Media (3 credit hours)
Study of the ways classical myth and culture appear in modern media such as film, TV, comics, the internet and others, with focus on why ancient stories, ideas and images are still appealing, but also how and hwy they are used in new ways with new meanings.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

CLA 320 Masterpieces of Classical Lit (3 credit hours)
Study of great works of Greek and Latin Literature in a genre such as tragedy, comedy, epic or lyric, with attention to both literary merit and cultural importance. All readings in English. May be taken up to three times in different genres for credit.

R: Sophomore Standing
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

CLA 325 Gender, Ethnicity & Identity in the Ancient World (3 credit hours)
Study of the formation of ideas and practices regarding gender, ethnicity, and identity in the ancient Greek and Roman world, with attention to both continuities and difference between ancient and modern views

R: Sophomore Standing
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

CLA 395 Special Topics in Classical Studies (3 credit hours)
For topics not part of regular course offerings, or offering of new courses on a trial basis. May be taken up to three times provided the topics are different.

CLA 398 Independent Study in Classical Studies (1-3 credit hours)
Individualized study in classical language, culture or literature. Topic, mode of study, and credit hours to be determined in consultation with faculty member supervising work. May be taken up to three times provided the topic is sufficiently different. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

R: Sophomore Standing

Foreign Languages (FL)

FL 210 Global Literature and Culture (3 credit hours)
This course examines urban society, popular culture, and social change in the twentieth century in different regional contexts - East Asia, Latin America, the Middle East, South Asia, Western Europe, and Francophone or other colonial contexts. The regional focus of the course varies as the teaching team varies. The course is divided into segments which may include: Language and the Print Revolution; War and Colonization; Society and Gender Issues; Popular Culture and the Arts; and Cultural Expression in the Age of Global Capital. Content will include lectures and primary and secondary materials from multiple regional contexts.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FL 211 Introduction to the French-speaking World (3 credit hours)
An introduction to the diverse nature of the French-speaking world and its relationship to the United States. By examining various types of media from literature to film, we will trace the roots of Franco-American relationships from Imperialism to the present day. Topics include historical and current perspectives from Acadia, Haiti and the Antilles, North and West Africa and Europe. It will emphasize questions of identity, migration, creolite, negritude, social justice and current events.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FL 216 Art and Society in France (3 credit hours)
An overview of the visual arts in France, defined broadly, and their relationship to French society and culture: painting, architecture, photography, cinema, book production, gardens, fashion, food, television, popular culture, and mass media, including the Internet. The principal themes of the course are how France's cultural heritage is embodied in its rich tradition of visual expression and how artists' visual expressions have either served to represent, glorify, or critique the nation.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

FL 219/ENG 219 Studies in Great Works of Non-Western Literature (3 credit hours)
Readings, in English translation, or non-Western literary masterpieces from the beginnings of literacy in the Middle East, Asia, and Africa to the modern period, including excerpts from texts such as the Upanishads, the Ramayana, the Sundiata, Gilgamesh, A Thousand and One Nights, and the Quran and such authors as Confucius, Oe Kenzaburo, Omar Khayyam, Rumi, and Amos Oz.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FL 220/ENG 220 Studies in Great Works of Western Literature (3 credit hours)
Readings, in English translation, of Western literary masterpieces, from the beginnings of literacy in the Middle East and Europe towards the present, including such authors as Homer, Sophocles, Virgil, Ovid, Augustine, Dante, Machiavelli, Shakespeare, Cervantes, Moliere, Voltaire, Goethe, Austen, Flaubert, Dickinson, Tolstoy, Kafka, and Woolf. Credit will not be given for both ENG/FL 220 and either ENG/FL 221 or ENG/FL 222.

Restricton: Credit is not allowed for both ENG 220 and ENG 221 or ENG 222.
GEP Global Knowledge, GEP Humanities
Typically offered in Summer only

FL 221/ENG 221 Literature of the Western World I (3 credit hours)
Readings from English translations of Biblical, Classical, Medieval, and Early Renaissance literature, including works by such authors as Homer, Plato, Virgil, Ovid, St. Paul, St. Augustine, Marie de France, and Dante. Credit is not allowed for both ENG 221 and ENG 220.

Restriction: Credit is not allowed for both ENG 221 and ENG 220.
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FL 222/ENG 222 Literature of the Western World II (3 credit hours)
Readings from English translations of Renaissance, Neo-Classical, Romantic, and Early Modern literature, emphasizing the cultures of continental Europe from the Renaissance to 1900, and including such authors as Petrarch, Erasmus, Rabelais, Machiavelli, Shakespeare, Moliere, Voltaire, Rousseau, Goethe, Flaubert, and Tolstoy. Credit is not allowed for both ENG 220 and ENG 222.

Restriction: Credit is not allowed for both ENG 222 and ENG 220.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

FL 223/ENG 223 Contemporary World Literature I (3 credit hours)
Twentieth-century literature of some of the following cultures: Russian, Eastern European, Western European, Latin American, Canadian, Australian.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

FL 224/ENG 224 Contemporary World Literature II (3 credit hours)
Twentieth-century literature of some of the following cultures: Asian, Middle Eastern, African, Caribbean, Native-American.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

FL 246/ENG 246 Literature of the Holocaust (3 credit hours)
Fictional and nonfictional versions of the Holocaust, focusing on themes of survival, justice, theology, and the limits of human endurance.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FL 250 Austrian Culture Up Close (3 credit hours)
This course provides students with direct experiences of Austrian culture while studying in Vienna, Austria's capital city. Readings in Austrian history, literature, music, psychology, and the visual arts, supplemented by numerous museum tours, concerts, and travel in Austria and central Europe. Students will examine and evaluate Austrian culture, society, and history through a variety of primary-source cultural artifacts (e.g. visual art, literature, architecture, music, and scientific literature) as well as secondary sources (e.g. articles and interpretive essays). Taught in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Summer only

FL 275/ENG 275 Literature and War (3 credit hours)
A geographical and thematic examination of war and questions it raises, as reflected in selected writings from, Homer, Sophocles, Japan's Tale of the Heike, Shakespeare, The Bhagavad-Gita, Keegan, Kipling, Graham Green, Mulden, Michael Herr, Dexter Filkins, Lucius Shepherd as well as writers on Just War and Deterrence Theory, and military science.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FL 295 Special Topics in Foreign Languages and/or Literatures (1-6 credit hours)
A special projects course on topics to be determined as needed in the departmental program.

Typically offered in Fall, Spring, and Summer

FL 298 Independent Study in Foreign Language or Literature (1-6 credit hours)
Individualized study in a foreign language or literature. Topic, mode of study and credit hours to be determined in consultation with the faculty member supervising work. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FL 299/ED 299 Field Experience for 21st Century Teaching (1 credit hours)
This course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Foreign Language Education majors.

Prerequisite: ECI 204 and ED 204
Typically offered in Spring only

FL 392/ENG 392 Major World Author (3 credit hours)
Intensive study in English, of the writings of one (or two) author(s) from outside the English and American traditions. Sample subjects: Homer, Virgil and Ovid, Lady Murasaki, Marie de France and Christine de Pizan, Dante, Cervantes, Goethe, Balzacand Flaubert, Kafka, Proust, Lessing and Gordimer, Borges and Marquez, Neruda, Achebe, Soyinka, Calvino, Walcott and Naipaul. Topics will vary from semester to semester. May be repeated for credit with new topic.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FL 393/ENG 393 Studies in Literary Genre (3 credit hours)
Concentrated treatment of one literary genre, such as the epic, the lyric, the drama, satire, romance, autobiography, the essay, the novel, or the short story. Treatment of materials from several national or ethnic cultures and several periods. All readings in English. Course may be taken three times for credit. Course may be taken 3 times in different genres.

Prerequisite: Sophomore standing and above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FL 394/ENG 394 Studies in World Literature (3 credit hours)
Study of a subject in world literature: for example, African literature, Asian literature, Hispanic literature, East European literature, Comedy, the Epic, the Lyric, Autobiography, the Faust legend, or Metamorphosis. Subjects vary according to availability of faculty. Readings in English translation.

Restriction: Sophomore Standing and Above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

FL 395 Study Abroad Programs (1-3 credit hours)
Specific category of courses involving language and/or culture taught in foreign countries through the Department Study Abroad Program.

FL 406/ENG 406 Modernism (3 credit hours)
Review and discuss the International Modernist movement in literature, from its nineteenth-century origins to its culmination in the early twentieth century. Identify and discuss definitions of modernity, as embodied in a variety of genres. Discuss Modernist texts within a variety of cultures that produced them.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FL 407/ENG 407 Postmodernism (3 credit hours)
Study literary expressions of postmodernism, from its origins in the Modernist movement through its culmination in the later decades of the twentieth century and after. Examine post modernity, as embodied in a variety of genres. Situate postmodernist texts within a variety of cultures that have produced them.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FL 424/FL 524 Linguistics for ESL Professionals (3 credit hours)
Study of the diachronic nature of language and the phonological, morphological, syntactic, and semantic features of English in relation to other world language groups. Application of linguistic principles to the ESL classroom. Analysis of common errors in grammar due to first language interference. Discussion of teaching strategies based on current research in second-language acquisition. Credit will not be given for both FL 424 and FL 524.

Typically offered in Spring only

FL 427/ECI 427/ECI 527/FL 527 Methods and Materials in Teaching English as a Second Language (3 credit hours)
Methodologies and current approaches to teaching English as a Second Language. Techniques and strategies for teaching reading, writing, listening, speaking and culture. Selection, adaptation, and creation of instructional materials for various levels of proficiency and teaching situations. Evaluation and assessment of written and oral language proficiency through standardized and non-standardized assessment tools. Students cannot receive credit for both FL/ECI 427 and FL/ECI 527.

Typically offered in Fall and Spring

FL 436/ECI 436/FL 536/ECI 536 Perspectives on English as a New Language (3 credit hours)
Examination of the complexity of multiculturalism in American society and the challenges faced by immigrant families in adapting to U.S. institutions. Emphasis on understanding historical, legal, cultural and pedagogical issues with respect to learning English as a new language [ENL]. No credit given for both FL/ECI 436 and FL/ECI 536.

GEP U.S. Diversity
Typically offered in Fall and Spring

FL 440 Internship in Teaching English as a New Language (3 credit hours)
Capstone course in which candidates practice and further develop the knowledge, skills, and dispositions necessary for teaching English language learners through a set of clinical field experiences in a K-12 classroom.

Prerequisites: FL 436 and FL 424 and FL 427. After the completion of two prerequisites, FL 440 may be taken concurrently with the third prerequisite, pending instructor approval.
Typically offered in Fall and Spring

FL 441 Strategies and Curriculum Design in Teaching English as a Foreign Language (TEFL) (3 credit hours)
This course provides an overview of three main aspects of teaching English as a Foreign Language: planning, instructing, and assessing. Students will examine the most common types of curricula and practice syllabus design, lesson planning, and assessments. They will explore the characteristics of different types of learners (e.g., young learners, post-secondary adults, immigrants, etc.) and their motivation for learning English. Students will practice a variety of communicative, collaborative activities for all levels and contexts.

P: FL 427 (Methods and Materials in Teaching ESL)
Typically offered in Spring only

FL 492 Senior Seminar in Foreign Languages & Literatures (3 credit hours)
Senior seminar for foreign language majors with concentration in non-European / less-commonly taught languages. Focus on recent trends in scholarship, career guidance, senior research projects or equivalent. Conducted in English. Students will be required to provide a detailed summary of their project in the language of their concentration.

Prerequisite: FLJ 301 or FLC 301 or FLN 301 or FLA 301
Typically offered in Spring only

FL 495/FL 595 Special Topics in Foreign Languages and Literatures (1-6 credit hours)
A concentrated study of a special period, author or genre to be determined as needed in the departmental program.

FL 498 Independent Study in Foreign Language or Literature (1-6 credit hours)
Individualized study of a foreign language or literature. Topic, mode of study, and credit hours to be determined in consultation with the faculty member supervising work. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FL 505/ECI 505 Issues and Trends in Foreign Language Education: Theory & Practice (3 credit hours)
An exploration of theory and practice issues related to foreign language teaching. Inquiry into proficiency-oriented instruction, innovative methodological approaches, the National Standards and learning scenarios, integrating culture, options for testing and assessment, content-based instruction, the role of grammar in second language acquisition, teaching foreign language students with learning disabilities, and Foreign Language in the Elementary School (FLES) in North Carolina. Students will examine case studies related to these topics and engage in a classroom action research project.

Prerequisite: Graduate standing
Typically offered in Fall and Summer

FL 506 Instructional Technology in Foreign Language Education: Addressing the Standards (3 credit hours)
Hands-on experience in appropriately selecting and applying a number of instructional technologies to foreign language teaching and learning in relation to the current National Standards. Analysis and use of effective technology tools including hardware, software, and courseware. Emphasis will be on the application of Technology-Enhanced Language Learning (TELL) as it integrates the National Standards' goals of Communication, Cultures, Connections, Comparisons, and Communities.

Restriction: Graduate standing; NC Initial/A licensure in French, Spanish or ESL
Typically offered in Summer only

FL 507 College Teaching of Foreign Languages (3 credit hours)
Principles of second language acquisition and foreign language pedagogy. Examination of problematic concepts in teaching Spanish and French. Thorough treatment of instructional technology appropriate to foreign language teaching and learning. Regular observation of practicing instructors and micro-teaching in college-level Spanish or French classes. Credit not given for both FL 507 and either FL/ECI 505 or FL/ECI 506. Course taught in English. Required for new FLL Teaching Assistants.

Prerequisite: Graduate status
Typically offered in Fall only

FL 508 Second Language Acquisition Research: Interlanguage Development (3 credit hours)
This course introduces students to the objectives, methods, and findings of research investigating how classroom learners acquire French and Spanish as a second language. It examines specific features of French and Spanish interlanguage including: grammatical gender, copular ser/estar and idiomatic uses of etre/avoir, pronominalization, verbal systems, and longitudinal/cross-sections studies of interlanguage development. Course content bridges the gap between second language acquisition research, foreign language teaching methodology courses, and curriculum implementation. Graduate standing or consent of instructor required.

Prerequisite: Graduate Standing or Permission of the Instructor
Typically offered in Spring only

FL 524/FL 424 Linguistics for ESL Professionals (3 credit hours)
Study of the diachronic nature of language and the phonological, morphological, syntactic, and semantic features of English in relation to other world language groups. Application of linguistic principles to the ESL classroom. Analysis of common errors in grammar due to first language interference. Discussion of teaching strategies based on current research in second-language acquisition. Credit will not be given for both FL 424 and FL 524.

Typically offered in Spring only

FL 527/FL 427/ECI 427/ECI 527 Methods and Materials in Teaching English as a Second Language (3 credit hours)
Methodologies and current approaches to teaching English as a Second Language. Techniques and strategies for teaching reading, writing, listening, speaking and culture. Selection, adaptation, and creation of instructional materials for various levels of proficiency and teaching situations. Evaluation and assessment of written and oral language proficiency through standardized and non-standardized assessment tools. Students cannot receive credit for both FL/ECI 427 and FL/ECI 527.

Typically offered in Fall and Spring

FL 535 Teaching Academic Writing to Multilingual Learners (3 credit hours)
Students will explore current theory and research in second language writing. Topics include intercultural rhetoric, second language writing curriculum, first language grammar interference, and the development of academic vocabulary. Students will learn innovative teaching strategies and activities that help multilingual writers practice writing across genres and disciplines.

Restriction: Graduate Standing
Typically offered in Fall only

FL 536/ECI 536/FL 436/ECI 436 Perspectives on English as a New Language (3 credit hours)
Examination of the complexity of multiculturalism in American society and the challenges faced by immigrant families in adapting to U.S. institutions. Emphasis on understanding historical, legal, cultural and pedagogical issues with respect to learning English as a new language [ENL]. No credit given for both FL/ECI 436 and FL/ECI 536.

GEP U.S. Diversity
Typically offered in Fall and Spring

FL 539/ENG 539 Seminar In World Literature (3 credit hours)
Rotating topics in world literature, including treatment of the subject's theoretical or methodological framework. Possible subjects: colonialism and literature; orality and literature; the Renaissance; the Enlightenment; translation; comparison ofNorth and South American literatures; African literary traditions; post-modernism and gender. Readings in English (original languages encouraged but not required).

Typically offered in Spring only

FL 595/FL 495 Special Topics in Foreign Languages and Literatures (1-6 credit hours)
A concentrated study of a special period, author or genre to be determined as needed in the departmental program.

FL 675 Special Project in TESOL (3 credit hours)
Detailed investigation to research, write, and present a research project of selected topics in Teaching English to Speakers of Other Languages (TESOL). Topic and mode of study to be determined in consultation with student's project advisory committee.

Typically offered in Fall, Spring, and Summer

Foreign Languages and Literatures - Arabic (FLA)

FLA 101 Beginning Arabic 101 (3 credit hours)
Beginning Arabic is for students who have had no prior experience with the language. It is the first in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. Authentic materials from the Arabic media will be used in addition to text-related video and audio materials. An introduction to Arab culture will be integrated throughout the semester.This course is designed for true beginners who have had no previous experience with the Arabic language, either written or spoken. Credit will be allowed for either FLA 101 or FLA 111, but nor for both.

Typically offered in Fall and Summer

FLA 102 Beginning Arabic 102 (3 credit hours)
This course is the second in a series which develops reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. Authentic materials from the Arabic media will be used in addition to text-related video and audio materials. An introduction to Arab culture will be integrated throughout the semester.Credit will be allowed for either FLA 102 or FLA 112, but not for both.

Prerequisite: FLA 101 or 111
Typically offered in Spring and Summer

FLA 103 Beginning Arabic 101 Conversation (1 credit hours)
Supplements conversational practice for FLA 101 to help students develop oral proficiency at the beginning level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in basic social situations

Corequisite: FLA 101
Typically offered in Fall and Summer

FLA 104 Beginning Arabic 102 Conversation (1 credit hours)
Supplements conversational practice for FLA 102 to help students develop oral proficiency at the advanced beginning level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in basic social situations.

Corequisite: FLA 102
Typically offered in Spring and Summer

FLA 201 Intermediate Arabic I (3 credit hours)
Intermediate Arabic I is the third in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. An increased emphasis is placed onthe acquisition of vocabulary and grammatical tools necessary to undertake more in-depth readings and discussions of news articles from the Arab media. Authentic materials from the Arab media will be used in addition to text-related video and audio materials.

Prerequisite: FLA 102 or FLA 112
Typically offered in Fall only

FLA 202 Intermediate Arabic II (3 credit hours)
Intermediate Arabic II is the fourth in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. A continued emphasis is placed on the acquisition of vocabulary and grammatical tools necessary to undertake more in-depth readings and discussions of news articles from the Arab media. Authentic materials from the Arab media will be used in addition to text-related video and audiomaterials.

Prerequisite: FLA 201
Typically offered in Spring only

FLA 203 Intermediate Arabic Conversation I (1 credit hours)
Supplements conversational practice for FLA level 201 or higher. This course helps students develop oral proficiency at the intermediate level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in various social situations.

Prerequisite: FLA 102
Typically offered in Fall only

FLA 204 Intermediate Arabic Conversation II (1 credit hours)
Supplements conversational practice for FLA level 202 or higher. This course helps students develop oral proficiency at the intermediate high level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in various social situations.

Prerequisite: FLA 201
Typically offered in Spring only

FLA 301 Advanced Intermediate Arabic I (3 credit hours)
Advanced Intermediate Arabic I is the fifth in a series of courses which develop whole language skills in Modern Standard Arabic with active speaking and listening skills in the Egyptian dialect. Upon completion of this course the student will havethe tools necessary to understand and produce all the basic structures of Modern Standard Arabic. Arabic film and media will be used in class. The student will also be introduced to selected short stories from modern Arabic literature.

Typically offered in Fall only

FLA 318 Egyptian Culture through Film (3 credit hours)
This course offers a survey of cinema in modern Egypt using film as a medium to learn about the cultural and social structures in Egypt. The course incorporates weekly screenings of feature films representing different styles and periods. Students will be required to read relevant material, take essay exam questions, write film reviews, a final paper, and give a presentation of their final paper. The course is taught in English.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

FLA 330 Media Arabic (3 credit hours)
An introduction to the language of print and Internet news media of the Arab world, using authentic materials from Arabic newspapers, Internet news sites, and magazines. This course provides students with the tools necessary to build a core media vocabulary base, comprehend front page news stories, read critically, and detect bias, in selected news content, and develop listening skills necessary for understanding oral news reports.

Prerequisite:FLA 202
Typically offered in Spring only

FLA 351 Modern Arab Popular Culture (3 credit hours)
Introduction to basic aspects of cultural practices and production in diverse societies of the Arabic-speaking world in translation, including family relationships, education, work life, religious practices, gender and sexuality, language, and aesthetic traditions, including music, art, and film. Reading and analysis of representative works of modern Arab visual and print cultures including language, literature, film, digital media, music, and art with attention to cultural analysis as well as to historical and cultural background.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

FLA 440 Modern Arabic Short Story (3 credit hours)
An advanced language skills course which introduces students to contemporary Arabic literature through selected readings of modern Arabic short stories. Students will develop an understanding of this rich literary genre as a reflection of concurrent social structures, political landscapes, and cultural traditions in Middle Eastern societies. Emphasis will also be placed on recognizing advanced grammatical structures in Modern Standard Arabic with attention given to the increased use of vernacular expression in modern literary works. Assigned readings, writing assignments, and class discussions will be in Arabic.

Prerequisite: FLA 301 or FLA 330
Typically offered in Fall only

Forestry (FOR)

FOR 150 Critical Thinking and Data Analysis (2 credit hours)
Exploration and practical experience with basis for making resource management decisions. Learning to pose questions that drive research and analysis. Discovering differences between found and built answers. Examining spreadsheet structure and functionality for manipulating data. Establishing solid grounds for conclusions and actions in natural resources contexts. Experiencing thinking processes from posing questions to articulating well-founded answers in coherent, persuasive discourse.

Typically offered in Spring only

FOR 172 Forest System Mapping and Mensuration I (2 credit hours)
Concepts and application of basic forest and land resource measurement techniques used in forestry and related fields. Measuring distances and areas; orienteering; basic air photo and topographic map interpretation; introduction to GPS; measuring tree characteristics; introduction to forest sampling. Application of spreadsheets and word processing to analyze and summarize resource characteristics. Field trip required.

Typically offered in Fall only

FOR 204 Silviculture (2 credit hours)
Silvical characteristics and growth requirements of forest trees; dynamics of stand growth, species-site relationships, site productivity, forest pest interactions, hydrology and nutrient cycling in forest ecosystems; emphasis on understanding and applying ecological principles to the production of multiple benefits at the forest community level.

Typically offered in Summer only

FOR 248 Forest History, Technology and Society (3 credit hours)
Examining forest resource use and issues throughout history. Tracing developments and concepts that created the context for today's issues concerning global forest resources. Examining how wood resource availability shaped civilization's development, and examining consequences on forest resources of civilization's scientific, social, and technological progress.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

FOR 250 Professional Development II: Communications in Natural Resources (1 credit hours)
Development of written and oral communication skills for forestry and natural resources management. Discussion topics include interactive communication, writing to a target audience, common pitfalls in technical writing, various kinds of technical writing, poster and oral presentations, reviewing and revising writing, and responding to questions in a professional manner.

Typically offered in Spring only

FOR 252 Introduction to Forest Science (3 credit hours)
Integration of biological principles into studies of tree growth, reproduction, establishment, survival, and disturbance. Discussions of regional silviculture and of effects of humans on forest ecosystems. Instruction in forest sampling and tree identification. Many laboratories meet outdoors.Not open to Forest Management majors.

Not open to Forest Management Majors (15FOMND,15FORMTBS, 15FGM)
Typically offered in Spring only

FOR 260 Forest Ecology (4 credit hours)
Introduction to forest ecosystems, their structure and functions, and the processes that regulate them including: radiation, temperature, water, and biogeochemistry; productivity; plant populations; forest communities; succession; natural disturbances; and human influences. Must have a strong love of trees.

Typically offered in Spring only

FOR 261 Forest Communities (2 credit hours)
Study of the species composition, distribution, site requirements, and succession of the principal forest communities of southeastern North America. Identification of important member plant species. Field trips to typical examples.

Prerequisite: FOR 339 or PB 220 or PB 403
Typically offered in Summer only

FOR 264 Forest Wildlife (1 credit hours)
Diversity of fauna that inhabits forest communities in the Piedmont of North Carolina. Inventory terrestrial and aquatic habitats and identify various vertebrate and invertebrate species. Insect collection initiated. The life histories of representative species presented.

Typically offered in Summer only

FOR 265 Fire Management (1 credit hours)
Effects of wildfire and prescribed fire on forest ecosystem components and processes; fire behavior and the ecosystem and meterologic factors that affect it; silvicultural uses of fire; organization, equipment, and tactics for wildfire suppression; fire suppression exercises on the North Carolina Division of Forest Resources' Forest Fire Simulator.

Typically offered in Summer only

FOR 273 Forest System Mapping and Mensuration II (3 credit hours)
Procedures and Instruments for measuring various tree and stand characteristics. Determination of stem volume and taper. Planning and implementation of forest resource samples to provide population estimates using fixed-radius and variable-radius sampling. Detailed coverage of land measurements and mapping of boundary surveys. Use of aerial photography, topographic maps, and GPS to aid in resource assessment. Incorporation of inventory data into a GIS. Basic statistical concepts applied to resource measurements. Taught off-campus at Hill Forest.

Prerequisite: FOR 172
Typically offered in Summer only

FOR 293 Independent Study in Forest Management (1-6 credit hours)
Independent Study for Forest Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FOR 294 Independent Study in Forest Management (1-6 credit hours)
Independent Study for Forest Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FOR 295 Special Topics in Forestry (1-6 credit hours)
Study of forestry topics not covered in existing courses at the introductory level. Development of a new course on a trial basis.

Typically offered in Fall, Spring, and Summer

FOR 303 Silvics and Forest Tree Physiology (3 credit hours)
Ecological and physiological processes influencing establishment, growth, and development of forest stands with particular emphasis on forest types of Southeastern United States; influence of resource availability on forest stand productivity; physical and biochemical processes associated with tree function, including water relations, mineral nutrition, transport and translocation, photosynthesis, respiration; internal and environmental factors regulating tree growth and development.

P: (CH 101 or 103) and [(CH 201 and 202) or (CH 203 and 204) or PY 205 or PY 211]
Typically offered in Fall only

FOR 304 Theory of Silviculture (4 credit hours)
Ecological processes affecting the establishment and growth of forest stands with particular emphasis on forest types of the Southeastern United States. Forest stand productivity, how productivity is influenced by site, stand, climatic factors, and the application of site specific prescriptions to establish and manipulate the composition, growth, and health of forest stands.

Prerequisite: FOR 260 or PB 360 or AEC 360
Typically offered in Spring only

FOR 318/PP 318 Forest Pathology (3 credit hours)
Major diseases of forest trees and deterioration of wood products emphasizing principles of plant pathology; diagnosis; nature, physiology, ecology, and dissemination of disease-causing agents; mechanisms of pathogenesis; epidemiology and environmental influences; principles and practices of control.

Prerequisite: PB 200
Typically offered in Fall and Spring

FOR 319 Forest Economics (3 credit hours)
Economic approaches for evaluating the production and costs of forest management, timber harvesting activities, and nontimber forest products. Estimating the financial returns of long-term investments in timber or other forest resources, including discounted cash flow analysis and capital budgeting techniques. Property taxes and income tax treatment of timber and their effects on investment returns. Demand estimation and timber supply analyses.

Prerequisite: ARE 201 or EC 205 or EC 201
Typically offered in Fall only

FOR 330 North Carolina Forests (3 credit hours)
An introduction and overview of forests in North Carolina with emphasis on the importance of forests in the 21st century. Topics include: history and distribution of forests, soils-sit relationships, forestry practices, non-conventional management objectives. Two required Saturday field trips.

Typically offered in Fall only

FOR 334 Operations Research Applications in Natural Resources (1 credit hours)
Introduction to the application and use of management science in forestry and natural resources. The course will introduce decision and information theory and mathematical programming techniques including linear, non-linear and integer programming concepts. The emphasis is on problem formulation and solution using computer programs. Half semester course.

Typically offered in Spring only

FOR 339 Dendrology (4 credit hours)
Identification and elementary silvics of woody plants of eastern North America with studies of their classification, characteristics, and habitats. Consideration of trees from northern and western North America and the Caribbean region. Field identification with trips to forest communities.

Typically offered in Fall only

FOR 350 Professional Development III: Ethical Dilemmas in Natural Resource Management (1 credit hours)
Study of ethical issues confronting natural resource management professionals, including: biodiversity conservation, private property rights, traditional religion and ecological values, community rights, environmental racism, hunting and animal rights, business ethics, and the purpose and content of professional codes of ethics.

Prerequisite: Junior standing.
Typically offered in Spring only

FOR 353 GIS and Remote Sensing for Environmental Analysis and Assessment (3 credit hours)
This course provides a survey of topics targeting the processing and analysis of remotely sensed and other geospatial data collected in forestry, environmental, and natural resource inventory and analyses. Students develop a fundamental understanding of analysis techniques and data requirements that include aerial and photogrammetry applications, geostatistical and 3D image analyses, DEM and hydrologic modeling, image enhancement techniques, land cover classifications and accuracy assessment.

Restriction: Juniors & Seniors Only
Typically offered in Spring only

FOR 374 Forest Measurement, Modeling, and Inventory (3 credit hours)
Mathematical functions required for quantifying the yield of timber and non-timber products. Procedures for planning, conducting, and analyzing forest inventories. Use of mathematical models to estimate growth and yield of forest stands and non-timber products for management decisions.

Prerequisite: FOR 273
Typically offered in Fall only

FOR 402/ENT 402 Forest Entomology (3 credit hours)
Fundamentals of morphology, classification, biology, ecology and control of insects attacking trees, with emphasis on silvicultural practices.

Prerequisite: Junior standing.
GEP Natural Sciences
Typically offered in Spring only

FOR 405/FOR 505 Forest Management (4 credit hours)
Fundamental principles and analytical techniques necessary in the planning, management and optimization of forest operations. Formulation of objectives and constraints, yield forecasting, forest regulation, procurement and marketing, inventory methods, and management plan preparation. Written and oral reporting.

Prerequisite: FOR 304, FOR 319, FOR 374
Typically offered in Fall only

FOR 406 Forest Inventory, Analysis and Planning (4 credit hours)
Independent project in designing and implementing a multi-resource survey; analyze stand conditions; forecast growth, yield and revenue of timber and forest products; use linear programming to prepare a long-term management plan subject to economic,social, and ecological constraints; assess economic and environmental impacts of potential actions; and report results orally and in writing.

Prerequisite: FOR 405, FOR 460
Typically offered in Spring only

FOR 408/FOR 508 Hardwood Management (3 credit hours)
Examines characteristics of and requirements for successfully manipulating stands of deciduous trees to meet specific economic, habitat and social objectives. Analyzes biological and site physical factors that affect growth and yield potential, opportunities for operational activities and expected results. Compares differences among deciduous species that affect responses to silvicultural stand manipulation.

Prerequisite: FOR 204 or Junior Standing
Typically offered in Fall only

FOR 411 Forest Tree Genetics and Biology (3 credit hours)
Genetics as it is applied in forest management for both conifers and hardwoods. The variation, evolution and genetics of forest trees. Methods for selection, breeding, seed production, and vegetative propagation. Exotics, wood properties, and tree improvement as a forest management tool.

Prerequisite: Junior standing
Typically offered in Spring only

FOR 414 World Forestry (3 credit hours)
Management of global forest resources; distribution and trends in forest cover; role of forests in economic development; international production and trade of forest products; current policy issues, including tropical deforestation, certification, and carbon sequestration; social forestry and non-timber forest products; international institutions and aid for conservation and development; identification and evaluation of sources of current information on global forestry issues.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

FOR 415 World Forestry Study Tour (1 credit hours)
Field trip to Mexico and/or Central America for seven days over spring break. Examine tropical forestry issues through field visits to timber concessions, plantations, nurseries, wood products firms, protected areas, and agroforestry projects; meetings with representatives of forest research institutes, government agencies, timber industry, cooperatives, and environmental organizations; and interaction with local people. Fee for field trip determined annually.Offered during spring break, as aone week field trip to Mexico and/or Central America.

Corequisite: FOR 414
Typically offered in Spring only

FOR 420/NR 420/FOR 520/NR 520 Watershed and Wetlands Hydrology (4 credit hours)
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

Prerequisite: SSC 200 and (FOR 260 or PB 360 or AEC 360)
Typically offered in Spring only

FOR 422/FOR 522 Consulting Forestry (3 credit hours)
Forest land acquisition and ownership: ownership, appraisal, legal considerations, financial management and planning. Producing forest resources: timber, wildlife, recreation, farm products, water, minerals, specialty products, and development. Marketing forest resources: timber, recreation, farm leases, minerals, specialty products, and developed property. Forest resources consulting: forms of organization, pricing of services, consultant client relationships (Law of Agency), professional ethics and continuing education.

Prerequisite: Senior standing in Forest Management
Typically offered in Fall only

FOR 430 Forest Health and Protection (3 credit hours)
This course will introduce students to the major insect and disease problems of North American forests, both native and introduced, with an emphasis on the recognition and management of pests and the damage they cause. Wild land fire, invasive plants, and climate change and their interactions with forest insect and diseases will also be covered.

Prerequisite: PB 200 or BIO 181 or BIO 183 or FOR 260 or BIO 360 or PB 360 (or other Biology or Plant Biology course).
Typically offered in Fall only

FOR 434/FOR 534 Forest Operations and Analysis (3 credit hours)
Management science and operational techniques in forestry. Logging road layout and construction, and machine systems: harvesting machine optimization and selection. Harvesting, production and forest planning. Decision and inventory theory, and other techniques for solving problems typically encountered in forest operations management. Required overnight weekend field trip.

Junior standing or above
Typically offered in Spring only

FOR 472 Forest Soils (4 credit hours)
The course will evaluate how forest soils form in the natural environment, but also their relations to forest management and sustainability. Coursework includes soil physical, chemical, and biological properties, and also special topics such as soil fertility, soil formation, soil taxonomy and classification, soil organic matter management, and soil C and N cycles. There are many factors that contribute to forest soils differing from traditional cultivated soils. These factors will be explored in addition the variation in management styles for forest soils. The goal of this course is to gain an understanding of the basic properties and processes of forest soils as well as evaluate the role of these soils in sustainable forest management. Two Saturday Labs will be required.

Prerequisites: CH 101 & CH 102 and PB 200 or BIO 181
Typically offered in Spring only

FOR 491/NR 491 Special Topics in Forestry and Related Natural Resources (1-4 credit hours)
Independent (or group) study or research of a forestry or related natural resources topic with a faculty supervisor of the student's choice. Also courses offered on a trial basis.

Typically offered in Fall and Spring

FOR 493 Independent Study in Forest Management (1-6 credit hours)
Independent Study for Forest Management students at the advanced level developed under the direction of a faculty member. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FOR 494 Independent Study in Forest Management (1-6 credit hours)
Independent Study for Forest Management students at the advanced level developed under the direction of a faculty member. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

FOR 501 Dendrology (3 credit hours)
Identification and natural history of eastern woody species with studies of their taxonomic classification, physical characteristics, and typical habits. Laboratories stress sight recognition and use of identification keys and trips to natural forest communities.

Prerequisite: PB 200
Typically offered in Fall only

FOR 502 Forest Measurements (1 credit hours)
One-third semester mini-course. Forest measurements covering principles, terminology, and practical field applications. Land area measurement, units of timber measure (cubic feet, cords, weight, board feet), estimating volume of standing trees, sampling techniques for forest inventory (strips, plots, points), measures of site quality and stand density, methods for projecting future timber volumes.

Typically offered in Fall only

FOR 503 Tree Physiology (1 credit hours)
One-third semester mini-course. Fundamental principles of physiological processes in forest trees affecting tree and stand growth and development in natural forests and managed plantations. Concepts of whole plant physiological processes includingphotosynthesis, respiration, water relations, nutrition, periodic growth, sexual and vegetative reproduction, and seedling quality with forestry examples of each process.

Prerequisite: Graduate standing
Typically offered in Fall only

FOR 504 The Practice of Silviculture (3 credit hours)
The theory and practice of stand regeneration, controlling composition, intermediate treatments and growth; application of the knowledge of silvics in the management of stands. Emphasis on forest communities of North America. Co-requisite course is FOR 506: Silviculture Laboratory (Optional)

Typically offered in Spring only

FOR 505/FOR 405 Forest Management (4 credit hours)
Fundamental principles and analytical techniques necessary in the planning, management and optimization of forest operations. Formulation of objectives and constraints, yield forecasting, forest regulation, procurement and marketing, inventory methods, and management plan preparation. Written and oral reporting.

Prerequisite: FOR 304, FOR 319, FOR 374
Typically offered in Fall only

FOR 506 Silviculture Laboratory (1 credit hours)
Development of site specific prescriptions to establish stands for a wide variety of objectives, including fiber, water, wildlife, recreation and health. Emphasis on forest communities of North America.

Corequisite: FOR 504
Typically offered in Spring only

FOR 507 Silviculture Mini Course (1 credit hours)
One-third semester mini-course. A condensed version of silviculture. Ecological processed affecting establishment and growth of forest stands with particular emphasis on forest types of southeastern United States. Forest stand productivity, how productivity influenced by site, stand, climatic factors, and application of site specific prescriptions to establish and manipulate composition, growth, and health of forest stands.

Typically offered in Spring only

FOR 508/FOR 408 Hardwood Management (3 credit hours)
Examines characteristics of and requirements for successfully manipulating stands of deciduous trees to meet specific economic, habitat and social objectives. Analyzes biological and site physical factors that affect growth and yield potential, opportunities for operational activities and expected results. Compares differences among deciduous species that affect responses to silvicultural stand manipulation.

Prerequisite: FOR 204 or Junior Standing
Typically offered in Fall only

FOR 509 Forest Resource Policy (1 credit hours)
One-third semester mini-course. Principles of forest policies and processes. Political processes, institutional and interest group participation, forestry laws and programs, current issues, and policy analyses.

Typically offered in Spring only

FOR 510 Introduction to GPS (1 credit hours)
One-third semester mini-course. Introduction to collection and use of mapping grade global positioning satellite systems data. Includes review of cartographic properties, mission planning, hands-on collection of GPS points, lines, and areas, differential correction, editing, and exporting GPS files to a GIS.

Typically offered in Fall only

FOR 513 Silviculture for Intensively Managed Plantations (3 credit hours)
This course provides an up-to-date understanding of the ecological and physiological bases of forest stand productivity and a silvicultural systems framework to use this knowledge for making site specific prescriptions that are cost effective and environmentally sustainable.

Prerequisite: FOR 507
Typically offered in Spring only

FOR 514 Woodland Stewardship (3 credit hours)
An introduction and overview of non-industrial private forestry in the Southeast United States with emphasis on active forest management. Topics include history of human impact on forests, evolution of forest, forestry practices, timber and non timber management objectives, financial aspects of forest land management, and management planning. One required all day field trip.

Typically offered in Fall only

FOR 515/ECG 515 Environmental and Resource Policy (3 credit hours)
Application of price theory and benefit-cost analysis to public decisions related to resources and environment. Emphasis on evaluation of water supply and recreation investments, water quality management alternatives, public-sector pricing, common property resources and optimum management of forest and energy resources.

Prerequisite: EC(ARE) 301 or 401
Typically offered in Spring only

FOR 519 Forest Economics (3 credit hours)
Economics applied to problems in forest management, including timber demand and supply models, optimal rotation length, benefit-cost analysis of forestry projects, impacts of forest taxation and consideration of non-market forest goods and services.

Prerequisite: Basic course in economics
Typically offered in Fall only

FOR 520/NR 520/FOR 420/NR 420 Watershed and Wetlands Hydrology (4 credit hours)
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

Prerequisite: SSC 200 and (FOR 260 or PB 360 or AEC 360)
Typically offered in Spring only

FOR 522/FOR 422 Consulting Forestry (3 credit hours)
Forest land acquisition and ownership: ownership, appraisal, legal considerations, financial management and planning. Producing forest resources: timber, wildlife, recreation, farm products, water, minerals, specialty products, and development. Marketing forest resources: timber, recreation, farm leases, minerals, specialty products, and developed property. Forest resources consulting: forms of organization, pricing of services, consultant client relationships (Law of Agency), professional ethics and continuing education.

Prerequisite: Senior standing in Forest Management
Typically offered in Fall only

FOR 531 Wildland Fire Science (3 credit hours)
Physical, chemical, biological, and ecological processes associated with wildland fire, particular emphasis on fire behavior, fuels, weather, climate and the associated effects on ecology, management, fire suppression, prescribed fire, and smoke emissions and exposure. Fire's effect on national policy, social and natural history of North America. In-depth exercises in fire and smoke modeling using established predictive systems.

Typically offered in Spring only

FOR 532 Wildland Firefighter (3 credit hours)
National Wildfire Coordination Group Firefighter Type II Certification, including study of the National Incident Command Systems (ICS-100), Human Dimensions in the Wildland Fire Service (L-180) Introduction to Wildland Fire Behavior (S-190), Firefighting Safety and Training (S-130). Weekly reading seminar, lectures and problem sessions. Last 4 weeks of semester will be prescribed fire planning and field implementation of methodologies learned in course.

Typically offered in Fall only

FOR 534/FOR 434 Forest Operations and Analysis (3 credit hours)
Management science and operational techniques in forestry. Logging road layout and construction, and machine systems: harvesting machine optimization and selection. Harvesting, production and forest planning. Decision and inventory theory, and other techniques for solving problems typically encountered in forest operations management. Required overnight weekend field trip.

Junior standing or above
Typically offered in Spring only

FOR 540 Advanced Dendrology (3 credit hours)
Identification and life histories of native and naturalized woody plants. Use of taxonomic manuals and literature. Identification of problematic groups. Concentration on North America, with discussion of other continents. Overnight field trips to natural forest communities.

Prerequisite: BO 403 or FOR 339
Typically offered in Spring only

FOR 561 Forest Communities of the Southeastern Coastal Plain (1 credit hours)
Species composition, distribution, site requirements, and succession of principal forest communities of southeastern Coastal Plain. Identification of important member plant species. Overnight field trips to typical examples.

Prerequisite: FOR 212, FOR 501
Typically offered in Summer only

FOR 562 Forest Communities of the Southern Appalachians (1 credit hours)
Species composition, distribution, site requirements, and succession of principal forest communities of southern Appalachians. Identification of important member plant species. Overnight field trips to typical examples.

Prerequisite: FOR 212, FOR 501
Typically offered in Summer only

FOR 565 Plant Community Ecology (4 credit hours)
Consideration of structure and function of terrestrial vascular plant communities, with emphasis on both classical and recent research. Measurement and description of community properties, classification, ordination, vegetation pattern in relation to environment, ecological succession and a survey of vegetation of North America.

Prerequisite: Undergraduate Ecology Course
Typically offered in Spring only

FOR 574 Forest Mensuration and Modeling (3 credit hours)
Study of mathematical functions required for quantifying the yield of timber and non-timber products. Procedures for planning, conducting, and analyzing forest inventories, use of mathematical models to estimate growth and yield of forest stands and non-timber products for management decisions.

Prerequisite: ST 511 or equivalent; College Calculus preferred
Typically offered in Fall only

FOR 575 Advanced Terrestrial Ecosystem Ecology (3 credit hours)
Views organisms and physical environment as integrated system. Outlines processes governing assimilation and cycling of energy, carbons, nutrients, and water. Evaluates ecosystem responses to intensive management, global climate change, air pollution, biofuels production, fragmentation, large-scale land use change. Illustrates application of ecosystem science approach to important regional and global questions through scaling of empirical, ecosystem-level data, ongoing research. Provides experience in hypothesis testing and experimental design, data analysis and interpretation, proposal development, and publication for research professionals. Graduate Standing.

Typically offered in Spring only

FOR 583 Tropical Forestry (3 credit hours)
Principles of tropical ecology, dendrology and agroforestry. Primary emphasis on establishment and management of tropical plantations with lesser emphasis on natural stands. Operation and management of tropical nurseries.

Prerequisite: Senior standing
Typically offered in Fall only

FOR 595 Special Topics (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis.Also used to develop and test new 500-level courses.

Typically offered in Fall, Spring, and Summer

FOR 601 Graduate Seminar (1 credit hours)
Weekly seminar in which students registered for course present the results of research and special projects. Invitation to all graduate students and faculty in department to attend and join discussion.

Typically offered in Fall and Spring

FOR 603 Research Methods in Forestry and Environmental Resources (1 credit hours)
Philosophy and objectives of scientific research and steps in the research process. Basic and applied research, inductive and deductive reasoning and need for hypothesis development and testing as a basis for scientific research. Special emphasis on preparation of study plans, graduate theses, published articles and technical presentations.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

FOR 610 Special Topics In Forestry (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis.Also used to develop and test new 500-level courses.Credits Arranged.

Typically offered in Fall, Spring, and Summer

FOR 630 Independent Study in Forestry (1 credit hours)
Independent study in Forestry under the supervision of a Forestry and Environmental Resources faculty member. Restricted to graduate students in the Department of Forestry and Environmental Resources with consent of the supervising faculty. May not be taken in the first semester of graduate study.

Typically offered in Fall, Spring, and Summer

FOR 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FOR 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

FOR 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall and Spring

FOR 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FOR 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

FOR 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

FOR 713 Advanced Topics In Silviculture (3 credit hours)
Critical examination of selected silvicultural topics, with special emphasis on concepts and phenomena distinguishing forests from other biotic communities and silviculture from other fields of applied biology. Emphasis on intensive silviculture in United States and selected international locations. A required written research proposal.

Prerequisite: FOR 304
Typically offered in Fall only

FOR 725/GN 725 Forest Genetics (3 credit hours)
Application of genetic principles to silviculture, management and wood utilization. Emphasis on variation in wild populations, the bases for selection of desirable qualities and fundamentals of controlled breeding.

Typically offered in Spring only

FOR 726/CS 726/ANS 726 Advanced Topics In Quantitative Genetics and Breeding (3 credit hours)
Advanced topics in quantitative genetics pertinent to population improvement for quantitative and categorical traits with special applications to plant and animal breeding. DNA markers - phenotype associations. The theory and application of linear mixed models, BLUP and genomic selection using maximum likelihood and Bayesian approaches. Pedigree and construction of genomic relationships matrices from DNA markers and application in breeding.

Prerequisite: ST 511, Corequisite: ST 512
Typically offered in Spring only

FOR 727 Tree Improvement Research Techniques (3 credit hours)
Research methods involved in forest tree breeding and genetics programs. Emphasis on laboratory, greenhouse and field research techniques. Stress also on summary and presentation of research results.

Prerequisite: FOR 411 or GN 411
Typically offered in Spring only

FOR 728 Quantitative Forest Genetics Methods (3 credit hours)
Applications of basic quantitative genetic methods in forest tree breeding and genetic research. Principles and procedures for partitioning experimental variance, estimating genetic parameters from different mating and test designs. Predicting breeding value and gain and developing breeding strategies.

Prerequisite: GN 703, ST 701
Typically offered in Fall only

FOR 734 Advanced Forest Management Planning (3 credit hours)
History, principles, structures and use of modern forest management planning and decision-making techniques. Emphasis on optimization procedures and public forest management.

Prerequisite: FOR 405 or FOR 434 or OR 501, Corequisite: FOR 772
Typically offered in Spring only

FOR 750 Ecological Restoration (3 credit hours)
Historical bases and philosophical examination of concepts of ecosystem restoration. Mechanics of restoring soils, hydrology, plant community composition and structure, and landscape levels ecosystem functions. Quantitative evaluations of restoration success.

Prerequisite: BO 360, SSC 200, Corequisite: BO 565
Typically offered in Spring only

FOR 753 Environmental Remote Sensing (3 credit hours)
Principles and applications of remote sensing technology to earth resources and environmental studies. Electromagnetic energy, data acquisition platforms, sensors and scanners, processing of digital remotely sensed data, error analysis and accuracyassessments, and integration of remotely sensed data with other data types used in natural resource management.

Prerequisite: FOR 353
Typically offered in Fall only

FOR 795 Advanced Special Topics in Forestry (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis.Also used to develop and test new 700-level courses.

Typically offered in Fall and Spring

FOR 801 Seminar (1 credit hours)
Weekly seminar in which students registered for course present the results of research and special projects. Invitation to all graduate students and faculty in department to attend and join discussion.

Typically offered in Fall and Spring

FOR 803 Research Methods in Forestry and Environmental Resources (1 credit hours)
Philosophy and objectives of scientific research and steps in the research process. Basic and applied research, inductive and deductive reasoning and need for hypothesis development and testing as a basis for scientific research. Special emphasis onpreparation of study plans, graduate theses, published articles and technical presentations.

Prerequisite: Grad. standing
Typically offered in Fall only

FOR 810 Special Topics In Forestry (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis.Also used to develop and test new 800-level courses.

Typically offered in Fall, Spring, and Summer

FOR 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

FOR 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

FOR 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

FOR 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

Genetic Engineering and Society (GES)

GES 506/ENT 506 Principles of Genetic Pest Management (3 credit hours)
Introduction to the biological aspects of genetic pest management (GPM). Genetic techniques for GPM, including historical uses (such as the sterile insect technique) and approaches that are currently in development. Practical issues relating to the deployment of GPM, including ecological and economic considerations.

Typically offered in Fall only

GES 508/COM 508 Emerging Technologies and Society (3 credit hours)
Provides frameworks for understanding emerging technologies and their social, political, and cultural contexts. Presents historical case studies, ethnographic accounts, and theoretical perspectives that introduce students to ways of thinking about science and technology, nature and culture, and democracy and expertise. Graduate standing is required.

Typically offered in Spring only

GES 591 Special Topics in Genetic Engineering and Society (1-6 credit hours)
Special topics and experimental course offerings in Genetic Engineering and Society.

Typically offered in Fall, Spring, and Summer

Genetics (GN)

GN 301 Genetics in Human Affairs (3 credit hours)
Appreciation and understanding of genetics in everyday life. Topics include basic principles of transmission genetics, molecular genetics, population genetics, and the effects of the environment on gene expression and phenotype. Applications of genetics in human development and disorders, genetic testing for medical and forensic purposes, and genetic engineering will be covered. Basic principles as well as ethical, legal, social, and public health issues will be covered.

GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

GN 311 Principles of Genetics (4 credit hours)
Basic concepts and principles of prokaryotic and eukaryotic genetics. Mendelian inheritance, polygenic inheritance, linkage and mapping, chromosome aberrations, population genetics, evolution, DNA structure and replication, gene expression, mutation, gene regulation, extranuclear inheritance, bacterial and viral genetics, and recombinant DNA technology.

Prerequisite: BIO 183 or ZO 160
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

GN 312 Elementary Genetics Laboratory (1 credit hours)
Genetic experiments and demonstrations using a variety of bacterial, plant and animal organisms. Mendelian inheritance, linkage analysis, population genetics, cytogenetics, biochemical genetics, DNA isolation, electrophoresis, and Southern blotting.

Corequisite: GN 311
Typically offered in Fall and Spring

GN 421/GN 521 Molecular Genetics (3 credit hours)
Biological macromolecules and their interactions, DNA topology, eukaryotic genome structure, chromatin and chromosome structure, transcription and transcription regulation, epigenetics, RNAi and RNA processing, recombinant DNA technology, genetic transformation and cloning of plants and animals. Bacteria, viruses, plants, animals and fungi as genetic systems. Students cannot receive credit for both GN 421 and GN 521.

Prerequisite: C- or better in GN 311
Typically offered in Fall and Spring

GN 423 Population, Quantitative and Evolutionary Genetics (3 credit hours)
This course is an introduction to population, quantitative and evolutionary genetics. This course will acquaint students with basic population genetics models. The course will cover genetic variation; measures of genetic variation; basic and advanced topics of selection; ecological genetics; inbreeding; genetic drift and effective population size; mutation; neutral theory and coalescence; gene flow and population structure; linkage disequilibrium and recombination; quantitative genetics; heritability;' quantitative trait loci; molecular population genetics and evolution.

Prerequisite: GN 311 and (MA 131 or MA 141)
Typically offered in Spring only

GN 425 Advanced Genetics Laboratory (2 credit hours)
This is a challenging advanced genetics laboratory designed to provide research and communication training and in-depth understanding of modern genetics through hands-on activities. Students will participate in a semester-long supervised research project in contemporary genetics using a model genetic organism and state-of-the-art techniques. The project will be directly related to research in the coordinating faculty member's laboratory. The project will require literature review, hypothesis development, experimental design and execution, data analysis and presentation of results in written and oral form.

Prerequisite: GN 312; Corequisite: GN 421
Typically offered in Fall and Spring

GN 427 Introductory Bioinformatics (3 credit hours)
This course is an introduction to bioinformatics for genetic and biological sciences. The course will provide a foundation in biological computing that includes command line interfaces, reformatting data, creating and editing graphics, automating analyses and database access, and scripting in biological programming languages used for bioinformatics such as Python, Perl, and R. Laptop required.

Prerequisite: GN 311 and (MA 131 or MA 141) with grades of C- or better
Typically offered in Fall only

GN 428 Introduction to Machine Learning in Biology (3 credit hours)
New techniques in genomics have revolutionized biology, but generate large quantities of data that present challenges in extracting signal from noise. This course will provide students the basic skills to manipulate and integrate different types of biological datasets and to learn how to mine them using data analysis tools ranging from basic to state of the art. Machine learning methods provide a framework to analyze vast amounts of biological information and extract meaningful signals. By the end of the semester, students will have had exposure to a variety of modern machine learning tools for classification and prediction. We will focus on exploration of DNA data (with millions of variants), expression data (> 20,000 genes), and microbiome data (thousands of features), combined with various disease/experimental measurements. The course will cover the basics of loading and exploring datasets using visualization, followed by basic machine learning basic methods including classification and regression algorithms.

Prerequisite: C- or better in GN 311 and C- or better in MA 131 or MA 141 and C- or better in ST 311
Typically offered in Spring only

GN 434 Genes and Development (3 credit hours)
Overview of pivotal experiments in embryology and developmental genetics; genes and genetic pathways that control development in animal model systems and humans; focus on the application of molecular genetic approaches to the study of genes and development; reading and discussion of primary scientific literature. Cannot receive credit for both GN 434 and BIO 361.

Prerequisite: C- or better in GN 311
Typically offered in Fall, Spring, and Summer

GN 441/GN 541 Human and Biomedical Genetics (3 credit hours)
This course is an in depth study of human and biomedical genetics and the role of genetics in human health and disease. The course will aquaint students with contemporary knowledge of genetics in disease causation and susceptibility, the use of model organisms to inform human biology and contemporary topics in human genetics research like epigenetics, therapeutic cloning, gene therapy, role of genetics in response to drugs and predictive medicine. Credit cannot be given for both 441 and 541.

Prerequisite: C- or better in GN 421
Typically offered in Fall only

GN 450/GN 550 Conservation Genetics (3 credit hours)
The main objective of this course is to expose upper division undergraduate students and graduate students to conservation genetic tools and applications. Students will learn the genetic and genomic theory and methods commonly used in conservation and management of species. In addition, the course will provide hands-on experience working on current conservation projects here at North Carolina State University. Working in groups, the students will collect, run, and analyze those data for a scientific paper. The final project for all students will be a conservation genetic grant proposal.

Prerequisite: GN 311
Typically offered in Spring only

GN 451 Genome Science (3 credit hours)
Genomic approaches with a foundation in classical and molecular genetics, including both historical strategies used in early major genome projects, and cutting edge contemporary methods for genomics and systems biology; the sequencing, assembly, and annotation of genomes and transcriptomes; use of genomic methods to tackle problems in epigenetics, metagenomics, and proteomics; application to a wide variety of species and biological questions, including evolution and human health; reading, discussion, and presentation of current scientific literature.

Prerequisite: C- or better in GN 311
Typically offered in Spring only

GN 453 Personal Genomics (3 credit hours)
This course will teach students the principles and practices of data analysis associated with human genetic research. Students will gain an understanding of how DNA variation explains human ancestry and how DNA variation is used to identify genes affecting complex traits. Students will analyze real data sets to determine human ancestry and quantitative traits using computational tools presented in the course.

Prerequisite: C- or better in GN 311 and C- or better in ST 311
Typically offered in Spring only

GN 456 Epigenetics, Development, and Disease (3 credit hours)
Scientists are just beginning to fully appreciate how our genes and the environment interact to influence human development and disease. The emerging field of epigenetics offers new insights into these complex connections. Epigenetics is the study of heritable changes in gene expression and phenotypes caused by mechanisms other than changes in the underlying DNA sequence. Topics may include imprinting, mechanisms driving epigenetic modifications, how environmental exposures may influence your grandchildren's health, why identical twins exhibit differences in behavior or disease susceptibility, and epigenetic and environmental bases of diverse diseases. We will also discuss experimental strategies for studying epigenetics. JR standing.

Prerequisite: B or better in GN 311
Typically offered in Spring only

GN 461 Advanced Bioinformatics (3 credit hours)
This course provides in-depth experience in applying bioinformatic computing techniques to experimental data with a focus on the genetic and biological sciences. The course will provide experience in genome sequence analysis and assembly, extracting, manipulating and visualizing genetic and molecular data, analysis of macromolecular sequences, and generating and visualizing phylogenetic date. Laptop required.

Prerequisite:GN 427 and ST 311 with grades of C- or better
Typically offered in Spring only

GN 490 Genetics Colloquium (1 credit hours)
This course will involve critical study of research in genetics. Students will evaluate primary research publication on prepared topics assigned by instructor, with emphasis on review of recent and current research.

Prerequisite: GN 421
Typically offered in Spring only

GN 496 Genetics Research Experience (3 credit hours)
GN 496 provides an opportunity for students to gain real-world experience by conducting independent research in a genetics research program. A minimum of 135 hours must be completed for the three hours credit. The experience must be arranged by the student and approved by the Director of the Undergraduate Genetics Program in advance of beginning the work. To gain approval, students must submit the completed GN 496 Contract, signed by their GN 496 supervisor (Research Mentor) and by their academic advisor. The student is required to write a research paper evaluating the results of their project. In addition to the work described in the contract, students will complete a series of reflective written assignments during and at the end of their GN 496 experience.

Minimum of sophomore standing. Limited to Genetics Majors and Genetics Minors. Students must submit required signed course contract prior to registration.
Typically offered in Fall, Spring, and Summer

GN 497 Genetics Teaching Experience (3 credit hours)
GN 497 provides an opportunity for students to gain experience in an aspect of genetics education research and/or developing, implementing, and evaluating the effectiveness of materials for use in the genetics classroom. A minimum of 135 hours must be completed for the three hours credit. The experience must be arranged by the student and approved by the Director of the Undergraduate Genetics Program in advance of beginning the work. To gain approval, students must submit the completed GN 497 Contract, signed by their GN 497 Teaching Mentor and by their academic advisor. The student is required to write a scientific paper evaluating the results of their project. In addition to the work described in the contract, students will complete a series of reflective written assignments during and at the end of their GN 497 experience.

Minimum of sophomore standing. Limited to Genetics Majors and Genetics Minors. Students must submit required signed course contract prior to registration.
Typically offered in Fall, Spring, and Summer

GN 521/GN 421 Molecular Genetics (3 credit hours)
Biological macromolecules and their interactions, DNA topology, eukaryotic genome structure, chromatin and chromosome structure, transcription and transcription regulation, epigenetics, RNAi and RNA processing, recombinant DNA technology, genetic transformation and cloning of plants and animals. Bacteria, viruses, plants, animals and fungi as genetic systems. Students cannot receive credit for both GN 421 and GN 521.

Prerequisite: C- or better in GN 311
Typically offered in Fall and Spring

GN 541/GN 441 Human and Biomedical Genetics (3 credit hours)
This course is an in depth study of human and biomedical genetics and the role of genetics in human health and disease. The course will aquaint students with contemporary knowledge of genetics in disease causation and susceptibility, the use of model organisms to inform human biology and contemporary topics in human genetics research like epigenetics, therapeutic cloning, gene therapy, role of genetics in response to drugs and predictive medicine. Credit cannot be given for both 441 and 541.

Prerequisite: C- or better in GN 421
Typically offered in Fall only

GN 550/GN 450 Conservation Genetics (3 credit hours)
The main objective of this course is to expose upper division undergraduate students and graduate students to conservation genetic tools and applications. Students will learn the genetic and genomic theory and methods commonly used in conservation and management of species. In addition, the course will provide hands-on experience working on current conservation projects here at North Carolina State University. Working in groups, the students will collect, run, and analyze those data for a scientific paper. The final project for all students will be a conservation genetic grant proposal.

Prerequisite: GN 311
Typically offered in Spring only

GN 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

GN 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall only

GN 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's Student
Typically offered in Fall and Spring

GN 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's Student
Typically offered in Fall and Spring

GN 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

GN 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's Student
Typically offered in Fall only

GN 701 Molecular Genetics (3 credit hours)
A discussion of the structure and function of genetic material at a molecular level. Consideration of both prokaryotic and eukaryotic systems. The aim to describe genetics in terms of chemical principles.

Prerequisite: GN 311
Typically offered in Fall only

GN 702 Cellular and Developmental Genetics (3 credit hours)
Regulation of genes involved in cellular function, differentiation and development in eukaryotes. Presentation of biological systems and model organisms used to study genetic control of cellular and developmental processes.

Prerequisite: GN 701
Typically offered in Spring only

GN 703 Population and Quantitative Genetics (3 credit hours)
Mutation and origin of genetic variation. Measuring genetic variation in natural populations. Gene and genotype frequencies. Hardy-Weinberg equilibrium. Values, means, genetic and environmental variance, heritability of quantitative traits. Random genetic drift and inbreeding. Natural and artifical selection. Theory and tests of models of maintenance of genetic variation. Molecular evolution of genes and proteins. Genome evolution.

Prerequisite: GN 311 and ST 512
Typically offered in Spring only

GN 713/ANS 713 Quantitative Genetics and Breeding (3 credit hours)
Quantitative and population genetic theory of breeding problems; partitioning of genetic variance, maternal effects, genotype by environment interaction and genetic correlation; selection indexes; design and analysis of selection experiments; marker-assisted selection.

Prerequisite: GN 509, ST 512
Typically offered in Fall only

GN 720/HS 720/CS 720 Molecular Biology In Plant Breeding (3 credit hours)
Theory and principles of molecular biology applied to plant breeding. Understanding of the relationship between genes and crop traits. Principles and molecular mechanisms of crop traits, and their applications to solve breeding problems and improve crop traits, which include heterosis, male/female sterility, self-incompatibility, polyploidy, double haploid, protoplast fusion, random mutagenesis, plant regeneration, transgenic breeding, advanced genome editing for breeding, gene silencing, gene activation, gene drive, plant synthetic biology, metabolic engineering, epigenetics for trait improvement, gene stacking, decoy and R genes, and bioconfinement.

P: CS 211 or GN 311 or equivalent, and PB 421 or equivalent.
Typically offered in Spring only

GN 721/ST 721 Genetic Data Analysis (3 credit hours)
Analysis of discrete data, illustrated with genetic data on morphological characters allozymes, restriction fragment length polymorphisms and DNA sequences. Maximum likelihood estimation, including iterative procedures. Numerical resampling. Development of statistical techniques for characterizing genetic disequilibrium and diversity. Measures of population structure and genetic distance. Construction of phylogenetic trees. Finding alignments and similarities between DNA sequences. Locating genes with markers.

Prerequisite: ST 430 and GN 311
Typically offered in Spring only

GN 725/FOR 725 Forest Genetics (3 credit hours)
Application of genetic principles to silviculture, management and wood utilization. Emphasis on variation in wild populations, the bases for selection of desirable qualities and fundamentals of controlled breeding.

Typically offered in Spring only

GN 735 Functional Genomics (3 credit hours)
Methodology of experimental genomics; genome sequencing, gene expression arrays, genomic screens, proteomics. Aims and achievements of microbial, plant, animal, human genome projects. Applications of genomics including parasitology, breeding, functional genomics, evolutionary genetics. Interface with bioinformatics, data technology.

Prerequisite: GN 701
Typically offered in Spring only

GN 745/HS 745/CS 745 Quantitative Genetics In Plant Breeding (1 credit hours)
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

Prerequisite: CS(GN, HS) 541, ST 712, course in quantitative genetics recommended
Typically offered in Spring only

GN 746/HS 746/CS 746 Cytogenetics in Plant Breeding (2 credit hours)
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

Typically offered in Spring only

GN 756/ST 756 Computational Molecular Evolution (3 credit hours)
Phylogenetic analyses of nucleotide and protein sequence data. Sequence alignment, phylogeny reconstruction and relevant computer software. Prediction of protein secondary structure, database searching, bioinformatics and related topics. Project required.

Prerequisite: GN 311 and ST 511
Typically offered in Fall only

GN 757/ST 757/HS 757 Quantitative Genetics Theory and Methods (3 credit hours)
The essence of quantitative genetics is to study multiple genes and their relationship to phenotypes. How to study and interpret the relationship between phenotypes and whole genome genotypes in a cohesive framework is the focus of this course. We discuss how to use genomic tools to map quantitative trait loci, how to study epistasis, how to study genetic correlations and genotype-by-environment interactions. We put special emphasis in using genomic data to study and interpret general biological problems, such as adaptation and heterosis. The course is targeted for advanced graduate students interested in using genomic information to study a variety of problems in quantitative genetics.

Prerequisite: ST 511
Typically offered in Fall only

GN 758/MB 758 Microbial Genetics & Genomics (3 credit hours)
Structure and function in microbial genetics, with emphasis on microbial genome organization, stable maintenance and evolution. DNA mutation and repair pathways, transcriptional and translational regulation, DNA replication and recombination and characterization of recombinant DNA molecules. Applications of genetic and genomic analysis methods to microbial processes, including strain construction, genome manipulation, and enhancement of gene expression.

Prerequisite: BCH 451 or GN 311
Typically offered in Spring only

GN 761/PB 761/BCH 761 Advanced Molecular Biology Of the Cell (3 credit hours)
An advanced graduate class involving integrated approaches to complex biological questions at the molecular level, encompassing biochemistry, cell biology and molecular genetics. The course will focus on an important, current area of research in eukaryotic biology using the primary scientific literature, and will involve class discussions, oral presentations, and a written research proposal.

Typically offered in Spring only

GN 768/BCH 768 Nucleic Acids: Structure and Function (3 credit hours)
An advanced treatment involving integrated approaches to biological problems at the molecular level, encompassing biochemistry, cell biology and molecular genetics. Broad, multidisciplinary approaches to solving research problems in biology and thecritical study of primary scientific literature, the development of a research proposal, oral presentations and class discussions.

Prerequisite: BCH 701 and 703
Typically offered in Spring only

GN 810 Special Topics in Genetics (1-6 credit hours)
Critical study of selected areas and special topics of current interest in genetics and related fields.

Typically offered in Fall and Spring

GN 820 Special Problems (1-6 credit hours)
Special topics designed for additional experience and research training.

Prerequisite: Advanced Graduate standing
Typically offered in Fall and Spring

GN 850 Professionalism and Ethics (1 credit hours)
The course is designed to give students background in professionalism, scientific ethics and responsible conduct of science. Topics include the role of the scientist in society, ethical theory, data acquisition and ownership, scientific midconduct,authorship, peer review, conflicts of interest and commitment, intellectual property, ethics of teaching and mentoring, ethical treatment of animal and human subjects, ethics of genetics research, job hunting and interviewing.

Prerequisite: Graduate standing
Typically offered in Fall only

GN 860/HS 860/CS 860 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Spring only

GN 861/HS 861/CS 861 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Fall only

GN 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

GN 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

GN 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

GN 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

GN 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

GN 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Geographic Information Systems (GIS)

GIS 205 Spatial Thinking with GIS (3 credit hours)
Spatial thinking and how it relates to the basic foundations of geospatial science and geographic information systems (GIS) are introduced. Students will learn to tell stories through maps using geographic information and geospatial data and analysis by applying spatial reasoning through a series of interactive assignments and discussions. Students will learn to define spatial problems and design solutions across a variety of disciplines, setting the stage for additional technical coursework in GIS and Geospatial Science.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

GIS 280 Introduction to GIS (3 credit hours)
This course provides an overview of the operations and functions of geographic information systems [GIS]. Students develop a fundamental understanding of geographic information management and analysis methods. Emphasis is placed on the nature of geographic information, working with spatial data, and elementary geospatial analysis and modeling techniques. Students learn effective operation of GIS software and gain exposure to GIS tools that support these emphasis areas. Extensive independent learning and computer experiences include online laboratory sessions, alongside optional online or in-person weekly help sessions.

Typically offered in Fall and Spring

GIS 295 Special Topics in Geospatial Information Science (1-4 credit hours)
Special Topics in Geospatial Information Science at the 200 level for offering courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

GIS 501 Geospatial Professionalism (2 credit hours)
Students will examine a variety of topics critical to successful navigation of the geospatial profession, with an emphasis on map communication and presentation, interpreting geospatial research, the ethical, legal, and social implications (ELSI) of using spatial data, metadata concepts, and linking results to policy actions. Students will engage in several writing, presentation, and interpretation exercises.

Typically offered in Fall and Spring

GIS 510 Fundamentals of Geospatial Information Science and Technology (3 credit hours)
This course provides an advanced overview of how geographic information systems [GIS] facilitate data analysis and communication to address common geographic problems. Students improve spatial reasoning and problem definition expertise while emphasizing geographic data models and structures, data manipulation and storage, customization through programming, and the integration of geospatial analysis and modeling into project-based problem solving applicable to a variety of disciplines. Skilled application of both desktop and cloud-based GIS software supports these areas. Extensive independent learning and computer experiences include virtual laboratory sessions, alongside optional online or in-person weekly help sessions to facilitate student learning.

Prerequisite: Graduate Standing or PBS or Permission of Instructor
Typically offered in Fall and Spring

GIS 512 Introduction to Environmental Remote Sensing (3 credit hours)
Principles and hands-on techniques for processing and analyzing remotely sensed data for natural resource applications. Topics include review of the electromagnetic spectrum, pre-processing (georectification, enhancements and transformations), processing (visual interpretation, indices, supervised and unsupervised classification) and post-processing (masking, change analysis and accuracy assessment) of digital image data. This course will provide students with fundamental concepts and skills needed to pursue further studies in digital processing of remotely sensed data.

Typically offered in Fall and Spring

GIS 515 Cartographic Design (2 credit hours)
Principles of cartographic design and how to apply them to produce high-quality geographic information system (GIS) based maps. Successful students will acquire an understanding of map design and experience applying it with GIS software. Students produce project maps in both print and web media.

Prerequisite: GIS 510
Typically offered in Fall and Spring

GIS 517/LAR 517 GIS Applications in Landscape Architecture and Environmental Planning (3 credit hours)
Introduction to the methods and applications of geographic spatial modeling technology in landscape architecture and environmental planning.

Typically offered in Fall only

GIS 520 Spatial Problem Solving (3 credit hours)
Focus on spatial problem solving from a geographic information perspective. Students learn to solve spatial problems through advanced analysis using geospatial technologies, learn to integrate and analyze spatial data in various formats, and explore methods for displaying geographic data analysis results to guide decision making. All course materials are delivered through the Internet, with optional weekly on-campus and synchronous online help sessions.

Prerequisite: GIS 510 or PA 541 or SSC 440
Typically offered in Fall and Spring

GIS 521 Surface Water Hydrology with GIS (3 credit hours)
The application of geographic information systems (GIS) to surface water modeling including stream and watershed delineations, regulatory wetlands jurisdiction determinations, and flood mapping. In addition students will develop spatial computation methods to support hydrological analysis in land use planning, landscape management, and engineering assessments.

Prerequisite: GIS 510 or PA 541 or SSC 440
Typically offered in Fall and Spring

GIS 530 Spatial Data Foundations (3 credit hours)
This course focuses on geospatial information systems from a mathematical and information science perspective. We discuss theoretical frameworks for conceptualizing geographic data, including levels of measurement, data control, and the vector data and raster data paradigms. Then we discuss the geometric underpinnings of geospatial systems: representing data with geographic elements, spatial referencing systems, and projection. Next, we explore map-related topology and computational geometry concepts. Finally, we survey the algorithms for core spatial manipulations, such as interpolation and polygon operations.

Prerequisite: GIS 510 or PA 541 or SSC 440
Typically offered in Fall and Spring

GIS 532 Geospatial Data Science and Analysis (2 credit hours)
This course provides the background and foundation necessary for geospatial analysis, with emphasis on spatial statistics. Introduction to data handling techniques, conceptual and practical geospatial data analysis and GIS in research will be provided. Problems raised by the use of geospatial data will be introduced to provide an awareness of issues, their consequences, and potential solutions. The focus of this course is application and interpretation of analytical methods, rather than derivation of techniques. Students will also explore the interoperability between open source analytical platforms (such as R) and GIS platforms, in addition to other open source software. Students should expect weekly assignments, lectures, and hands-on training using GIS and statistical software. Prior knowledge in basics of GIS is recommended. Topics include descriptive and inferential statistical methods for geospatial data.

Prerequisite: GIS 510
Typically offered in Spring only

GIS 535 Web and Mobile GIS Protocols (3 credit hours)
This course examines the design, development and deployment of web and mobile geospatial applications using internet and web-based protocols. Throughout the course, students will develop and deploy web and mobile GIS maps and applications relevant to their career using on-premises hosted infrastructure. Course participants will be required to complete assignments with data relevant to their interests. Additionally, students will search for and examine scientific and popular literature to understand how the course concepts are being employed and to foster ideas and discussion.

Prerequisite: GIS 510
Typically offered in Fall only

GIS 540 Geospatial Programming Fundamentals (3 credit hours)
This course provides fundamental skills for geospatial programming. Topics include calling geographic processing tools, batch processing, performing file i/o in an external computing language and building, graphical user interfaces and displays. To support these tasks, students learn basic programming concepts, such as pseudocode, flow-control, code re-use, and debugging. In the final project, students streamline GIS work-flow and customize GIS user interfaces. Familiarity with GIS software is required, but no prior programming experience is expected.

Prerequisite: GIS 510 or PA 541 or SSC 440
Typically offered in Fall and Spring

GIS 550 Geospatial Data Structures and Web Services (3 credit hours)
This course examines the spatial database models and structures used in geospatial information science and technology as well as the design and implementation of web and related mobile computing geospatial tools and systems. Students develop, evaluate, and deploy multiple spatial data models and web services that include connections to external data sources and systems.

Prerequisite: GIS 540
Typically offered in Fall and Spring

GIS 582/MEA 582 Geospatial Modeling (3 credit hours)
The course provides foundations in methods for GIS-based surface analysis and modeling. The topics include proximity analysis with cost surfaces and least cost paths, multivariate spatial interpolation and 3D surface visualization. Special focus is on terrain modeling, geomorphometry, solar irradiation, visibility, and watershed analysis. Students are also introduced to the basic concepts of landscape process modeling with GIS and to the principles of open source GIS. Introductory level knowledge of GIS or surveying/ geomatics principles is required.

Typically offered in Fall and Spring

GIS 584/MEA 584 Mapping and Analysis Using UAS (3 credit hours)
The course provides an overview of UAS mapping technology and its rules and regulations. The principles of UAS data collection are explained along with optional hands-on practice with in flight planning and execution. The main focus is on processing imagery collected from UAS using structure from motion techniques and deriving orthophoto mosaics and ultra-high resolution digital elevation models of land surface, vegetation and structures. More advanced topics include multi-temporal 3D data analysis, fusion with lidar data and 3D visualization.

Prerequisite: GIS 510 or GIS/MEA 582 or Permission of Instructor
Typically offered in Summer only

GIS 590 Geospatial Information Science Master's Project (3 credit hours)
This is the culmination course for The Master of Geospatial Information Science and Technology degree. This course provides students with the opportunity to demonstrate their accumulated degree skills and expertise by developing and communicating the solution to a complex geospatial problem through a Master's Capstone project. The project will include interoperable spatial and non-spatial data, web services, customized user interfaces and workflows completed in collaboration with a community partner. The student will design and manage a major project and professionally communicate their analysis and results to a public audience.

Prerequisite: GIS 550
Typically offered in Fall and Spring

GIS 595 Special Topics in Geospatial Information Science (1-6 credit hours)
Special Topics in Geospatial Information Science

Typically offered in Fall and Spring

GIS 601 Seminar in Geospatial Information Science (1 credit hours)
Seminar in Geospatial Information Science

Typically offered in Fall and Spring

GIS 609 Geospatial Forum (1 credit hours)
The Geospatial Forum brings together researchers, educators, practitioners, and students of the geospatial sciences in an exciting, weekly series of lively presentations and facilitated discussions centered upon frontiers in geospatial analytics and geospatial solutions to complex challenges. Live discussions are recorded and made available online for students.

Typically offered in Fall and Spring

GIS 610 Special Topics in Geospatial Information Science (1-6 credit hours)
Special Topics in Geospatial Information Science

Typically offered in Fall and Spring

GIS 630 Independent Study (1-3 credit hours)
Advanced topics not otherwise included in curriculum for advanced graduate students on a tutorial basis. Determination of credits and content by participating faculty in consultation with Director of Graduate Programs. Departmental consent required

Typically offered in Fall, Spring, and Summer

GIS 660 MGIST Professional Portfolio (1 credit hours)
This course will focus on creating an effective digital portfolio, including content selection, description and reflection, and web site organization and design. The digital portfolio will present personal MGIST program accomplishments to demonstrate individual competences through knowledge, skills, and abilities of a geospatial science professional. Intended for students in their last semester in the MGIST Program.

Restriction: Graduate Student in the MGIST Program; Corequisite: GIS 590
Typically offered in Fall and Spring

GIS 710 Geospatial Analytics for Grand Challenges (3 credit hours)
Examination of sustainable solutions to grand societal challenges using geospatial analytics. Emphasis is placed on the roles that location, spatial interaction, and multi-scale processes play in scientific discovery and communication. Discussion of seminal and leading-edge approaches to problem-solving is motivated by grand challenges such as controlling the spread of emerging infectious disease, providing access to clean water, and creating smart and connected cities. Students also engage in several written and oral presentation activities focused on data science communication skills and professionalization.

Typically offered in Fall only

GIS 711/CSC 711 Geospatial Data Management (3 credit hours)
Data management principles and technologies for efficient implementation of geospatial applications. This course introduces students to: spatial and temporal data types, data models, geometry models, spatial predicates, spatial access methods, and spatial query processing. In addition, students will be exposed to modern data management systems for geospatial application development and data integration principles. Prior GIS programming knowledge and knowledge of database management systems and SQL is preferred.

Typically offered in Spring only

GIS 712 Environmental Earth Observation and Remote Sensing (3 credit hours)
Focus is on passive electro-optical (microwaves, infrared and visible) remote sensing and will cover the physics of remote sensing, light interactions with Earth surface materials, limitations, advantages and disadvantages of passive remote sensing techniques, estimation of bio/geo-physical parameters from remote sensing data, and sensor performance and mission design for applications including hydrology, cryosphere, atmosphere-ocean dynamics, ecosystems and carbon cycle, and land use land cover change. Students should have introductory knowledge of GIS and remote sensing.

Typically offered in Fall only

GIS 713 Geospatial Data Mining (3 credit hours)
This course equips students with the theoretical background and practical computational skills required to use data mining methodologies, including clustering, PCA, spatial autocorrelation, neural networks, classification and regression trees, and high performance, open source geocomputation. The course is designed around, and pays particular attention to, approaches for data with spatial components. Students are expected to have a working knowledge of basic geographic principles, statistical principles, GIS, and remote sensing. Some experience with R programming would also be beneficial.

Typically offered in Fall only

GIS 714 Geospatial Computation and Simulation (3 credit hours)
This course focuses on theoretical concepts and computational methods that describe, represent and simulate the functioning of real-world geospatial processes. We define the general properties of geospatial computing and explain the role of simulations in analysis and understanding of observed spatial phenomena, testing of hypotheses and theories, and prediction of spatio-temporal systems behavior. We discuss the current methods and techniques for simulations using deterministic, stochastic and rule-based models as well as agent-based simulation of complex systems. Hands-on component of the course will cover implementation of simulations in GIS and advanced applications driven by the student's research. Some prior programming experience is expected along with exposure to geospatial modeling, such as in GIS/MEA 582 or equivalent.

Restriction: 15GAPHD or Permission of Instructor
Typically offered in Spring only

GIS 715 Geovisualization (3 credit hours)
This course focuses on visualization and interface design for geospatial analytics. With readings from textbooks and visualization literature, we'll discuss the applied science visualization, the human visual system, properties of light and color, visual salience, motion and space perception, human-computer interaction, and visual thinking processes at it relates to geospatial data. The course will also include hands-on exploration of free and open source geospatial data manipulation and geovisualization tools and interaction with current technologies within the Center for Geospatial Analytics' Geovisualization Laboratory. Some prior programming experience is preferred (GIS540 or equivalent).

Restriction: Graduate standing in Geospatial Analytics or Permission of Instructor
Typically offered in Spring only

GIS 790 Special Topics in Geospatial Analytics (1-6 credit hours)
Special Topics in Geospatial Analytics

Typically offered in Fall, Spring, and Summer

GIS 810 Special topics in Geospatial Analytics (1-6 credit hours)
Special topics in Geospatial Analytics

Typically offered in Fall, Spring, and Summer

GIS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Typically offered in Fall and Spring

GIS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Typically offered in Fall and Spring

Geography (GEO)

GEO 200 Principles of Geography (3 credit hours)
Basic ideas in the field of geography. The scope of geography as an academic field explored. Emphasis placed on mastery of geographic tools, e.g., maps, globes, and media materials and sources. Regional study of contemporary world.

GEP Social Sciences
Typically offered in Spring only

GEO 220/SOC 220 Cultural Geography (3 credit hours)
Investigates the world's past and present cultural diversity by studying spatial patterns of population, language, religion, material and non-material culture, technology and livelihoods, communities and settlements and political organization and interaction.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Summer only

Global Knowledge (GK)

GK 295 Global Knowledge Special Topics (1-3 credit hours)
Special topics course offering for the general education Global Knowledge category.

Global Public Health (GPH)

GPH 112 Wicked Problems, Wolfpack Solutions: Global Pandemic (2 credit hours)
Wicked Problems, Wolfpack Solutions is a shared academic experience designed for all students new to NC State. Each year, this course focuses on a current wicked problem, defined as a highly complex problem that can only be addressed through collaborative, multidisciplinary efforts. This course explores a wicked problem and possible solutions through the perspectives of NC State scholars representing many different areas of study and reflects NC State's commitment to inclusion of individuals and ideas from a broad diversity of backgrounds and experiences. GPH 112 focuses on the wicked problem of Global Pandemics.

R: New First-Year Students and New Transfer Students
GEP Interdisciplinary Perspectives
Typically offered in Summer only

GPH 201 Fundamentals of Global Public Health (3 credit hours)
Introduction to Public Health, providing a population-based perspective on disease and injury causation and prevention. Environmental, social, behavioral, and biological determinants of health and disease. Access to health services from a global perspective. Selected tools of disease control and health promotion and problems related to health-care delivery to society as a whole and to vulnerable populations.

Typically offered in Fall and Spring

GPH 404/ST 404 Epidemiology and Statistics in Global Public Health (3 credit hours)
This course will provide a general introduction to the quantitative methods used in global health, combining elements of epidemiology and biostatistics. The course will focus on linear and logistic regression, survival analysis, traditional study designs, and modern study designs. Students will learn fundamental principles in epidemiology, including statistical approaches, and apply them to topics in global public health. The course prerequisite is a B- or better in one of these courses: ST 305, ST 311, ST 350, ST 370, or ST 371. In addition, a B- or better in GPH 201 is strongly recommended.

Pre-requisite: B- or better in one of these courses: ST 305, ST 311, ST 350, ST 370, or 371
Typically offered in Fall only

GPH 425 Global Health and Physiology (6 credit hours)
This Study Abroad course is designed to immerse students in current physiology and disease research, tropical medicine, and global health issues while providing students with an opportunity to gain hands-on experience in the field of global health. Students spend three weeks on campus exploring scientific, policy, cultural, and governmental influences on global health before traveling to a developing country to participate in medical service outreach for 2 weeks. Application to and acceptance into this Study Abroad course and payment for travel is required for course participation.

Prerequisite: C- or better in BIO 212 or BIO 250 of BIO 240 or BIO 245
Typically offered in Summer only

Graduate Economics (ECG)

ECG 515/FOR 515 Environmental and Resource Policy (3 credit hours)
Application of price theory and benefit-cost analysis to public decisions related to resources and environment. Emphasis on evaluation of water supply and recreation investments, water quality management alternatives, public-sector pricing, common property resources and optimum management of forest and energy resources.

Prerequisite: EC(ARE) 301 or 401
Typically offered in Spring only

ECG 528/FIM 528/MA 528 Options and Derivatives Pricing (3 credit hours)
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

Prerequisites: MA 341 and MA 405 and MA 421
Typically offered in Fall only

ECG 530 Topics in Labor Economics (3 credit hours)
This course covers topics in labor economics including labor supply, labor demand, human capital, household production, discrimination, and immigration. The course textbook will be supplemented with readings from academic research papers. Students will learn how empirical research evaluates the predictions of economic theory and the impact of public policy. Students will gain an understanding of how to read and critique empirical research by applying the theory and measurement techniques developed by economists.

Prerequisites: ECG 505 and ECG 561
Typically offered in Spring only

ECG 537 Health Economics (3 credit hours)
Microeconomic analysis of public and private policy issues concerning health care financing and delivery in United States including: choice under conditions of asymmetric information; health insurance; performance of physician, hospital, long-term care and pharmaceutical markets.

Prerequisite: EC(ARE) 401 or ECG 700
Typically offered in Fall only

ECG 540 Economic Development (3 credit hours)
Examination of problems encountered in promoting regional and national economic development. Consideration given to structural changes required for raising standards of living. Some basic principles of economics applied to suggest ways of achieving development goals. Planning strategies, policies and external assistance.

Prerequisite: EC(ARE) 301 or 401
Typically offered in Spring only

ECG 548 International Economics (3 credit hours)
This course covers the determinants of international trade, migration, and investment and their connection with economic growth. It also covers macro/monetary issues, including exchange rates, financial markets and monetary-fiscal policy in open economies.

Prerequisite: EC 301
Typically offered in Spring only

ECG 561/ST 561 Applied Econometrics I (3 credit hours)
Introduction and application of econometrics methods for analyzing cross-sectional data in economics, and other social science disciplines, such as OLS, IV regressions, and simultaneous equations models. Students should have had a statistical methods course at the 300 level or above as well as Calculus I and II.

Typically offered in Fall only

ECG 562 Applied Econometrics II (3 credit hours)
This course is a continuation of Applied Econometrics I (ECG 561). After a review of probability and statistics, and simple and multiple regression models, we explore the following topics: regression using panel (longitudinal) data, instrumental variables regression, regression with a binary dependent variable, prediction with many regressors and ``Big Data'' methods, and time series regression. The emphasis is on recognizing the conditions in which it is appropriate to apply the various techniques, formulating a relevant model, estimating the model and interpreting the results. This course will also provide the students practical experience in applied econometrics using STATA.

P: ECG 561
Typically offered in Spring only

ECG 563 Applied Microeconometrics (3 credit hours)
This course will survey econometric methods for the analysis of panel and limited dependent variable data. Both the theoretical foundation and empirical application of methods will be covered. Topics include fixed and random effects, program evaluation, censored, truncated, discrete choice and count data models. Although not required, ECG 561, ST 511 or ST 512 is encouraged prior to taking this class.

Typically offered in Fall only

ECG 564 Big Data Econometrics (3 credit hours)
The goal of this course is to introduce students to a wide range of methods, which are designed to tackle commonly seen real-world problems, and are intensively used in the current literature. These methods include linear regression, logistic regression, bootstrapping, cross validation, bagging, boosting, splines, random forests, neural networks, and support vector machines. This course is application oriented. We will emphasize the intuition behind each method and touch on a little bit of theory.

P: EC 451 or ECG 561 or ST 430
Typically offered in Fall only

ECG 590 Special Economics Topics (1-6 credit hours)
Examination of current problems on a lecture-discussion basis. Course content varies as changing conditions require new approaches to deal with emerging problems.

Typically offered in Fall, Spring, and Summer

ECG 630 Independent Study (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

ECG 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ECG 700 Fundamentals of Microeconomics (3 credit hours)
Preparatory course for ECG701-702, intended for those lacking sufficient background to go directly into those courses Economic theory with extensive use of calculus. Consumer and producer optimization. Price and output determination in competitive markets, monopoly, and imperfectly competitive markets. Factor Markets. General equilibrium, externalities and public goods.

Prerequisite: MA 131 and EC(ARE)301
Typically offered in Fall only

ECG 701 Microeconomics I (3 credit hours)
Theory of consumer behavior. Primal-dual relationships in consumer theory including indirect utility functions and consumer expenditure functions. Properties of consumer demand functions. Consumer welfare measurement. Production technology and the theory of the firm including cost minimization and profit maximization. Dual relationships in producer theory including cost functions and profit functions. Properties of firm output supply and input demand equations. Long-run market equilibrium in a competitive market environment. Market equilibrium with upward sloping input supply equations. The theory of monopoly.

Prerequisite: ECG 700, MA 231
Typically offered in Fall only

ECG 702 Microeconomics II (3 credit hours)
General equilibrium. Economics of information and uncertainty. Game theory. Mechanism design and social choice. Contract theory.

Prerequisite: ECG 701
Typically offered in Spring only

ECG 703 Fundamentals of Macroeconomics (3 credit hours)
Fundamental topics in macroeconomics, including consumption, investment, government purchases, taxation, government debt, output supply, money and inflation, unemployment, elementary economic growth. Emphasis is on the microeconomic foundations of macroeconomics. Economic intuition is stressed.

Prerequisite: EC(ARE) 301,EC 302,BUS(ST)350,MA 131
Typically offered in Spring only

ECG 704 Macroeconomics I (3 credit hours)
Rigorous examination of basic macroeconomic theory, including household choice of consumption demand and labor supply, capital accumulation and economic growth, government purchases, taxation, government debt, investment, consumption and investment under uncertainty, real business cycle models. Throughout the course, the connection between economic intuition and formal mathematical analysis is emphasized. The level of mathematical rigor is high.

Prerequisite: ECG 561, ECG 703, MA 242
Typically offered in Fall only

ECG 705 Macroeconomics II (3 credit hours)
Continuation of ECG 704. Topics include, but are not limited to, money demand and supply; money and growth; inflation; term structure of interest rates; money and fluctuations, including real and New Keynesian models; theories of unemployment; conduct of policy and problems of time consistency; asset pricing; introduction to open economy models.

Prerequisite: ECG 704
Typically offered in Spring only

ECG 706 Industrial Organization (3 credit hours)
Survey of microeconomic literature on industrial organization: internal structure of the firm, number and sizes of firms in an industry, pricing and output behavior of firms. Public policy, including antitrust laws, patent and copyright laws, and government regulation of industry.

Prerequisite: ECG 700
Typically offered in Fall only

ECG 707 Topics In Industrial Organization (3 credit hours)
Advanced study of selected topics such as oligopoly theory, empirical models of industry, principal-agent contracts, economic theories of firm organization, antitrust issues, economic theories of regulation and economics of property rights.

Prerequisite: ECG 700
Typically offered in Spring only

ECG 708 Advanced Microeconomic Theory (3 credit hours)
Survey of literature on game theory focusing on applications to numerous areas of economics. Course will cover the classic literature on auctions, matching theory and non-cooperative game theory. Special focus on applying these theoretical results to practical problems of market design.

Prerequisite: ECG 702
Typically offered in Fall only

ECG 709 Behavioral and Experimental Economics (3 credit hours)
Survey of literature on behavioral and experimental economics from a broad perspective, with coverage of numerous fields of economics, including both laboratory and field experiments. Methodology of experimental economics and design of laboratory and field experiments will be covered.

Prerequisite: ECG 702
Typically offered in Spring only

ECG 715 Environmental and Resource Economics (3 credit hours)
Theoretical tools and empirical techniques necessary for understanding of resource and environmental economics, developed in both static and dynamic framework. Discussions of causes of environmental problems, possible policies and approaches to nonmarket valuation. Analysis of resource use over time using control theory for both renewable and exhaustible resources.

Prerequisite: ECG 700
Typically offered in Fall only

ECG 716 Topics In Environmental and Resource Economics (3 credit hours)
Advanced study of selected topics in environmental and resource economics. Topics vary with interests of instructor and students.

Prerequisite: ECG 715
Typically offered in Spring only

ECG 730 Labor Economics (3 credit hours)
Application of microeconomic theory and econometric methods to labor market behavior in both static and dynamic contexts. Labor demand analysis, labor force participation, hours of work, household production, human capital, distribution of earnings,information and search, and mobility.

Prerequisite: ECG 700 and one of the following: ECG(ST) 561, ST 422, ST 512, ST 708
Typically offered in Fall only

ECG 739 Empirical Methods for Development Economics and Applied Microeconomics (3 credit hours)
This course will provide an in-depth study of the application of the core tools of causal inference and microeconometrics to answer questions in development microeconomics. The class will largely consist of two activities: (1) close reading and guided discussion of seminal and recent papers and (2) the analysis of real data to estimate causal relationships. While the particular applications we study will come largely from development economics, the course is intended to be useful to students in diverse areas of applied micro.

Prerequisite: ECG 751 and ECG 753
Typically offered in Spring only

ECG 740 Economic Growth and Development (3 credit hours)
Microeconomic issues of growth. Technology adoption and the distributional effects of technical change; the role of agriculture in economic development; land tenure and tenancy arrangements; the role of agrarian institutions in the development process; and poverty, inequality and economic growth in developing countries. Approximately equal time devoted to theory and evidence.

Typically offered in Fall only

ECG 741 Agricultural Production and Supply (3 credit hours)
Advanced study in logic of, and empirical inquiry into, producer behavior and choice among combinations of factors and kinds and qualities of output; aggregative consequences of individuals' and firms' decisions in terms of product supply and factordemand; factor markets and income distribution; and general interdependency among economic variables.

Prerequisite: ECG 700
Typically offered in Fall only

ECG 742 Consumption, Demand and Market Interdependency (3 credit hours)
Analysis of behavior of individual households and of consumers in aggregate with respect to consumption of agricultural products; impact of these decisions on demand for agricultural resources, competition among agricultural regions and for markets;and interdependence between agriculture and other sectors of the economy.

Prerequisite: ECG 700
Typically offered in Spring only

ECG 748 Theory Of International Trade (3 credit hours)
Consideration of specialized body of economic theory dealing with international movement of goods, services, capital and payments. A theoretically oriented consideration of policy.

Prerequisite: ECG 700, 703
Typically offered in Spring only

ECG 749 Monetary Aspects Of International Trade (3 credit hours)
Macroeconomic problems of an open economy including balance of payments adjustment mechanism, alternative exchange rate systems, external effects of monetary and fiscal policy, optimum currency areas and international monetary reform.

Prerequisite: ECG 703
Typically offered in Fall only

ECG 750/ST 750 Introduction to Econometric Methods (3 credit hours)
Introduction to principles of estimation of linear regression models, such as ordinary least squares and generalized least squares. Extensions to time series and panel data. Consideration of endogeneity and instrumental variables estimation. Limited dependent variable and sample selection models. Attention to implementation of econometric methods using a statistical package and microeconomic and macroeconomic data sets.

Prerequisite: ST 421; Corequisite: ST 422
Typically offered in Spring only

ECG 751/ST 751 Econometric Methods (3 credit hours)
Introduction to important econometric methods of estimation such as Least Squares, instrumentatl Variables, Maximum Likelihood, and Generalized Method of Moments and their application to the estimation of linear models for cross-sectional ecomomic data. Discussion of important concepts in the asymptotic statistical analysis of vector process with application to the inference procedures based on the aforementioned estimation methods.

Prerequisite: ST 421, ST 422
Typically offered in Fall only

ECG 752/ST 752 Time Series Econometrics (3 credit hours)
The characteristics of macroeconomic and financial time series data. Discussion of stationarity and non-stationarity as they relate to economic time series. Linear models for stationary economic time series: autoregressive moving average (ARMA) models; vector autoregressive (VAR) models. Linear models for nonstationary data: deterministic and stochastic trends; cointegration. Methods for capturing volatility of financial time series such as autoregressive conditional heteroscedasticity (ARCH) models. Generalized Method of Moments estimation of nonlinear dynamic models.

Prerequisite: ECG(ST) 751
Typically offered in Spring only

ECG 753/ST 753 Microeconometrics (3 credit hours)
The characteristics of microeconomic data. Limited dependent variable models for cross-sectional microeconomic data: logit/probit models; tobit models; methods for accounting for sample selection; count data models; duration analysis; non-parametricmethods. Panel data models: balanced and unbalanced panels; fixed and random effects; dynamic panel data models; limited dependent variables and panel data analysis.

Prerequisite: ECG 751
Typically offered in Spring only

ECG 765 Mathematical Methods For Economics (3 credit hours)
Linear algebra and matrices, optimization with equality and inequality constraints, comparative statistics, differential and difference equations, intertemporal optimization. Economic applications to utility and profit maximization, national income determination, economic growth, business cycles.

Prerequisite: MA 231 , introductory course in linear algebra
Typically offered in Fall only

ECG 766 Computational Methods in Economics and Finance (3 credit hours)
Fundamental methods for forumlating and solving economic models numerically will be developed. Emphasis on defining the mathematical structure of problems and practical computer methods for obtaining model solutions. Major topics include solution of systems of equations, complementarity relationships and optimization. Finite and infinite dimensional problems will be addressed, the latter through the use of finite dimensional approximation techniques. Particular emphasis placed on solving dynamic asset pricing, optimization and equilibrium problems. MS in Financial Mathematics Program required.

Prerequisite: (MA 305 or MA 405) and MA 341 and EC 301 and EC 302 and (CSC 112 or 114) or equivalents.
Typically offered in Fall only

ECG 784 Advanced Macroeconomics (3 credit hours)
Advanced study of macro-economics. Emphasis on business cycles and behavior of real variables. Real, incomplete information and disequilibrium theories of the business cycle; rational expectations; contract theory and indexation; investment; and effects of government expenditure, taxes and debt.

Prerequisite: ECG 704
Typically offered in Spring only

ECG 785 Monetary Economics (3 credit hours)
