Field course for students desiring a specialization in monetary economics or macroeconomics. Survey of current topics in monetary theory and policy.

Prerequisite: ECG 705
Typically offered in Spring only

ECG 790 Avanced Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

ECG 830 Independent Study (1-3 credit hours)
Typically offered in Fall and Summer

ECG 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Graphic Communications (GC)

GC 120 Foundations of Graphics (3 credit hours)
Introductory course providing orientation to language of graphics for students majoring in any field. Designed to help develop ability to use CAD within the context of a concurrent design process to understand how everyday objects are designed, analyzed and created. Emphasis placed on decision-making processes involved with creating geometry and development of modeling strategies that incorporate intentions of designer.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

GC 250 Architectural Graphic Communications (3 credit hours)
Architectural Graphic Communications is an advanced graphic course designed to expand on the concepts covered in the introductory courses (GC 120, GC 210, GC 211). The emphasis is on strengthening architectural sketching and CAD drawing skills and showing how specific construction processes and materials selected for an architectural design affect commercial and residential production architectural drawings. Topics include perspectice drawing, shadow projection, texturization, rendered plans,elevations and other related topics.

Prerequisite: GC 120 or TDE 220
Typically offered in Fall and Spring

GC 320 3D Spatial Relations (3 credit hours)
Analysis and solution of three-dimensional space problems utilizing graphic principles of orthogonal projection techniques. Application of studies of lines; surfaces; solids; surface intersections; surface development; vectors; and civil, mechanical, and geographical structures.

Prerequisite: GC 120
GEP Mathematical Sciences
Typically offered in Fall and Spring

GC 330 Basic Technical Animation (3 credit hours)
Create technical animations to communicate scientific and technical information to a variety of audiences and environments. Includes performing basic skills in image processing including cropping, transformations, color manipulation and color enhancement. Students will apply basic concepts of constructing 3-D objects, spaces, and environments. Create technical animations which apply environmental attributes including surface study, texture, color, lighting models, photo-realism, and raytracing.

Prerequisite: GC 120 or TDE 220
Typically offered in Fall only

GC 340 Concepts of Website Development (3 credit hours)
An introduction to the essential elements of web site development for students in Technology Education and Graphic Communications. Content focuses on planning and executing web site for educational effectiveness, user interfaces, site testing, and maintenance. Course provides instruction in software appropriate for creating a website.

Typically offered in Summer only

GC 350 Applied CAD/D and Geometric Controls (3 credit hours)
Techniques for producing mid-level computer models of individual parts and assemblies of parts. Application of conventional tolerancing and geometric tolerancing and dimensioning. Investigation of design for manufacture and CAD/CAM (Computer-AidedDesign/Computer-Aided Manufacture) processes. Conventions and standards for technical drawing documentation.

Prerequisite: GC 120
Typically offered in Fall and Spring

GC 420 Visual Thinking (3 credit hours)
Develop visual thinking skills through a series of exercises using various visual media. Integrates and stresses drawing and construction activities essential to visual thinking. Emphasis on direct observation (seeing), mental imagery and sketching that is based upon three-dimensional space. Develops students' visual and drawing skills and provides for their application toward solving open-ended spatial problems. Intended for the scientific and technically oriented student.

Typically offered in Fall and Spring

GC 450 Advanced Graphics Usage with CAD (3 credit hours)
Advanced applications of 3-dimensional solid modeling tools in technical and engineering environments. Theory and application of manufacturing databases developed with 3-D modeling tools. Development and management of 3-D geometry using modeling software. Emphasis on application of 3-D modeling technology.

Prerequisite: GC 350 -- Applied CAD/D and Geometric Controls
Typically offered in Fall and Spring

GC 496 Special Topics in Graphic Communications (1-4 credit hours)
Topical study in areas of current interest and need to students and/or needs of curricula served by Graphic Communications.

Typically offered in Fall, Spring, and Summer

GC 498 Independent Study in Graphic Communications (1-4 credit hours)
Independent study in areas of current interests and needs of students in the field of Graphic Communications and the visual sciences. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: GC 120 or TDE 220
Typically offered in Fall, Spring, and Summer

Graphic Design (GD)

GD 201 Design, Context, and Experience (6 credit hours)
Introduction to analysis and form-making in graphic design through investigations of design artifacts as components of larger and physical, social, cultural, and technological systems. Appropriate student-owned technology and software required. Graphic Design Majors Only, except with Department Head permission

Prerequisite: GD 210 Co-requisite: GD 217
Typically offered in Fall only

GD 202 Designing for Settings, People, and Use (6 credit hours)
Relationships among audience/user interpretive behavior, attributes of physical and cultural settings, and objects with attention to different perspectives on the role of the designer. Graphic Design Majors Only, except with Department Head permission.

Prerequisite: GD 201, GD 217; Corequisite: GD 317
Typically offered in Spring only

GD 203 History of Graphic Design (3 credit hours)
Events, ideas, movements, designs and individuals that have historical significance and influence on contemporary graphic design and the graphic design profession. Concentration on graphic design of the last 100 years.

GEP Visual and Performing Arts
Typically offered in Spring only

GD 210 Image and Tech Tinkering (6 credit hours)
GD 210 is an introduction to exploration with imagery and technology. It introduces basic critical and interpretative ideas about images in context and with users in mind. This includes fundamentals of both the reproduction and experience of imagery that are particularly relevant to the Graphic Design curriculum. GD 210 also introduces students to technologies relevant to current and future design practice, and nurtures rapid ideation through prototyping techniques. Graphic Design majors only, except with Department Head permission.

Prerequisite: D 104
Typically offered in Spring only

GD 217 Typography and Technology (3 credit hours)
Introduction to typography with respect to four primary systems: reading, form, language, and technology. Appropriate student-owned technology and software required. Graphic Design majors only, except with Department Head permission.

Prerequisite: GD 210
Typically offered in Fall only

GD 301 Branding, Interaction, and Service Design (6 credit hours)
Investigations of branding, interaction, and service design in response to problems of complex systems and contexts. Graphic Design majors only, except with Department Head permission.

Prerequisite: GD 202. Corequisite: GD 417
Typically offered in Fall only

GD 303 Graphic Design Theory and Practice (3 credit hours)
An examination of theories and critical perspectives shaping graphic practice. The course includes a discussion of contemporary design strategy in business and the role of visual communication in the information age.

GEP Visual and Performing Arts
Typically offered in Fall only

GD 310 Visualization, Representation, and Display (3 credit hours)
Surveying, documenting, and interpreting sites and subjects; representing relationships among settings, people, and objects through image-making strategies, such as activity maps, interviews, panoramas, and visual essays. Graphic Design majors only, except with Department Head permission for other college of design majors.

Prerequisite: GD 210
Typically offered in Spring only

GD 317 Typographic Language, Writing, and Reading (3 credit hours)
Continuation of typography and technology with greater emphasis on the individual reading experience, including page sequencing, grids, and the relationship between historical conventions and new interpretive demands on readers. Graphic Design majors only, except with Department Head permission.

Prerequisite: GD 217
Typically offered in Spring only

GD 400 Advanced Graphic Design Studio (6 credit hours)
Topical and interdisciplinary studios addressing advanced visual communication problems. Graphic Design Majors only, except with Department Head permission.

Prerequisites: GD 301 and GD 203 and GD 303
Typically offered in Fall and Spring

GD 401 Graphic Design Practicum (3 credit hours)
Capstone experience focused on the transition from school to career. Individual capstone project and discussions of professional practice, guidelines, and ethics. Graphic Design majors only, seniors.

Prerequisite: GD 301 and GD 410 and GD 417
Typically offered in Fall only

GD 410 Online and Mobile Interaction Design Systems (3 credit hours)
Exploration of dynamic communication systems, including methods for visualizing user interaction, setting conditions for user experience, and managing collaborative work. Graphic Design majors only, except with Department Head permission for other College of Design majors.

Prerequisite: GD 310
Typically offered in Fall only

GD 417 Information and Publishing Design Systems (3 credit hours)
Continuation of typographic language, writing, and reading with attention to advanced grid, form, and font systems in the design of multi-page documents, as well as issues of production and printing. Graphic Design majors only, except with Department Head permission.

Prerequisite: GD 317
Typically offered in Fall only

GD 490 Graphic Design International Studio (6 credit hours)
Define visual communication design problems and develop design solutions in an international setting. Studio projects related to design, culture, and traditional and contemporary visual communication. Directed studies in history and culture, and in artifact making. Additional travel and trip costs are required beyond registration fees, as well as appropriate immunizations.Graphic Design majors and departmental approved Elective ("swing") Studio for all other College of Design Majors with Junior or Graduate Standing in Major.

Prerequisite: Junior standing in the major and Study Abroad Office approval
Typically offered in Summer only

GD 492 Special Topics in Graphic Design (3 credit hours)
Topics of current interest in Graphic Design. Normally used to develop new courses. Graphic Design Majors, and department approved elective for all other college of Design Majors with Junior or Graduate standing in major.

Prerequisite: Jr standing in Graphic Design major
Typically offered in Fall, Spring, and Summer

GD 494 Internship in Graphic Design (3 credit hours)
Supervised field experience in graphic design offices and organizations. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in Graphic Design and 3.0 GPA or better
Typically offered in Fall, Spring, and Summer

GD 495 Independent Study in Graphic Design (1-3 credit hours)
Special projects in graphic design developed under the direction of a faculty member on a tutorial basis. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in Graphic Design and 3.0 GPA or better
Typically offered in Fall, Spring, and Summer

GD 501 Graduate Graphic Design Studio (9 credit hours)
Student-defined graphic design projects in response to critical content framework presentation by GD 571 faculty. Center of framework on role of design objects as cognitive artifacts and extension, transformation or diminishment of human thought by their form and content. Interaction of potential audiences with designer-created artifacts. Graphic design majors only.

Corequisite: GD 571
Typically offered in Fall only

GD 502 Graduate Graphic Design Studio II (9 credit hours)
Student-defined graphic design projects in response to critical content framework presentation by GD 572 faculty. Center of framework on role of design objects as cultural artifacts and their reflection on social diversity of both designers and audiences. Creation, reproduction, distribution and reception of messages in both designer-created artifacts and audience's response. Graphic design majors only.

Prerequisite: GD 501, Corequisite: GD 572
Typically offered in Fall only

GD 503 Graduate Graphic Design Studio III (9 credit hours)
Student-defined graphic design projects in response to critical content framework presentation by GD 671 faculty. Center of framework on nature of new information environments. Shape and response of technologies to new cognitive and cultural relationships among audiences.

Prerequisite: GD 573, Corequisite: GD 671
Typically offered in Spring only

GD 510 Imaging for Graphic Design IV (3 credit hours)
Advanced problems in the visual design and structuring of information in interactive multimedia presentations. Topics include the design of interfaces, navigation, motion graphics, and websites as well as exploration of narrative and hypermedia approaches to the organization of content.

Prerequisite: GD 410, Design Majors
Typically offered in Spring only

GD 517 Type IV (3 credit hours)
Advanced problems of typographic expression/communication in which typographic variables are used to alter, enhance, or reinforce verbal meaning. Historic precedent and experimentation with the conventions for typographic form are explored. The impact of the computer on changes in typographic aesthetics, including motion graphics, typeface design, and website design.

Prerequisite: GD 417, Design Majors
Typically offered in Spring only

GD 571 Design As Cognitive Artifact (3 credit hours)
Relationship between theories of human cognition and graphic design. Analysis and critique of design objects as cognitive artifacts and extension, transformation or diminishment of human thought by their form and content. A critical examination of cognitive, linguistic and social science theories shaping graphic design. Non-majors by permission only.

Typically offered in Spring only

GD 572 Design as Cultural Artifact (3 credit hours)
Introduction to recent theories in various disciplines concerning a cultural understanding of graphic design. Theories of mass and popular culture, critiques of creativity and authorial intentionality, influences of interpretive criticism, theories of consumption and issues of cultural representation. Emphasis on adaptation of these theories to an understanding of the cultural significance of graphic design. Non-majors by permission only.

Typically offered in Fall and Spring

GD 573 New Information Environments (3 credit hours)
Changing role of graphic design in new information environments. Implications of new technology on social construction of meaning, impact of electronic media on culture and cognition, and differences in designing artifacts and designing experiences.Non-majors by permission only.

Prerequisite: GD 503
Typically offered in Spring only

GD 580 Special Topics In Graphic Design History (1-6 credit hours)
Topics of current interest in interpretation, criticism, methodology and research, relating to graphic design history. Further specialized study in history of printing, typography, communication, image-making and information systems. Investigation of how we study artifacts, production and producers.

Prerequisite: GD 242
Typically offered in Spring only

GD 581 Graphic Design Final Project Research (3 credit hours)
A seminar course to assist students in preparing foundation for final project to be conducted in GD 688 Final Project Studio.

Prerequisite: GD 502
Typically offered in Fall only

GD 588 Final Project Studio In Graphic Design (6 credit hours)
Final project for graduate students supervised by members of their graduate advisory committees.

Prerequisite: GD 581
Typically offered in Spring only

GD 592 Special Topics In Graphic Design (1-6 credit hours)
Topics of current interest to program/option offered by faculty in School. Subjects offered under this number normally used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall only

GD 610 Special Topics In Graphic Design (1-6 credit hours)
An investigation of special topics in graphic design of a particular interest to advanced students under direction of chair of graduate committee on a tutorial basis; credit and content vary with each student.

Prerequisite: Permission of grad. advisor
Typically offered in Fall and Spring

GD 630 Independent Study In Graphic Design (1-3 credit hours)
Special problems in various aspects of graphic design developed under the direction of a faculty member on a tutorial basis.

Typically offered in Fall, Spring, and Summer

GD 676 Special Project In Graphic Design (1-3 credit hours)
Seminar on subjects of current interest in graphic design, presented by persons not part of regular faculty.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

GD 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

GD 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

GD 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

GD 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

Health and Exercise Studies Minor (HESM)

HESM 201 Coaching Baseball/Softball (2 credit hours)
Theories, techniques, and strategies of coaching baseball/softball.

HESM 202 Coaching Basketball (2 credit hours)
Theories, techniques, and strategies of coaching basketball.

Typically offered in Fall, Spring, and Summer

HESM 203 Coaching Football (2 credit hours)
Theories, techniques, and strategies of coaching football.

Typically offered in Fall and Spring

HESM 204 Coaching Golf (2 credit hours)
Theories, techniques, and strategies of coaching golf.

Typically offered in Fall, Spring, and Summer

HESM 205 Coaching Soccer (2 credit hours)
Theories, techniques, and strategies of coaching soccer.

HESM 207 Coaching Tennis (2 credit hours)
Theories, techniques, and strategies of coaching tennis.

HESM 209 Coaching Volleyball (2 credit hours)
Theories, techniques, and strategies of coaching volleyball.

Typically offered in Fall only

HESM 211 Strength Training and Conditioning (2 credit hours)
Knowledge and skills necessary for designing and implementing strength and conditioning programs. This course does not constitute credit toward meeting the minimum university Physical Education requirements

Typically offered in Fall and Spring

HESM 212 Alcohol, Drugs and Tobacco (2 credit hours)
Theories of drug use, pharmacology, tolerance, dependence, nicotine, alcohol usage, alcoholism, sedative-hypnotics, narcotics, amphetamines, cocaine, marijuana, hallucinogens, steroids and treatment. This course does not constitute credit toward meeting the Physical Education GER requirement

Typically offered in Fall, Spring, and Summer

HESM 213 Human Sexuality (2 credit hours)
Physiological and psychosocial aspects of human sexuality. Emphasis placed on health-related topics of birth control, pregnancy, childbirth, abortion and sexually-transmitted diseases. Concepts of gender acquisition, sexual values, and sexual morality discussed as related to the promotion of healthy lifestyles within contemporary American culture.

HESM 214/PRT 214 Foundations in Outdoor Leadership and Adventure Education (3 credit hours)
Foundations in outdoor leadership and adventure education topics include outdoor education history, group development models, experiential education theories, leadership styles and facilitation, risk management for groups, expedition and trip planning, employment opportunities, current trends and issues, environmental stewardship, assessment and evaluation.

Typically offered in Spring only

HESM 275 Behavior Change in Wellness (2 credit hours)
This course introduces students to the eight dimensions of wellness (social, physical, emotional, occupational, intellectual, environmental, spiritual, financial) and features a series of lectures, in-class activities and discussions, course readings, and personal wellness profile, co-curricular wellness activities, and a behavior change project. Wood Wellness Village first time residents; This course does not fulfill the health and exercise studies GEP requirement.

Restricted to: Wood Wellness Village Students only
Typically offered in Fall only

HESM 280 Responding to Emergencies (2 credit hours)
This course introduces the basics of first aid treatment for the lay rescuer. Topics include CPR, AED use, chocking and bleeding emergencies, and other basic first aid procedures. This course does not satisfy the Physical Education GEP requirement.

Typically offered in Fall, Spring, and Summer

HESM 284 Women's Health Issues (2 credit hours)
This course will review health and wellness issues affecting women through their life span. It will explore medical concerns and prevention as well as social health issues that disproportionately affect women in contemporary society. Discussions of current critical topics in women's health will also take place. Minor courses.

Typically offered in Fall, Spring, and Summer

HESM 285 Personal Health (2 credit hours)
Behavior change, wellness, stress management, cardiovascular diseases, alcohol and tobacco use, cancer, infectious diseases, arthritis, human sexual response, sexual assault, contraception, and sexually transmitted diseases. This course does not constitute credit toward meeting the Physical Education GER requirement

Typically offered in Fall, Spring, and Summer

HESM 286 Nutrition, Exercise and Weight Control (2 credit hours)
A nutrition, exercise and weight management program emphasizing the basics of proper nutrition and exercise. Emphasis on lifestyle changes and their relationship to appropriate weight management. Medical request

Typically offered in Fall, Spring, and Summer

HESM 287 Stress Management (2 credit hours)
Impact of stress upon the psychological and physiological function of the body. Exploration and interaction with stress management techniques. This course does not constitute credit toward meeting the Physical Education GER requirement

Typically offered in Spring only

HESM 300 Practicum in Health (1 credit hours)
This course focuses on applying program development, management, evaluation, and educational strategies and techniques within a health-related setting. Students are required to purchase internship liability insurance to participate in the practicum; the fee is automatically charged upon registration. Contact University Insurance & Risk Management for more details.

Prerequisite: HESM 285, HESM 375, HESM 377, and 6 hours of electives from the Health Minor
Typically offered in Fall, Spring, and Summer

HESM 301 Coaching Practicum (1 credit hours)
A 30-hour practical coaching experience in a middle school or high school setting. Specific placement will depend upon the various playing sessions for the sports involved. Students are required to purchase internship liability insurance to participate in the practicum; the fee is automatically charged upon registration. Contact University Insurance & Risk Management for more details.

Prerequisite: Requires departmental consent, First Aid, and CPR Certification or Equivalent
Typically offered in Fall, Spring, and Summer

HESM 303 Sports Science Practicum (1 credit hours)
A 30-hour practical sports science specialist experience in a fitness specific setting within the triangle area. Course does not constitute credit toward meeting the physical education requirement. Students are required to purchase internship liability insurance to participate in the practicum; the fee is automatically charged upon registration. Contact University Insurance & Risk Management for more details.

Prerequisite: Completed coursework in Sports Science Minor
Typically offered in Fall, Spring, and Summer

HESM 315 Challenge Course and Team Building Facilitation (3 credit hours)
Participants will learn the theory and practical skills necessary to facilitate and operate team building activities and high ropes challenge courses. Students will facilitate group initiatives, low course elements, zip lines and high course elements. Safety, risk management, programming, facilitation and debriefing techniques are presented and discussed in detail. Participate in one weekend of low elements and high course element training. Additional charge assessed for the field trip.

Typically offered in Spring only

HESM 316 Outdoor Education Pedagogy (3 credit hours)
Techniques for teaching outdoor skills and activities are covered including teaching and learning styles, lesson planning, classroom management and risk management. Emphasis is placed on presentations of skills instruction for outdoor educators. Students will make numerous outdoor activity skills presentations, including a student-led group presentation. Students will also evaluate and provide feedback for classmates. Students must participate in two required weekend field trips and a one-day group project at the NC State instructional climbing center. Additional charge assessed for the field trips. Refer to the online schedule of classes for the current charge and dates.

P: Two of the three courses: HESO 255, HESO 257, HESO 258
Typically offered in Fall only

HESM 324 Concert Dance History (3 credit hours)
An overview of the development of Western theatrical dance. This course introduces the major figures and movement theories of the 19th & 20th Centuries with particular emphasis on major stylistic trends and cultural influences. Readings, discussions, lectures, and films/videotapes will introduce selected choreographers and the concerns that inform their work. Additional readings in dance philosophy and aesthetics will address ideas such as form, expression, audience expectations, and performance conventions. A small fee may be required for concert attendance.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring only

HESM 370 Foundations of Sport Coaching and Instruction (2 credit hours)
This course will introduce methods of skill instruction, basic teaching strategies, and pedagogy in the area of sport coaching. Students will learn how to properly organize drills, plan safe and effective practices, present age-appropriate sport skills to athletes at the youth, middle and high school levels, and evaluate motor-skill development of athletes. This course will also explore psychomotor, cognitive, and affective development and performance of athletes in school and community settings. Students in this course will have the opportunity to teach cooperatively with peers and will also be presented with opportunities to teach micro-lessons in their area of sport interest.

Typically offered in Spring only

HESM 375 Health Planning and Programming (2 credit hours)
This course is designed to assist students in developing a foundation in health programming. Students will learn the necessary skills to develop, implement, and evaluate health education programs.

Prerequisite: HESM 285 Personal Health
Typically offered in Fall only

HESM 377 Methods of Health Promotion (2 credit hours)
This course focuses on methods and techniques for delivering health-related content to diverse populations. Cooperative learning, critical thinking, peer educator training, and decision-making will be applied to various health dimensions.

Typically offered in Spring only

HESM 381 Athletic Training (3 credit hours)
Incidence, causes, prevention and treatment of sports-related injuries. Conditioning for sports, injury recognition and evaluation, taping techniques, first aid care, treatment and reconditioning.

Prerequisite: HESM 280 or HESM 281 or or CPR/First aid Certification
Typically offered in Fall, Spring, and Summer

HESM 395 Special Topics in Health and Exercise Studies (1-3 credit hours)
Examination of selected topics in health, outdoor leadership, sports science, coaching, and dance. This course does not fulfill the GEP requirement for Health and Exercise Studies.

Typically offered in Fall, Spring, and Summer

HESM 402 Practicum Experience in Outdoor Programs (1 credit hours)
The practicum experience provides a short-term, supervised opportunity for students to participate in leading an outdoor activity course or program. The practicum is the integration of academic preparation with its application in a field setting. The student may be assigned to a Department of Health and Exercise Studies outdoor activity course, program or to an approved non-University program in order to meet this requirement. The practicum student must be directly involved in the program for a minimum of 30 hours. Students are required to purchase internship liability insurance to participate in the practicum; the fee is automatically charged upon registration. Contact University Insurance & Risk Management for more details.

Prerequisite: HESM 214, HESM 315, HESM 316, First aid/CPR certification or equivalent
Typically offered in Fall, Spring, and Summer

HESM 476 Motor Learning and Sport Performance (3 credit hours)
This course will introduce the concepts, principles, and theories dealing with the performance of motor skills as applied in the areas of sport performance and physical activity. Topics will discuss how skilled movements are learned, maintained, and enhanced as well as explore some of the basic physiological, bio-mechanical, and cognitive influences which affect the quality of skilled performance. This course is primarily designed to benefit sport coaches, physical educators, and fitness instructors.

Typically offered in Fall only

HESM 477 Coaching Concepts (3 credit hours)
Practical and theoretical concepts essential to the preparation of coaches. This course does not constitute credit toward meeting Physical Education requirements

Typically offered in Fall, Spring, and Summer

HESM 478 Exercise Physiology and Sports Science (3 credit hours)
Basic principles of human anatomy, physiology, and biomechanics and their relationship to athletic coaching.

Typically offered in Fall, Spring, and Summer

HESM 479 Sport Management (3 credit hours)
Planning, organizing, leading, and evaluating within a sport context; fundamentals of accounting, budgeting, economics, marketing, strategic planning, ethics, and their use in sport settings; techniques of personnel, facility, and sporting event management.

HESM 480 Principles of Exercise Programming (3 credit hours)
Fundamentals and scientific principles necessary to plan, design, implement, and evaluate individual exercise programs.

Prerequisite: HESM 478
Typically offered in Fall and Spring

Health Exercise Studies Dance (HESD)

Health Exercise Studies Fitness (HESF)

HESF 100 Cross Training (2 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility, and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobic activities as well as strength and endurance conditioning exercises.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESF 101 Fitness and Wellness (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced running activities as well as strength and endurance conditioning exercises.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 102 Fitness Walking (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced fitness walking techniques and strength conditioning exercises.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 103 Water Aerobics (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues are also addressed. The components of fitness will be met through structured individually paced water aerobics classes that will take place in chest deep water. Muscular strength activities could take place in or out of water.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 104 Swim Conditioning (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. This course covers the mechanics of a variety of strokes, training methods, training principles, safety, with swim techniques that maximize fitness gains and minimize injuries.

Prerequisite: PE 215 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESF 105 Aerobics and Body Conditioning (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobics classes. Muscular strength activities could take place in or out of the aerobics room.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 106 Triathlon (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced swim, cycle and run training techniques. The student must provide bicycles and ANSI approved helmets.

Prerequisite: PE 221 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESF 107 Run Conditioning (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced running activities on an indoor or outdoor track, and/or a cross-country route. Muscular strength activities will occur in a weight room or incorporated during running activities.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 108 Water Step Aerobics (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individual paced water step aerobics classes that will take place in chest deep water on an aquatic exercise step. Muscular strength activities could take place in our out of the water.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESF 109 Step Aerobics (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced step aerobics classes. Muscular strength activities could take place in or out of the aerobics room.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 110 Adapted Physical Education (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobic, muscular strength and muscular endurance activities that meet the need of students with medical/physical limitations. For students with medical problems who are unable to take regular Physical Education classes. Repeatable up to two semesters.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESF 111 Indoor Group Cycling (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced indoor group cycling classes. Muscular strength activities could take place in or out of the main classroom.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 112 Fitness Kickboxing (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. Fitness kickboxing includes strikes against a heavy bag, focus mitt punching, medicine ball core exercises, running, and jumping rope. The components of fitness will be met through structured fitness kickboxing activities as well as strength and endurance conditioning exercises.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 113 High Intensity Conditioning (1 credit hours)
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of fitness: cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced high intensity aerobic and strength activities. High Intensity Conditioning includes plyometrics, agility drills, and running, as well as strength exercises using body weight and a variety of equipment such as dumbbells, barbells, and medicine balls. Exercises are set to various interval lengths ranging from 20-120 seconds. Use of heart rate training will be emphasized in order to differentiate between high intensity and steady state aerobic exercise.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESF 120 Movement and Meditation (1 credit hours)
This course is designed to teach and apply the principles of lifetime health-related fitness through a variety of movement activities and guided meditation practices. In this hybrid course, students meet one day per week for lectures, group discussions, and meditation practices. Students will complete two (45-minute) physical movement practices per week outside of class time, following an individualized plan to include cardio-respiratory and cardiovascular endurance, muscular strength and endurance, and mobility components. Students will design their movement plans in conjunction with the instructor during the first weeks of the course. This is an inclusive course and is suitable for students of all movement capabilities. A portion of the seats in each section will be reserved for students that have limited HESF 100-level courses options due to movement limitations. Contact the instructor for permission to enroll in a restricted seat.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

Health Exercise Studies Outdoor (HESO)

HESO 253 Orienteering (1 credit hours)
Navigating on foot from defined point to defined point, with use of map and compass in the shortest possible time.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 255 Canoeing (1 credit hours)
Instruction and experience in canoe skills; emphasizing paddling skills, safety, flat and moving water travel techniques and proper equipment selection. Plan and participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to the online schedule of classes for the current charge.

Prerequisite: Basic swimming ability required
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 257 Backpacking (1 credit hours)
Designed for students with little or no backpacking experience. Safe and environmentally-sound camping practices. Equipment/clothing, first aid and safety management agencies, land navigation, and trip planning. Plan and participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to online schedule of classes for the current charge.

Prerequisite: Must pass basic fitness test
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 258 Rock Climbing 1 (1 credit hours)
Instruction and direct experience for the beginning rock climber. Emphasis on safe rope systems for belaying and climbing movement on rock.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESO 259 Rock Climbing 2 (1 credit hours)
Development of gym to crag rock climbing skills and practices including: climbing safety, belaying techniques, anchor systems, partner and self-rescue, rappelling and ascending techniques, minimal impact climbing, and climbing hazards. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to the online schedule of classes for the current charge.

Prerequisite: HESO 258
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 262 Whitewater Canoeing (1 credit hours)
Instruction and skill development of fundamental whitewater canoeing skills. Paddling strokes and maneuvers for use on whitewater, river safety, basic river rescue, equipment selection and care, and environmental ethics. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to the online schedule of classes for the current charge.

Prerequisite: HESO 255, Intermediate swimming ability required
GEP Health and Exercise Studies
Typically offered in Fall only

HESO 263 Whitewater Kayaking (1 credit hours)
This class is designed for students with little or no whitewater kayaking experience to develop basic kayaking skills and help them become proficient paddlers. Topics will include whitewater safety, equipment use and care, paddle strokes and river running techniques, basic rescue techniques, kayak navigation, basic hydrology, and trip planning. Participate in one required weekend field trip. Additional charge assessed for the field trip. Refer to the online schedule of classes for the current charge. Students must pass swim test to participate in course.

Prerequisite: Intermediate swimming ability
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 276 Whitewater Rafting (1 credit hours)
Whitewater rafting skills and practices emphasizing safe river travel, minimal impact river camping techniques, and trip planning. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to PackTracks for the current charge.

Prerequisite: Intermediate swimming ability required
GEP Health and Exercise Studies
Typically offered in Spring only

HESO 277 Mountain Biking (1 credit hours)
Bike handling, minimal impact trail riding skills, safety, fitness, basic maintenance and repair, and equipment selection. Students must provide their own bike, helmet, protective equipment, and clothing.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 278 Fly-Fishing (1 credit hours)
Instruction and experience in basic fly-fishing skills. Emphasis on casting techniques, tackle selection, habitat evaluation, minimal impact travel, safety, fitness, equipment selection and trip planning. Basic swimming ability and field trip required. Transportation provided by the Physical Education Department. Charge required with a non-refundable deposit.

Prerequisite: Basic swimming ability
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESO 283 Mountaineering (2 credit hours)
Instruction and experience in alpine climbing skills emphasizing snow and ice travel, safety, land navigation, winter hazard evaluation, minimal impact camping skills, and equipment selection. Several classroom sessions will be conducted prior to the trip. Plan and participate in a ten-day field trip over spring break. Additional charge assessed for the field trip with a non-refundable deposit. Refer to the online schedule of classes for the current charge.

Prerequisite: HESO 258, HESO 257
GEP Health and Exercise Studies
Typically offered in Spring only

HESO 284 Sea Kayaking (1 credit hours)
Instruction and experience in basic sea kayaking skills. Emphasis on paddling techniques, open water travel, navigation, minimal impact camping, safety, fitness, equipment selection and trip planning. Plan and participate in one required field trip.Additional charge assessed for the field trip with a non-refundable deposit. Refer to the online schedule of classes for the current charge.

Prerequisite: Intermediate swimming ability
GEP Health and Exercise Studies
Typically offered in Fall and Spring

Health Exercise Studies Racquet (HESR)

HESR 242 Badminton (1 credit hours)
This is a beginning badminton course in which students will develop the basic skills necessary to play the game of badminton. Technical skills include the overhead and underhand clears, the short and long serves, drop shots and the smash. Instruction will include an emphasis on the fundamental strategies and rules used in both singles and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of badminton.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESR 249 Tennis I (1 credit hours)
This is a beginning tennis course in which students will develop the basic skills necessary to play the game of tennis. Technical skills include forehand and backhand ground strokes, volleys, serves and proper footwork. Students will also learn the fundamental rules, basic strategies, and court positioning for singles and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of tennis.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESR 250 Tennis II (1 credit hours)
This course will review some of the basic tennis skills introduced in the PE 249 Tennis I course. Additionally, this course will introduce more advanced techniques in stroke production and skill development such as the topspin and slice serves, approach shots, half-volleys, and drop shots. Students will analyze some of the various styles of play used in the game of tennis and perform drills as well as match play situations that will improve performance based on offensive and defensive tactics in both singles and doubles.

Prerequisite: HESR 249
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESR 255 Pickleball (1 credit hours)
This is a beginning pickleball course in which students will develop the basic skills to play the game of pickleball. Technical skills include forehand and backhand groundstrokes, volleys, serves, lobs, overheads, dink shots, and proper footwork. Students will also learn the fundamental rules, basic strategies, and court positioning for singles and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of pickleball.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESR 256 Racquetball (1 credit hours)
This is a beginning racquetball course in which the students will develop the basic skills to play the game of racquetball. Technical skills include forehand and backhand groundstrokes, ceiling balls, serves and proper footwork. Students will also learn the fundamental rules, basic strategies, and court positioning for singles, cuttthroat and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of racquetball. Approved protective eyewear must be provided by the student.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

Health Exercise Studies Specialty (HESS)

HESS 219 Gymnastics (1 credit hours)
Develop basic gymnastics skills on vault, bars, beam, floor, and trampoline. 1) To assist the students in safely learning progressions on each of these events for skill development. 2) To acquire the fitness requirements associated with learning these skills. 3) To identify the hazards and risks associated with gymnastics and 4) To identify basic skills and terminology associated with the sport.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESS 235 Beginning Karate (1 credit hours)
Introduction to traditional Japanese karate: kihon (basic punching, striking, blocking, and kicking techniques); kata (formal drills); yakusoku kumite (pre-arranged sparring); and demonstration of ji-yu-kumite (controlled free sparring). Karate uniform required.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESS 237 Weight Training (1 credit hours)
This is an introductory weight training course in which students will learn the principles of muscular development, as well as development of overall fitness. Free weights, machines, exercise equipment, and body weight exercises will be used to apply these principles. Various training systems and protocols will be introduced along with content of muscular physiological adaptations.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESS 239 Self Defense (1 credit hours)
Basic self defense and techniques. Skills covered include strikes, blocks, and escapes; plus psychology of general and sexual assault. Physical contact will occur between students and with the instructor as well.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESS 243 Bowling (1 credit hours)
This is a beginning bowling course in which the students will develop the basic skills necessary to play and enjoy the game of bowling. Technical skills include ball rotation and delivery along with proper foot work. Students will also learn the fundamental rules, basic strategies for throwing a strike ball, general theory for converting spares, and scoring along with bowling etiquette, terminology, rules, and safety precautions. Basic fitness and training principles will be discussed as applicable to the sport of bowling. Additional fee assessed.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESS 245 Golf (1 credit hours)
This course will provide golf instruction at an introductory level. Coursework will introduce full swing fundamentals, chipping, pitching, and putting fundamentals, rules and etiquette on the golf course, and history of the game. Students will develop an appreciation for the game of golf through practice, play, and time on the golf course. There is a required charge for class meetings held at local golf courses. Refer to the online schedule of classes for the current charge. Students must provide their own transportation to the golf course.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESS 251 Target Archery (1 credit hours)
Shooting fundamentals, safety, selection, and care of equipment.

GEP Health and Exercise Studies
Typically offered in Fall, Spring, and Summer

HESS 252 Skiing/Snowboarding (1 credit hours)
Instruction and experience in the fundamentals of skiing or snowboarding. Emphasis on safety, controlled turns and stops, equipment selections, and pre-season preparation. Slope instruction held at a selected site during winter break. Additional charge assessed for trip with a non-refundable deposit. Refer to the online schedule of classes for program format options, current charges and trip dates. Students are responsible for providing their own transportation. Final grades will not post until the second week of January. In the interim, a grade of LA will be given. December graduating seniors should be aware this will delay graduation clearance and posting of degrees.

GEP Health and Exercise Studies
Typically offered in Fall only

HESS 296 Independent Study in Physical Education (1-3 credit hours)
Independent study in Physical Education will vary according to the specialized topic of interest. Credit and content determined by instructor. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

Health Exercise Studies Team (HEST)

HEST 216 Soccer (1 credit hours)
Soccer with emphasis on skills development, playing strategies, and rules of the game.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HEST 261 Basketball (1 credit hours)
Offensive and defensive skills development and systems of team work. Coverage of strategies, history and rules of the sport.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HEST 265 Slow Pitch Softball (1 credit hours)
Develop basic skills, rules and strategies for playing slow pitch softball. This course provides an ideal setting for beginning through intermediate players to acquire or enhance skill sets and obtain knowledge to participate recreationally in a slow pitch softball game or league.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HEST 266 Ultimate Frisbee (1 credit hours)
Emphasis on skill development, aerobic fitness and spirit of competition. Includes flight dynamics, various throwing and catching techniques, offensive skills, defensive skills, equipment, strategies, and rules of the game.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HEST 267 Flag Football (1 credit hours)
An introduction to the skills, history, rules and strategy of flag football.

GEP Health and Exercise Studies
Typically offered in Fall only

HEST 269 Volleyball I (1 credit hours)
This course is designed to teach and apply the basic volleyball fundamentals of setting, passing, serving, spiking, court movement, and game strategy.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HEST 270 Volleyball II (1 credit hours)
This course is designed to go beyond the basic volleyball skills. Emphasis will be placed on floater, top spin, and jump serves, forearm passing, setting, back setting, strong side and weak side attacking, blocking and advance serve reception techniques.

Prerequisite: HEST 269
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA - Health Exercise Aquatics (HESA)

HESA 214 Beginning Swimming (1 credit hours)
Swimming strokes and deep water skills for the non-swimmer to survive in the water.

GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 215 Advanced Beginning Swimming (1 credit hours)
Continuation of Basic Strokes acquired in Beginning Swimming, additional new strokes, and survival skills.

Prerequisite: HESA 214 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 217 Survival Swimming (1 credit hours)
This course will provide NCSU students with the opportunity to learn water survival skills and techniques that will enhance their chances of survival if stranded in the water. Skills include drownproofing, underwater swimming, survival swim strokes, jumping from a height, clothing inflation techniques, and swimming through a simulated oil/debris field. These survival skills and techniques will help promote physical fitness and a healthy lifestyle.

Prerequisite: HESA 214 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 221 Intermediate Swimming (1 credit hours)
This course is designed to provide instruction in five basic swim strokes-front crawl (freestyle), back crawl (backstroke), breaststroke, elementary backstroke and sidestroke. Additional emphasis will be placed on increased cardiovascular fitness along with skill development in treading water, underwater swims, turns and dives.

Prerequisite: HESA 214 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 223 Lifeguard Training (2 credit hours)
This course is designed to provide entry-level lifeguard participants with the knowledge and skills prevent, recognize and respond to emergencies and to provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee assessed for certification.

Prerequisite: PE 221 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 226 Skin and Scuba Diving I (2 credit hours)
This course is designed for students with little or no experience, emphasizing safety and responsible skin and scuba diving techniques. Topics include the use and care of scuba equipment, diving skills, problem solving, emergency procedures, basic rescue techniques, direct and indirect effects of pressure, medical contradictions, oxygen enriched are diving, and gas management. Optional fee assessed for open-water training field trip and certification. Students must provide their own transportation for fieldtrip(s).

Prerequisite: PE 221 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 227 Skin & Scuba Diving II (2 credit hours)
This course will build on the knowledge and skills learned in Skin & Scuba Diving I with emphasis on diver rescue techniques. Coursework will require a deeper understanding of dive planning, dive physiology, gas management, and diving first aid. Coursework will also require a higher skill level relating to propulsion techniques, navigation, equipment handling, buoyancy control, search & recovery techniques, and diving first aid than is required in Skin and Scuba Diving I. Optional fee assessed for open water training fieldtrip and certification. Students must provide their own transportation for fieldtrip(s).

Prerequisite: HESA 226 or equivalent skills
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 229 Scuba Leadership (2 credit hours)
This course will provide NCSU students with the opportunity to build upon the skills learned in PE 227 and progress towards proficiency as a scuba diving leader. This course will help promote physical fitness and skill development in scuba diving, as well as an understanding of the knowledge and skills of scuba diving leadership. Participation in scuba leadership provides interested students with the opportunity to seek clarification as a scuba diving leader. Fee is assessed for required fieldtrip(s). Students must provide their own transportation for fieldtrip(s).

Prerequisite: HESA 227 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

HESA 231 Scientific Diving (3 credit hours)
This course covers the knowledge, skills, and diving experience necessary to plan and safely conduct scientific dives with regards to site selection, safety procedures, gas mix considerations, equipment requirements, data collection techniques, and dive team selection. These skills and techniques will help promote physical fitness and a healthy lifestyle. Successful completion of all phases of the course will qualify students for certification as a "scientific diver." This course meets American Academy of Underwater Sciences (AAUS) guidelines. Fee is assessed for required fieldtrip(s). Students must provide their own transportation for fieldtrip(s).

Prerequisite: HESA 227 or equivalent skill
GEP Health and Exercise Studies
Typically offered in Fall and Spring

History (HI)

HI 205 Western Civilization Since 1400 (3 credit hours)
A survey of Western Civilization from the Renaissance to the present.

Typically offered in Fall and Spring

HI 207 Ancient Mediterranean World (3 credit hours)
The ancient cultures of the Middle East, Greece and Rome, including Mesopotamian, Egyptian, Hebrew, Phoenician, Greek and Roman societies and cultures.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 208 The Middle Ages (3 credit hours)
Medieval civilization as it emerged from the declining Roman Empire through its apogee in the 13th century. The transition from the classical to the medieval world, the impact of the Germanic influx, the Islamic influence, the Crusades, and the political, economic, and social institutions of the High Middle Ages.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 209 From Renaissance to Revolution: The Origins of Modern Europe (3 credit hours)
Exploration of the political, economic, social, and cultural history of Western Europe during an intense and exciting period of transition from a medieval to a modern world. Topics to be discussed include Renaissance art and philosophy; the printing revolution and the French Revolution; climate change and economic dislocation; witchcraze; religious reforms and religious wars; commercialization; navigation; empire; slavery; the new science; and new ideas about democracy, equality, and modernity.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 210 Modern Europe 1815-Present (3 credit hours)
Survey of the history of European societies and political systems from 1815 to the present.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 214 History and Archaeology of Ancient Latin America (3 credit hours)
Exploration of ancient Latin American civilizations and early Europeans in the region through archaeological and historical analysis. Major themes include migrations of people into the Western hemisphere, the rise and decline of states and empires such as the Maya, Aztecs, Moche, and Incas, inter-regional trade, development of writing and communication systems, religious ideology, social and political infrastructure and mechanisms of control. Unique cultural forms discussed include mummies, pyramids, military techniques, political propaganda, and agricultural innovation. Contemporary issues addressed include media representations of the past, indigenous rights, and looting and destruction of cultural property.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 215 Colonial Latin America (3 credit hours)
Exploration of the pre-Hispanic indigenous roots and the colonial period in Latin America. Major themes include the origins and development of social, political, economic and religious institutions from pre-conquest times to the achievement of independence. Topics include ancient American cultures, conquest and settlement by Spain and Portugal, colonial rule in theory and practice, religious life and structures, the colonial economy and labor, and independence movements.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 216 Modern Latin America (3 credit hours)
Analysis of the last two centuries of social, political, economic, and intellectual life in Latin America and the Caribbean. Course readings include primary sources, declassified CIA documents, and Latin American literature. Course themes include social and political conflicts, changing gender relations, human rights abuses, the effect of the US and global economic forces, and the impact of the growing Latino population in the U.S.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 217 Caribbean History (3 credit hours)
Exploration of the social, economic, political, intellectual, and cultural histories of the Caribbean. Major course topics include pre-Columbian indigeneity, colonization & imperialism, plantation slavery, abolition & emancipation, the Haitian and Cuban Revolutions, gender & migration, and decolonization & independence. The course emphasizes the diversity of the region and places the islands of the Caribbean within the wider context of a modern globalizing world.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 221 British History to 1688 (3 credit hours)
History of the British peoples from earliest times to the Glorious Revolution. Social, political, constitutional developments; relationship between history and literature; synthesis of British cultures.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 222 History of British Cultures and Societies From 1688 (3 credit hours)
British people from Glorious Revolution to the present. Social, political, constitutional development; history and literature; growth and decline of British empire; spread of British culture.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 232 The World from 1200 to 1750 (3 credit hours)
The making of the modern world through interregional conquest and commerce from 1200 to 1750. Focus on the growing global circulation of peoples, pathogens, goods, and ideas.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 233 The World Since 1750 (3 credit hours)
This course surveys the making of the world from 1750 to the present. Topics include: the Industrial Revolution, the development of the Nation-States, the rise of European, American and Japanese Empires, WWI, inter-war reconfigurations of colonial empires, anti-colonial nationalist movements, the Great Depression, the Cold War, struggles for political and economic independence among newly independent nations, the US-dominated neo-liberal order from the 1980s to the present, and contemporary global conflicts over ethnicity, religion, resources, disease, and the environment.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 240/HA 240 Introduction to Visual Culture (3 credit hours)
Introduction to the role of visual cultural production in the nineteenth and twentieth centuries in expressing and shaping both individual and collective identities. Case studies of imperialism, gender, and war draw from different regional histories and utilize a variety of visual genres - such as photography, popular posters, painting, advertising, and film stills - to study how visual culture can be used as evidence to understand the past, using the approaches of the disciplines of History and Art History.

Prerequisite: Sophomore standing
GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 251 American History I (3 credit hours)
Themes in early American history: colonial clash and mix of cultures; generation of an American consciousness; federalism and democracy in national politics; expansion and immigration; racial and sectional division. Credit is not allowed for both HI 251 and HI 253.

GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 252 American History II (3 credit hours)
Themes in post-Civil War American history: impact of war on American foreign and domestic policy; the repercussions of industrialization and economic modernization; continuity and change in American institutions and values; problem solving in pluralistic society. Credit is not allowed for both HI 252 and HI 254.

GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 253 Early American History (3 credit hours)
Themes in early American history with an emphasis on diversity in the U.S.; focus on colonial clash and mix of cultures, generation of an American consciousness, federalism and democracy in national politics, expansion and immigration, and racial and sectional division. Credit is not allowed for both HI 253 and HI 251.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

HI 254 Modern American History (3 credit hours)
Major themes in modern American history with an emphasis on diversity in the United States; focuses on aspects of race/ethnicity, gender, class, sexual orientation, disability, religious and/or age identities as it considers the impacts of industrialization and economic modernization; impact of war on American domestic and foreign policy; continuity and change in American institutions and values; problem solving in a pluralistic society. Credit is not allowed for both HI 254 and HI 252.

X: Credit not allowed for both HI 254 and HI 252.
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

HI 263 Asian Civilizations to 1800 (3 credit hours)
The history of China, India, Japan, and Southeast Asia from 500 to 1800. The making of the Asian region through the rise and fall of five great empires: the Tang, the Mongol, the Mughal, the Qing, and the British empires.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 264 Modern Asia: 1800 to Present (3 credit hours)
Introductory survey of 19th and 20th century Asia, with attention to Japan, Southeast Asia, India and China. Emphasis on cultural and political crises of the 19th century and revolutionary transformations of the 20th century.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 270 Modern Middle East (3 credit hours)
Social and political change in the Middle East in the nineteenth and twentieth centuries. Decline of the Ottoman empire, the rise of nationalism, the waxing and waning of European imperialism in the region, and the creation of modern states and societies and their ideological and economic underpinnings.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 275/AFS 275 Introduction to History of South and East Africa (3 credit hours)
The African kingdoms (Lunda, Buganda, and Zulu); the European encroachment; the origins of colonialism and the character of colonial societies and economies, South African apartheid; African protest, nationalism and independence.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 276/AFS 276 Introduction to History of West Africa (3 credit hours)
The history of Western Africa. Forest civilizations and the slave trade, trade and the expansion of Islam, colonialism in West Africa; African nationalism and the achievement of independence; and postcolonial West Africa.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

HI 300 History Methods and Writing (3 credit hours)
Introduction to the process of researching and writing history. Techniques for locating and interpreting primary and secondary sources. Analysis and criticism of the varieties of history. The craft of historical writing. Because this course is designed to prepare students for research and writing in the History major, it should be taken before the student takes Departmental Advanced Electives in History.

R: Sophomore standing and History Majors or History Minors
Typically offered in Fall and Spring

HI 305 Frauds and Mysteries of the Past (3 credit hours)
Myths, mysteries, misconceptions, and hoaxes in history and archaeology. Examination of popular fascinations with the past, fallacies invoked in historical myths, and misappropriation of the past. Students learn about and implement methods and evidence used by scholars to interpret past peoples and events, logic, skepticism, and critical thinking, interpretative, and analytical skills. Students apply these skills in discussions, in-class activities, and creative assignments to debunk and disprove inaccurate and problematic claims about the past. Case studies of topics such as: stereotypes about early humans, Atlantis, mythical beasts, pyramid alignment, conspiracy theories, art fakes and forgeries, and alien visitations.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 307 Jewish History (3 credit hours)
Survey of major topics in the history of the Jews, focusing on the development of Jewish life on the European continent but also covering the patterns of migration that created a global diaspora as well as the forces that formed modern Israel.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 317 Cuba Today: Historical and Sociopolitical Perspectives (3 credit hours)
This course, offered in Havana, Cuba, through the Study Abroad Office, examines Cuban political, social and economic dynamics through historical and sociopolitical perspectives. It explores the process and legacy of colonization, the role of slavery in colonial society, Santeria, healthcare, education and international relations in revolutionary Cuba. In order to take this course, students must be degree seeking and it must count towards their degree.

GEP Global Knowledge, GEP Humanities
Typically offered in Summer only

HI 318 Environmental History of Cuba: Prehistory to the Present (3 credit hours)
This course, offered in Havana, Cuba, is designed to introduce students to the environmental history of the country, from the pre-history to present. Among the core topics examined are the social, economic and environmental impacts of sugar, tobacco and coffee cultivation, the relationships between animal husbandry and deforestation, and the history of foreign tourism and its environmental implications. The course closes with an examination of the "Special Period" in Cuba beginning in 1989, and the rise of organic and urban agriculture in Cuba. In order to take this course, students must be degree seeking and it must count towards their degree.

GEP Interdisciplinary Perspectives
Typically offered in Summer only

HI 320/REL 320 Religion in American History (3 credit hours)
Representative people, movements and thought in the major religions within the context of American society and culture.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 321 Scientific Revolution and European Society, 1500-1800 (3 credit hours)
Exploration of the changing role that the arts, technology, and sciences played in shaping early modern European culture, society, and global power, between 1500 and 1800. Examination of the historical context of developments such as machine-making, new scientific ideas, patronage of science and technology, the formation of distinct technical and scientific fields, nation-building projects, and global ventures.

GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HI 322 Rise of Modern Science (3 credit hours)
Analysis of how "modern" science developed in Europe since the 1500s, exploring the foundation of the ideas, scientific practices, institutions, and cultural meaning and power of science in modern society. Examples taken from the creation of the mechanistic worldview and Newtonian science, and the development of modern disciplines such as chemistry, geology, biology, and physics.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HI 323 Science, American Style (3 credit hours)
Exploration of the distinctive nature of American science and its place in American culture. Analysis of the historical context of developments, such as early contributions to science, natural history, and paleontology; the growth of professionalization of science; ideas about scientific management and social applications such as eugenics; and the creation of the atomic bomb and the rise of "Big Science" after WWII.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 324 History of Common Law and Constitution (3 credit hours)
Survey of the development of common law and constitution from the earliest Roman and Anglo-Saxon beginnings to the era of the French and American Revolutions. The focus will be on the European social, political and intellectual contexts within which Anglo-American law emerged, and the foundations of legal and constitutional principles. Topics include the origins of courts and the judiciary; the evolution of jury trial and the early history of the law of evidence; conflicts and compromised between secular and ecclesiastical law; rights and limits to property ownership at common law; and problems regarding the legal status of women, children, servants and slaves.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 332 Germany and the World Wars (3 credit hours)
Germany's rise as a world power in the years prior to World War i, the emergence of Adolf Hitler and national socialism, and the consequences in defeat of World War II. Topics include nationalism, industrialism and the struggle of workers, imperialism, religious minorities and racial theories, sexual revolution, democratization, international relations and war, postwar occupation and reconstruction, and popular culture in music and film.

Prerequisite:3 hrs of History or Sophomore Standing
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 335 The World at War (3 credit hours)
Comparative history of the experience of war over time and place. Topics include the interactions between war and society; effects on combatants and non-combatants, especially women and children; and the role of technology.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 337 Spy vs. Spy: Cold War Intelligence History (3 credit hours)
This course will examine the often deadly intelligence efforts that characterized the Cold War (USA vs. USSR) of 1945-1991. While the history of that era marks the major political, economic, and military events, much occurred in the shadows. This wide-ranging intelligence competition affected - and was affected by - both American and Russian societies and cultures. Drawing on selected readings, this course will seek to describe this struggle to know and to conceal, and offer useful context to explain how and why it influenced the course of the Cold War.

GEP Humanities
Typically offered in Spring only

HI 338 Empire, War, and Revolution in Russia (3 credit hours)
Survey of Russian history since the advent of modern reform following the 1861 Serf Emancipation. The course treats the failure of an increasingly outdated monarchy to cope with the rise of an influential urban educated class, and industrial work force, and Populist and Marxist revolutionary movements. The course traces the degeneration of the 1917 socialist revolution into a hardened dictatorship which, forced by conditions outside its control, waged a destructive but victorious war, saving Europe from Nazism. It treats the 1991 Soviet collapse and the challenges and failures of the post-Stalin and post-Soviet periods.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 340 History of Agriculture (3 credit hours)
An introduction to the history of agriculture from a global perspective. The course explores our evolving relationship with plants and animals, including the earliest experiments in domestication and husbandry, short- and long-term developmental trajectories, local- and global-scale patterns, and coverage of diverse places and times. Themes include agricultural practices, food systems, landscape transformations, technological innovations, social and political organization, inequality, exploitation, food security, and sustainability.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 341 Technology in History (3 credit hours)
The role of technology in society from earliest times to the present. Major achievements in technology and an examination of the nature of invention, innovation and adaptation of technologies and their impact on Western Civilization.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HI 342 Global Environmental History (3 credit hours)
Environmental history from a global perspective, covering a broad time span and examining both how humans have shaped their environment and how they are shaped by it. Topics include hunter-gatherer societies, the environmental forces which fostered sedentary societies, the rise and fall of early civilizations, and the relationship of water, wind, coal, steam, petroleum and other energy forms to human development and environmental processes. Examination of the dynamic interplay between the environment and social forces such as trade, imperialism, labor, public health, population growth, consumption, and social movements.

GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

HI 344 Dinomania: Dinosaurs in Culture and Science (3 credit hours)
The cultural and scientific history of dinosaurs as simultaneously an object of scientific knowledge and of popular culture. Attention will be paid to early dinosaur discoveries and interpretations, the competitive exploration for dinosaurs in the US West and other exotic places, the origin and international spread of dinomania, dinosaurs as cultural icons, and the ways that dinosaurs have been represented in the media and in public museums. This course will include critical discussion of how natural science is done, how ideas about dinosaurs are culturally embedded, and how and why those ideas change over time.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 345 American Popular Culture (3 credit hours)
Popular culture as reflection of as well as contributor to American historical trends. Changes in forms of entertainment (music, books, popular art, theater, film, television, etc.), from the artisanal culture of the late 18th century through the rise of 19th- and early 20th-century commercial culture to the evolution of mass media culture in the late 20th and early 21st centuries.

GEP Humanities
Typically offered in Spring only

HI 346 The Civil War Era in Popular Culture (3 credit hours)
Survey of the causes, trajectories, and consequences of the American Civil War and the social, political, and economic struggles of Reconstruction. Draws on history and literary studies to investigate how Americans represented and misrepresented the Civil War era, through an examination of popular culture. Emphasis on conflicts concerning regional identity, race, class, gender, and sexuality in the history and memory of the Civil War era.

GEP Humanities, GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Spring only

HI 350 American Military History (3 credit hours)
American military experience and its relationship to other historical developments. Use of military force in terms of strategy and tactics and as an element in the nation's diplomatic, political, social, economic and intellectual life.

GEP Humanities
Typically offered in Fall only

HI 351 U.S. Naval History (3 credit hours)
The role of the U.S. Navy in American history. Sea power, national defense and foreign policy. The impact of technology on naval warfare and the historical evolution of missions of the U.S. Navy.

GEP Humanities
Typically offered in Spring only

HI 354 The Rise of the American Empire (3 credit hours)
This course investigates the rise of the American Empire from the Spanish American War of 1898 through the 2001 attacks on the World Trade Center. The purpose of the course is not only to acquaint you with the crises and triumphs of US foreign policy from 1898 to 2001, but also to help you develop your own analysis of whether the acquisition of empire was accidental or deliberate, or a combination of both.

GEP Humanities
Typically offered in Spring only

HI 360 U.S. Agricultural History (3 credit hours)
U.S. Agricultural history from colonial era to present. Attention to the major economic, social, political, environmental and cultural forces that shaped American agriculture from the 16th century to 21st century. Discussion of the role of technological change and evolution of governmental policy in U.S. agriculture. Exposure to major episodes demonstrating fundamental changes and continuities in U.S. agriculture. Discussion of the diversity of American farmers and farmworkers and their struggles for equality and access.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 361 Global History of American Food and Drink (3 credit hours)
Interdisciplinary examination of food and drink, exploring major food cultures around the world, global food trends from the Columbian Exchange of the 1400s and 1500s through increased globalization to industrialization, and the recent history of American food, foodways, and food problems.

GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 364 History of North Carolina (3 credit hours)
History of North Carolina from early European exploration to the present. Features of North Carolina society which made this state similar to and different from other southern states and the nation as a whole.

GEP Humanities
Typically offered in Fall, Spring, and Summer

HI 365 The American West (3 credit hours)
A history of the American borderlands with emphasis on the trans-Mississippi West. Cycles of exploration, conquest, and exploitation of this region. Influence of the frontier in the development of the United States.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 366 Native American History (3 credit hours)
An introductory interpretation of the varied historical experiences of many nations native to North America from the first migrations of peoples into the continent until the present, including the variety and diversity of Indian cultures and experiences; native resistance to colonialism, expansion, and U.S. federal policies; and the survival and continuity of native cultures and peoples through more than four centuries of contact, conquest, and change.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 369 Sexuality in U.S. History (3 credit hours)
Exploration of the social construction of sexualities from the early seventeenth century to the present day. This course will focus on the United States, but we will begin with the history of sexuality in early modern Europe to see where ideas of sexuality in colonial America had their roots. We will proceed through the chronological development of the history of sexuality in North America. Throughout the semester, we will explore dominant and alternative constructions of sexuality; trace the changing and contested meanings of sexuality; and explore the implications of these understandings in sexuality for power relations in the history of the United States. While issues of gender and race frequently intersect with sexuality, we will be focused primarily on the latter.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 370 Modern Egypt (3 credit hours)
Exploration of the political, socio-economic, and cultural history of Egypt from the end of the 18th century (the 1798 exploration led by Bonaparte) to the present day; including the late Ottoman period (1798-1805), the birth of the modern state (1805-1922), Egypt's liberal experiment (1922 - 1952), the Nasser era (1952-1970), the neo-liberal age (since 1970), and concluding with the January 25th Revolution. The investigation follows two main threads: the conflictual relationships that developed over the past two centuries between the state and society in all its diversity, and the continuous struggle over the definition of the Egyptian nation that these conflicts have generated.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring and Summer

HI 371 Modern Japan, 1850 to Present (3 credit hours)
Survey of Japan's emergence as a modern nation and world power. Topics include nation-state formation; modernization and its dislocations; democratization and authoritarianism; imperialism, international politics, and war; postwar reforms; changing gender relations; popular culture; and social problems.

Prerequisite: 3 hours of History or Sophomore standing
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 372/AFS 372 African-American History Through the Civil War, 1619-1865 (3 credit hours)
African background and continuity of the particular role, experience and influence of African Americans in the United States through the Civil War.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 373/AFS 373 African-American History Since 1865 (3 credit hours)
The history of African-Americans from the Reconstruction era through the Civil Rights movement of the 1950s and 1960s to the present.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 374 Visual Culture of Modern South Asia (3 credit hours)
History of visual-cultural production in expressing and shaping socio-political configurations in the South Asian subcontinent. Treats visual evidence over 300 years to understand the integrative relationship and flow of cultural production across elite patronage and popular values through common themes and stories. Changing state formations and power relationships-- from the Mughal empire and its successor states through British imperial control and after independence-- are studied as contexts for the visual culture that emerges and changes across these time periods. Knowledge gained from HI 263 [Asian Civilizations to 1800] or HI 264 [Modern Asia] is helpful but not required.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 375 Global History of Travel and Tourism (3 credit hours)
This course traces the development of travel and tourism from ancient times to modern days, examining it as an agent that both produces and reflects social-cultural activities. It draws on different travel-energized materials-from topographic descriptions to sentimental narratives-to examine how people traveled long distances for various reasons and to analyze their impressions of foreign lands and reflections on their home population. Topics include how the crossing of boundaries reflected and reshaped the meanings of place, the formation of identity, the spread of religion and aesthetics, the accumulation of knowledge and scientific empiricism, as well as the consumption of visual and material culture.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 376 Global Migrations (3 credit hours)
Global Migrations examines human mobility from the early modern period to the present. Challenging popular assumptions about who migrates, where they move to, and why, it explores mobility as a fundamental element of how empires, states and societies came to be. Special attention will be paid to cross-cultural connections made possible by migrant populations, questioning whether "globalization" is only a twentieth century phenomenon. The course provides a basic knowledge of major global migration movements, from the Mongols and the Silk Road to the Atlantic slave trade, twentieth century labor migrations and contemporary issues such as trafficking, statelessness and diaspora politics. Throughout, it examines the challenges and opportunities that migrations pose for immigrants, as well as sending and receiving societies.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 377 The Silk Road in the Medieval World (3 credit hours)
Historical examination of the "Silk Road," the collection of trade routes across Eurasia that connected "East" and "West," as a pre-modern form of globalization. Focus is on the heyday of the Silk Road in the medieval period, ca. 350 - 1450 CE, and its roots in the Han and Roman Empires of classical antiquity up to its transformation in the early modern sea routes and colonization of the Americas. Topics include trade and the production of silk and porcelain, the transmission of religions and technologies, travel and travelogues, foodways, and trans-national empires of medieval China and medieval Europe.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 380 History of Nonprofits, Philanthropy, and Social Change (3 credit hours)
This course explores the historical development of nonprofits and philanthropy in the United States from the colonial period to the present: the origins of charity and philanthropy as concepts for social change and social justice, the rise of benevolent societies in the nineteenth century, the creation of philanthropic foundations and advocacy organizations in the twentieth century, and the construction of complex relationships between modern nonprofits, the state, and the private sector.

GEP Humanities
Typically offered in Spring only

HI 381 NGO Nonprofits in a Global Context (3 credit hours)
Non-Governmental Organizations (NGOs) are a crucial component and a revealing characteristic of the strength and effectiveness of a country's civil society. Examining their histories outside of the U.S. gives us a window into global culture, values, and modes of everyday life, and into notions about "charity" and "public good" in a given society. We will use India as a case study to develop a set of questions about how NGOs function in different societies, examining how researchers and activists partner with NGOs in different parts of the world to address pressing environmental, economic, social, and cultural-production issues.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 382 History of Capitalism in America (3 credit hours)
The phrase "capitalism in America" raises big questions, and this course will look at such questions as: What is capitalism anyway? What was the relation between slavery and capitalism? Is capitalism the story of heroic entrepreneurs who through vision and courage built new enterprises? Has the government played any positive role in American capitalism or has it just stood in the way? Is fraud an aberration or an essential part of capitalism? Why has America had all these financial crises and how have Americans responded to them? Is capitalism in the twenty-first century something new or is it just a continuation of longer trends? Is it even reasonable to talk about capitalism in the United States alone?

GEP Humanities, GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Spring only

HI 385 Introduction to Public History (3 credit hours)
History is about people: their societies, economies, cultures, and politics and how these changed over time. In Public History, history is also for people, in that careful and exacting historical research can facilitate dialogue and be applied to contemporary problems. Just as important, Public History is history saved, researched, and analyzed with people, for public historians work with individuals and groups to collaboratively understand history and preserve historical resources for future generations. This class treats the major concepts, scholarship, and research methods shaping the Public History field; it is also an opportunity to test the fields theories in projects that will create new resources for historical learning in our community. Required field trip fee of $10.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Summer

HI 386 Introduction to Museum Studies (3 credit hours)
Museums and their curating practices in a global context. Topics include the social, cultural, and political positions of museums and the evolution of their functions; the role of collector, the curator, and the visitor; and theories and practices of display and representation of objects and culture. Students will gain hands on experience with how museums produce, interpret, and exhibit knowledge.

Typically offered in Spring only

HI 390 Internship in History (3 credit hours)
Directed work experience for history students with internship-site mentoring and evaluation. Engagement in the community as a practitioner. Course requires 140 contact hours with the sponsoring organization. The course includes an on-campus class meeting and presentation at the end of the semester. Students must have at least a 3.0 overall GPA and at least a 3.0 GPA in the major, be a junior or senior, and must complete the application process with the Department of History. Students must provide their own transportation to the internship site. Modest liability insurance fee required.

Prerequisite: Juniors & Seniors with Cumulative GPA of 3.0 or above and 3.0 GPA or above in History courses, HI 300 and 12 hours of History courses and consent of the department
Typically offered in Fall, Spring, and Summer

HI 395 History: Study Abroad (1-3 credit hours)
Topical History courses taught in NCSU Study Abroad programs. (Current listings available in Study Abroad Office, CHASS Dean's Office and History Department).

Prerequisite: 3 hours of History or Sophomore standing

HI 399 Special Topics in History (1-3 credit hours)
Timely topical courses or experimental course offerings in intermediate-level historical study. Students cannot receive credit for multiple sections of HI 399 unless the topics are different.

Typically offered in Fall, Spring, and Summer

HI 400/HI 500 Civilization of the Ancient Near East (3 credit hours)
The civilization of Mesopotamia and Egypt from earliest times to the fall of Babylon in 539 B.C. Credit for both HI 400 and HI 500 is not allowed

Prerequisite: 3 hours of History
Typically offered in Fall only

HI 402/REL 402 Early Christianity to the Time of Eusebius (3 credit hours)
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority. Students may not receive credit for both REL /HI 402 and REL/HI 502.

Prerequisite, one of: REL 312, REL 317, or HI 207.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 403/HI 503 Ancient Greek Civilization (3 credit hours)
The history of the Hellenes from the Minoan civilization through Alexander's legacy, with readings in Herodotus and Thucydides. Credit will not be given for both HI 403 and HI 503.

Typically offered in Spring only

HI 404/HI 504 Rome to 337 A.D. (3 credit hours)
The development of ancient Rome from its origins in Italy, through the rise as an Empire embracing the entire Mediterranean World and Western Europe, to Constantine, Christianity and the foundation of Constantinople. Examines critically the political achievement of a people who rose from an obscure Italian city to a world empire, with emphasis on the analysis of primary sources. Credit will not be given for both HI 404 and HI 504

P: 3 hrs. of History

HI 405/HI 505 History and Archaeology of the Roman Empire (3 credit hours)
Analysis of Rome's rule over the Mediterranean World in the first four centuries A.D. through the use of literary and archaelologic sources. Special emphasis on imperial army and frontier security. Credit will not be given for both H1 405 and H1 505

P: 3 hrs. of History

HI 406/HI 506 From Roman Empire to Middle Ages (3 credit hours)
Late Antiquity and the early Middle Ages. The transition from classical civilization to the basis of modern civilizations; the fall of Rome, the Germanic kingdoms, Byzantium, the establishment of Christianity, the birth and growth of Islam. Credit will not be given for both HI 406 and HI 506

P: 3 hrs. of History
Typically offered in Spring only

HI 407/REL 407 Islamic History to 1798 (3 credit hours)
The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe. Credit will not be given for both REL/HI 407 and REL/HI 507.

Prerequisite: 3 hrs HI or REL 300 or above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 408/REL 408 Islam in the Modern World (3 credit hours)
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

Prerequisite: 3 hours of history or religious studies
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

HI 409/HI 509 The High Middle Ages (3 credit hours)
Medieval culture from 10th through 13th centuries: revival of the Roman Empire, monastic and papal reform, rise of universities, evolution of representative bodies, the Gothic style, troubadour and goliardic poetry, scholasticism, and revival of Roman law. Credit will not be given for both HI 409 and HI 509

P: 3 hrs. of History

HI 410 Italian Renaissance (3 credit hours)
The historical, literary, and cultural developments defining the "Renaissance" period of Italian history from the late fourteenth century to the end of the sixteenth century. Topics include critical analysis of the concept of a "renaissance" and its usefulness for historical interpretation; the intersection of politics, religion, society, art, and literature in relation to defining a "Renaissance" culture; and the development of a global money economy and the cultural output it inspired in Europe.

P: 3 hrs. of History
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Summer

HI 411/HI 511 Trials of Faith: Religious Reformation in Early-Modern Europe (3 credit hours)
Examination of the great disruption in European civilization associated with the Protestant and Catholic Reformations. The course considers the new religious ideas and practices associated with the Reformations and transformation they produced in European political and economic life; the violence they provoked; the new thinking about families and gender roles they encouraged, the spread of European religions around the globe with European voyages of discovery and conquest, and the beginning of ideas about religious toleration. Credit will not be given for both HI 411 and HI 511.

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 412/HI 512 The Sexes and Society in Early-Modern Europe (3 credit hours)
Examination of changes in gender relations; ideas about the sexes, femininity, and masculinity; the roles of women and men in political, religious, economic, scientific, and family life in Europe between the late Middle Ages and the French Revolution. Credit for HI 412 and HI 512 is not allowed.

P: 3 hrs. of History
GEP Global Knowledge

HI 414/HI 514 From Kings to Revolution: The History of Early-Modern France (3 credit hours)
Examination of the most politically powerful and culturally dominant kingdom in early-modern Europe, which dissolved into a revolution that destroyed its monarchy while establishing ideas about democracy and equality. From the glories of the Versailles palace to the misery of peasant villages, topics include the beginnings of the French state and nation in the warfare and religious conflicts of 1500s, political and economic developments, the growth of an internationally influential French culture, religious change, controversies over gender roles, and the origins of the French Revolution. Credit will not be given for both HI 414 and HI 514.

P: 3 hrs. of History
GEP Global Knowledge

HI 415/HI 515 The French Revolution (3 credit hours)
Broadly based analysis of France's first revolutionary era; the enlightenment and its impact, the causes and character of the Revolution in France; impact of these events in France and Europe. Credit will not be given for both HI 415 and HI 515

P: 3 hrs. of History
GEP Global Knowledge

HI 418/HI 518 Fascist Italy and Nazi Germany (3 credit hours)
Fascism as a theoretical concept, rise of fascism in Italy and Germany, seizure of power by Mussolini and Hitler, organization of the economy, churches, military, women, youth, and culture under the dictatorships. Students will not receive credit for both HI 418 and HI 518

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 419/HI 519 Modern European Imperialism (3 credit hours)
Historical background of European overseas expansion; its impact on the economics, politics and culture of both Europe and the colonized world; the significance of imperialism and anti-colonial nationalism in shaping the modern world. Credit will not be given for both HI 419 and HI 519

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Spring only

HI 421/HI 521 European Intellectual History: The Eighteenth Century (3 credit hours)
Historical examination of some of the major figures of the European Enlightenment, beginning with Locke and ending with Kant. Credit will not be given for both HI 421 and HI 521

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 422/HI 522 European Intellectual History: The 19th Century (3 credit hours)
Historical examination of some of the major figures of European thought during the 19th century, beginning with the enthusiasm of the period of the French Revolution and ending with the disillusionment of the fin de siecle. Credit will not be given for both HI 422 and HI 522

P: 3 hrs. of History
GEP Global Knowledge

HI 423/HI 523 Women in European Enlightenment (3 credit hours)
Historical analysis of feminist thought and action during the Enlightenment of the 1700s. Topics include women's role in the development of Western knowledge and science, historical construction of the gendered "nature" of women, education and political resources available to women, and their strategies for emancipation. Credit will not be given for both HI 423 and HI 523.

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Spring only

HI 425/HI 525 Tudor and Stuart England (3 credit hours)
British history from the Reformation through the Civil War. Emphasis on key developments in social, political and economic life: The development of a new concept of kingship, the growing independence of Parliament, the search for religious uniformity and the changing status of the aristocracy and gentry. Credit will not be given for both HI 425 and HI 525

P: 3 hrs. of History
GEP Global Knowledge

HI 429 20th Century Britain (3 credit hours)
British political, social and economic history since 1914, with reference to the effects of two world wars, the growth of the Welfare State, Britain's decline as a power, and its search for a new role in the world. Credit will not be given for both HI 429 and HI 529.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Summer only

HI 430/HI 530 Modern France (3 credit hours)
French history from the downfall of Napoleon I to the present, with a short introductory survey of the Old Regime and the French Revolution. Cultural, social and economic developments and political trends. Credit will not be given for both HI 430 and HI 530

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 434/HI 534 Theory and Practice of Digital History (3 credit hours)
Introduces students to the theory and practice of digital history. Students will examine theoretical scholarship on digital practices in history, learning how to acquire, edit, process, analyze, and present humanistic data. Students will critique examples of digital history including digital archives, exhibits, scholarship, and teaching resources, and then apply conceptual knowledge in the creation of their own digital history projects. The course is geared to students without prior knowledge of coding. Credit will not be given for both HI 434 and HI 534.

R: Graduate Standing or PBS
Typically offered in Fall only

HI 437 Topics in Central and East European History (3 credit hours)
Topical focus on specific problems and events occurring in the region in and between Germany and Russia in modern history. The course is designed to expose advanced undergraduates, principally history majors, to intensive reading, writing, and discussion of focused topics in the subject area. Previous modern European history credit is advised. This course is repeatable once for credit when offered with a different topic.

P: 3 hrs. of History
Typically offered in Spring only

HI 440/HI 540 American Environmental History (3 credit hours)
Interactions between humans and their environments in America; environmental focus on themes in American history such as colonial settlement, industrialization, progressivism, the New Deal, the 1960s. Credit will not be given for both HI 440 and HI 540.

Prerequisite: 3 hours of History
GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

HI 441/HI 541 Colonial and Revolutionary U.S (3 credit hours)
Origins of the English colonies in America to the American Revolution. European background to colonization, merging of different cultures, effects of mercantile doctrine, causes of revolution. Credit will not be given for both HI 441 and HI 541

P: 3 Hours of History

HI 443/HI 543 U.S. Constitutional History to 1883 (3 credit hours)
This course examines the origins and development of the U. S. Constitution from the Articles of Confederation to 1883. The course specifically looks at the federal Convention of 1787, the national bank debate and early constitutional interpretation;the constitution and its interaction with politics, economics, and society; the powers of Congress-taxation, contracts, commerce and war. The course also examines sovereignty, slavery and civil rights. It ends with an analysis of the Civil War Amendments and the transformation in American constitutionalism. Credit for both HI 443 and HI 543 is not allowed

P: 3 hrs. of History
Typically offered in Fall only

HI 444 U.S. Constitutional History Since 1870 (3 credit hours)
Examines the transformation of American Constitutional thought after the Civil War; the triumph of nationalism and the evolution of a new federal theory; the rise and fall of federal protections of civil rights in the late 19th-century and the CivilRights Revolution in the 20th century. Explores key concepts as civil liberties, judicial activism and judicial restraint; procedural and substantive due process, liberty of contracts and entrepreneurial liberty, Japanese internment, privacy, women and gender issues; explores free speech, religious freedom, civil liberties. Credit for both HI 444 and HI 544 is not allowed.

P: 3 hrs. of History
Typically offered in Spring only

HI 445/HI 545 Early American Borderlands (3 credit hours)
Examines the social, political, and cultural development of the eastern American frontiers between the early seventeenth and mid-nineteenth centuries. Addresses the relationships between settlers and environments, settlers and Native Americans. Explores the structure and life of pioneer families, the development of new institutions, the role of governments in regulating settlements, and the evolution of the "frontier myth." Credit cannot be given for both HI 445 and HI 545.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 446/HI 546 Topics in Civil War and Reconstruction (3 credit hours)
Examination of the historiography of the American Civil War and Reconstruction. Topics include the origins of the war, military strategy, the northern and southern homefront, nationalism and citizenship, slavery and freed labor, changing gender roles and ideologies, struggles over racial inequality, and conservatism and radicalism during Reconstruction. Credit will not be given for both HI 446 and HI 546.

Prerequisite: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 447/WGS 447/HI 547/WGS 547 Women in America: From Contact to the Civil War (3 credit hours)
The historical experience of women in America from Native American and European contact through the colonial period to the immediate post-Civil-War years (to 1890). Topics include the history of women's work, education, legal and political status, religious experience, and sex roles, with consideration of age, class, race, sexual preference, and region as significant variables in women's experience in America. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

P: 3 Hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 448/WGS 448/HI 548/WGS 548 American Women in the Twentieth Century (3 credit hours)
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 449/HI 549 U.S. Labor to 1900 (3 credit hours)
This course explores the history of work, workers, and working-class life and labor in the United States from the founding of the first European colonies to the beginning of the twentieth century: bound and free labor in colonial America, the transformation of urban worklife in the decades preceding the Civil War, slavery and class formation in the antebellum South, the effects of immigration on American workers, and the impact of race and gender on workers' solidarity. Credit will not be given for both HI 449 and HI 549.

P: 3 hrs. of History
GEP U.S. Diversity

HI 450 U.S. Labor Since 1900 (3 credit hours)
This course explores the history of work, workers, and working class organizations in the twentieth century United States; with particular attention to three core issues in twentieth-century American labor history: whether the US South has a particular form of labor history; the historical struggle for workersÂ¿ rights to collectively act and protest; and the intersections between race, ethnicity, immigration and labor in the twentieth-century US. Credit will not be given for both HI 450 and HI 550.

P: 3 hrs. of History
GEP U.S. Diversity

HI 451/HI 551 The Vietnam War (3 credit hours)
The Vietnam War in Vietnamese historical context. A study of major works on the legacy of French colonialism; the growth of Vietnamese radicalism and communism; World War II and the Vietnamese Revolution; the French Indochina War and political division; nation building in north and south Vietnam; conflict between north and south; American intervention; and the memory of war in Vietnam. Credit for both HI 451 and HI 551 is not allowed.

Prerequisite: 3 hours of History
Typically offered in Spring only

HI 452/HI 552 Recent America (3 credit hours)
Examination of contemporary opinions and historical interpretations of major problems in American life since 1939, including World War II, its social and economic consequences; Korea and the Cold War, big business and labor; civil rights and feminist movements; countercultures, Vietnam and Watergate. Credit will not be given both for HI 452 and HI 552

P: 3 Hours of History

HI 453/HI 553 United States-Latin American Relations Since 1823 (3 credit hours)
Critical analysis of the last two centuries of relations between the US and Latin America. Exploration of major policies using primary sources and declassified CIA documents. Major themes include US economic, political, and military influence, covert and overt US interventions, and response by Latin American governments. Historical perspectives on contemporary inter-American problems such as drugs, environment, debt crisis, human rights abuses, and the impact of the Latino population in the U.S. Credit will not be given both for HI 453 and HI 553.

Prerequisite: 3 hrs. of History
Typically offered in Spring only

HI 454 History of U.S. Foreign Relations, 1900-Present (3 credit hours)
America's emergence as a world power; American diplomatic history since 1900; the expansion of American economic and cultural relations; the evolution of the American foreign policy bureaucracy; and the historical forces and personalities that have shaped American relations with other nations. Credit for both HI 454 and HI 554 will not be allowed

P: 3 hrs. of History

HI 455/AFS 455/HI 555/AFS 555 History of the Civil Rights Movement (3 credit hours)
The black revolution; stages and leaders of the movement; successes and failures in the fight for desegregation, the vote, and economic opportunity; impact of Civil Rights movement on the United States. Credit will not be given both for AFS/HI 455 and AFS/HI 555.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 459/HI 559 The Early American Republic (3 credit hours)
Examines the social, political, and cultural development of the Early Republic, the period in American history roughly from the Revolutionary War through the Administration of John Quincy Adams. Employs the life of Thomas Jefferson-the quintessential American, as the foundation for delving into the historical problems, interpreting primary sources, and analyzing secondary sources. Encourages graduate students to analyze the ways in which historiographic debates complicate our understanding of the Early American Republic. Credit will not be given for both HI 459 and HI 559.

Prerequisite: 3 hrs. of History

HI 461/HI 561 Civilization of the Old South (3 credit hours)
The distinctive features of the Old South as part of the regional development of United States history. Consideration of colonial factors in the making of the South, development of the plantation system and slavery, Southern social order, intellectual and cultural life, economic development, and rise of Southern nationalism. Credit will not be given for both HI 461 and HI 561

Prerequisite: 3 hrs. of History

HI 462/HI 562 Southern History since the Civil War (3 credit hours)
Exploration of many American "Souths" from Reconstruction to the present. How race/ethnicity, gender, class, geography, sexuality, and culture inform "Southern" identity; major political and economic changes; and the region's relationship to the nation and the world. Credit will not be given for HI 462 and HI 562.

Prerequisite: 3 hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

HI 463/HI 563 Topics in History and Memory (3 credit hours)
Explores how "collective memory" develops. Examines how memory is represented through public speeches, civic celebrations, monuments and memorials, and other forms of popular and political culture. Analyzes what is recalled, what is forgotten, and who decides. Asks why memory is made public. May be repeated once for credit when offered with a different topic. Credit will not be given for both HI 463 and HI 563.

Typically offered in Fall, Spring, and Summer

HI 465 Oil and Crisis in the Gulf (3 credit hours)
Historical roots and development of the Persian Gulf region from the late nineteenth century until the present with an emphasis on the social, economic, cultural and political transformations following the discovery of oil, and subsequent events such as the Arab Oil embargo of 1973, the Iranian Revolution, the Iran-Iraq war, and the two Gulf wars.

P: 3 hrs. of History
GEP Global Knowledge

HI 466 History of the Palestinian-Israeli Conflict (3 credit hours)
Historical roots and development of the Palestinian-Israeli conflict from the late nineteenth century until the present through the study of the history and historiography of Zionism, Palestinian nationalism, creation of the state of Israel, establishment of settlements, conflicts and peace negotiations, as well as a study of the impact of this conflict on both Israeli and Palestinian societies, economies and cultures.

P: 3 hrs. of History
GEP Global Knowledge

HI 467 Modern Mexico (3 credit hours)
Major developments in Mexican national life since 1821. The 19th century: the era of Santa Anna, the war with the United States, the Reform, the French intervention, and the dictatorship of Profirio Diaz. The 1910 Revolution and the resulting transformation of Mexico's political, social and economic institutions. Reading knowledge of Spanish helpful but not required.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall only

HI 468/HI 568 Slavery in the Americas (3 credit hours)
Exploration of the development of chattel slavery throughout the Americas. Analysis of the emergence and development of New World slavery in ways that encourage students to think critically about the historical processes of abolition, emancipation, and freedom across the Atlantic world. The lectures and readings seek to dislodge the notion that the "history of slavery" only pertains to the United States. The course, instead, emphasizes commonalities and differences in ways that challenge assumptions that the institution was exceptional in any given region. Credit will not be given for both HI 468 and HI 568.

Prerequisite: 3 Hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 469/HI 569 Latin American Revolutions (3 credit hours)
Comparative analysis of causes, participants, process, and outcome of revolutions in Mexico, Bolivia, Cuba, and Central America. Credit for both HI 469 and HI 569 will not be given

Prerequisite: 3 Hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 470/HI 570 Exploring World History (3 credit hours)
Introduction to the methods, themes, and narratives of world history. As a distinct approach to historical study, world history focuses on dynamic connections and relationships among regions of the world and the variety of global processes - related to trade, religion, production, consumption, migration, imperialism, disease, and technologies - that connected them. The course is a suggested elective for future teachers who will teach world history in high school, as well as an ideal course for History majors and graduate students who want to explore the connections among all the regionally specific upper division courses they have taken. Credit will not be given for both HI 470 and HI 570.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 471/HI 571 Revolutionary China (3 credit hours)
China 1900 to present. Examination of political, cultural, and socio-economic revolutionary phases of China's 20th-century transformation from traditional empire to communism. Particular attention to post-1949 problems of nation-building. Credit will not be given for both HI 471 and HI 571

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 472 Fashion, Food, and Fun: Material Culture in Chinese History (3 credit hours)
Exploration of the history of everyday material culture in China, covering a wide range of physical objects such clothes, tea, architecture, and woodblock printing. Examination of how the material culture of different time periods evolved in response to varying historical factors and contributed to the formation of cultural norms. Focus on both textual and visual historical records, as well as objects from the Gregg Museum.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall only

HI 473/HI 573 Japan's Empire in Asia, 1868-1945 (3 credit hours)
An advanced survey of Japanese relations with Asia in the nineteenth and twentieth centuries. Structures and ideologies of imperialism and colonialism; modernization, nationalism and social change; migration and mobility; resistance and collaboration; and legacies of empire. Credit will not be given for both HI 473 and HI 573

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 474 Modern India (3 credit hours)
The history of the Indian sub-continent, from the 16th century to the present. Focus on political, economic and cultural change under the Mughal Empire and the British Raj; the problems of independent India, Pakistan and Bangladesh.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall only

HI 475/AFS 475/HI 575/AFS 575 History of the Republic of South Africa (3 credit hours)
Evolution of the Republic of South Africa's society, with emphasis on the interaction of diverse peoples and cultures. Particular attention is given to the period since 1870. Credit will not be given for both HI (AFS) 475 and HI 575.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall and Spring

HI 476/AFS 476/HI 576/AFS 576 Leadership in Modern Africa (3 credit hours)
Recent sub-Saharan African political history (excluding South Africa). Overview of concepts, vocabulary, historical trends. Detailed examination of specific African countries as case studies, such as Ghana, Nigeria, Zimbabwe, Tanzania. Credit will not be given for both HI (AFS) 476 and HI 576.

Prerequisite: 3 hours of history
GEP Global Knowledge

HI 477 Women in the Middle East (3 credit hours)
The varied forces influencing lives of women in Middle East from beginning of Islam to present.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 478 Islam and Christianity in Sub-Saharan Africa (3 credit hours)
Expansion and interaction of Islam and Christianity in sub-Saharan Africa in the nineteenth and twentieth centuries, and their influence and impact on the economy, politics, and society. Topics include missionary activity, resistance to imperial authority, the role of the churches, and the influence of religion on leadership, education, nationalism, and post-colonialism. Credit will not be given for both HI 478 and HI 578.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall only

HI 479/AFS 479/HI 579/AFS 579 Africa (sub-Saharan) in the Twentieth Century (3 credit hours)
Developments in sub-Saharan Africa during the colonial period, from the end of the nineteenth century to the advent of decolonization in the early 1960s. Interplay of political, social, economic and cultural factors in the experiences of African peoples during this period. Credit will not be given for both HI (AFS) 479 and HI 579

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 481/HI 581 History of the Life Sciences (3 credit hours)
Historical context of the individuals, ideas, scientific practices, and social goals that created the core concepts of the modern biological sciences, from Renaissance medicine to molecular biology, with a focus on interconnections of the scientific knowledge and perspective of the life sciences with other aspects of culture, including other sciences, views about nature and life, religious belief, medical practice, and agriculture. Topics include the development of biological experiments; theories of ecology and evolution; the chemical understanding of health, food, and drugs; and the modern molecular revolution. Credit will not be given for both HI 481 and HI 581.

P: 3 hrs. of History
GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 482/HI 582 Darwinism in Science and Society (3 credit hours)
Scientific development of Darwinism and its reception by the scientific community and the general public. Social impact of theories of evolution as reflected in Social Darwinism, eugenics, sociobiology, and relationship of sciences to ethics and religion. Credit will not be given both for HI 482 and HI 582

P: 3 hrs. of History
GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 483/HI 583 Science and Religion in European History (3 credit hours)
Are science and religion inherently in conflict with each other? Historical analysis of the idea of the Â¿warfare between religion and science,Â¿ treating their complex relationship and respective cultural authority before 1800, including the relationship of science and religion in Europe during periods of the Reformation, the creation of early modern states, and the Enlightenment of the 1700s. Topics include visions of nature and utopias, the creation of mechanistic science in the 1600s, and natural theology. Credit will not be given for both HI 483 and HI 583.

P: 3 hrs. of History
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 484/HI 584 Science in European Culture (3 credit hours)
The role of science in shaping early modern European identity, culture and polity in the 1600s and 1700s. Drawing on documents and material culture, topics include the meaning of natural wonders, explorations, travel literature, instruments and mapping, colonies and empire, and universal expos. Credit will not be given for both HI 484 and HI 584.

P: 3 hrs. of History
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 485/HI 585 History of American Technology (3 credit hours)
Technology in American history: the ideological, social, economic, and institutional contexts of technological change from the 1760's to the present. Impacts of new technological systems. Credit will not be given for both HI 485 and HI 585.

Prerequisite: 3 hours of History
GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 486/HI 586 Science and Empire (3 credit hours)
The development of European science in the context of world exploration, global commercial expansion, local knowledge, and visions of colonization and empire. Credit will not be given for both HI 486 and HI 586.

Prerequisite: 3 hours of History
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 488/HI 588 Family and Community History (3 credit hours)
Theory and research in family history, local history, and community studies, as well as application to public history presentation and community development. Students cannot receive credit for both HI 488 and HI 588.

P: Graduate Standing
Typically offered in Fall only

HI 491 Seminar in History (3 credit hours)
Detailed investigation of selected topics in history. Consult Department of History for specific topics.

Prerequisite:HI 300 and 18 hours of History
Typically offered in Fall and Spring

HI 494 Honors Directed Readings in History (3 credit hours)
Directed readings course covering the literature of a broad historiographical field, from which the student should ultimately draw a more specialized topic for an Honors Thesis (HI 495 and HI 496). Both written and oral assignments based on the assigned reading may be made. Enrollment requires a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and instructor prior to registration by the department.

Typically offered in Fall, Spring, and Summer

HI 495 Honors Research in History I (3 credit hours)
Research and preparation of a draft honors thesis. Topic and procedures to be determined by the student and the supervising faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

HI 496 Honors Research in History II (3 credit hours)
Completion of the honors thesis. Topic to be determined by the student and the supervising faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: HI 495
Typically offered in Fall and Spring

HI 498 Independent Study in History (1-6 credit hours)
Extensive readings on predetermined topics focused around a central theme. Permission of the department is required. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: 3 hours of History

HI 499 Special Topics in History (1-3 credit hours)
Timely topical courses or experimental course offerings in advanced historical study.

Prerequisite: 3 hours of History
Typically offered in Fall and Spring

HI 500/HI 400 Civilization of the Ancient Near East (3 credit hours)
The civilization of Mesopotamia and Egypt from earliest times to the fall of Babylon in 539 B.C. Credit for both HI 400 and HI 500 is not allowed

Prerequisite: 3 hours of History
Typically offered in Fall only

HI 502/REL 502 Early Christianity to the Time of Eusebius (3 credit hours)
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority. Students may not receive credit for both REL /HI 402 and REL/HI 502.

Prerequisite: Graduate standing
Typically offered in Fall only

HI 503/HI 403 Ancient Greek Civilization (3 credit hours)
The history of the Hellenes from the Minoan civilization through Alexander's legacy, with readings in Herodotus and Thucydides. Credit will not be given for both HI 403 and HI 503.

Typically offered in Spring only

HI 504/HI 404 Rome to 337 A.D. (3 credit hours)
The development of ancient Rome from its origins in Italy, through the rise as an Empire embracing the entire Mediterranean World and Western Europe, to Constantine, Christianity and the foundation of Constantinople. Examines critically the political achievement of a people who rose from an obscure Italian city to a world empire, with emphasis on the analysis of primary sources. Credit will not be given for both HI 404 and HI 504

P: 3 hrs. of History

HI 505/HI 405 History and Archaeology of the Roman Empire (3 credit hours)
Analysis of Rome's rule over the Mediterranean World in the first four centuries A.D. through the use of literary and archaelologic sources. Special emphasis on imperial army and frontier security. Credit will not be given for both H1 405 and H1 505

P: 3 hrs. of History

HI 506/HI 406 From Roman Empire to Middle Ages (3 credit hours)
Late Antiquity and the early Middle Ages. The transition from classical civilization to the basis of modern civilizations; the fall of Rome, the Germanic kingdoms, Byzantium, the establishment of Christianity, the birth and growth of Islam. Credit will not be given for both HI 406 and HI 506

P: 3 hrs. of History
Typically offered in Spring only

HI 507/REL 507 Islamic History to 1798 (3 credit hours)
The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe. Credit will not be given for both REL/HI 407 and REL/HI 507.

Prerequisite: Graduate Standing
Typically offered in Fall only

HI 508/REL 508 Islam in the Modern World (3 credit hours)
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

Prerequisite: Graduate Standing
Typically offered in Fall only

HI 509/HI 409 The High Middle Ages (3 credit hours)
Medieval culture from 10th through 13th centuries: revival of the Roman Empire, monastic and papal reform, rise of universities, evolution of representative bodies, the Gothic style, troubadour and goliardic poetry, scholasticism, and revival of Roman law. Credit will not be given for both HI 409 and HI 509

P: 3 hrs. of History

HI 511/HI 411 Trials of Faith: Religious Reformation in Early-Modern Europe (3 credit hours)
Examination of the great disruption in European civilization associated with the Protestant and Catholic Reformations. The course considers the new religious ideas and practices associated with the Reformations and transformation they produced in European political and economic life; the violence they provoked; the new thinking about families and gender roles they encouraged, the spread of European religions around the globe with European voyages of discovery and conquest, and the beginning of ideas about religious toleration. Credit will not be given for both HI 411 and HI 511.

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 512/HI 412 The Sexes and Society in Early-Modern Europe (3 credit hours)
Examination of changes in gender relations; ideas about the sexes, femininity, and masculinity; the roles of women and men in political, religious, economic, scientific, and family life in Europe between the late Middle Ages and the French Revolution. Credit for HI 412 and HI 512 is not allowed.

P: 3 hrs. of History
GEP Global Knowledge

HI 514/HI 414 From Kings to Revolution: The History of Early-Modern France (3 credit hours)
Examination of the most politically powerful and culturally dominant kingdom in early-modern Europe, which dissolved into a revolution that destroyed its monarchy while establishing ideas about democracy and equality. From the glories of the Versailles palace to the misery of peasant villages, topics include the beginnings of the French state and nation in the warfare and religious conflicts of 1500s, political and economic developments, the growth of an internationally influential French culture, religious change, controversies over gender roles, and the origins of the French Revolution. Credit will not be given for both HI 414 and HI 514.

P: 3 hrs. of History
GEP Global Knowledge

HI 515/HI 415 The French Revolution (3 credit hours)
Broadly based analysis of France's first revolutionary era; the enlightenment and its impact, the causes and character of the Revolution in France; impact of these events in France and Europe. Credit will not be given for both HI 415 and HI 515

P: 3 hrs. of History
GEP Global Knowledge

HI 518/HI 418 Fascist Italy and Nazi Germany (3 credit hours)
Fascism as a theoretical concept, rise of fascism in Italy and Germany, seizure of power by Mussolini and Hitler, organization of the economy, churches, military, women, youth, and culture under the dictatorships. Students will not receive credit for both HI 418 and HI 518

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 519/HI 419 Modern European Imperialism (3 credit hours)
Historical background of European overseas expansion; its impact on the economics, politics and culture of both Europe and the colonized world; the significance of imperialism and anti-colonial nationalism in shaping the modern world. Credit will not be given for both HI 419 and HI 519

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Spring only

HI 521/HI 421 European Intellectual History: The Eighteenth Century (3 credit hours)
Historical examination of some of the major figures of the European Enlightenment, beginning with Locke and ending with Kant. Credit will not be given for both HI 421 and HI 521

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 522/HI 422 European Intellectual History: The 19th Century (3 credit hours)
Historical examination of some of the major figures of European thought during the 19th century, beginning with the enthusiasm of the period of the French Revolution and ending with the disillusionment of the fin de siecle. Credit will not be given for both HI 422 and HI 522

P: 3 hrs. of History
GEP Global Knowledge

HI 523/HI 423 Women in European Enlightenment (3 credit hours)
Historical analysis of feminist thought and action during the Enlightenment of the 1700s. Topics include women's role in the development of Western knowledge and science, historical construction of the gendered "nature" of women, education and political resources available to women, and their strategies for emancipation. Credit will not be given for both HI 423 and HI 523.

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Spring only

HI 525/HI 425 Tudor and Stuart England (3 credit hours)
British history from the Reformation through the Civil War. Emphasis on key developments in social, political and economic life: The development of a new concept of kingship, the growing independence of Parliament, the search for religious uniformity and the changing status of the aristocracy and gentry. Credit will not be given for both HI 425 and HI 525

P: 3 hrs. of History
GEP Global Knowledge

HI 530/HI 430 Modern France (3 credit hours)
French history from the downfall of Napoleon I to the present, with a short introductory survey of the Old Regime and the French Revolution. Cultural, social and economic developments and political trends. Credit will not be given for both HI 430 and HI 530

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 533 Theory and Practice of Oral History (3 credit hours)
Explores the practice of oral history. Examines historical works drawn primarily from oral sources. Teaches students to design and implement oral history projects based on independent research.

Typically offered in Spring only

HI 534/HI 434 Theory and Practice of Digital History (3 credit hours)
Introduces students to the theory and practice of digital history. Students will examine theoretical scholarship on digital practices in history, learning how to acquire, edit, process, analyze, and present humanistic data. Students will critique examples of digital history including digital archives, exhibits, scholarship, and teaching resources, and then apply conceptual knowledge in the creation of their own digital history projects. The course is geared to students without prior knowledge of coding. Credit will not be given for both HI 434 and HI 534.

R: Graduate Standing or PBS
Typically offered in Fall only

HI 535 Spatial History (3 credit hours)
Introduces students to the methods, problems, and questions of spatial history. Students will examine major works in spatial history and historical geography, and develop their own projects utilizing the tools of historical GIS. Students will engage in theoretical discussions about the role of space in history and, at the same time, will acquire the skills for collecting, managing, and analyzing historical spatial data. The course is geared to students without prior knowledge of GIS. Graduate standing or PBS status.

R: Graduate Standing or PBS
Typically offered in Spring only

HI 539 History Of the Soviet Union and After (3 credit hours)
History of the Soviet state and society from the 1917 Revolution, including post-Soviet situation. Political disarray and resistance to the Bolshevik regime, 1917-21; industrialization, urbanization and application of coercive techniques of rule; popular reconciliation with Party state and great power status during World War II and after; fate of non-Russian nationalities; de-Stalinization, stagnation and failed attempt at Party renewal after 1985. Credit for both HI 439 and HI 539 is not allowed

HI 540/HI 440 American Environmental History (3 credit hours)
Interactions between humans and their environments in America; environmental focus on themes in American history such as colonial settlement, industrialization, progressivism, the New Deal, the 1960s. Credit will not be given for both HI 440 and HI 540.

Prerequisite: 3 hours of History
GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 541/HI 441 Colonial and Revolutionary U.S (3 credit hours)
Origins of the English colonies in America to the American Revolution. European background to colonization, merging of different cultures, effects of mercantile doctrine, causes of revolution. Credit will not be given for both HI 441 and HI 541

P: 3 Hours of History

HI 543/HI 443 U.S. Constitutional History to 1883 (3 credit hours)
This course examines the origins and development of the U. S. Constitution from the Articles of Confederation to 1883. The course specifically looks at the federal Convention of 1787, the national bank debate and early constitutional interpretation;the constitution and its interaction with politics, economics, and society; the powers of Congress-taxation, contracts, commerce and war. The course also examines sovereignty, slavery and civil rights. It ends with an analysis of the Civil War Amendments and the transformation in American constitutionalism. Credit for both HI 443 and HI 543 is not allowed

P: 3 hrs. of History
Typically offered in Fall only

HI 544 US Constitutional History Since 1870 (3 credit hours)
Examines the transformation of American constitutional thought after the Civil War; the triumph of nationalism and the evolution of a new federal theory; the rise and fall of federal protections of civil rights. Explores key concepts such as civil liberties, judicial activism and judicial restraint; analyzes procedural and substantive due process, liberty of contracts and entrepreneurial liberty; evaluates Japanese internment, privacy, gender equality, free speech, religious freedom, civil liberties. credit not given for both HI 444 and 544

Prerequisite: Graduate standing
Typically offered in Spring only

HI 545/HI 445 Early American Borderlands (3 credit hours)
Examines the social, political, and cultural development of the eastern American frontiers between the early seventeenth and mid-nineteenth centuries. Addresses the relationships between settlers and environments, settlers and Native Americans. Explores the structure and life of pioneer families, the development of new institutions, the role of governments in regulating settlements, and the evolution of the "frontier myth." Credit cannot be given for both HI 445 and HI 545.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 546/HI 446 Topics in Civil War and Reconstruction (3 credit hours)
Examination of the historiography of the American Civil War and Reconstruction. Topics include the origins of the war, military strategy, the northern and southern homefront, nationalism and citizenship, slavery and freed labor, changing gender roles and ideologies, struggles over racial inequality, and conservatism and radicalism during Reconstruction. Credit will not be given for both HI 446 and HI 546.

Prerequisite: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 547/WGS 547/HI 447/WGS 447 Women in America: From Contact to the Civil War (3 credit hours)
The historical experience of women in America from Native American and European contact through the colonial period to the immediate post-Civil-War years (to 1890). Topics include the history of women's work, education, legal and political status, religious experience, and sex roles, with consideration of age, class, race, sexual preference, and region as significant variables in women's experience in America. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

P: 3 Hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 548/WGS 548/HI 448/WGS 448 American Women in the Twentieth Century (3 credit hours)
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

HI 549/HI 449 U.S. Labor to 1900 (3 credit hours)
This course explores the history of work, workers, and working-class life and labor in the United States from the founding of the first European colonies to the beginning of the twentieth century: bound and free labor in colonial America, the transformation of urban worklife in the decades preceding the Civil War, slavery and class formation in the antebellum South, the effects of immigration on American workers, and the impact of race and gender on workers' solidarity. Credit will not be given for both HI 449 and HI 549.

P: 3 hrs. of History
GEP U.S. Diversity

HI 550 U. S. Labor Since 1900 (3 credit hours)
This course explores the history of work, workers, and working class organizations in the twentieth century United States; with particular attention to three core issues in twentieth-century American labor history: whether the US South has a particular form of labor history; the historical struggle for workersÂ¿ rights to collectively act and protest; and the intersections between race, ethnicity, immigration and labor in the twentieth-century US. Credit for both HI 450 and HI 550 is not allowed.

Prerequisite: Graduate standing

HI 551/HI 451 The Vietnam War (3 credit hours)
The Vietnam War in Vietnamese historical context. A study of major works on the legacy of French colonialism; the growth of Vietnamese radicalism and communism; World War II and the Vietnamese Revolution; the French Indochina War and political division; nation building in north and south Vietnam; conflict between north and south; American intervention; and the memory of war in Vietnam. Credit for both HI 451 and HI 551 is not allowed.

Prerequisite: 3 hours of History
Typically offered in Spring only

HI 552/HI 452 Recent America (3 credit hours)
Examination of contemporary opinions and historical interpretations of major problems in American life since 1939, including World War II, its social and economic consequences; Korea and the Cold War, big business and labor; civil rights and feminist movements; countercultures, Vietnam and Watergate. Credit will not be given both for HI 452 and HI 552

P: 3 Hours of History

HI 553/HI 453 United States-Latin American Relations Since 1823 (3 credit hours)
Critical analysis of the last two centuries of relations between the US and Latin America. Exploration of major policies using primary sources and declassified CIA documents. Major themes include US economic, political, and military influence, covert and overt US interventions, and response by Latin American governments. Historical perspectives on contemporary inter-American problems such as drugs, environment, debt crisis, human rights abuses, and the impact of the Latino population in the U.S. Credit will not be given both for HI 453 and HI 553.

Prerequisite: 3 hrs. of History
Typically offered in Spring only

HI 554 History Of U. S. Foreign Relations, 1900-Present (3 credit hours)
American diplomatic history since 1900; the expansion of American economic and cultural relations; the evolution of the American foreign policy bureaucracy; and the historical forces and personalities that shaped American relations with other nations. Credit for both HI 454 and HI 554 is not allowed

Typically offered in Fall only

HI 555/AFS 555/HI 455/AFS 455 History of the Civil Rights Movement (3 credit hours)
The black revolution; stages and leaders of the movement; successes and failures in the fight for desegregation, the vote, and economic opportunity; impact of Civil Rights movement on the United States. Credit will not be given both for AFS/HI 455 and AFS/HI 555.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HI 559/HI 459 The Early American Republic (3 credit hours)
Examines the social, political, and cultural development of the Early Republic, the period in American history roughly from the Revolutionary War through the Administration of John Quincy Adams. Employs the life of Thomas Jefferson-the quintessential American, as the foundation for delving into the historical problems, interpreting primary sources, and analyzing secondary sources. Encourages graduate students to analyze the ways in which historiographic debates complicate our understanding of the Early American Republic. Credit will not be given for both HI 459 and HI 559.

Prerequisite: 3 hrs. of History

HI 561/HI 461 Civilization of the Old South (3 credit hours)
The distinctive features of the Old South as part of the regional development of United States history. Consideration of colonial factors in the making of the South, development of the plantation system and slavery, Southern social order, intellectual and cultural life, economic development, and rise of Southern nationalism. Credit will not be given for both HI 461 and HI 561

Prerequisite: 3 hrs. of History

HI 562/HI 462 Southern History since the Civil War (3 credit hours)
Exploration of many American "Souths" from Reconstruction to the present. How race/ethnicity, gender, class, geography, sexuality, and culture inform "Southern" identity; major political and economic changes; and the region's relationship to the nation and the world. Credit will not be given for HI 462 and HI 562.

Prerequisite: 3 hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

HI 563/HI 463 Topics in History and Memory (3 credit hours)
Explores how "collective memory" develops. Examines how memory is represented through public speeches, civic celebrations, monuments and memorials, and other forms of popular and political culture. Analyzes what is recalled, what is forgotten, and who decides. Asks why memory is made public. May be repeated once for credit when offered with a different topic. Credit will not be given for both HI 463 and HI 563.

Typically offered in Fall, Spring, and Summer

HI 566 Readings in Native American History (3 credit hours)
Readings in the varied historical experiences of nations native to North America from the first migrations of peoples into the continent until the present, including the variety and diversity of native cultures and experiences; native resistance to colonialism, expansion, and U.S. federal policies; and the survival and continuity of native cultures and peoples through more than four centuries of contact, conquest, and change.

HI 568/HI 468 Slavery in the Americas (3 credit hours)
Exploration of the development of chattel slavery throughout the Americas. Analysis of the emergence and development of New World slavery in ways that encourage students to think critically about the historical processes of abolition, emancipation, and freedom across the Atlantic world. The lectures and readings seek to dislodge the notion that the "history of slavery" only pertains to the United States. The course, instead, emphasizes commonalities and differences in ways that challenge assumptions that the institution was exceptional in any given region. Credit will not be given for both HI 468 and HI 568.

Prerequisite: 3 Hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 569/HI 469 Latin American Revolutions (3 credit hours)
Comparative analysis of causes, participants, process, and outcome of revolutions in Mexico, Bolivia, Cuba, and Central America. Credit for both HI 469 and HI 569 will not be given

Prerequisite: 3 Hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 570/HI 470 Exploring World History (3 credit hours)
Introduction to the methods, themes, and narratives of world history. As a distinct approach to historical study, world history focuses on dynamic connections and relationships among regions of the world and the variety of global processes - related to trade, religion, production, consumption, migration, imperialism, disease, and technologies - that connected them. The course is a suggested elective for future teachers who will teach world history in high school, as well as an ideal course for History majors and graduate students who want to explore the connections among all the regionally specific upper division courses they have taken. Credit will not be given for both HI 470 and HI 570.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 571/HI 471 Revolutionary China (3 credit hours)
China 1900 to present. Examination of political, cultural, and socio-economic revolutionary phases of China's 20th-century transformation from traditional empire to communism. Particular attention to post-1949 problems of nation-building. Credit will not be given for both HI 471 and HI 571

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 572 The Rise of Modern Japan, 1850-Present (3 credit hours)
Japan's emergence as a modern nation and world power. Topics include nation-state formation; modernization and its dislocations; democratization and authoritarianism; imperialism, international politics, and war; postwar reforms; changing gender relations; popular culture; and social problems. Credit will not be given for both HI 472 and HI 572

Prerequisite: Graduate standing
Typically offered in Spring only

HI 573/HI 473 Japan's Empire in Asia, 1868-1945 (3 credit hours)
An advanced survey of Japanese relations with Asia in the nineteenth and twentieth centuries. Structures and ideologies of imperialism and colonialism; modernization, nationalism and social change; migration and mobility; resistance and collaboration; and legacies of empire. Credit will not be given for both HI 473 and HI 573

P: 3 hrs. of History
GEP Global Knowledge
Typically offered in Fall only

HI 575/AFS 575/HI 475/AFS 475 History of the Republic of South Africa (3 credit hours)
Evolution of the Republic of South Africa's society, with emphasis on the interaction of diverse peoples and cultures. Particular attention is given to the period since 1870. Credit will not be given for both HI (AFS) 475 and HI 575.

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Fall and Spring

HI 576/AFS 576/HI 476/AFS 476 Leadership in Modern Africa (3 credit hours)
Recent sub-Saharan African political history (excluding South Africa). Overview of concepts, vocabulary, historical trends. Detailed examination of specific African countries as case studies, such as Ghana, Nigeria, Zimbabwe, Tanzania. Credit will not be given for both HI (AFS) 476 and HI 576.

Prerequisite: 3 hours of history
GEP Global Knowledge

HI 578 Islam and Christianity in Sub-Saharan Africa since the 19th Century (3 credit hours)
Expansion and interaction of Islam and Christianity in sub-Saharan Africa in the nineteenth and twentieth centuries, and their influence and impact on the economy, politics, and society. Topics include missionary activity, resistance to imperial authority, the role of the churches, and the influence of religion on leadership, education, nationalism, and post-colonialism. Credit will not be given for both HI 478 and HI 578; graduate standing for HI 578.

Typically offered in Fall only

HI 579/AFS 579/HI 479/AFS 479 Africa (sub-Saharan) in the Twentieth Century (3 credit hours)
Developments in sub-Saharan Africa during the colonial period, from the end of the nineteenth century to the advent of decolonization in the early 1960s. Interplay of political, social, economic and cultural factors in the experiences of African peoples during this period. Credit will not be given for both HI (AFS) 479 and HI 579

Prerequisite: 3 hours of History
GEP Global Knowledge
Typically offered in Spring only

HI 581/HI 481 History of the Life Sciences (3 credit hours)
Historical context of the individuals, ideas, scientific practices, and social goals that created the core concepts of the modern biological sciences, from Renaissance medicine to molecular biology, with a focus on interconnections of the scientific knowledge and perspective of the life sciences with other aspects of culture, including other sciences, views about nature and life, religious belief, medical practice, and agriculture. Topics include the development of biological experiments; theories of ecology and evolution; the chemical understanding of health, food, and drugs; and the modern molecular revolution. Credit will not be given for both HI 481 and HI 581.

P: 3 hrs. of History
GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 582/HI 482 Darwinism in Science and Society (3 credit hours)
Scientific development of Darwinism and its reception by the scientific community and the general public. Social impact of theories of evolution as reflected in Social Darwinism, eugenics, sociobiology, and relationship of sciences to ethics and religion. Credit will not be given both for HI 482 and HI 582

P: 3 hrs. of History
GEP Interdisciplinary Perspectives
Typically offered in Spring only

HI 583/HI 483 Science and Religion in European History (3 credit hours)
Are science and religion inherently in conflict with each other? Historical analysis of the idea of the Â¿warfare between religion and science,Â¿ treating their complex relationship and respective cultural authority before 1800, including the relationship of science and religion in Europe during periods of the Reformation, the creation of early modern states, and the Enlightenment of the 1700s. Topics include visions of nature and utopias, the creation of mechanistic science in the 1600s, and natural theology. Credit will not be given for both HI 483 and HI 583.

P: 3 hrs. of History
GEP Global Knowledge, GEP Interdisciplinary Perspectives

HI 584/HI 484 Science in European Culture (3 credit hours)
The role of science in shaping early modern European identity, culture and polity in the 1600s and 1700s. Drawing on documents and material culture, topics include the meaning of natural wonders, explorations, travel literature, instruments and mapping, colonies and empire, and universal expos. Credit will not be given for both HI 484 and HI 584.

P: 3 hrs. of History
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HI 585/HI 485 History of American Technology (3 credit hours)
Technology in American history: the ideological, social, economic, and institutional contexts of technological change from the 1760's to the present. Impacts of new technological systems. Credit will not be given for both HI 485 and HI 585.

Prerequisite: 3 hours of History
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HI 586/HI 486 Science and Empire (3 credit hours)
The development of European science in the context of world exploration, global commercial expansion, local knowledge, and visions of colonization and empire. Credit will not be given for both HI 486 and HI 586.

Prerequisite: 3 hours of History
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

HI 587/ANT 587 Cultural Resource Management (3 credit hours)
Theoretical and practical overview of U.S. federal and state laws, institutions, and practices related to the inventory, evaluation, preservation, protection, and overall management of cultural resources; history and philosophical bases of Cultural Resource Management (CRM); professional ethics; indigenous and other stakeholder interests in CRM; and comparative national regulations outside the U.S. and the international heritage management and organizations. Graduate standing in history required.

Typically offered in Spring only

HI 588/HI 488 Family and Community History (3 credit hours)
Theory and research in family history, local history, and community studies, as well as application to public history presentation and community development. Students cannot receive credit for both HI 488 and HI 588.

P: Graduate Standing
Typically offered in Fall only

HI 589 Interpretation in Historic Sites and Parks (3 credit hours)
Methodologies of interpreting history at historic sites and parks; training in interpretive tools linking historiography and research methodology with real places for presentation to the public; considerations of practical application. Five day trips required. Graduate standing or NDS.

Requisite: NCSU Graduate Students (MR or DR), NDS Students Only
Typically offered in Spring only

HI 591 Museum Studies (3 credit hours)
Organization and operation of museums as historical agencies. Role of museums in historical research and education. Graduate standing or NDS.

Typically offered in Fall only

HI 593 Material Culture (3 credit hours)
Current theories of material culture analysis and their application to history museums. Graduate standing or NDS.

Typically offered in Spring only

HI 594 Cultural Heritage (3 credit hours)
Use of the past and its cultures in reinforcing identities. Global development of heritage preservation, cultural resource management, and heritage tourism. Role of heritage professionals in identification, study, assessment, preservation, interpretation, management, and promotion of historic and cultural resources. Law and regulations that protect and preserve cultural resources. Graduate standing or NDS.

Typically offered in Fall only

HI 595 Special Topics in History (1-6 credit hours)
Topical courses or experimental course offerings in advanced historical study.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

HI 596 Introduction To Public History (3 credit hours)
Historical origins of public history, applications of history to public life, historiography and major paradigms in the field, and debates about the public role of historians. Graduate standing in History.

Typically offered in Fall only

HI 597 Historiography and Historical Method (3 credit hours)
Major steps in development of historical investigation; analysis of elements of historical research; discussion of methodology and archival materials used by contemporary scholarly historian.

Typically offered in Fall only

HI 598 Historical Writing (3 credit hours)
Critical studies in the methods and practice of contemporary historical writing.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

HI 599 Independent Study (1-3 credit hours)
Individualized study conducted under supervision of graduate faculty. Course of study, assigned readings, course projects or papers, and methods of evaluating work to be detailed in writing and approved by department head.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

HI 642 Internship In Public History (3 credit hours)
Supervised internship experience with a public or private historical agency or institution or local, regional, or national significance. Graduate standing in History.

Typically offered in Fall, Spring, and Summer

HI 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Spring only

HI 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

HI 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

HI 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

HI 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

HI 787 African American Public History (3 credit hours)
Issues in public history practice as they relate to the collection, preservation, and interpretation of African American cultural history. Graduate standing in history required.

Typically offered in Spring only

HI 788 Native American Public History (3 credit hours)
Issues in public history practice as they relate to the collection, preservation, and interpretation of Native American history. Graduate standing in history required.

Typically offered in Fall only

HI 789 Public History in International Context (3 credit hours)
Global public history since 1945, including functions of historical memory as they relate to global economics of public history, world heritage, and the transnational contexts for the work of historians.

Typically offered in Spring only

HI 791 Colloquium in Public History (3 credit hours)
Advanced historiographical readings on major topics in public history. Graduate standing only.

Typically offered in Spring only

HI 792 Colloquium in History (3 credit hours)
Advanced historiographical readings on major topics in history. May be repeated for credit with different topic. Graduate standing in History only.

Typically offered in Fall and Spring

HI 795 Special Topics (1-6 credit hours)

HI 799 Independent Study (1-3 credit hours)
Independent Study

Typically offered in Fall and Spring

HI 885 Doctoral Supervised Teaching (1-3 credit hours)

HI 889 Doctoral Dissertation Seminar (1 credit hours)
Development of a solid dissertation structure, research strategy and drafting of framing chapters, preparation of dissertation proposal and proposal presentation, strategies for revision of dissertation. Three consecutive semesters beginning in semester of exams. Graduate standing in history only.

Typically offered in Fall and Spring

HI 895 Doctoral Dissertation Research (1-9 credit hours)
Typically offered in Fall and Spring

HI 896 Summer Dissert Res (1 credit hours)
Typically offered in Summer only

HI 899 Doctoral Dissertation Preparation (1-3 credit hours)

History of Art (HA)

HA 201 History of Art from Caves to the Renaissance (3 credit hours)
Art from prehistory through Ancient Greece and Rome through Italian Renaissance. Major art forms of painting, sculpture, and architecture, and how they reflect their historical context.

GEP Visual and Performing Arts
Typically offered in Fall only

HA 202 History of Art From the Renaissance Through the 20th Century (3 credit hours)
Art from the Northern Renaissance in Europe through the 20th century in Europe and America: painting, sculpture and architecture recent mixed media techniques such as collage, and trottage.

GEP Visual and Performing Arts
Typically offered in Spring only

HA 203 History of American Art (3 credit hours)
A history of American Art (painting, sculpture and architecture) from the Colonial Period through the 20th century.

GEP Visual and Performing Arts
Typically offered in Fall and Spring

HA 240/HI 240 Introduction to Visual Culture (3 credit hours)
Introduction to the role of visual cultural production in the nineteenth and twentieth centuries in expressing and shaping both individual and collective identities. Case studies of imperialism, gender, and war draw from different regional histories and utilize a variety of visual genres - such as photography, popular posters, painting, advertising, and film stills - to study how visual culture can be used as evidence to understand the past, using the approaches of the disciplines of History and Art History.

Prerequisite: Sophomore standing
GEP Global Knowledge, GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

HA 298 Special Topics in Art History (3 credit hours)
Special topics in art history with emphasis on chronological periods such as 20th-century art of the Italian Renaissance or on fields of art such as paintings, sculpture, photography, or architecture.

Typically offered in Fall, Spring, and Summer

HA 395 History of Art: Study Abroad (3 credit hours)
Topical History of Art courses taught in NC State Study Abroad programs. (Current listings available in History Department, Study Abroad Office and CHASS Dean's Office.)

Typically offered in Fall, Spring, and Summer

HA 401 19th Century European Art from Revolution to Post-Impressionism (3 credit hours)
From the politically charged art of the French Revolution, through Neo-classicism, Romanticism, Realism, Impressionism and Post-Impressionism, this course examines styles, subject matter and cultural context of the many, rapid artistic changes in the long 19th century.

Prerequisite: HA 201 or HA 202
GEP Visual and Performing Arts
Typically offered in Fall only

HA 404 Italian Renaissance Art and Material Culture (3 credit hours)
From villas to teaspoons, this course investigates daily life in Renaissance Italy, 1300-1550, through the architecture, painting, sculpture, and art objects that people commissioned and used. Works of art will be analyzed in terms of style, subject matter, and historical context.

Prerequisite: 3 hrs. of HA
GEP Visual and Performing Arts

HA 410 History of the Art of Photography (3 credit hours)
History of and the interaction between art and photography from the invention of photography to the present.

Prerequisite: 3 Hours of History of Art, Film, History, or Literature
GEP Visual and Performing Arts
Typically offered in Spring only

HA 498 Independent Study in History of Art (1-6 credit hours)
Directed independent study of topics in the History of Art. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: 3 hours History of Art
Typically offered in Fall and Spring

Honors (HON)

HON 202 Inquiry, Discovery, and Literature (3 credit hours)
A study of works of literature that treats the themes of inquiry and discovery--its risks, its creativeness, its ambiguities and complexities, and its moral dilemmas--through selected works from literature and other media, including theater, music, visual arts, and film. Analysis of each work in terms of its historical context and internal structure as well as its treatment of the nature of inquiry and discovery.

R: Honors or Scholars
GEP Humanities
Typically offered in Fall, Spring, and Summer

HON 290 Honors Special Topics - Humanities/US Diversity (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GEP requirements in Humanities and US Diversity co-requisite. Interdisciplinary in character and often team-taught.

Restricted to students in the University Honors Program. Other students upon approval.
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

HON 291 Honors Special Topics-Mathematics (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in mathematics, interdisciplinary in character and often team-taught.

Prerequisite: HON student
GEP Mathematical Sciences
Typically offered in Fall and Spring

HON 292 Honors Special Topics-Natural Sciences (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in the natural sciences, interdisciplinary in character and often team-taught.

Prerequisite: HON student
GEP Natural Sciences
Typically offered in Fall and Spring

HON 293 Honors Special Topics - Interdisciplinary Perspectives/ Global Knowledge (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GEP requirements in Interdisciplinary Perspectives and and Global Knowledge co-requisite. Interdisciplinary in character, and often team-taught.

R: Honors or Scholars
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 294 Honors Special Topics-Humanities (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in the Humanities, and interdisciplinary in character.

Prerequisite: HON student
GEP Humanities
Typically offered in Fall and Spring

HON 295 Honors Special Topics-Social Science (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in the social sciences, interdisciplinary in character, and often team-taught.

R: Honors or Scholars
GEP Social Sciences
Typically offered in Fall and Spring

HON 296 Honors Special Topics - Interdisciplinary Perspectives (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in Interdisciplinary Perspectives.

R: Honors or Scholars
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 297 Honors Special Topics - Interdisciplinary Perspectives/US Diversity (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GEP requirements in Interdisciplinary Perspectives and US Diversity co-requisite. Interdisciplinary in character and often team-taught.

R: Honors or Scholars
GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall and Spring

HON 298 Honors Research/Independent Study (1-3 credit hours)
Research/independent Study for University Honors Program students. Repeatable if content differs. Research or independent study under supervision of faculty members. Project approval by the Honors Program Advisory Committee necessary prior to registration. Permission of the University Honors Program required. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

HON 299 Honors Special Topics - Visual and Performing Arts (3 credit hours)
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in Visual and Performing Arts, interdisciplinary in character and often team-taught.

R: Honors or Scholars
GEP Visual and Performing Arts
Typically offered in Fall and Spring

HON 300 Race, Membership, and Eugenics (3 credit hours)
Theories of race are linked to eugenics, a belief and practice of improving the genetic quality of the human population drove much of American social policy in the early 20th century. The practice and science that supports it has historical roots in the US and in particular for poor people and people of color. This course will examine race, membership, and eugenics and the impact on American society, as well as explore the scientific and social trends that supported the movement. Course restricted to University Honors Program Students; others by permission of the UHP.

R: University Honors Program Students; others by permission of the University Honors Program
GEP U.S. Diversity
Typically offered in Fall and Spring

HON 310 The Creative Process in Science: Realities, Comparisons, and Culture Perceptions (3 credit hours)
What is creativity in the context of the sciences? How does the creative process in science differ from and how is it similar to the creative process in other fields? This interdisciplinary perspectives course helps students to develop an understanding of scientific creativity through readings in history and philosophy of science, in the psychology of creativity, in original scientific papers, in biography and in memoirs. Student will analyze representations of scientific creativity in films and literature, conduct interviews with scientists, artists, musicians, and humanists, and analyze the social and institutional context of creativity.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Spring only

HON 311 Words through Space and Time (3 credit hours)
Cultures differentiate and frame events in various ways. At the heart of conceptual events are WORDS: an inventory of the ways a particular group of people depict and understand the interactions they have with each other and with the world around them. Through a detailed examination of lexical phenomena in cultures around the world, we will become familiar with the ways in which language and culture interact, the extent to which these surface in our everyday lives and the explanations proposed by various fields for their existence.

GEP Global Knowledge, GEP Interdisciplinary Perspectives

HON 312 Outbreak (3 credit hours)
Students will evaluate disease outbreaks from multiple different perspectives, including the biology of the infectious agent, clinical implications, and social/economic/political factors contributing to the spread of the disease or that were impacted by a major epidemic/pandemic. This course will be inquiry-guided. The instructor will not generally be "presenting material", but rather providing the structure in which students will be guided to investigate the issues from multiple perspectives through the use of case studies, primary and secondary literature, student-driven research and presentations, and concept mapping.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

HON 313 Reading Machines (3 credit hours)
This course invites first-year students into a historically ranging, critically intensive, and hands-on learning environment about the technologies by which humans transmit our cultural inheritance and ideas. "Reading Machines" takes a long view of how we got to now, from the history of manuscripts and books to the electronic platforms of the digital present. These are all machines of reading; in turn, this class will "read" those machines as objects of study. The course proposes that 1) then and now, our technologies for sharing text, image, and data crucially shape the ideas which they convey, and 2) these contexts can help students plan and execute new mechanisms for communication in the present. The course's modules offer critical frameworks of background readings and discussions, a lab-like experience with the materials or skills involved, and applied projects for students to experiment with and study.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 314 Society's Mirror: Literature in 20th-Century America (3 credit hours)
This course looks at several key works of twentieth-century American literature and asks what they reveal about the society in which they were produced. In honor of the beginning anew of the 20s, the first half of our class will consider the many ways literature in the Jazz Age represented and critiqued the era - from stories published in popular magazines, which find their modern-day equivalent in streaming services, to authors of the Harlem Renaissance. The second half of the class will take us to the second half of the century, where we will consider how authors like Ken Kesey, Shirley Jackson, and Margaret Atwood reveal and challenge prevailing conformity. To continue with our metaphor, the frame for our mirror will consist of the social, cultural, and material contexts in which these works were published, understood, and interpreted.

R: Honors or Scholars
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

HON 340 Religion and Freedom (3 credit hours)
For a variety of reasons, "religion" is one of the most controversial subject matters in contemporary cultures. Beyond sensationalism and outrage, though, modern societies have taken shape in part through complex debates about the role (or lack thereof) of religion in public life. At the core of these considerations are clashing understandings of the relation between religion and freedom, two broad categories with a range of different meanings. This course will explore these differing understandings by considering: legal arguments proposing freedom of religion, and the challenges of religious pluralism; arguments urging freedom from religion, in defense of secular public life; and invocations of freedom through religion, via human creative expression, social activism, ritual, or cosmology. We will examine not just scholarly writings about religion but literature, films, and other media that have shaped the ongoing conversation.

R: University Honors Program Students; others by permission of the University Honors Program
GEP Interdisciplinary Perspectives
Typically offered in Fall only

HON 341 Time Travel (3 credit hours)
A study of contemporary metaphysics organized around the topic of time travel. David Lewis, perhaps the foremost contemporary metaphysician, argues that time travel is possible. His argument is based on ingenious positions about three central topics of metaphysics, personal-identity, causation, and free will. Students will consider each of these topics in some detail, always with an eye to their implications for time travel.

Prerequisite: HON student
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

HON 344 Kantian Ethics (3 credit hours)
In this course students will be introduced to foundations of morality by exploring one of the most significant moral theories in the history of philosophy, Kantian ethics. The course will focus on Kant's ideas about morality and discuss his proof of the fundamental principles of ethics. Students will be introduced to some of the enduring moral questions, such as What ought I to do? What can I hope? Are there universal moral principles and whether I ought to follow them? They will learn a variety of approaches to ethical issues and their reflection in social and political reality.

GEP Humanities
Typically offered in Spring only

HON 345 On the Human (3 credit hours)
Students in this seminar course actively explore human singularity: the properties, if any, that distinguish persons from animals and machines. Do we have souls? To what extent can we give physical explanations of our thoughts and actions? What, if anything, do scientific experiments tell us about our differences from chimps and artificial intelligences? What are the ethical implications of new biotechnologies? Should we be allowed to use genetic and neural engineering to change human nature? Students read articles, watch videos, stimulate class discussions with prepared questions, write short essays and a final paper, and participate in a 60-minute team presentation.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 347 Freedom and the Self (3 credit hours)
This course explores the complex and interrelated concepts of freedom and the self. The bulk of our time will be devoted to a close reading of several philosophical texts in which these concepts loom large. The course ends with a careful examination of three novels that, in various ways, take up the central themes of the class. Our intention in doing so is to reflect on the way that imaginative novelists treat these themes. This will enable us to ask broader and more interesting questions about freedom and selfhood.

R: University Honors Program Students; others by permission of the University Honors Program
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

HON 348 Emotion and Reason (3 credit hours)
Consider the range of emotions that one experiences in a lifetime, from the joy of being with your loved ones to the fear of losing them, from the thrill of success to the sadness of defeat. Pleasant or aversive, emotions play a central role in our lives. Despite their obvious importance, emotions have been considered by many philosophers to be inferior to another distinctive faculty in human beings, namely reason. The idea that emotions are primitive, irrational and dangerous and thus to be controlled and constrained by reason has been embraced by eminent thinkers from Plato and the Stoics to Kant. In this course, we will focus on the relationship between reason and emotion in moral cognition and cognition more generally, and we will investigate how/to what extent reason can be said to be distinct from and superior to emotion.

Restriction: University Honors Program students. Open to other students by permission of the UHP.
GEP Interdisciplinary Perspectives
Typically offered in Fall only

HON 352 Self, Schooling, and the Social Order: A Critical Examination (3 credit hours)
What is the purpose of schooling? What role does it play in producing particular types of citizens and social structures? Theorists have imagined education as a space for democracy, as a way to cultivate identity, or as a method to train workers. All of these imaginaries attempt to understand interrelationship between the self, schooling, and the social order. This course will survey major social theories and, within the context of those theories, encounter texts which examine how schooling serves to maintain or subvert the social order. Course restricted to University Honors Program students; others by permission of the UHP.

GEP Social Sciences, GEP U.S. Diversity

HON 353 Code Breakers: Unlocking the Mysteries of One Human Language (3 credit hours)
This course will introduce you to the architecture of one language. Students will work from scratch with a speaker of a language that none of us know, with the goal of unlocking the mysteries of that language at all levels - sound system, word formation, sentence structure, semantics and pragmatics. You will learn how to elicit field data through direct questioning and gathering of texts, how to organize field data, how to prepare entries in a field dictionary, and how to organize and write grammar. Course restricted to University Honors Program students; others by permission of the UHP.

GEP Global Knowledge, GEP Social Sciences

HON 354 The Winners and Losers of U.S. Agricultural Policy (3 credit hours)
This course explores the history and unintended consequences of U.S. (and international) agricultural policy. We will develop tools to assess the logical, objective, and critical analysis of agricultural policies. Every policy intervention involves winners and losers and your objectives will be to identify and evaluate how welfare is affected by government intervention. Students will explain, hypothesize, or interpret a disciplinary issue, based on critically analyzed evidence. Current events will be emphasized and students will investigate how trade tensions between the U.S. and other countries often result in retaliation against U.S. agriculture. Grades will be based on student presentations, debates, class participation, and a final policy paper.

R: Honors or Scholars
GEP Social Sciences
Typically offered in Fall and Spring

HON 355 Feelings of/from Technology: Analog Bodies in Digital Spaces (3 credit hours)
While we live in a Digital Age, we have only begun to understand its full significance. What new possibilities arise in a virtualized future? Can we escape scarcity, this planet, even death? What problems might our technologies solve? Modern technologies also raise new existential challenges: Why has the increased prosperity that technologies provide been met with seemingly impoverished and unhappy lives, loneliness, and alienation? How does technology mediate our sense of identity and the relations we have with society, nature, and ourselves? This course will explore the phenomenology of technological life - that is, the descriptive study aimed at looking at the relations between humans and our world, a technologically-mediated world. We will use this experiential and descriptive approach to consider the moral dimensions and psychological and sociological consequences of digital and emerging technologies, especially information and communications technologies (ICTs) like the internet and social media.

R: Honors or Scholars
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 356 Sweet: A Global History of Sugar (3 credit hours)
In 2015, The Washington Post reported that on average, Americans consumed 126 grams of sugar per day, more than double the amount recommended by the World Health Organization. Yet China and India, which had the earliest known mass production of sugar, consume much less. Why? Applying the overlapping theories and methodologies of cultural history and anthropology as well as other components of Food Studies, this class will explore the world travels and vicissitudes of sugar as a commodity and cultural marker. We will trace sugar's production in the first age of capitalism and its reliance on the global slave trade for production as well as the development of its rituals of consumption, in conjunction with other stimulants and intoxicants, such as chocolate, tea, and rum. We will consider the rise of the modern western obsession with sweets in comparison to other cultures, using our own experiences and observations.

R: Honors or Scholars
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

HON 360 Music and Resistance (3 credit hours)
Music and Resistance will examine how people use music both as a tool of oppression and a method of resisting oppression. Course topics will include the use of western classical music by colonial powers; music and torture; music during World War II (including the use of music in concentration camps and as propaganda in Allied and Axis countries); music in Indian Boarding Schools; music in the American Civil Rights Movement; and hip hop as the music of oppressed populations in Europe and the United States. Reading assignments will come from a wide range of sources and disciplinary perspectives including scholarly articles, book chapters, and personal memoirs. We will listen to and discuss music from multiple genres including hip hop, pop, jazz, folk, and the western classical tradition. No previous musical experience as a performer is required to be successful in this class.

R: Honors or Scholars
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HON 367 Introduction to Interdisciplinary Biomedical Teamwork (1 credit hours)
HON 367 (Introduction to Interdisciplinary Biomedical Teamwork is a special weekly seminar that will introduce students to Team Science (teamwork) and Biomedical Research. Students will be introduced to the Comparative Medicine Institute (CMI) U-STAR program, faculty mentors involved with the program and cutting-edge research associated with the program. Seminar topics will include: CMI and interdisciplinary research on campus, instructional seminars on literature searching, scientific writing, research ethics and research overviews by U-STAR training faculty.

Typically offered in Fall, Spring, and Summer

HON 390 Music and the Celtic World (3 credit hours)
In this course, students explore the diverse musics of the Celtic world, from cultural practices of the ancient Celts to folk and popular traditions of Ireland, Scotland, Wales, Brittany, Galicia, Cape Breton, and the United States. They investigate the origin and meanings of "Celtic music," and study its diverse instrumental, vocal, and dance traditions, and its varied performance practices, occasions, and purposes. Through history, literature, poetry, spirituality, and mythology, students examine the realities and fictions of the ancient and modern Celtic world. Through live and recorded music and dance performance, they consider the continuities of Celtic culture across time and space, and the significance of Celtic music today in terms of cultural identity, tradition, and globalization.

R: University Honors Program
GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Visual and Performing Arts
Typically offered in Spring only

HON 395 Honors Cooperative Education (3 credit hours)
Experimental work in government or industry for Honors Program students with two semesters completed in Honors. Typically students work 40 hrs/week with salary. Work supervisor, faculty adviser and Honors Program Director must sign HON 395 Honors Cooperative Ed contract. NC State cooperative Education requires paper work; student must pay fee rate for a 0-5 credit hour course. No other courses permitted along with HON 395. Student report of the independent project is required.

Prerequisite: Two semester full time in University Honors Program
Typically offered in Fall and Spring

HON 397 Honors Extension and Engagement (1-6 credit hours)
Opportunity for significant hands-on involvement in extension and engagement research/project as mentored by NC County Extension employees often in cooperation with community employers/executives, local and government officials, and county citizens. Approved plan of work required with significant independent research/project including a reflective journal, a final paper and presentation at the NC State Undergraduate Research Symposium or a venue appropriate to the discipline. Students must provide their own transportation.

Prerequisite: One semester good standing in University Honors Program
Typically offered in Fall and Spring

HON 398 Honors Special Topics (1-6 credit hours)
A seminar or other learning experience within an academic framework that may be on- or off-campus. Enables the development of new HON courses outside the GER list.

Typically offered in Fall, Spring, and Summer

HON 496 Honors Capstone Seminar (3 credit hours)
Honors Seminars open to Juniors and Seniors in all disciplinary Honors Programs, and others with permission of the University Honors Program. Repeatable if content differs. A series of seminars with differing subjects, interdisciplinary in character and sometimes team-taught, allowing advanced students to explore topics from a multidisciplinary perspective and to apply their knowledge to issues and problems in the present world. Permission of the University Honors Program

Prerequisite: HON student
Typically offered in Fall and Spring

HON 497 Interdisciplinary Biomedical Research Capstone (2 credit hours)
Interdisciplinary Biomedical Research (BioMR) Science Capstone Seminar. This seminar is intended to provide practical real-world engagement to integrate interdisciplinary biomedical team science teamwork, communication, and leadership. The seminar will include exploring and engaging with a science-based Common Reading where students will use leadership, communication, and team science skills to evaluate multiple aspects of team dynamics including unconscious bias. The seminar will also include active engagement opportunities in the areas of academics, government, and industry. These diverse experiential learning opportunities will further allow students to explore team science, leadership, and communication. This course will also involve an end of semester roundtable conversation and service component, all designed to reinforce the learning outcomes.

Typically offered in Fall, Spring, and Summer

HON 498 Honors Research/Creative Project 1 (3 credit hours)
Opportunity for hands-on faculty mentored research/creative project. Course may be stand-alone project completed in one semester/summer, or serve as part of a two semester project that is completed at the end of Honors Research/Creative Project 2 (HON 499). Approved plan of work required with significant independent research/creative project culminating with final paper and presentation at the NC State Undergraduate Research Symposium or other venues appropriate to the discipline. Research within or outside the student's discipline may fulfill experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: One semester in good standing in University Honors Program, UHP student
Typically offered in Fall, Spring, and Summer

HON 499 Honors Research/Creative Project 2 (3 credit hours)
Opportunity for hands-on faculty mentored research/creative project. Course serves as final part of a two-semester project that began with Honors Research/Creative Project 1 (HON 498)or approved disciplinary research experience. Approved plan of work required with significant independent research/creative project culminating with final paper and presentation at the NC State Undergraduate Research Symposium or other venues appropriate to the discipline. Research within or outside the student's discipline may fulfill experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: One semester in good standing in University Honors Program, UHP student
Typically offered in Fall, Spring, and Summer

Horticulture Science (HS)

HS 101 Introduction to Ornamentals and Landscape Technology (1 credit hours)
Introduction to the collegiate experience, academic skills of successful students, and scope, purpose, and objectives of the Agricultural Institute with an emphasis on areas related to the ornamental and landscape plants industry. Students will explore college and departmental resources, academic policies and procedure, the green industry, career opportunities, and current trends and issues in horticulture.

Requisite: Agricultural Institute Only
Typically offered in Fall only

HS 111 Plant ID (3 credit hours)
Identification, adaptation, culture, and use of ornamental trees, shrubs, vines, ground covers and herbaceous plants.

Requisite: Agricultural Institute Only
Typically offered in Fall only

HS 115 Plant Growth and Development (3 credit hours)
Examination of how plants grow and respond to environmental and cultural stimuli. Topics include: cell growth; flower, fruit, seed, shoot, and root development and functions; anatomy of stems, roots and leaves; hormonal regulation of growth; adaptations for survival; plant responses to temperature, light and gravity; photosynthesis, transpiration, and absorption of water and nutrients.

Requisite: Agricultural Institute Only
Typically offered in Fall only

HS 121 Plant Propagation (3 credit hours)
Principles and practices involved in sexual (seed) and asexual (vegetative) propagation of a variety of plants. Methods of asexual propagation include cuttings, layering, budding and grafting, division, separation, and micropropagation (tissue culture). Emphasis on factors affecting the regeneration of species by particular techniques.

Requisite: Agricultural Institute Only
Typically offered in Spring only

HS 131 Fruit & Vegetable Production (3 credit hours)
The objective of this course is to give students a fundamental and practical understanding of small-scale fruit & vegetable production in North Carolina. Agricultural Institute students only.

Requisite: Agricultural Institute Only
Typically offered in Spring only

HS 141 Greenhouse Crop Production (3 credit hours)
Production of greenhouse crops. Emphasis on greenhouse construction and environmental manipulation of crop growth. Site selection, construction materials, greenhouse design. Specific flowering crops as models to demonstrate potted flowering plant, cut flower, and bedding plant production systems. Hands-on crop production experience plus trips to commercial floriculture production and marketing facilities.

Typically offered in Spring only

HS 144/PP 144 Weeds & Diseases of Ornamentals (3 credit hours)
The objective of this course is to give students a fundamental and practical understanding of weed, disease, and pesticide management in the ornamental industries in North Carolina. Agricultural Institute students only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

HS 151 Nursery Production (3 credit hours)
Total aspects of field and container nursery stock production including site selection and development, propagation, growing procedures, harvesting, marketing, shipping and labor management practices.

Requisite: Agricultural Institute Only
Typically offered in Spring only

HS 162 Landscape Maintenance (3 credit hours)
A study of the maintenance of landscaped areas including plant material selection, installation, pruning, fertilization, and pest control of trees, shrubs, lawns, flower beds, and interior plants.

Requisite: Agricultural Institute Only
Typically offered in Fall only

HS 171 Landscape Construction (3 credit hours)
This course will provide students a fundamental and practical understanding of landscape construction techniques and equipment. AGI students only.

Requisite: Agricultural Institute Only
Typically offered in Spring only

HS 175 Horticulture Entrepreneurial Skills for Local Markets (3 credit hours)
This course is structured to introduce students to entrepreneurship, startups and the basic principles of business administration and management with focus in the horticulture industry in local markets. The class will give students the opportunity to learn pragmatic skills and tools to start their own business or to be successful managers in local horticulture industries. Students will describe and discuss the following topics: marketing, management, accounting, finance, and the issues involved with starting and managing a small horticultural business.

Typically offered in Spring only

HS 200 Home Horticulture (3 credit hours)
Introduction and review of home horticulture as it relates to the horticultural enthusiast. A general understanding of plant growth, structure, and development; house plant selection and care, selecting trees, shrubs, and flowers for the home landscape, and other related topics. Note: this course was previously offered as HS 100.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

HS 201 The World of Horticulture: Principles and Practices (3 credit hours)
Principles of plant growth and development relating to production and utilization of fruit, vegetable, floricultural, and ornamental crops. Historical, economic, and global importance of horticultural crops and services.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

HS 202 Home Plant Identification (3 credit hours)
An introductory course developed in conjunction with Longwood Gardens on plant taxonomy, identification, characteristics, and use in the home landscape. A palette of 150 plants will be covered including identification by scientific and common names and aspects of their cultivation. Not for Horticultural Science Majors [SH, THG, THL].

Typically offered in Spring only

HS 203 Home Plant Propagation (3 credit hours)
Not for Horticultural Science Majors (SH, THG, THL). Substitution of HS 203 for HS 301 are not allowed. An introduction to the basic principles of sexual and asexual plant propagation, including seeds, cuttings, layering, Grafting, and Division.

GEP Natural Sciences
Typically offered in Spring only

HS 204 Home Landscape Maintenance (3 credit hours)
An understanding of the basic principles of landscape maintenance including, but not limited to, soil fertility and management, tree biology, pruning, turfgrass maintenance, plant selection, irrigation management and waterwise gardening, integrated pest management, and hardscape construction. Not for Horticultural Science majors (SH, THG, THL).

Prerequisite: HS 200 or HS 201
GEP Natural Sciences
Typically offered in Fall and Spring

HS 205 Home Food Production (3 credit hours)
Home food production will play an important role in increasing the sustainability of the world's food systems for the foreseeable future. The goal of this course is to familiarize students with the scientific knowledge and tried-and-true practices needed to successfully produce food at home, even in small-scale environments such as decks and patios. On-campus students will be required to participate in two Saturday field trips to visit local home gardens. Distance educations students will be required to visit two home gardens in their area. Not for Horticultural Science Majors (SH, THG, THL).

Typically offered in Fall and Spring

HS 215/ANS 215 Agricultural Genetics (3 credit hours)
To provide an introduction to the science of genetics as applied to agriculture. Emphasis is given to qualitative and quantitative genetics. By the end of this course, students should be able to apply genetic concepts to efficiently solve problems and make predictions necessary for "real-life" agricultural situations.

Prerequisite: BIO 183 or equivalent or instructor's consent
GEP Natural Sciences
Typically offered in Fall only

HS 242 Introduction to Small Scale Landscape Design (3 credit hours)
Landscape Horticulture is concerned with the small-scale design and use of plants and other materials to help humans relate better to the land. In this course, we will pursue an understanding of this relationship and explore the social, environmental, and economic implications of landscape design and the processes by which this understanding can be employed to design residential landscapes. There are an infinite number of design possibilities for each project, so it's a designer's responsibility and challenge to develop a creative and functional design that accommodates the needs of the users and is appropriate for a specific site.

GEP Visual and Performing Arts
Typically offered in Spring only

HS 250 Home Landscape Design: Creating Garden Spaces (3 credit hours)
Home landscape design is a 3-credit hour course for non-landscape design majors. Students will be introduced to the various issues associated with landscape design at the residential level. Through a series of Power Point lectures, on-line discussions, and small projects/exercises, students will gain an understanding of landscape graphics. Skills in design, and develop landscape plans and other forms of landscape graphics. Students will use all of their learned skills to develop a design for a given site using provided design software.

Typically offered in Summer only

HS 252 Landscape Graphic Communication (2 credit hours)
This class is an introduction to the basic graphic skills necessary to develop and communicate creative ideas in landscape design. In the design process, we use graphic skills to communicate our ideas, starting with analysis, moving on to concept, then to design development, and finally to illustrative renderings. The design process will be introduced and serve as a backdrop for incrementally introducing graphic skills. The class will become confident in the use of manual drawing skills, and will be introduced to the use of computer drafting skills. Graphics supplies, with an estimated expense of $120.00, are required for the course.

Prerequisite: Horticultural Science Majors
Typically offered in Spring only

HS 272 Landscape Design/Build (6 credit hours)
This course will consist of the development of design and construction projects, which will incorporate the entire design process culminating with a complete set of construction documents, cost predictions and built projects. Critical and creative thinking strategies are incorporated in teaching and learning activities. Course materials and experiences will prepare the student for further design/build experiences as well as the NC Landscape Contractor's Licensing Exam.

Prerequisite: HS 201 and HS 242
Typically offered in Fall only

HS 275 Floral Design (3 credit hours)
This course explores the history of floral design, care, handling, and identification of fresh cut flowers, the use of tools, equipment, and supplies and the application of basic design styles, and displays. Students will gain hand-on experience in creating a wide variety of floral displays and will be able to keep their arrangements. An additional fee (not greater than $200) will be assessed to your tuition bill for fresh flower supplies for the semester for this class.

GEP Visual and Performing Arts
Typically offered in Fall only

HS 280 Hands-On-Horticulture (3 credit hours)
This course will provide students a fundamental and practical understanding of applied techniques in horticulture. Students will learn basic hardscape construction, basic wooden landscape structure construction, vegetable harvest, propagation of perennial plants, principles of irrigation installation, safe and efficient use of landscape equipment including arboriculture, and professional certification and licensing. Pesticide Licensing Fee of $75 required.

Typically offered in Summer only

HS 290 Horticulture: Careers and Opportunities (1 credit hours)
Introduction and orientation to programs in horticultural science. Discussion of the current status of horticulture, extension and research. Emphasis on undergraduate program management, internships, graduate education, and career planning. Guest lectures, career opportunities and qualifications for employment in horticulture and related fields.

Typically offered in Fall only

HS 301 Plant Propagation (4 credit hours)
Theoretical basis and techniques for successful asexual and sexual propagation of seed plants and ferns. Influence of heredity, phytopathological infection, and environmental conditions on success and quality of propagules. Recent developments and innovations in propagation techniques and methodologies.

Prerequisite: BIO 181 or BO 200
GEP Natural Sciences
Typically offered in Fall only

HS 302 Gardening with Herbaceous Perennials (3 credit hours)
Examination of the use of herbaceous perennials in the home garden and commercial landscapes. Topics include: general plant characteristics, culture and management, garden attributes, design usage, horticultural history, propagation, use of exotic (nonnative)species in the garden, heirloom roses and ornamental grasses.

Prerequisite: BIO 183 or BO 200
Typically offered in Spring only

HS 303 Ornamental Plant Identification I (3 credit hours)
Identification, distribution, growth, characteristics, adaptation, and usage of ornamental plants. Emphasis on bedding plants, trees and gymnosperms.

Prerequisite: BIO 181
GEP Natural Sciences
Typically offered in Fall only

HS 304 Ornamental Plant Identification II (3 credit hours)
Identification, distribution, growth, characteristics, adaptation, and usage of ornamental plants. Emphasizes shrubs, ground covers, and vines.

Prerequisite: BIO 181
GEP Natural Sciences
Typically offered in Spring only

HS 357 Landscape Grading and Drainage (4 credit hours)
This course is an introduction to landforms, site grading and drainage, and the manipulations of such landforms necessary to create built landscapes. Site design, site development, and site engineering all refer to the process of grading and drainage. Grading and drainage are processes used to reshape the earth's surface and to convey surface water runoff.

Prerequisite: Landscape Horticulture (11HORTTHL) students, HS 242 and 252
Typically offered in Spring only

HS 400 Residential Landscaping (6 credit hours)
Equips students with the necessary skills to create functional, aesthetic, and humanistic designs for residential and other small scale projects. Aspects of problem identification, project organization, design, execution, and evaluation. Required field trip with fee.

Prerequisite: HS 242, HS 252, HS 303, HS 304, and HS 357
Typically offered in Spring only

HS 410/CS 410 Community Food Systems (3 credit hours)
This course explores the economic, socio-cultural, policy and health perspectives of community food systems using a multidisciplinary and systems-level framework. Students will use a systems framework to critically examine local and global food challenges related to food insecurity, food justice and food sovereignty, food waste and sustainable approaches to addressing food challenges. Novel aspects of this course include student experiential learning opportunities that include service learning with community partners addressing local food challenges, team building through group work and in-class discussion and development of personal food ethic provocative proposition.

Prerequisite:Junior or senior standing
Typically offered in Fall only

HS 411 Nursery Management (3 credit hours)
Principles and practices of production, management, and marketing of field-grown and container-grown nursery plants. One of three scheduled weekend field trips required at students' expense.

Prerequisite: BIO 181, SSC 200, Junior standing
Typically offered in Fall only

HS 416/HS 516 Planting Design (4 credit hours)
Developing and cultivating a design process for creating meaningful and compelling ornamental planting designs through the study and practice of spatial articulation (form, enclosure, permeability), physical properties of plants (line, form, texture, color), client/site analysis and program development, visual journaling, garden narrative, presentation skills, utilizing principles of visual composition, design communication, and understanding and resolving technical and horticultural issues in contemporary planting design.

Prerequisite: Landscape Horticulture (11HORTTHL) concentration, HS 400
Typically offered in Fall only

HS 418 Digital Media Graphic for Landscape Designers (3 credit hours)
Digital media is used in the landscape design profession as a tool with analytic, expressive, and representational abilities. The course focuses on introducing landscape design students to digital representational tools used to communicate design ideas for small scale landscape design projects. Students will be introduced to techniques used in AutoCAD, Photoshop, Illustrator, InDesign, and Sketch Up modeling programs. Digital representation will be used to develop the variety of images necessary to explore and communicate design intentions. Materials for this course will cost approximately $50.

Prerequisite: HS 242 and HS 400
Typically offered in Fall only

HS 420/HS 520 Green Infrastructure (3 credit hours)
Green infrastructure is defined as the interconnected networks of natural and constructed ecological systems within and in-between urban areas. When implemented in a holistic way, green infrastructure can provide benefits at the residential, neighborhood, community levels providing for greater health and well-being, an improved functional environment, and a thriving dynamic economy. Well-designed urban landscapes offer significant economic and social benefits that directly improve the urban environment for people, plants and animals- from increasing real estate value and reducing energy costs, to enhancing health and food security, and providing habitat for a diverse population of animals and plants. Since addressing environmental issues requires a multidisciplinary approach, this course is designed for any student with interests in horticulture, biological engineering, landscape architecture, environmental sciences, urban forestry, and any others who care about the sustainability of their communities.

Typically offered in Fall only

HS 421/HS 521 Temperate-Zone Tree Fruits: Physiology and Culture (3 credit hours)
Physiology and culture of the major temperate-zone tree fruit and nut crops of the United States. Fundamental principles underlying woody plant growth as applied to the culture of specific tree-fruit crops with emphasis on crops of commercial importance to North Carolina.

Prerequisite: BIO 181 or B0 200
Typically offered in Spring only

HS 422 Small Fruit Production (3 credit hours)
Importance and economic value of blackberries, blueberries, cranberries, grapes, raspberries, strawberries and minor small fruit crops in the agricultural economy of the USA and the world. Cultural requirements of these crops and manipulation of their known morphological and physiological traits for successful production. Six all afternoon field trips are required.

Prerequisite: BIO 181, SSC 200, HS 201
Typically offered in Spring only

HS 423/HS 523 Viticulture (3 credit hours)
A presentation of the commercial importance, distribution, anatomy, physiology, and production of Genus Vitis (grapes) including cultivars, propagation, canopy management, diseases, weed control, physiology, anatomy, irrigation, wine production, climates and soils. This course will not require students to provide their own transportation. Non-scheduled class time for field trips or out-of-class activities IS required for this class

Prerequisite: Junior standing or Senior standing
Typically offered in Spring only

HS 428/SSC 428 Service-Learning in Urban Agriculture Systems (1 credit hours)
Course provides students a hands-on experience in urban agriculture with under-served youth in the Raleigh area. Students partner with a community gardening organization to provide knowledge and experience in soil science and agriculture to youth with the goals of increasing urban food security and developing student leadership skills. Particular emphasis is places on reflecting on course activities and deepening of skills related to extension, outreach, and working with diverse populations. Course designed to be taken as a companion course to SSC 427, however can be taken as a stand-alone course.

Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101
GEP U.S. Diversity
Typically offered in Spring only

HS 431 Vegetable Production (4 credit hours)
Principles and practices of production and marketing of seventeen vegetable crops grown in the U.S. Additional topics include pest management, seed technology, food safety, sustainable agriculture, use of genetically engineered crops, and consumer issues.

Prerequisite: BIO 181, SSC 200
Typically offered in Fall only

HS 432/HS 532 Introduction to Permaculture (3 credit hours)
Permaculture means "permanent culture," and ..."is the conscious design and maintenance of cultivated ecosystems that have the diversity, stability, and resilience of a natural ecosystem." [Bill Mollison] This course will explore a design/thinking methodology that seeks to provide our essential physical needs, food, water, shelter, energy, etc., while doing so in an environmentally friendly, sustainable manner. This course is restricted to upper level undergraduate, graduate, or matriculated continuing education students. STUDENTS MAY NOT RECEIVE CREDIT FOR BOTH HS 432 AND HS 532.

Typically offered in Fall and Summer

HS 433/HS 533 Public Garden Administration (3 credit hours)
This course addresses the practices, programs, and professional skills that are critical to the successful management of public gardens. The aim of the course is to better prepare graduate students and upper-level undergraduates for potential careers in public garden administration. Topics will include a brief history, impact, and current trends of public gardens in the United States; plant collections; managing staff, volunteers, and boards, and the visiting public; finances and fund raising; educational programming; visitor services; and careers in public gardens. Two Saturday off-campus field trips are required.

Typically offered in Fall only

HS 440 Greenhouse Management (3 credit hours)
Perspective of greenhouse systems management. Selection of greenhouse site, construction, heating, cooling and production systems. Emphasis on greenhouse operations, cost accounting and analysis. Other topics; root substrates, sanitation, water, fertilization, chemical growth regulation, temperature, light and marketing. Hands-on experience in greenhouse operations plus trips to commercial greenhouses and markets.

Prerequisite: SSC 200 and HS 201
Typically offered in Fall only

HS 442 Floriculture Crop Production (3 credit hours)
Production of floricultural crops. Emphasis on environmental manipulation and scheduling of crop growth and development for targeted market periods. Specific flowering crops as models to demonstrate potted flowering plant, cut flower, and bedding plant production systems. Hands-on crop production experience plus field trips to commercial floriculture production and marketing facilities.

Prerequisite: SSC 200, HS 201
Typically offered in Spring only

HS 451/HS 551 Plant Nutrition (3 credit hours)
An understanding of the basic mineral nutrient requirements, nutritional monitoring procedures, and fertilizer application methods in horticultural production systems including those for fruits, field vegetables, fruits and vegetables under plasticulture, nursery crops, landscapes, greenhouse flowers and vegetables, interior plantscapes, hydroponics, and organic farming.

Prerequisite: SSC 200
Typically offered in Spring only

HS 462/HS 562/FS 562/FS 462 Postharvest Physiology (3 credit hours)
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

Typically offered in Spring only

HS 471 Landscape Ecosystem Management (4 credit hours)
Well-designed, installed, and maintained urban/suburban ecosystems offer significant economic and social benefits that directly improve the environment for people, plants and animals. Learn how to select, install and maintain plants as part of a sustainable landscape. This course provides students with the tools to understand and implement landscape ecosystem management techniques that include, but are not limited to plant selection and maintenance, soil maintenance and renovation, thoughtful application of common landscape chemistry and IPM, urban/suburban wildlife conservation (including plant pollinators), and installation and promotion of green infrastructure practices.

Prerequisite: SSC 200
Typically offered in Fall only

HS 475 Horticulture Entrepreneurship (3 credit hours)
This course is structured to introduce students to entrepreneurship, startups and the basic principles of business administration and management with focus in the horticulture industry in a global context. The goal of this class is to give students pragmatic knowledge and tools to start their own business or to be successful managers in the horticulture industry. Students will describe and discuss the entrepreneurial thinking process and as they analyze the following business topics: marketing, management and leadership, accounting, and finance.

Typically offered in Spring only

HS 476/HS 576 Crop Physiology and Production in Controlled Environments (3 credit hours)
This course focuses on plant eco-physiological responses to different environmental factors such as: light intensity, quality, duration and penetration; CO2 diffusion; thermodynamic properties of moist air; root environment; air dynamics; water relations; and canopy energy balance. In addition, the course emphasizes the application of controlled environment technologies to manipulate crop responses. The laboratory is designed to optimize the production of edible crops in greenhouses and vertical farms by applying the foundational knowledge of plant eco-physiology in combination with advance controlled environment technologies.

Prerequisite: PB 321 or PB 421 and either MA 114 or MA 121 or MA 131 or MA 141
Typically offered in Spring only

HS 480/CS 480 Sustainable Food Production (capstone) (1 credit hours)
This course introduces students to the process of developing a project for presentation in the area of sustainable food production and food systems. Students are to synthesize and integrate knowledge acquired in previous course work and other learning experiences and to apply theory and principles in a situation that approximates some aspect of professional practice. Students are expected to present their projects at the end of the semester in a PowerPoint style format to faculty and student peers.

Prerequisites: Senior standing and CS 430
Typically offered in Fall and Spring

HS 491 Sustainable Agriculture Entrepreneurship Study Abroad (3 credit hours)
This course provides an international perspective on entrepreneurship and sustainability in agricultural and life sciences while examining one of three unique, Spanish-speaking locations (Oaxaca, Mexico; Valencia, Spain; and Queretaro, Mexico. The course is led by three instructors that speak Spanish, have very close ties to the communities visited, and are experts in the fields of sustainability and entrepreneurship. The different components of sustainability: increase in production, efficient use of non-renewable resources, ecological stewardship, economic improvement, and increase in quality of life will be experienced. The practice of entrepreneurship will be identified through examples of the implementation of these sustainable motivators as then analyze different businesses' strengths and constraints. This course intends to give an intimate look into an international location with the intent of getting students out of their comfort zone, challenging their mindsets, and providing the opportunity to experience cultural and agricultural diversity.

Typically offered in Summer only

HS 492 Horticulture Internship (1-3 credit hours)
A learning experience in Horticultural Science where a student can gain real-world experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience (135 hours = 3 credits). The experience must be arranged by the student and approved by the Department of Horticultural Science prior to the start of the experience. To gain approval, a student must submit the completed HS 492 contract and have it approved by their experience supervisor and the undergraduate coordinator. In addition to the work described in the contract, a student will complete two reflective assignments.

Typically offered in Fall, Spring, and Summer

HS 493 Research Experience in Horticultural Science (1-3 credit hours)
A learning experience in Horticultural Science where a student can gain research experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience (135 hours = 3 credits). The experience must be arranged by the student and approved by the undergraduate coordinator prior to the start of the experience. To gain approval, a student must submit the completed HS 493 contract and have it approved by their research experience supervisor and the undergraduate coordinator. In addition to the work described in the contract, a student will complete a two reflective assignments.

Typically offered in Fall, Spring, and Summer

HS 494 Teaching Experience in Horticultural Science (1-3 credit hours)
A learning experience in Horticultural Science where a student can gain teaching experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience (135 hours = 3 credits). The experience must be arranged by the student and approved by the undergraduate coordinator prior to the start of the experience. To gain approval, a student must submit the completed HS 494 contract and have it approved by their experience supervisor and the undergraduate coordinator. In addition to the work described in the contract, a student will complete two reflective assignments.

Typically offered in Fall, Spring, and Summer

HS 495 Experimental Courses in Horticultural Science (1-6 credit hours)
Offering of new courses on a trial basis. Topic varies based on offering. Repetition with different course content acceptable up to 2 times and total of 6 units.

Typically offered in Fall, Spring, and Summer

HS 502/PP 502/CS 502 Plant Disease: Methods & Diagnosis (2 credit hours)
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips arerequired.

Prerequisite: PP 315
Typically offered in Fall only

HS 516/HS 416 Planting Design (4 credit hours)
Developing and cultivating a design process for creating meaningful and compelling ornamental planting designs through the study and practice of spatial articulation (form, enclosure, permeability), physical properties of plants (line, form, texture, color), client/site analysis and program development, visual journaling, garden narrative, presentation skills, utilizing principles of visual composition, design communication, and understanding and resolving technical and horticultural issues in contemporary planting design.

Prerequisite: Landscape Horticulture (11HORTTHL) concentration, HS 400
Typically offered in Fall only

HS 520/HS 420 Green Infrastructure (3 credit hours)
Green infrastructure is defined as the interconnected networks of natural and constructed ecological systems within and in-between urban areas. When implemented in a holistic way, green infrastructure can provide benefits at the residential, neighborhood, community levels providing for greater health and well-being, an improved functional environment, and a thriving dynamic economy. Well-designed urban landscapes offer significant economic and social benefits that directly improve the urban environment for people, plants and animals- from increasing real estate value and reducing energy costs, to enhancing health and food security, and providing habitat for a diverse population of animals and plants. Since addressing environmental issues requires a multidisciplinary approach, this course is designed for any student with interests in horticulture, biological engineering, landscape architecture, environmental sciences, urban forestry, and any others who care about the sustainability of their communities.

Typically offered in Fall only

HS 521/HS 421 Temperate-Zone Tree Fruits: Physiology and Culture (3 credit hours)
Physiology and culture of the major temperate-zone tree fruit and nut crops of the United States. Fundamental principles underlying woody plant growth as applied to the culture of specific tree-fruit crops with emphasis on crops of commercial importance to North Carolina.

Prerequisite: BIO 181 or B0 200
Typically offered in Spring only

HS 523/HS 423 Viticulture (3 credit hours)
A presentation of the commercial importance, distribution, anatomy, physiology, and production of Genus Vitis (grapes) including cultivars, propagation, canopy management, diseases, weed control, physiology, anatomy, irrigation, wine production, climates and soils. This course will not require students to provide their own transportation. Non-scheduled class time for field trips or out-of-class activities IS required for this class

Prerequisite: Junior standing or Senior standing
Typically offered in Spring only

HS 532/HS 432 Introduction to Permaculture (3 credit hours)
Permaculture means "permanent culture," and ..."is the conscious design and maintenance of cultivated ecosystems that have the diversity, stability, and resilience of a natural ecosystem." [Bill Mollison] This course will explore a design/thinking methodology that seeks to provide our essential physical needs, food, water, shelter, energy, etc., while doing so in an environmentally friendly, sustainable manner. This course is restricted to upper level undergraduate, graduate, or matriculated continuing education students. STUDENTS MAY NOT RECEIVE CREDIT FOR BOTH HS 432 AND HS 532.

Typically offered in Fall and Summer

HS 533/HS 433 Public Garden Administration (3 credit hours)
This course addresses the practices, programs, and professional skills that are critical to the successful management of public gardens. The aim of the course is to better prepare graduate students and upper-level undergraduates for potential careers in public garden administration. Topics will include a brief history, impact, and current trends of public gardens in the United States; plant collections; managing staff, volunteers, and boards, and the visiting public; finances and fund raising; educational programming; visitor services; and careers in public gardens. Two Saturday off-campus field trips are required.

Typically offered in Fall only

HS 541/CS 541 Plant Breeding Methods (3 credit hours)
Overview of plant breeding methods for advanced undergraduate and beginning graduate students. Covers principles and concepts of inheritance, germplasm resources, pollen control, measurement of genetic variances, and heterosis. Special topics include heritability, genotype-environment interaction, disease resistance, and polyploidy. In-depth coverage on methods for breeding cross-pollinated and self-pollinated crops. Prepares students for advanced plant breeding courses.

Prerequisite: ST 511, Corequisite: ST 512
Typically offered in Fall only

HS 550 Environmental Nursery Production (3 credit hours)
The course focuses on the impacts of the nursery industry on the environment and environmentally sound nursery practices. Exploration of the major challenges facing the nursery industry that drive decision making during production. Evaluation of past and current research addressing these challenges and sampling procedures and interpretation will be learned. Graduate status and an undergraduate nursery production or management course or working knowledge of nursery production required.

Prerequisite: HS 411, Nursery Management, or an equivalent course.
Typically offered in Fall only

HS 551/HS 451 Plant Nutrition (3 credit hours)
An understanding of the basic mineral nutrient requirements, nutritional monitoring procedures, and fertilizer application methods in horticultural production systems including those for fruits, field vegetables, fruits and vegetables under plasticulture, nursery crops, landscapes, greenhouse flowers and vegetables, interior plantscapes, hydroponics, and organic farming.

Prerequisite: SSC 200
Typically offered in Spring only

HS 562/FS 562/FS 462/HS 462 Postharvest Physiology (3 credit hours)
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

Typically offered in Spring only

HS 576/HS 476 Crop Physiology and Production in Controlled Environments (3 credit hours)
This course focuses on plant eco-physiological responses to different environmental factors such as: light intensity, quality, duration and penetration; CO2 diffusion; thermodynamic properties of moist air; root environment; air dynamics; water relations; and canopy energy balance. In addition, the course emphasizes the application of controlled environment technologies to manipulate crop responses. The laboratory is designed to optimize the production of edible crops in greenhouses and vertical farms by applying the foundational knowledge of plant eco-physiology in combination with advance controlled environment technologies.

Prerequisite: PB 321 or PB 421 and either MA 114 or MA 121 or MA 131 or MA 141
Typically offered in Spring only

HS 590 Special Problems in Horticultural Science (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in horticultural science.

Typically offered in Fall, Spring, and Summer

HS 601 Professional Presentation Skills in Horticultural Science (2 credit hours)
The purpose of this course is to familiarize the students with the professional presentation skills they need to be successful. These skills include speaking, writing, poster and website development, based on the student's proposed research/project and literature review.

Typically offered in Fall only

HS 610 Special Topics in Horticultural Science (1-6 credit hours)
Investigation of special theoretical problems at 600 level in horticultural science not related to a thesis problem; new 600-level courses during developmental phase.

Typically offered in Fall, Spring, and Summer

HS 615 Advanced Special Topics (1-6 credit hours)
Investigation of theoretical problems at the 600 level in horticultural science not related to a thesis problem; new 600-level courses during the development phase.

Typically offered in Fall, Spring, and Summer

HS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall, Spring, and Summer

HS 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall and Spring

HS 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall and Spring

HS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall, Spring, and Summer

HS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall, Spring, and Summer

HS 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall, Spring, and Summer

HS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's in Horticultural Science
Typically offered in Summer only

HS 699 Master's Thesis Preparation (1-9 credit hours)
Original research on specific problems in fruit, vegetable and ornamental crops.

Prerequisite: Master's in Horticultural Science
Typically offered in Fall, Spring, and Summer

HS 703 Breeding Asexually Propagated Crops (1 credit hours)
Principles and problems associated with breeding clonally propagated crops and techniques used in overcoming these problems. Taught third five weeks of semester. Drop date is by last day of 3rd week of minicourse.

Prerequisite: CS 413
Typically offered in Fall only

HS 704 Plant Nomenclature (1 credit hours)
A practical foundation in plant nomenclature and nomenclatural references. Emphasis on the evolution of international rules for naming plant taxa and their application in both wild and cultivated plants. Nomenclature applications used in patents, cultivar releases and journal articles. Taught mid-semester. Taught five weeks of semester.

Prerequisite: PB 421
Typically offered in Spring only

HS 705 Physiology Of Flowering (1 credit hours)
Examination of physiological basis of flowering in plants such as: floral initiation, transition to reproductive growth; floral development; plant response to light, temperature, nutrition, water supply; plant age; chemical growth regulation and in vitro flowering. Taught first five weeks of fall semester. Drop date is by last day of 3rd week of minicourse.

Prerequisite: PB 421
Typically offered in Fall only

HS 707 Environmental Stress Physiology (1 credit hours)
Physiology of plant responses to environmental stresses, with emphasis on current research in selected physiological, molecular, and biochemical mechanisms for tolerance to environmental stresses such as temperature extremes, drought, salt, pathogens and other plants.

Prerequisite: PB 421
Typically offered in Fall only

HS 716/CS 716 Weed Biology (3 credit hours)
This course analyzes the interactions between human disturbance and dynamics of weed populations and communities. Emphasis is given to factors that drive weed control actions and the ecological and evolutionary processes by which weeds survive and adapt to these actions. Similarities and differences between weeds and invasive plant species are discussed as well as benefits and limitations of using traditional ecological theory from natural systems to explain weed behavior in highly disturbed environments.

Prerequisite: CS 414
Typically offered in Spring only

HS 717/CS 717 Weed Management Systems (1 credit hours)
Weed management systems including integration of cultural, biological, mechanical and chemical methods for vegetables, fruits, ornamentals, turf, small grains, corn, tobacco, cotton, peanuts, aquatic and non-cropland settings. Taught second 5 weeksof semester. Drop date is by last day of 3rd week of minicourse.

Prerequisite: CS 414
Typically offered in Fall only

HS 720/CS 720/GN 720 Molecular Biology In Plant Breeding (3 credit hours)
Theory and principles of molecular biology applied to plant breeding. Understanding of the relationship between genes and crop traits. Principles and molecular mechanisms of crop traits, and their applications to solve breeding problems and improve crop traits, which include heterosis, male/female sterility, self-incompatibility, polyploidy, double haploid, protoplast fusion, random mutagenesis, plant regeneration, transgenic breeding, advanced genome editing for breeding, gene silencing, gene activation, gene drive, plant synthetic biology, metabolic engineering, epigenetics for trait improvement, gene stacking, decoy and R genes, and bioconfinement.

P: CS 211 or GN 311 or equivalent, and PB 421 or equivalent.
Typically offered in Spring only

HS 725/SSC 725/TOX 725/CS 725 Pesticide Chemistry (1 credit hours)
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taughtduring the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225)
Typically offered in Fall only

HS 727/SSC 727/TOX 727/CS 727 Pesticide Behavior and Fate In the Environment (2 credit hours)
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: CS(HS,SSC,TOX) 725,SSC 200
Typically offered in Fall only

HS 729/CS 729 Herbicide Behavior In Plants (2 credit hours)
Chemical, physiological and biochemical actions of herbicides in plants including uptake, translocation, metabolism and mechanism of action.

Prerequisite: BO 751 and BO 752 and CS(HS,SSC) 725
Typically offered in Spring only

HS 745/CS 745/GN 745 Quantitative Genetics In Plant Breeding (1 credit hours)
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

Prerequisite: CS(GN, HS) 541, ST 712, course in quantitative genetics recommended
Typically offered in Spring only

HS 746/CS 746/GN 746 Cytogenetics in Plant Breeding (2 credit hours)
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

Typically offered in Spring only

HS 757/GN 757/ST 757 Quantitative Genetics Theory and Methods (3 credit hours)
The essence of quantitative genetics is to study multiple genes and their relationship to phenotypes. How to study and interpret the relationship between phenotypes and whole genome genotypes in a cohesive framework is the focus of this course. We discuss how to use genomic tools to map quantitative trait loci, how to study epistasis, how to study genetic correlations and genotype-by-environment interactions. We put special emphasis in using genomic data to study and interpret general biological problems, such as adaptation and heterosis. The course is targeted for advanced graduate students interested in using genomic information to study a variety of problems in quantitative genetics.

Prerequisite: ST 511
Typically offered in Fall only

HS 790 Special Problems in Horticultural Science (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in horticultural science.

Typically offered in Fall, Spring, and Summer

HS 815 Advanced Special Topics (1-6 credit hours)
Investigation of theoretical problems at 600 level in horticultural science not related to a thesis problem; new 600-level courses during development phase.

Typically offered in Fall, Spring, and Summer

HS 860/CS 860/GN 860 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Spring only

HS 861/CS 861/GN 861 Plant Breeding Laboratory (1 credit hours)
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

P: CS 741 or GN 741 or HS 741
Typically offered in Fall only

HS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Typically offered in Fall, Spring, and Summer

HS 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

HS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

HS 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

HS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Humanites and Social Sciences (HSS)

HSS 120 Introduction to Humanities & Social Sciences (2 credit hours)
Introduction to humanities and social science disciplines by comparing methods of inquiry and perspectives on a social/cultural issue. The course will also facilitate exploration of college and university resources, opportunities, and policies, and address skills for academic, personal, and career success. First-year entering Humanities and Social Sciences majors only.

R: New Freshmen with majors in the College of Humanities and Social Sciences only
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

HSS 392/COM 392 International and Crosscultural Communication (3 credit hours)
Patterns and problems of verbal and non-verbal forms of crosscultural communication. Avoidance and management of cultural conflict arising from awareness of characteristics and crosscultural communication. Impact on communication of differing cultural perspectives.

GEP Global Knowledge, GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Summer

Humanities (HUM)

HUM 295 Humanities Special Topics (3 credit hours)
Special topics course offering for the general education Humanities category.

GEP Humanities
Typically offered in Fall, Spring, and Summer

Humanities and Global Knowledge (HUMG)

HUMG 295 Humanities and Global Knowledge Special Topics (3 credit hours)
Special topics course offering for the general education Humanities and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Humanities (HUM) requirement.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

Humanities and U.S. Diversity (HUMU)

HUMU 295 Humanities and U.S. Diversity Special Topics (3 credit hours)
Special topics course offering for the general education Humanities and U.S. Diversity categories. This course may be used for the U.S Diversity (USD) co-requisite and/or for the Humanities (HUM) requirement.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

Immunology (IMM)

IMM 751/MB 751 Immunology (3 credit hours)
Introduction to mechanisms of immunity in man and animals. Emphasis on interactions between cells of the immune system in production of immune responses and the molecules in control of these interactions.

Prerequisite: BCH 451, GN 411, MB 351
Typically offered in Spring only

IMM 757/PO 757 Comparative Immunology (3 credit hours)
Compare and contrast the immune system structure and function of animal species of agricultural and veterinary significance with that of humans and traditional biomedical model organisms. Discuss key evolutionary differences, how different species use different mechanisms to achieve the same outcomes, and the clinical implications for these differences.

Prerequisite: MB 751 or MB 441 or BIO 414
Typically offered in Spring only

IMM 783/MB 783/CBS 783 Advanced Immunology (3 credit hours)
In depth study of the basic cellular and molecular mechanisms of immunity, including antigen processing and presentation, T cell development, initiation of the immune response, effector mechanisms, and immunological memory. The course is designed for advanced graduate students who wish to focus on the current concepts in immunology.

Prerequisite: MB (IMM) 751
Typically offered in Fall only

Industrial and Systems Engineering (ISE)

ISE 135 Computer-Based Modeling for Engineers (3 credit hours)
Introductory course in computer-based modeling and programming using Python for Engineering Applications. Emphasis on algorithm development and engineering problem solving. Methodical development of Python scripts to link with Microsoft Excel using xlwings plugin through proper specifications; documentation, style; control structures; data types and data abstraction; graphical user interface design. Projects: design problems from industrial engineering systems. Functional relationships will be given and programs will be designed and developed from a list of specifications.

Prerequisite: E 115, Corequisite: MA 141
Typically offered in Fall and Spring

ISE 215 Foundations of Design & 3D Modeling for Engineers (1 credit hours)
This is an 8 week course. An introductory engineering graphics course which builds on the foundations of computer-aided 2D sketching and 3D modeling for industrial engineers. Students will develop and refine their ability to communicate designs via modeling techniques prolific in industry. The concurrent nature of ideation, engineering analysis and manufacturing will be emphasized as students review case studies and develop their own models. Constraint-based design will drive strategies that accurately reflect design intent and promote part family relationships and automation. Students will work in small teams to create a mechanism that must achieve certain functional criteria. ISE majors have priority registration for this course.

Prerequisite: E115 and Corequisite: ISE216
Typically offered in Fall and Spring

ISE 216 Product Development and Rapid Prototyping (3 credit hours)
Introduction to product development and prototyping. Team-based development of a new product during the semester. Specific topics are voice of the customer, product specification and parameter specification, Quality Function Deployment and the House of Quality, concept generation, concept selection, detailed design using SolidWorks, prototyping, design for assembly, design for the environment, and intellectual properties and patents. Team presentations of a functional prototype of their product at the end of the semester.

Corequisite: ISE 215
Typically offered in Fall and Spring

ISE 311 Engineering Economic Analysis (3 credit hours)
Engineering and managerial decision making. The theory of interest and its uses. Equivalent annual costs, present worth, internal rates of return, and benefit/cost ratios. Accounting depreciation and its tax effects. Economic lot size and similar cost minimization models. Sensitivity analysis. Cost dichotomies: fixed vs. variable, and incremental vs. sunk, use of accounting data. Replacement theory and economic life. Engineering examples.

Prerequisite: Grade of C or better in MA 141
Typically offered in Fall, Spring, and Summer

ISE 315 Introduction to Computer-Aided Manufacturing (1 credit hours)
This is an 8 week course. Introduction to the principles of modern-day multi-axis machine tool control, using computer-aided manufacturing (CAM) software tools. Emphasis is placed on transferring part geometry from CAD to CAM, for the development of CNC-ready programs. Industry file formats, machining strategies, G & M-code generation, optimization and verification techniques will also be investigated. Upon successful completion of this course, students will be able to demonstrate proficiency in the use of industry-relevant CAD/CAM software and will be able to extend that knowledge to practice through exercises and projects. Use of CNC machine tools will be introduced and demonstrated in the department's physical lab spaces. ISE majors have priority registration for this course.

Prerequisite: ISE 215 and Co-requisite: ISE 316
Typically offered in Fall, Spring, and Summer

ISE 316 Manufacturing Engineering I - Processes (3 credit hours)
Analytical study and design of manufacturing engineering with emphasis on mfg. and processes. Addresses the interaction of design, materials, and processing. Laboratory instruction and hands-on experience in metrology, machining, process planning,economic justification, and current mfg. methodologies.

Prerequisite: MSE 200 and ISE 216; Co-requisite: ISE 315
Typically offered in Fall, Spring, and Summer

ISE 352 Fundamentals of Human-Machine Systems Design (3 credit hours)
Introduction to work methods and ergonomics. Coverage of methods to improve operator performance and production process efficiency. Techniques include project evaluation and review, operator-machine ratios, line balancing, work sampling, time study, wage payment, and pre-determined time systems. Ergonomics component includes workstation and hand-tool design, and methods for designing cognitive work and work environment.

Prerequisite: C- or better in ST 371; C or better in ISE 135
Typically offered in Fall and Spring

ISE 361 Deterministic Models in Industrial Engineering (3 credit hours)
Introduction to mathematical modeling, analysis techniques, and solution procedures applicable to decision-making problems in a deterministic environment. Linear programming models and algorithms and associated computer codes are emphasized.

Prerequisite: (MA 303 or MA 341) and C or better in ISE 135
Typically offered in Fall, Spring, and Summer

ISE 362 Stochastic Models in Industrial Engineering (3 credit hours)
Introduction to mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production systems. Methodologies covered include probability theory and stochastic processes. Applications relate to design and analysisof problems, capacity planning, inventory control, waiting lines, and system reliability and maintainability.

Prerequisite: C or better in ISE 135 and (MA 303 or MA 341) and C- or better in ST 371 or ST 370
Typically offered in Fall and Spring

ISE 398 Lean Six Sigma for Industrial Engineering (1 credit hours)
This course leverages the Lean Six Sigma framework to analyze and solve problems as related to quality improvement projects. Students in this course will apply the Lean Six Sigma philosophy and goals to build problem-solving, analytical and technical skills while implementing successful change management techniques.

Corequisite: ISE 498 or ISE 521
Typically offered in Fall and Spring

ISE 408 Design and Control of Production and Service Systems (3 credit hours)
This course focuses on understanding the behavior of manufacturing plants and service systems through a thorough, generalizable and fundamental understanding of the factors affecting their behavior.

Prerequisite: ISE 135, ISE 362, and C- or better in ST 371
Typically offered in Fall and Spring

ISE 411/ISE 511 Supply Chain Economics and Decision Making (3 credit hours)
This course introduces students to the principles of microeconomic analysis applied to decision-making in supply chains. Emphasis will be put on strategic interactions between different decision makers in the supply chain, including suppliers, manufacturers, retailers, and consumers. Topics include classical demand and production theory, pricing and revenue management, competition between firms, and cooperation between and within firms under information asymmetry.

Prerequisite: ISE 135
Typically offered in Fall only

ISE 413/ISE 513 Humanitarian Logistics (3 credit hours)
This course provides a comprehensive treatment of humanitarian logistics (HumLog) from an operations research perspective, focusing on the use of quantitative modeling for decision making and best practices disaster management. Background and overview on disaster management will be covered. The four phases of the disaster management cycle are introduced as well as the types of decisions that are made in each phase. Mathematical models are presented for typical humanitarian logistics decisions, such as inventory prepositioning, facility location, transportation, routing and capacity planning.

Prerequisite: ISE 361
Typically offered in Spring only

ISE 416 Manufacturing Engineering II - Automation (3 credit hours)
Integration of design and mfg. through computer aided/automated process planning, concurrent engineering, and rapid prototyping. Fixed and programmable automation in mfg. and service. Autonomous mfg. systems such as computer numerical control (CNC), industrial robotics, automated inspection, electronics manufacturing and assembly.

Prerequisite: ISE 316
Typically offered in Fall only

ISE 417 Database Applications in Industrial & Systems Engineering (3 credit hours)
Rapid applications development (RAD) tools to design and implement database-based applications. The SQL database query language, a standard RAD environment and how to access information in a database from it, use of Visual Basic for Applications, and how to integrate these tools together to design and build engineering applications. Examples will be from manufacturing and production systems.

Prerequisite: C or better in ISE 135
Typically offered in Fall, Spring, and Summer

ISE 425/OR 425/OR 525/ISE 525 Medical Decision Making (3 credit hours)
This will focus on the use of optimization in Medicine. The main goal of this course is for you to develop an understanding of the recent methodological literature on optimization methods applied to medical decision making. We will cover a broad range of topics, both from the methodological perspective (study models using integer programming, dynamic programming, simulation, etc.) and from the public policy/public health perspective (who are the stake holders, what are the relevant questions modelers can answer, how is the patient taken into account, etc.).

P: ISE/OR 505 or equivalent and ISE 560 or equivalent or permission by instructor
Typically offered in Spring only

ISE 433/ISE 533/OR 433/OR 533 Service Systems Engineering (3 credit hours)
This course intends to provide a comprehensive treatment on the use of quantitative modeling for decision making and best practices in the service industries. The goal of this class is to teach students to able to identify, understand, and analyze services; and acquire the quantitative skills necessary to model key decisions and performance metrics associated with services. Students will be exposed both to classical and contemporary examples of challenges and opportunities that arise when working in the service sector.

Prerequisite: ISE 361
Typically offered in Spring only

ISE 435/ISE 535 Python Programming for Industrial & Systems Engineers (3 credit hours)
The objective of this course is to build on your knowledge of computing and data analysis by focusing on programming using the Python language. IN particular, you will learn more about the Python and its ecosystem of libraries, how to use data structures in Python programs, conduct File I/O operations, and perform numerical and scientific computing within Python. This course is designed for senior undergraduate and graduate students to get the basics of the Python language and learn to use it to perform scientific computing within Python with two of its most popular packages in use for heavy data intensive analysis - Numpy and SciPy. Several engineering examples from physics, industrial engineering core courses and general engineering will be used to contextualize the programming examples.

Prerequisites: ST 370 OR ST 371 and ISE 135 OR CSC 111 OR CSC 113 OR CSC 116 or ST 307 OR ST 308 OR ECE 209. Restrictive Statement: Department Approval Required
Typically offered in Fall only

ISE 437 Data Analytics for Industrial Engineering (3 credit hours)
In this course undergraduate students will learn to integrate statistical and mathematical modeling tools they learned in their previous classes to be able to design, develop and implement comprehensive advanced analytics solutions to address real industry problems. All class modules will be illustrated through real applications in Media, Financial, Retail and Manufacturing industries.

Prerequisites: (ST 370 or ST 371) and (ISE 135 or CSC 111 or CSC 113 or CSC 116 or ST 307 or ST 308 or ECE 209) and ISE 361.
Typically offered in Spring only

ISE 441 Introduction to Simulation (3 credit hours)
Discrete-event stochastic simulation for the modeling and analysis of systems. Programming of simulation models in a simulation language. Input data analysis, variance reduction techniques, validation and verification, and analysis of simulation output. Random number generators and random variate generation.

Prerequisite: MA 242, ST 372, ISE 362 and C or better in ISE 135
Typically offered in Fall and Spring

ISE 443 Quality Design and Control (3 credit hours)
Statistical methods in quality control. Control charts for variables and attributes. Process capability assessment. Role of experimentation in designing for quality. Total Quality Management. Tools for continuous quality improvement. Quality Function Deployment.

Prerequisite: ST 372 Restriction: ST 435 cannot be used as a substitute for this course.
Typically offered in Fall and Spring

ISE 447/ISE 547 Applications of Data Science in Healthcare (3 credit hours)
Health professional are capable of collecting massive amounts of data and look for best strategies to use this information. Healthcare analytics have the potential to reduce costs of treatment, predict outbreaks of epidemics, avoid preventable diseases and improve the quality of life in general. This course will explore some of the frequently used data science methods in healthcare and examine a compilation of the most recent academic journal articles on the subject. Students are expected to have a strong background in optimization and stochastic modeling.

Prerequisite: ISE 362
Typically offered in Fall only

ISE 452 Advanced Human-Machine Systems Design (3 credit hours)
Advanced concepts in human-machine systems design. Consideration of anatomical and physiological bases for design of work systems. Advanced biomechanical analysis and modeling for manual material handling design. Physiological and psychological capabilities and limitations as related to work systems design and human performance. Coverage of human information processing and performance theories and models, including pipe-line, signal detection theory, information theory, and motor control theory. Additional topics include human factors experimentation and neuroergonomics (brain and behavior).

Prerequisite: CE 214 and ISE 352
Typically offered in Spring only

ISE 453 Modeling and Analysis of Supply Chains (3 credit hours)
This course presents an overview of the basic issues and strategies involved in operating today's global supply chains, from the design of the supply chain network through the management and location of inventories to the design and operation of the logistics systems that distribute goods from their source to the consumer.

Prerequisite: ST 371 (C- or better), ISE 135, ISE 361, ISE 362
Typically offered in Fall and Spring

ISE 462 Advanced Stochastic Models in Industrial Engineering (3 credit hours)
Advanced topics related to mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production systems. Methodologies covered include economic analysis under uncertainty, discrete and continuous time stochastic processes. Applications relate to design, analysis and control relating to capacity planning, inventory control, waiting lines, and system reliability and maintainability.

Prerequisite: ISE 362
Typically offered in Fall only

ISE 489 Special Topics in Industrial and Systems Engineering (1-3 credit hours)
Directed coursework in Industrial and Systems Engineering with an emphasis on special topics and emerging areas of interest within the discipline.

Typically offered in Fall, Spring, and Summer

ISE 495 Project Work in Industrial Engineering (1-3 credit hours)
Special investigations, study or research related to the field of industrial engineering. In a given semester several students and/or student groups may be working in widely divergent areas under the direction of several members of the faculty.

Prerequisite: Junior standing.
Typically offered in Fall and Spring

ISE 498 Senior Design Project (3 credit hours)
Individual or group design projects requiring problem definition and analysis, synthesis, specification and presentation of a designed solution. Students work under faculty supervision either on actual industrial engineering problems posed by local industrial, service and governmental organization or on emerging research issues.

Prerequisite: ISE 408 and ISE 441 and ISE 453
Typically offered in Fall and Spring

ISE 501/OR 501 Introduction to Operations Research (3 credit hours)
Operations Research (OR) is a discipline that involves the development and application of advanced analytical methods to aid complex decisions. This course will provide students with the skills to be able to apply a variety of analytical methods to a diverse set of applications. Methods considered include linear and mixed-integer programming, nonlinear and combinatorial optimization, network models, and machine learning. Focus will be on how to translate real-world problems into appropriate models and then how to apply computational procedures and data so that the models can be used as aids in making decisions. Applications will include improving the operation of a variety of different production and service systems, including healthcare delivery and transportation systems, and also how OR can be used to make better decisions in areas like sports, marketing, and project management. Prerequisites include undergraduate courses in single variable differential and integral calculus and an introductory course in probability.

Prerequisites include undergraduate courses in single variable differential and integral calculus (similar to MA 421) and an introductory course in probability (similar to ST 421 or ST 371 and ST 372)
Typically offered in Fall and Spring

ISE 505/MA 505/OR 505 Linear Programming (3 credit hours)
Introduction including: applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

Prerequisite: MA 405
Typically offered in Fall only

ISE 510 Applied Engineering Economy (3 credit hours)
Engineering economy analysis of alternative projects including tax and inflation aspects, sensitivity analysis, risk assessment, decision criteria. Emphasis on applications.

Prerequisite: Undergrad. courses in engineering economics and ST
Typically offered in Spring only

ISE 511/ISE 411 Supply Chain Economics and Decision Making (3 credit hours)
This course introduces students to the principles of microeconomic analysis applied to decision-making in supply chains. Emphasis will be put on strategic interactions between different decision makers in the supply chain, including suppliers, manufacturers, retailers, and consumers. Topics include classical demand and production theory, pricing and revenue management, competition between firms, and cooperation between and within firms under information asymmetry.

Prerequisite: ISE 135
Typically offered in Fall only

ISE 513/ISE 413 Humanitarian Logistics (3 credit hours)
This course provides a comprehensive treatment of humanitarian logistics (HumLog) from an operations research perspective, focusing on the use of quantitative modeling for decision making and best practices disaster management. Background and overview on disaster management will be covered. The four phases of the disaster management cycle are introduced as well as the types of decisions that are made in each phase. Mathematical models are presented for typical humanitarian logistics decisions, such as inventory prepositioning, facility location, transportation, routing and capacity planning.

Prerequisite: ISE 361
Typically offered in Spring only

ISE 515 Manufacturing Process Engineering (3 credit hours)
Manufacturing process engineering, primary, secondary, finishing and assembly processes. Traditional and non-traditional manufacturing processes, group technology, manufacturing analyses and application of economic analyses. Graduate standing in Engineering.

Typically offered in Fall and Summer

ISE 519 Database Applications in Industrial and Systems Engineering (3 credit hours)
Rapid application development (RAD) tools to design and implement database-based applications. This includes: SQL query language, Visual Basic for Applications in database application construction, a standard RAD environment and how to access information in a database, entity/attribute modeling of the database structure, anomalies of database structures that create problems for applications, modeling of application system's functionality, and integrating these tools together to design and implement engineering applications. Examples from manufacturing and production systems. Restricted to advanced undergraduates and graduate students.

Prerequisite: ISE 110
Typically offered in Fall and Spring

ISE 520 Healthcare Systems Performance Improvement I (3 credit hours)
Methods used to improve the performance of health care delivery systems with emphasis on patient care cost, access, and quality. Adaptation of lean and six-sigma to rapid and continuous health care systems improvement through organizational and process transformation. Fundamentals of scheduling, staffing, and productivity in health systems employing simulation and optimization. Health care policy and management.

Prerequisite: ST 372, ISE 352, ISE 361, and ISE 441
Typically offered in Fall only

ISE 521 Healthcare Systems Performance Improvement II (3 credit hours)
Continuation of ISE 520 with a concentration on the completion of a healthcare systems process improvement project at the sponsoring health care institution. Project must employ the tools and techniques of healthcare systems process improvement. The project is done in conjunction with a diverse and multi-disciplinary team from the healthcare institution. The student must serve as a facilitator and coach, resulting in a project with measured success. Success will be determined by the improvement in patient care as quantified in cost, quality, and access.

Prerequisite: ISE 520
Typically offered in Spring only

ISE 525/ISE 425/OR 425/OR 525 Medical Decision Making (3 credit hours)
This will focus on the use of optimization in Medicine. The main goal of this course is for you to develop an understanding of the recent methodological literature on optimization methods applied to medical decision making. We will cover a broad range of topics, both from the methodological perspective (study models using integer programming, dynamic programming, simulation, etc.) and from the public policy/public health perspective (who are the stake holders, what are the relevant questions modelers can answer, how is the patient taken into account, etc.).

P: ISE/OR 505 or equivalent and ISE 560 or equivalent or permission by instructor
Typically offered in Spring only

ISE 533/OR 433/OR 533/ISE 433 Service Systems Engineering (3 credit hours)
This course intends to provide a comprehensive treatment on the use of quantitative modeling for decision making and best practices in the service industries. The goal of this class is to teach students to able to identify, understand, and analyze services; and acquire the quantitative skills necessary to model key decisions and performance metrics associated with services. Students will be exposed both to classical and contemporary examples of challenges and opportunities that arise when working in the service sector.

Prerequisite: ISE 361
Typically offered in Spring only

ISE 535/ISE 435 Python Programming for Industrial & Systems Engineers (3 credit hours)
The objective of this course is to build on your knowledge of computing and data analysis by focusing on programming using the Python language. IN particular, you will learn more about the Python and its ecosystem of libraries, how to use data structures in Python programs, conduct File I/O operations, and perform numerical and scientific computing within Python. This course is designed for senior undergraduate and graduate students to get the basics of the Python language and learn to use it to perform scientific computing within Python with two of its most popular packages in use for heavy data intensive analysis - Numpy and SciPy. Several engineering examples from physics, industrial engineering core courses and general engineering will be used to contextualize the programming examples.

Prerequisites: ST 370 OR ST 371 and ISE 135 OR CSC 111 OR CSC 113 OR CSC 116 or ST 307 OR ST 308 OR ECE 209. Restrictive Statement: Department Approval Required
Typically offered in Fall only

ISE 537 Statistical Models for Systems Analytics in Industrial Engineering (3 credit hours)
In this course, graduate students will learn basic data science methodologies. Examples of the methodologies include linear regression, generalized linear models, regularization and variable selection, and dimensionality reduction. In addition, students will also learn how to use these methods to solve real-world Industrial Engineering-related problems by analyzing industrial datasets and projects.

Prerequisite: ST 370: "Probability and Statistics for Engineers" or equivalent
Typically offered in Fall only

ISE 540/PSY 540 Human Factors In Systems Design (3 credit hours)
Introduction to problems of the systems development cycle, including human-machine function allocation, military specifications, display-control compatibility, the personnel sub-system concept and maintainability design. Detailed treatment given to people as information processing mechanisms.

Prerequisite: IE 452 or PSY 340, Corequisite: ST 507 or 515
Typically offered in Spring only

ISE 541 Occupational Safety Engrg (3 credit hours)
Occupational accident-injury study; morbidity, mortality; investigation and analysis. Hazard control; energy countermeasure strategies; control technology. Impact biomechanics, trauma and survivability. Risk assessment; systems safety analysis. Product design, manufacturing defects, system failures and human error as causative factors. Safety program development. Near-accident reporting. OSHA compliance; standards. Accident, trauma and forensic case studies from manufacturing, motor carrier andconstruction industries.

Typically offered in Spring only

ISE 543 Musculoskeletal Mechanics (3 credit hours)
Anatomy, physiology and biomechanics of musculoskeletal system including muscle bone, tendon, ligament, cartilage, nerve. Modeling of tissue and joints with special emphasis on spine and upper extremity. Physical, mathematical, optimization and finite element modeling techniques as applied in biomechanics research.

Prerequisite: BIO 125 or BAE(BIO) 235 or Graduate standing

ISE 544 Occupational Biomechanics (3 credit hours)
Anatomical, physiological, and biomechanical bases of physical ergonomics. Strength of biomaterials, human motor capabilities, body mechanics, kinematics and anthropometry. Use of bioinstrumentation, active and passive industrial surveillance techniques and the NIOSH lifting guide. Acute injury and cumulative trauma disorders. Static and dynamic biomechanical modeling. Emphasis on low back, shoulder and hand/wrist biomechanics.

Prerequisite: Graduate standing
Typically offered in Fall only

ISE 546/CSC 546 Management Decision and Control Systems (3 credit hours)
Planning, design, and development and implementation of comprehensive computer-based information systems to support management decisions. Formal information systems principles; information requirements analysis; knowledge acquisition techniques; information modeling. Information resource management for quality operational control and decision support; system evaluation, process improvement and cost effectiveness.

Prerequisite: CSC 423 or BUS 541
Typically offered in Fall only

ISE 547/ISE 447 Applications of Data Science in Healthcare (3 credit hours)
Health professional are capable of collecting massive amounts of data and look for best strategies to use this information. Healthcare analytics have the potential to reduce costs of treatment, predict outbreaks of epidemics, avoid preventable diseases and improve the quality of life in general. This course will explore some of the frequently used data science methods in healthcare and examine a compilation of the most recent academic journal articles on the subject. Students are expected to have a strong background in optimization and stochastic modeling.

Prerequisite: ISE 362
Typically offered in Fall only

ISE 552 Design and Control of Production and Service Systems (3 credit hours)
Basic terminology and techniques for the control of production and service systems including economic order quantity models; stochastic inventory models; material requirements planning; Theory of Constraints; single and mixed model assembly lines ; and lean manufacturing. Emphasis on mathematical models of the interaction between limited capacity and stochastic variability through the use of queueing models to describe system behavior.

Prerequisite: ST 371 or ST 372
Typically offered in Fall only

ISE 553 Modeling and Analysis of Supply Chains (3 credit hours)
Basic issues in operating supply chains, using state of the art modeling tools available for their analysis. Emphasis on using engineering models to develop insights into the behavior of these systems.

Prerequisite: ISE 361 and ST 372
Typically offered in Spring only

ISE 555 Digital Manufacturing (3 credit hours)
This course aims to introduce students on the power of digital manufacturing and design technologies, particularly how product data can seamlessly transfer through the entire lifecycle of a manufactured product. Students will also be introduced to methods to design and build plugin apps that interface with the design models. All hands-on modeling and virtual manufacturing exercises will be in Autodesk Fusion 360, a cloud based design and manufacturing software.

R: ISE 316 or Graduate Standing
Typically offered in Fall only

ISE 560/OR 560 Stochastic Models in Industrial Engineering (3 credit hours)
ISE/OR 560 will introduce mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production and service systems. Methodologies covered include probability theory and stochastic processes including discrete and continuous Markov processes. Applications relate to design and analysis of problems, capacity planning, inventory control, waiting lines, and service systems.

Typically offered in Fall only

ISE 562/TE 562/OR 562 Simulation Modeling (3 credit hours)
This course concentrates on design, construction, and use of discrete/continuous simulation object-based models employing the SIMIO software, with application to manufacturing, service, and healthcare. The focus is on methods for modeling and analyzing complex problems using simulation objects. Analysis includes data-based modeling, process design, input modeling, output analysis, and the use of 3D animation with other graphical displays. Object-oriented modeling is used to extend models and enhance re-usability.

Typically offered in Spring only

ISE 589 Special Topics In Industrial Engineering (1-6 credit hours)
Special developments in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 601 Seminar (1 credit hours)
Seminar discussion of industrial engineering problems for graduate students. Case analyses and reports.

Typically offered in Fall and Spring

ISE 610 Special Topics in Industrial Engineering (3-6 credit hours)
Special developments in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 637 Directed Study in Industrial Engineering (1-3 credit hours)
Independent study providing opportunity for individual students to explore topics of special interest under direction of a member of faculty.

Typically offered in Fall and Summer

ISE 639 Advanced Directed Study in Industrial Engineering (1-3 credit hours)
Independent study providing an opportunity for individual graduate students to explore advanced topics of special interest under the direction of a member of the faculty.

Typically offered in Fall, Spring, and Summer

ISE 677 Industrial Engineering Projects (1-6 credit hours)
Investigation and written report on assigned problems germane to industrial engineering. Maximum of six credits to be earned for MIE degree.

Prerequisite: MIE candidates
Typically offered in Fall, Spring, and Summer

ISE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ISE 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ISE 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ISE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ISE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Typically offered in Fall, Spring, and Summer

ISE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

ISE 699 Master's Thesis Preparation (1-9 credit hours)
For student who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ISE 707 Real-Time Control of Automated Manufacturing (3 credit hours)
Concepts and application of real-time control of automated manufacturing systems. Development of prototype manufacturing control applications involving introductions to following topics: computer architecture; real-time, multi-tasking operating systems; data modeling; multi-processing systems; local area networks; inter-task communication; and development of multi-tasking control systems. Design development of control system.

Typically offered in Fall only

ISE 708/MA 708/OR 708 Integer Programming (3 credit hours)
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some "hands on" computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

Prerequisite: MA 405, OR (MA,IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112)
Typically offered in Spring only

ISE 709/OR 709 Dynamic Programming (3 credit hours)
Introduction to theory and computational aspects of dynamic programming and its application to sequential decision problems.

Prerequisite: MA 405, ST 421
Typically offered in Spring only

ISE 711 Capital Investment Economic Analysis (3 credit hours)
Analysis of economic merits of alternatives including interest and income tax considerations. Risk and sensitivity exploration techniques. Introduction to analytical techniques for multiple objectives or criteria. Use of mathematical programming andcomputers for capital budgeting.

Prerequisites: ISE 311 and ST 371
Typically offered in Fall only

ISE 712 Bayesian Decision Analysis For Engineers and Managers (3 credit hours)
The Bayesian approach to decision making, with numerous applications in engineering and business. Expected value maximization, decision trees, Bayes' theorem, value of information, sequential procedures and optimal strategies. Axiomatic utility theory and controversies, utility of money, theoretical and empirical determination of utility functions and relationship to mean-variance analysis. Brief introduction to multi-attribute problems, time streams and group decisions.

Prerequisite: ST 371 or ST 421
Typically offered in Spring only

ISE 714 Product Manufacturing Engineering for the Medical Device Industry (3 credit hours)
Product development course targeted toward the medical device industry. Product design and development, concept generation and selection, parametric feature-based CAD, design for manufacturability (DFM) and assembly (DFA), tolerancing, rapid prototyping, tool design, tool fabrication, and medical device fabrication.

Prerequisite: ISE 515
Typically offered in Spring only

ISE 715 Manufacturing Process Engineering (3 credit hours)
Manufacturing process engineering, primary,secondary, finishing and assembly processes. concurrent engineering, process planning, group technology, manufacturing analyses and application of economic analyses.

Typically offered in Spring only

ISE 716 Automated Systems Engineering (3 credit hours)
General principles of operation and programming of automated systems. Automated assembly, automated manufacturing, and inspection systems. Control of automated manufacturing. Industrial logic systems and programmable logic controllers. Computer numerical control, industrial robotics, and computer integrated manufacturing.

Typically offered in Fall and Spring

ISE 718 Micro/Nano-Scale Fabrication and Manufacturing (3 credit hours)
Introduction to physical theory, process design, analysis, and characterization of micro/nano scale fabrication and manufacturing. The main focus of the course is on the fabrication/manufacturing of important types of microstructures used in micro/nano devices and the techniques and tools used to fabricate and characterize them.

Prerequisite: ISE 316 or graduate standing in the college of engineering
Typically offered in Spring only

ISE 723 Production Planning, Scheduling and Inventory Control (3 credit hours)
An analysis of Production-Inventory systems. Discussion of commonly used planning and scheduling techniques. Introduction to use of math modeling for solution of planning and scheduling problems. Interface with quality control and information systems.

Prerequisite: OR 501 and ST 511
Typically offered in Spring only

ISE 725 Foundations of Smart Manufacturing (3 credit hours)
The course introduces the concepts and applications of smart manufacturing systems that begin from the machine asset on the factory floor to the higher order information technology systems. Development of prototype smart manufacturing applications involving introduction to topics such as: real-time streaming machine sensor data through machine to machine (m2m) industrial communication protocols; unified namespaces for factory integration of information and operational technology; data modeling and data store architectures specifically for time series analysis and machine vision theory and applications critical to quality inspections at the factory floor.

Typically offered in Spring only

ISE 726 Theory of Activity Networks (3 credit hours)
Introduction to graph theory and network theory. In-depth discussion of theory underlying (1) deterministic activity networks (CPM): optimal time-cost trade offs; the problem of scarce resources; (2) probabilistic activity networks (PERT): critical evaluation of underlying assumptions; (3) generalized activity networks (GERT, GAN): applications of signal flow graphs and semi-Markov process to probabilistic branching; relation to the theory of scheduling.

Prerequisite: OR 501, OR(IE,MA) 505
Typically offered in Spring only

ISE 731 Multi-Attribute Decision Analysis (3 credit hours)
Specification of attributes/criteria/objectives for complex decisions. Determination of alternatives, attribute weights and decision-making process. Graphical and weighted evaluation techniques. Multi-attribute utility, multi-objective/goal programming and analytic hierarchy process methodologies. Computer applications and case studies.

Typically offered in Spring only

ISE 740/PSY 740 Engineering Psychology of Human-computer Interaction (3 credit hours)
Exploration of usability of computer technology. Theory and practice of user-centered design for HCI applications. Course focuses on current usability paradigms and principles, psychology of users, iterative and participatory design processes, system requirements specification, prototyping, user support systems, usability evaluation and engineering, interface design guidelines and standards. Application domains include, universal design, virtual reality, and scientific data visualization.

Prerequisite: IE(PSY) 540 or CSC 554

ISE 741 Systems Safety Engineering (3 credit hours)
Systems safety engineering. Course familiarizes students with techniques for identifying and recognizing potential safety hazards and the concept of risk assessment. Preliminary Hazard Analysis, Failure Modes and Effects Analysis, System and Subsystem Hazard Analysis, Fault Tree Analysis, Process Safety Management (29CFR1910.119) are explored together with applications to hazard analysis and control. Industrial situations and case studies are employed to illustrate usefulness of various system safety techniques.

Typically offered in Fall only

ISE 742 Environmental Stress, Physiology and Performance (3 credit hours)
Human skilled performance as affected by environmental stressors, including noise, vibration, heat, cold, accelerator, pressure altitude, toxic agents and illumination. Physiological effects of stressors and their relationship to health, performanceand, ultimately, to safety. Impact biomechanics and crash survival. Human survival in adverse environments. Combined stressor effects, physiological arousal, fatigue and performance decrement.

Typically offered in Spring only

ISE 743/PSY 743 Ergonomic Performance Assessment (3 credit hours)
Fundamentals of ergonomic performance measurement used to assess the effects of environment and system design on human performance. Treatment of topics such as workload measurement, measurement of complex performance, simulator studies, measurement of change, task taxonomies, criterion task sets and statistical methods of task analysis. Problems of laboratory and field research, measurement of change and generalizability of findings.

Prerequisite: PSY 200, ST 507 and 508
Typically offered in Fall only

ISE 744 Human Information Processing (3 credit hours)
Fundamentals of human information processing basic to skilled operator performance and the design of displays, controls and complex systems. Treatment of topics such as channel capacity, working memory, long-term memory, decision making, attention and process monitoring. Problems of display and control design and evaluation, evaluation of textual material, and human-computer interaction.

Prerequisite: PSY 200, ST 507 and 508
Typically offered in Spring only

ISE 745/PSY 745 Human Performance Modeling (3 credit hours)
Advanced aspects of human performance research. Qualitative models of human information processing. Characteristics and role of memory in decision making and response execution. Sensory channel parameters, attention allocation, time-sharing of tasks. Situation awareness and workload responses in complext tasks. Limitations of human factors experimentation. Factors in human multiple task performance. Cognitive task analysis and computational cognitave modeling/simulation of user behavior in specific applications.

Prerequisite: ST 507 or 515 or equivalent; IE (PSY) 540, CSC 554 or IE (PSY) 744

ISE 747/OR 747 Reliability Engineering (3 credit hours)
Introduction to basic concepts of reliability engineering. Application of probability and statistics to estimate reliability of industrial systems; development of reliability measures; analysis of static and dynamic reliability models; development and analysis of fault trees; analysis of Markovian and non-Markovian models; and optimization of reliability models.

Prerequisite: ST 511
Typically offered in Fall only

ISE 748 Quality Engineering (3 credit hours)
Introduction to basic concepts of quality engineering. Statistical process control (SPC) methods, acceptance sampling techniques, concept of parameter design and statistical as well as analytical techniques for its implementation, tolerance analysisand design, components of cost of poor quality and an introduction to quality management.

Prerequisite: OR 501, ST 511
Typically offered in Spring only

ISE 754 Logistics Engineering (3 credit hours)
Elements of logistics networks. Supply chain design: facility location and allocation; great-circle distances; geocoding. Multi-echelon production and inventory systems; sourcing decision systems. Vehicle routing: exact, approximation, and heuristic procedures; traveling salesman problem; basic vehicle routing problem and extensions; backhauling; mixed-mode transportation system design.

Prerequisite: ISE 453
Typically offered in Spring only

ISE 760/OR 760 Applied Stochastic Models in Industrial Engineering (3 credit hours)
Formulation and analysis of stochastic models with particular emphasis on applications in industrial engineering; univariate, multivariate and conditional probability distributions; unconditional and conditional expectations; elements of stochastic processes; moment-generating functions; concepts of stochastic convergence; limit theorems; homogeneous, nonhomogeneous and compound Poisson processes; basic renewal theory; transient and steady-state properties of Markov processes in discrete and continuous time.

Prerequisite: MA 303, ST 371
Typically offered in Fall only

ISE 761/OR 761 Queues and Stochastic Service Systems (3 credit hours)
Introduction of general concepts of stochastic processes. Poisson processes, Markov processes and renewal theory. Usage of these in analysis of queues, from with a completely memoryless queue to one with general parameters. Applications to many engineering problems.

Typically offered in Spring only

ISE 762/CSC 762/OR 762 Computer Simulation Techniques (3 credit hours)
Basic discrete event simulation methodology: random number generators, generating random objects, design of discrete event simulation, validation, analysis of simulation output, variance reduction techniques, Markov chain Monte Carlo, simulation optimization. The course has computer assignments and projects.

Students should have completed a course on stochastic models (similar to ISE 560 or ISE 760) and have a working knowledge of a programming language (e.g., Python, Matlab, R, or others).
Typically offered in Fall and Spring

ISE 766/MA 766/OR 766 Network Flows (3 credit hours)
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

Prerequisite: OR(IE,MA) 505
Typically offered in Spring only

ISE 767 Upper Extremity Biomechanics (3 credit hours)
Gross and functional anatomy of upper extremity; properties of tendons and synovial fluid; epidemiology; disorders of shoulder, elbow, wrist, hands, fingers; biomechanical modeling; personal factors affecting cumulative trauma disorder (CTD) risk, diagnosis and treatment of upper extremity CTDs; wrist splints; workplace ergonomics to alleviate upper extremity CTDs.

Typically offered in Fall only

ISE 768 Spine Biomechanics (3 credit hours)
Gross and fine anatomy of spine, mechanism of pain, epidemiology, in vitro testing, psychophysical studies, spine stability models, bioinstrumentation: intradiscal pressure, intra-abdominal pressure and electromyography. Biomechanics of lifting and twisting, effects of vibration, effects of posture/lifting style, lifting belts, physical models, optimization models, mathematical models, muscle models, finite element models, current trends in medical management and rehabilitation, chiropractic.

Typically offered in Fall only

ISE 772/OR 772 Stochastic Simulation Design and Analysis (3 credit hours)
This course is methodologically focused and a continuation of ISE 762 in Monte Carlo methods. The topics include, but are not limited to, Quasi-Monte Carlo, importance sampling and other advanced variance reduction approaches, derivative estimation, and advanced simulation optimization in continuous and finite spaces. While the application of these techniques to actual simulations is practiced as assignments, the discussion on simulation software and programming will be minimal. A current topic research presentation/paper required.

Prerequisite: (CSC,ECE,IE,OR) 762 and ST 516
Typically offered in Spring only

ISE 789 Advanced Special Topics In Industrial Engineering (3-6 credit hours)
Advanced topics in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

Typically offered in Fall and Spring

ISE 790 Advanced Special Topics System Optimization (1-6 credit hours)
Advanced topics in some phase of system optimization using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

Typically offered in Fall and Spring

ISE 794 Advanced Problems in Ergonomics (3 credit hours)
Exploration in depth of a problem area of contemporary interest involving man-machine-environment interface. Class discussion and analysis of research and theory, with special focus on human factors aspects of systems design and operation.

Typically offered in Fall only

ISE 796 Research Practicum in Human-Systems Engineering (3 credit hours)
Human-systems engineering research topic development, literature evaluation, experimental design, use of research instrumentation, data collection, basic data interpretation, statistical analysis, manuscript preparation.

Typically offered in Spring only

ISE 801 Seminar (1 credit hours)
Seminar discussion of industrial engineering problems for graduate students. Case analyses and reports.

Typically offered in Fall and Spring

ISE 812/MA 812 Special Topics in Mathematical Programming (1-6 credit hours)
Study of special advanced topics in area of mathematical programming. Discussion of new techniques and current research in this area. The faculty responsible for this course select areas to be covered during semester according to their preference and interest. This course not necessarily taught by an individual faculty member but can, on occasion, be joint effort of several faculty members from this university as well as visiting faculty from other institutions. To date, a course of Theory of Networks and another on Integer Programming offered under the umbrella of this course. Anticipation that these two topics will be repeated in future together with other topics.

Prerequisite: IE(MA,OR) 505
Typically offered in Spring only

ISE 816/MA 816 Advanced Special Topics Sys Opt (1-6 credit hours)
Advanced topics in some phase of system optimization. Identification of various specific topics and prerequisite for each section from term to term.

Typically offered in Fall and Spring

ISE 837 Directed Study in Industrial Engineering (1-3 credit hours)
Independent study providing opportunity for individual students to explore topics of special interest under direction of a member of faculty.

Typically offered in Fall, Spring, and Summer

ISE 839 Advanced Directed Study in Industrial Engineering (1-3 credit hours)
Independent study providing an opportunity for individual graduate students to explore advanced topics of special interest under the direction of a member of the faculty.

Typically offered in Fall, Spring, and Summer

ISE 861 The Design of Production Systems (3 credit hours)
The structure and operation of production planning, scheduling and control systems; emphasis on system structure, capacity planning, master production scheduling, shop loading and supply chain; investigation of current trends.

Typically offered in Fall only

ISE 877 Industrial Engineering Projects (1-6 credit hours)
Investigation and written report on assigned problems germane to industrial engineering. Maximum of six credits to be earned for MIE degree.

Prerequisite: MIE candidates
Typically offered in Fall, Spring, and Summer

ISE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ISE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ISE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ISE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ISE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ISE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Industrial Design (ID)

ID 102 Basic Industrial Design Studio (6 credit hours)
This course is a continuation of the work introduced in D104 with a focus on the industrial design discipline. This studio course examines the techniques and attitudes for dealing with exploration, identification, prototyping, evaluation and communication of problems and solutions arising from the design of physical artifacts in the natural and product environment. The design studio process includes the acquisition of languages and skills appropriate to creativity, design thinking, industrial design vocabulary and disciplined work habits.

Prerequisite: D104 and ID 110 Corequisites: ID 210 and ID216
Typically offered in Spring only

ID 110 Introduction to Digital Techniques (3 credit hours)
Introduction to the computer as a design tool for generating and manipulation of two-dimensional raster and vector imagery; techniques in two-dimensional concept rendering; 2D applications for design and production of presentation documentation; and an introduction to basic 3D digital techniques. Industrial design majors, department approved minor, and department approved elective for all other college of design majors.

Corequisite: D 104
Typically offered in Fall only

ID 201 Industrial Design Studio I (6 credit hours)
This course is an introduction to the theories, methods, and language of industrial design; elementary problems in form and function; transitional implications of hand-crafted and mass-produced objects in various materials. Industrial Design majors, and department approved elective ("swing") studio for all other College of Design majors.

Prerequisite: D 104 and ID 102 and ID 210 and ID 216; Corequisite: ID 310 and ID 316
Typically offered in Fall only

ID 202 Industrial Design Studio II (6 credit hours)
Introduction to the fundamentals of product development and design with emphasis on analytical and intuitive approaches to problem solving, technical skills, manufacturing and structural considerations in design of simple products/systems.

Prerequisite: ID 201 and ID 310 and ID 316; Corequisite: ID 255 and ID 240
Typically offered in Spring only

ID 210 Intermediate Digital Techniques (3 credit hours)
Progression of digital experiences that expand upon and combine the intellectual and conceptual skills required for digital 3D design visualization. Emphasis on solving design problems through development and manipulation of 3D form within the virtual environment.

Prerequisite: ID 110 and D 104; Corequisite: ID 102 and ID 216
Typically offered in Spring only

ID 216 Visualization I (3 credit hours)
This course is an introduction to the ideation process of conceiving, developing and recording ideas two-dimensionally.

Prerequisite: D 104 and ID 110; Corequisite: ID 102 and ID 210
Typically offered in Spring only

ID 240 Human-Centered Design (3 credit hours)
Introduction to the spectrum of human physical and cognitive capabilities as they relate to user interaction with designed products and environments. Industrial Design Majors and Department approved Elective for all other College of Design Majors with Junior or Graduate standing in Major.

Junior standing or above
Typically offered in Spring only

ID 244 History of Industrial Design (3 credit hours)
This survey class focuses on the history of modern design from the world of Art Nouveau in 1900 to Contemporary Design. The emphasis falls squarely on the development of mass production and its alignment with the Modern movement, with elements drawn from the history of architecture and the fine arts. The Bauhaus (1919-1933) is examined in detail as is the growth of the industrial design profession in the US between 1927 and 1944, when the Society of Industrial Designers was formed. Postwar styling and consumerism in the US are examined in conjunction with the development of human factors, its early investigations and influence on design since 1955. Material culture issues are examined through visits to the Gregg Museum of Art & Design and its growing collection of industrial design. Postmodernism, Universal Design, and User Experience Design are examined in the contexts of their emergence and relevance to design today.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

ID 255 Contemporary Manufacturing Processes I (3 credit hours)
Introduction to mass production processes and their influences on design. Materials and manufacturing processes utilized in quantity production. Emphasis on materials comparison and process selection in relation to product function, form, safety, human factors and manufacturability. Industrial Design majors and department approved Elective for all other College of Design majors.

Prerequisite: ID 201 and ID 315; Corequisite: ID 202
Typically offered in Spring only

ID 256 Contemporary Manufacturing Processes II (3 credit hours)
Second course in mass production processes and their influences on design. Emphasis on relationships between materials and manufacturing process selection, products design, and business. Related topics include rapid prototyping, 3D printing, electronics, color theory, drawings, working with vendors and suppliers, and production documentation. Industrial Design Majors and Department approved Elective for all other College of Design Majors.

Prerequisite: ID 255
Typically offered in Fall only

ID 262 Professional Practice in Industrial Design (3 credit hours)
Issues and situations encountered in a design practice. Topics include patents, trademarks, contracts, basic marketing skills within corporations and in design consultancies.

Typically offered in Spring only

ID 292 Special Topics in Industrial Design (1-3 credit hours)
Topics of current interest in Industrial Design. Normally used to develop new courses.

Typically offered in Fall, Spring, and Summer

ID 301 Industrial Design Studio III (6 credit hours)
This course provides individual and team-oriented design experiences that expand upon and combine intellectual and manual skills required for the practice of industrial design. Intermediate level integration of computer technology, including 3D digital modeling, rapid prototyping, interactive virtual product visualization. Emphasis on identifying and solving design problems through manipulation of design theory, ecological/environmental concerns, advanced materials and manufacturing techniques.

Prerequisite: ID 202 and ID 255 and ID 240; Corequisite: ID 340
Typically offered in Fall only

ID 302 Industrial Design Studio IV (6 credit hours)
This course provides individual and team-oriented design experiences that expand upon and combine intellectual and manual skills required for the practice of industrial design. Continuity and increased complexity of project categories from the previous semester, developed through advanced use of digital technology. Emphasis is placed on identifying and solving design problems through manipulation of design theory, application of human factors, product safety awareness, universal design principles and digital presentation of concepts.

Prerequisite: ID 301; Corequisite: ID 440
Typically offered in Spring only

ID 310 Advanced Digital Techniques (3 credit hours)
Methods and techniques for developing 3D digital models and animations that are compelling, unique, and relevant in the creative process of Industrial Design. Students begin to strategically integrate 3D digital technology as part of the larger curriculum relative to studios and support classes and are encouraged to look beyond current conventions to find new means of creating digital artifacts.

Prerequisite: ID 210
Typically offered in Fall only

ID 316 Visualization II (3 credit hours)
This course expands the ideation process of conceiving, developing and recording ideas two-dimensionally, placing greater emphasis on the creative development and recording of the design process.

Prerequisite: ID 216; Corerequisite: ID 310
Typically offered in Spring only

ID 340 Research Methods in Industrial Design (3 credit hours)
This class provides an overview of the role of human centered design research throughout the stages of the design process. Students will use primary and secondary sources to place people at the center of the design inquiry process and gain insights about people's needs and desires within the context of industrial design.

Prerequisite: ID 240 and ID 202; Corequisite: ID 301
Typically offered in Fall only

ID 401 Advanced Industrial Design Studio I (6 credit hours)
This course is an advanced studio experience that expands upon the intellectual, digital, and practical skills required of an industrial design practitioner. Emphasis on identifying and solving design problems through manipulation of design theory, application of human factors, product safety awareness, appropriate combination of materials and manufacturing techniques, and presentation of concepts.

Prerequisite: ID 302 and ID 440
Typically offered in Fall only

ID 402 Advanced Industrial Design Studio II (6 credit hours)
This course is the second advanced studio that expands upon and combine the intellectual, digital, and practical skills required of an industrial design practitioner. This is a capstone experience where the outcomes, in the form of product proposals, reflect synthesis of design research, problem framing, and solution of complex design problems. Students achieve these outcomes through as mastery and manipulation of design theory, the application of human factors, an awareness of product safety, and appropriate combination of materials and manufacturing techniques. An emphasis is placed on the presentation and communication of processes and concepts.

Prerequisite: ID 401
Typically offered in Spring only

ID 440 Experience Design for ID (3 credit hours)
This course explores the theory and practice of the user-experience (UX) development process in the context of Industrial Design (ID). Students will clearly identify principles and professional processes for research, development, documentation and implementation of various stages of work, including requirements analysis, user needs analysis, prototyping, mockups, and production as these relate to industrial design best practices.

Prerequisite: ID 301 and ID 340; Corequisite: ID 302
Typically offered in Spring only

ID 490 Industrial Design International Studio (6 credit hours)
Define industrial design problems and develop design solutions in an international setting. Studio projects related to design, culture, and traditional and contemporary limited and mass produced products. Focus on artifact making through directed studies. Industrial Design Majors, and Department approved Elective ("swing") Studio for all other College of Design Majors with Junior or Graduate standing in Major.

Prerequisite: Junior standing in Major, Approval of Study Abroad Office
Typically offered in Summer only

ID 492 Special Topics in Industrial Design (1-3 credit hours)
Topics of current interest in Industrial Design. Normally used to develop new courses. Industrial Design Majors, and Department approved Elective for all other College of Design Majors with Junior, Senior or Graduate standing in Major.

Junior standing or above
Typically offered in Fall, Spring, and Summer

ID 494 Internship in Industrial Design (1-6 credit hours)
Supervised field experience in product design offices, galleries, museums and other related organizations. Maximum of 6 credit hours. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing, 3.0 GPA or better. Instructor Consent.
Typically offered in Fall, Spring, and Summer

ID 495 Independent Study in Industrial Design (1-3 credit hours)
Special projects in industrial design developed under the direction of a faculty member on a tutorial basis. Maximum 6 credit hours - May be repeated. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in Industrial Design and 3.0 GPA or better. Instructor Consent.
Typically offered in Fall, Spring, and Summer

ID 500 Advanced Industrial Design (Series) (6 credit hours)
Advanced studies in industrial design. Special emphasis given to problem identification, program formulation and application of advanced design methods. All problems of an individual nature leading to a synthesis of previous design experience.

Prerequisite: Portfolio review
Typically offered in Fall and Spring

ID 511 Industrial Design Materials and Processes I (3 credit hours)
Analysis of paper, wood, metal and manufacturing processes utilized in production of mass-produced products. Advanced studies in mass production processes and their influence on design and development of products. Emphasis on material search and process selection in relation to product safety, cost, function, human factors, form, finishes and joining methods.

Prerequisite: Graduate standing
Typically offered in Spring only

ID 512 Industrial Design Materials and Processes II (3 credit hours)
Analysis of plastics and rubber and related manufacturing processes utilized in production of mass-produced products. Advanced studies in mass production processes and their influence on design and development of products. Emphasis on material search and process selection in relation to cost, product safety, function, human factors, form, finishes and joining methods.

Prerequisite: Graduate standing
Typically offered in Fall only

ID 521 Graduate ID Studio I (6 credit hours)
Track III MID introduction to the theories, methods, and language of industrial design; elementary problems in form and function; and transitional implications of hand-crafted and mass-produced objects, in various materials and media. This course is open to Track III MID graduate students. This course is a prerequisite for ID 522 Graduate Studio II.

Corequisite: ID 531 and ID 541
Typically offered in Fall only

ID 522 Graduate ID Studio II (6 credit hours)
Track III MID continued introduction to the fundamentals of product development and design with emphasis on analytical and intuitive approaches to problem solving, technical skills, manufacturing, and structural considerations in design of simple products/systems. This course is open to Track III Master of Industrial Design graduate students.

Prerequisite: ID 521; Corequisite: ID 532 and ID 542
Typically offered in Spring only

ID 531 Product Visualization I (3 credit hours)
Track III MID introduction to the ideation process of conceiving, developing and recording ideas two-dimensionally. This course is open to Track III Master of Industrial Design graduate students. This course is a prerequisite for ID532 Product Visualization II.

Typically offered in Fall only

ID 532 Product Visualization II (3 credit hours)
This is an advanced course which expands the ideation process of conceiving, developing and recording ideas two-dimensionally, placing greater emphasis on the creative development and recording of the design process. This course is open to Track III Master of Industrial Design graduate students. Successful completion of ID 531 Product Visualization I is a prerequisite for this course.

P: ID 531
Typically offered in Spring only

ID 541 Product Digital Techniques I (3 credit hours)
Track III MID introduction to the computer as a design tool for generating and manipulation of two-dimensional raster and vector imagery; techniques in two-dimensional concept rendering; 2D applications for design and production of presentation documentation; and an introduction to basic 3D digital techniques. This course is open to Track III Master of Industrial Design graduate students and is a prerequisite for ID 542 Product Digital Techniques II.

Typically offered in Fall only

ID 542 Product Digital Techniques II (3 credit hours)
Methods and techniques for developing 3D digital models and presentations that are compelling, unique, and relevant in the creative process of Industrial Design. Students begin to strategically integrate 3D digital technology as part of the larger curriculum relative to studios and support classes and are encouraged to look beyond current conventions to find new means of creating digital artifacts. This course is open to Track III Master of Industrial Design graduate students.

P: ID 541
Typically offered in Spring only

ID 552 Human Factors in Design (3 credit hours)
This course is an introduction to the spectrum of human physical and cognitive capabilities as they relate to user interaction with designed products and environments. Emphasis is placed on designers making conscious design decisions regarding useful, usable, and desirable product, systems, and service attributes.

P: Graduate Standing
Typically offered in Spring only

ID 581 Industrial Design Project Preparation (3 credit hours)
A seminar course designed to assist students in preparing groundwork for the final project to be conducted in design studio.

Prerequisite: Graduate standing
Typically offered in Fall only

ID 582 Special Topics In Industrial Design (1-6 credit hours)
F,S. Topics of current interest to program/option offered by faculty in the School. Subjects offered under this number normally used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ID 588 Final Project Studio In Industrial Design (6 credit hours)
Final project for graduate students supervised by members of their graduate advisory committees.

Prerequisite: ID 581
Typically offered in Spring only

ID 630 Independent Study In Industrial Design (1-3 credit hours)
Special problems in various aspects of industrial design developed under the direction of faculty member on a tutorial basis. Students should complete Graduate Independent Study Proposal form prior to registration.

Prerequisite: Graduate Standing or Permission of the Instructor
Typically offered in Fall, Spring, and Summer

ID 676 Special Project (1-3 credit hours)
Seminars on subjects of current interest in industrial design which are presented by persons not part of regular faculty.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ID 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

ID 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

ID 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

ID 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

Integrated Manufacturing Systems (IMS)

IMS 675 Manufacturing Systems Engineering Project (1-6 credit hours)
Individual or team project work in integrated manufacturing systems engineering resulting in an engineering report. Required of all degree candidates in IMSE master's program. Forms the basis for IMSE student's final oral examination.

Prerequisite: Graduate standing in IMSE
Typically offered in Fall, Spring, and Summer

IMS 680 Master's Directed Study (1-3 credit hours)
Independent study providing opportunity for individual students to explore topics of special interest under direction of a member of faculty.

Prerequisite: Graduate standing in IMSE
Typically offered in Fall, Spring, and Summer

IMS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

IMS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

IMS 696 Summer Project Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to project research.

Typically offered in Summer only

Interdisciplinary Perspectives (IPGE)

IPGE 295 Interdisciplinary Perspectives Special Topics (2-3 credit hours)
Special Topics course offered on a trial basis for the General Education Interdisciplinary perspectives category. Offered for a letter grade.

GEP Interdisciplinary Perspectives

Interdisciplinary Perspectives and Global Knowledg (IPGK)

IPGK 295 Interdisciplinary Perspectives and Global Knowledge Special Topics (2-3 credit hours)
Special topics course offering for the general education Interdisciplinary Perspectives and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Interdisciplinary Perspectives (IP) requirement.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

Interdisciplinary Perspectives and U.S. Diversity (IPUS)

IPUS 295 Interdisciplinary Perspectives and U.S. Diversity Special Topics (2-3 credit hours)
Special topics course offering for the general education Interdisciplinary Perspectives and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Interdisciplinary Perspectives (IP) requirement.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

Interdisciplinary Studies (IDS)

IDS 201 Environmental Ethics (3 credit hours)
Interdisciplinary consideration of ways in which field of study coupled with personal/cultural values contribute towards either solving or compounding environmental problems; provides framework for process of making ethical decisions.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

IDS 203/NR 203/PRT 203 Humans and the Environment (3 credit hours)
Solutions-focused examination of the varied, complex, and evolving frameworks used to make sense of how individuals & societies connect with the biophysical environment. Emphasis on current issues and relevance of interdisciplinary training to careers including environmental planning and policy, sustainable tourism, parks and recreation management, conservation, environmental education, and climate resilience. Topics include: population dynamics, public land and common resources, renewable natural resources, pollution, water resources, energy and non-renewable resources.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

IDS 210 Introduction to American Studies (3 credit hours)
Introduction to the interdisciplinary study of American culture through exploration of questions asked and methods used in the field of American Studies. Will incorporate historical, literary, anthropological, and cultural studies approaches and methods for studying culture through texts, objects, and people. Topics to be considered include literary and popular texts, music, clothing, and historical and contemporary American experiences and cultures. Includes one field trip for which students will need to provide their own transportation.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Spring only

IDS 211 Eating through American History (3 credit hours)
Examination of cultural and scientific forces that have shaped our relationship with food. Science and politics of dietary recommendations. Influence, over time, of economic, social and political conditions on food preparation, preference and nutritional knowledge. Role of religion, family, tradition and personal experience in shaping eating attitudes and behaviors. Roles played only by women in American food culture.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

IDS 220 The Science and Art of Happiness (3 credit hours)
Interdisciplinary inquiry into the nature of happiness; why it matters, how to promote it, and what harms it. The relevance of the body-mind connection for one's happiness. Current scientific insights into happiness from physiology, neuroscience, and psychology, as well as their connections to Aristotelian ethics and to the concept of suffering in Buddhism. Experiential component of the course consisting of scientifically supported techniques for daily practice for deepening the understanding of course materials and discussions.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Summer only

IDS 295 Special Topics in Interdisciplinary Studies (1-12 credit hours)
Detailed investigation of an interdisciplinary topic. Topic and mode of study to be determined by faculty member and/or teach team.

Typically offered in Fall, Spring, and Summer

IDS 310 Animals in the Global Community (3 credit hours)
A lecture/seminar exploring the interdisciplinary field of Human Animal Studies in a global context, examining cultural, economic, ethical, ecological, geographical, political, and psychological aspects of human/nonhuman interactions using readings, films, and guest lectures. E.g. what are global ecological/political ramifications of treating cattle as sacred versus breeding them for beef? Why are there more tigers in captivity than in the wild? What are our ethical obligations to the Great Apes? Concepts such as place and placelessness, boundaries, animals as refugees, and interspecies justice will be explored. Course includes team work, and a research project focusing on personal area of interest. Junior Standing or higher.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall only

IDS 490 Interdisciplinary Methods and Issues (3 credit hours)
Capstone seminar for students in the IDS self-design major. Intensive study of student's area of concentration, leading to a major research paper.

Prerequisite: Interdisciplinary Studies Self-Design Majors, Senior standing
Typically offered in Spring only

IDS 495 Special Topics in Interdisciplinary Studies (1-12 credit hours)
Examination of selected topics of an interdisciplinary nature.

Typically offered in Fall and Spring

IDS 496 Topics in Film and Interdisciplinary Studies (3 credit hours)
Detailed examination of film within interdisciplinary contexts. Specific topics will vary from semester to semester.

IDS 498 Independent Study in Interdisciplinary Studies (1-12 credit hours)
Independent investigation and discussion of a selected topic of an interdisciplinary nature. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

International Studies (IS)

IS 200 Introduction to International Studies (3 credit hours)
Introductory analysis of the diverse processes of globalization, and an interdisciplinary survey of the social, political, economic, and cultural patterns reflected in the interrelations between various regions of the world. Emphasis on the historical and cultural contexts of debates in current global issues. A foundation course for students preparing an International Studies major or minor.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

IS 250 Globalizing North Carolina (3 credit hours)
Examines from an anthropological and historic perspective the impact of transnational and global forces on specific communities in North Carolina post World War II. Emphasis placed on studying the consequences of urban growth and economic shifts away from the agricultural and manufacturing industries and toward financial services, scientific and technological research, and the knowledge-based industries. Consequences include increased infrastructural demands, environmental issues, increased income and educational inequalities, food production, socio-cultural clashes, and migration and immigration concerns. Course requires students to visit 1 to 2 museums outside of class times.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

IS 301 International Cultural Competency before Study Abroad (1 credit hours)
Study abroad experiences are often instrumental moments in a student's personal and intellectual development, when someone may "connect the dots" between local and global issues for the first time in ways that are intimately unique to their own experience. This course provides students with a chance to meaningfully develop their international cultural competency before they embark on a study abroad experience.

Typically offered in Spring only

IS 393 Theories of Globalization (3 credit hours)
This course offers an in-depth and interdisciplinary examination of various aspects of globalization including economics, human dimensions of environmental change, culture, ethics and power. The course aims to build student understanding of the relationship between theory and application in the field of international studies. This course is designed for international studies minors, as well as majors who are expected to bridge between introductory materials and capstone coursework.
Restriction: Minimum of 45 credit hours complete; IS majors and minors only

Prerequisite: IS 200
Typically offered in Fall and Spring

IS 395 Special Topics in International Studies (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

IS 471/ANT 571/ANT 471 Understanding Latino Migration (3 credit hours)
This collaborative, hands-on class examines what ultimately drives migration and how families, communities, and policy-makers respond to migration in ways that can keep the process going. Focusing on emigration from Mexico, Guatemala, Honduras, and El Salvador, the course reviews the historical foundation for today's migration with attention to migration to North Carolina.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Summer only

IS 491 Senior Seminar in International Studies (3 credit hours)
An intensive study of selected international issues, global dimensions and implications, leading to a major research paper.

Prerequisite: IS 393
Typically offered in Fall and Spring

IS 495 Advanced Special Topics in International Studies (3 credit hours)
Detailed investigation of an advanced topic in International Studies. Topic and mode of study to be determined by faculty member.

Typically offered in Fall, Spring, and Summer

IS 498 Independent Study in International Studies (1-6 credit hours)
Independent Study of a topic in International Studies. Mode of study determined by a faculty member and student(s). Independent Study courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" to be completed by the student(s) and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

International Studies (MIS)

MIS 598 Special Topics in International Studies (1-6 credit hours)
In-depth investigation of a contemporary topic in the field of international studies in a class context. Topic and mode of instruction to be determined by faculty member. May be taken for up to six hours of credit.

Prerequisite: Advanced Undergraduate standing, PBS status, or Graduate standing
Typically offered in Fall, Spring, and Summer

MIS 601 Colloquium in International Studies (3 credit hours)
Selected topics in international studies required for writing and oral presentation of MIS capstone paper.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

MIS 630 Independent Study (1-3 credit hours)
Investigation of topics of particular interest to advanced students under faculty direction on a tutorial basis. Credits and content vary with student/faculty discretion and needs.

Restricted: MIS Students Only
Typically offered in Fall, Spring, and Summer

MIS 651 Internship in International Studies (1-6 credit hours)
Exposure of student to value systems and technological environment of cultures other than his/her own through a supervised work experience. Application of technological knowledge to development problems. Required technical paper summarizing and analyzing this experience.

Prerequisite: MIS standing
Typically offered in Fall, Spring, and Summer

MIS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

MIS 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

MIS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

Landscape Architecture (LAR)

LAR 200 Landscape Architecture Introductory Studio (6 credit hours)
Small scale landscape architectural design. Site observation exercises and visits, physical design projects, reading and discussion. Basic skills in landscape architecture, discerning the environmental issues in design, understanding design process, drawing and verbally communicating issues, and idea conceptualization and realization.

Prerequisite: Design Majors and D 104
Typically offered in Fall only

LAR 210 Digital Drawing for Landscape Architecture (3 credit hours)
Digital modeling and computer aided design in landscape architecture. Integration of digital data in visualization of past, existing and future designs.

Prerequisite: LAR Majors
Typically offered in Fall only

LAR 211 Digital Design Media for Landscape Architecture (3 credit hours)
Principles and practices related to the use of digital applications in landscape architectural design. Includes two-dimensional raster imaging, vector graphics, photo simulation, and three-dimensional modeling.

Prerequisite: LAR Majors
Typically offered in Spring only

LAR 221 Introduction to Environment and Behavior for Designers (3 credit hours)
Integration of behavioral and environmental systems related to design. Exploration of humane, ecologically sound design alternatives.

GEP Humanities
Typically offered in Summer only

LAR 222 Perception and Behavior for Designers (3 credit hours)
Perceptual systems, linkages among them, and linkages between them and language and culture as these affect the design process.

Typically offered in Spring only

LAR 292 Special Topics in Landscape Architecture (1-3 credit hours)
Topics of current interest in Landscape Architecture. Normally used to develop new courses.

Typically offered in Fall, Spring, and Summer

LAR 400 Landscape Architecture Studio (6 credit hours)
Projects cover small scale design, urban landscapes, community design, and environmental management. Design process stressed, including attention to project organization, design synthesis and realization.

Prerequisite: D 105, LAR 200; or Departmental Head Approval
Typically offered in Spring only

LAR 430 Site Planning (3 credit hours)
Technical operations and environmental landscape controls for site development. Site analysis, grading and drainage, earthwork, horizontal and vertical control for road alignment. Graphic exercises.

Prerequisite: LAR 400 or LAR 501
Typically offered in Spring only

LAR 444 History of Landscape Architecture (3 credit hours)
The history of designed landscapes. Environmental, social and cultural factors which influence human made landscapes presented with history and art of landscape architecture.

GEP Visual and Performing Arts
Typically offered in Fall only

LAR 445 Sustainable Design and Development (3 credit hours)
This online, asynchronous course focuses on the global, regional and local environmental and social impacts of development. We explore sustainable design and development strategies and examine exemplary case studies in the following areas: climate change; ecosystems; water systems; food systems; material, resource and waste systems; building and energy systems; and cities and communities. Select UN Sustainable Development Goals provide a framework for this course and allow us to examine issues of equity as they relate to these goals.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

LAR 457 Landscape Construction Materials, Methods and Documentation (3 credit hours)
Materials, standards, and construction methods used to implement landscape architectural designs. Development of construction documents.

Prerequisite: LAR 400 or LAR 502
Typically offered in Summer only

LAR 465 Landscape Architecture International Studio (6 credit hours)
Define landscape architectural problems and develop design solutions in an international setting. Exercises and projects related to design, culture and the physical environment of the host country. Focus on landscape architecture, gardens and urbanism studied through sketching and documentation, discussion, site investigation, historical context, current design examples and design applications.

Prerequisite: Junior Standing in the College of Design and Approval of the International Study Abroad Office.
Typically offered in Spring only

LAR 492 Special Topics in Landscape Architecture (1-3 credit hours)
Topics of current interest in Landscape Architecture. Normally used to develop new courses.

Typically offered in Fall, Spring, and Summer

LAR 495 Independent Study in Landscape Architecture (1-3 credit hours)
Individual projects in landscape architecture developed under the direction of a faculty member on a tutorial basis. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in Landscape Architecture 3.0 GPA or better
Typically offered in Summer only

LAR 500 Landscape Design Studio (6 credit hours)
Application of information and skills developed in course work to environmental design problems. Process of site selection, activity programming, site planning and program evaluation followed employing creation of interactive communication systems between designer, clients and users. Goals include design of satisfying new landscapes as well as conservation and design strategies for existing culturally important landscapes and townscapes.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

LAR 501 Landscape Architecture Introduction Design Studio (6 credit hours)
Introduction to landscape architectural design thinking processes and applications that include: site analysis, post occupancy user studies, programming, site planning, graphic representation (drawing, model making, digital graphics), verbal communication, and criticism and reflection.

Typically offered in Fall only

LAR 502 Site Design and Environmental Planning Studio (6 credit hours)
Strategies, principles, and methods for designing and evaluating resilient ways and means to fit an intensive development program(s) on environmentally challenging, regionally specific sites. This design studio is integrally linked with courses LAR 527- Landform, Grading and Environmental Site Systems and LAR 520- Environment and Culture.

Prerequisite: LAR 501
Typically offered in Spring only

LAR 503 Landscape Architecture Design Development & Construction Documentation Studio (6 credit hours)
Site planning design refinement from conceptual schematic design through to the preparation of technical landscape architectural construction plans and details.

Prerequisite: LAR 501 and LAR 502 or permission of Department Head of DGP.
Typically offered in Fall only

LAR 504 Landscape Architecture International Design Studio (6 credit hours)
Application of design thinking processes in landscape architectural design situations resident within a host international urban venue. This is a studio course for Landscape Architecture students studying abroad.

Prerequisite: LAR 501 and LAR 502 and LAR 503 or department head or DGP consent.
Typically offered in Fall only

LAR 505 Landscape Architecture Final Project Studio (6 credit hours)
Individual semester long projects demonstrating capabilities in a full range of design and production skills.

Typically offered in Fall and Spring

LAR 506 Landscape Architecture Design + Build Studio (6 credit hours)
Design and construction implementation of sustainable construction practices for a low impact landscape system installation that responds to degraded environmental conditions.

Prerequisite: LAR 501 and LAR 502 and LAR 503 or department head or DGP consent.
Typically offered in Spring only

LAR 507 Advanced Topics Studio in Landscape Architecture and Environmental Planning (6 credit hours)
Advanced engagement, emphasizing research, development and application of experimental and best practices, on current and emerging landscape architectural and environmental planning topics of increased complexity. Advanced Topics Studios in LA and Env Plng integrate, apply, and reinforce materials including history and theory, site works, modeling and representation, research methods, environmental analysis, and professional practice delivered in LAR subject area courses.

Prerequisite: LAR 502 or department head or DGP consent.
Typically offered in Fall and Spring

LAR 508 Landscape Architecture Design Research Project (6 credit hours)
Independent research in a specific area of landscape architectural design with the requirement that the research be integrated and applied within a landscape architectural design context; provides opportunities for a student or team of students (up to 4 people) to engage in independent inquiry leading to the completion of a definitive scholarly, research-oriented landscape architectural design project. Requires consent of department head or DGP.

Prerequisite: LAR 507 and LAR 541 and LAR 697 or department head consent.
Typically offered in Fall, Spring, and Summer

LAR 509 Landscape Architecture Design Fundamentals (3 credit hours)
Introduction to the language, topics, and processes associated with landscape architectural design and the means used to envision and transform ideas into physical form in the landscape.

Typically offered in Summer only

LAR 510 Introduction to Landscape Architectural Drawing Applications (3 credit hours)
Introduction to fundamental drawing principles and methods utilized in landscape architectural design and representation applications. Topics covered include: freehand sketching, field observation diagrams and sketches, freehand and constructed perspectives, plan and section view drawings, shade and shadow, color, design process drawings, and presentation layout.

Typically offered in Summer only

LAR 513 Landscape Architecture Digital Media 1 (3 credit hours)
Introduction to the principles and practices related to the use of 2D and 3D digital media in landscape architectural design representation and communication applications.

Typically offered in Summer only

LAR 514 Landscape Architecture Digital Design Media 2 (3 credit hours)
Digital modeling and representation methods, applications and production using two and three-dimensional digital design media; this course is integrally linked with LAR 501, Landscape Architecture Introduction Design Studio.

Prerequisite: LAR 513 or instructor or department head, or DGP consent
Typically offered in Fall only

LAR 515 Advanced Landscape Architecture Digital Design Media (3 credit hours)
Advanced digital media tools and techniques to create and refine routines used in landscape architectural modeling and representation applications.

Prerequisite: LAR 513 and LAR 514 or consent of Department Head or DGP.
Typically offered in Fall only

LAR 517/GIS 517 GIS Applications in Landscape Architecture and Environmental Planning (3 credit hours)
Introduction to the methods and applications of geographic spatial modeling technology in landscape architecture and environmental planning.

Typically offered in Fall only

LAR 520 Environment and Culture (3 credit hours)
An integrative approach to human and natural systems, specifically the dynamic social and ecological forces that act upon, modify, and give meaning to landscapes.

Typically offered in Fall only

LAR 521 Values, Theory and Methods of Landscape Architecture (3 credit hours)
Radical change in profession of landscape architecture in the past decade. New and emerging roles for landscape architect include regional analysis, landscape assessment, land development, urban planning, recreation planning, etc. Development of core values and theories from which each emerged and survey of the techniques and methods of their development.

Prerequisite: Graduate standing
Typically offered in Fall only

LAR 523 Landscape Architecture Plant Identification (2 credit hours)
Introduction to the vocabulary and methods necessary to identify ornamental and native plants in the built and natural landscape. The course is structured around the understanding of the taxonomic tools necessary to identify plants.

Typically offered in Summer only

LAR 524 Planting Design Applications in Landscape Architecture (2 credit hours)
Introduction to theories, practices, and implications associated with the diverse uses of plants in landscape architectural design applications considerate of functional, ecologic, aesthetic, economic, maintenance, health, safety, welfare, and other factors.

Prerequisite: LAR 501 and LAR 502 or permission of Department Head of DGP.
Typically offered in Summer only

LAR 525 Landscape Architecture Field Studies (3 credit hours)
On-site observation and assessment of constructed landscape architectural projects focused on historic and contemporary design practices that promote environmental health, safety, wellbeing, and beauty through industry defined practices.

Typically offered in Fall only

LAR 527 Landform, Grading, and Environmental Site Systems (3 credit hours)
Introduction to landform representation, grading, environmental site systems, and best practices required in landscape architectural site design and environmental planning applications.

Prerequisite: LAR 501 or consent of instructor or department head or DGP.
Typically offered in Spring only

LAR 528 Landscape Architecture Construction Materials and Methods (3 credit hours)
Introduction to landscape architectural construction materials, methods, documentation, and implementation practices including best professional practices, and current and emerging technologies.

Prerequisite: LAR 501 and LAR 502 and LAR 527 or permission of department head or DGP.
Typically offered in Fall only

LAR 534 Landscape Architecture Theory and Criticism (3 credit hours)
Introduction to the pervasive principles, concepts, movements, and applications influencing landscape architectural planning and design.

Prerequisite: LAR 501 and LAR 502 and LAR 520 or consent of Department Head or DGP.
Typically offered in Fall only

LAR 535 Environmental Social Equity and Design (3 credit hours)
Principles of environmental justice and social equity in the context of design and community engagement; focus on the trends affecting environmental and human health in the built environment.

Typically offered in Spring only

LAR 540 Research Methods in Landscape Architecture and Environmental Planning (3 credit hours)
An overview of the role of research in landscape architecture and environmental planning with introductions to systematic inquiry that help to understand the complex relationships between people and their environment. The course explores different tools and approaches for answering research questions and translating research findings into usable strategies and environmental design solutions.

Typically offered in Spring only

LAR 542 Human Use of the Urban Landscape (3 credit hours)
Urban environment-behavior field research methods at site planning scale (behavior and cognitive mapping, interview and survey methods, archival research), suitable for application in practice. Methods of integrating user needs into design programming using participatory approaches. Evidence-based design applied to residential neighborhood, health, education, and recreation settings. Research activities conducted in small groups. No required texts. Overnight, weekend field trip at student expense.

R: Masters students at NCSU, UNC-CH, or Duke University. Upper level undergraduate students are allowed with permission of the instructor.
Typically offered in Spring only

LAR 543 Landscape Performance and Metrics (3 credit hours)
Concepts, tools and methods, and research to measure and integrate considerations of landscape performance including environmental, economic/life cycle, management, social, and aesthetic factors in landscape architectural applications.

Typically offered in Spring only

LAR 544 Contemporary Issues in Landscape Preservation (3 credit hours)
An examination of how local governments organize themselves to deal with the conservation and protection of areas of acknowledged cultural value or scenic/aesthetic character as well as the respective roles of federal, state, and local governments in these efforts. Particular attention will be given to understanding the recent past in preservation efforts.

Typically offered in Fall only

LAR 545 City Planning and Design - Building Great Communities (3 credit hours)
This course explores the history and heritage of city planning and design in an ever-urbanizing world, the legal underpinning and practice of the tools of planning in the US - comprehensive planning, zoning, infrastructure planning and design guidelines, environmental and social challenges for an urban planet, and the procurement of planning and design services, both from the perspective of the hiring entity as well as from that of the consultant.

Typically offered in Spring only

LAR 546 The Landscape Imperative (3 credit hours)
Exposure to the complex interrelationships of demographics, resource stewardship and land development in terms of the issues, questions, challenges and opportunities for landscape architects and urban designers.

Typically offered in Spring only

LAR 547 Greenway Planning and Design (3 credit hours)
Exposure to complex interrelationships in the planning, design, development and operations of greenway corridors and systems, including natural systems evaluation, community planning, public engagement, preparation of construction documents, construction administration, business practices, regulatory issues, legal framework, programming and funding.

Typically offered in Fall only

LAR 550 Landscape Architecture Professional Practice (3 credit hours)
Exposure to the range of practice opportunities in landscape architecture with an overview of career opportunities in the public (Federal, State, and Local) and private sectors as well as in non-traditional and emerging roles.

Typically offered in Spring only

LAR 552 Survey of Natural Hazards and Disasters (3 credit hours)
This survey course provides a graduate level introduction to the broad fields of study associated with natural hazards and disasters. Emphasis is placed on gaining an understanding of the defining characteristics of natural hazards and how their effects on human settlements can lead to a series of issues that help us understand what defines a disaster. This course introduces students to a range of topics including meteorology, geology, hydrology, engineering and building performance, policy making, planning, and sociology, among other disciplines. The course is framed using concepts of sustainable development and disaster resilience, including those pre- and post-disaster conditions and actions that enhance or hinder these aims. Emphasis is placed on the use of case studies of past disasters to help students understand the physical characteristics of natural hazards and how individual, community, state, regional, national and international actions led to the event becoming a disaster.

Typically offered in Fall only

LAR 554 Disaster Resilient Policy, Engineering and Design (3 credit hours)
This course addresses the interdisciplinary (policy, engineering and design) study and practice of disaster resilience. Emphasis is placed on the critical review of existing policies, programs and approaches taken that have led to increased levels of exposure to natural hazards, growing levels of social vulnerability and exponentially rising disaster losses. In an era of climate change, these issues are explored relative to the need to enhance adaptive capacity through sound policy, engineering and design. Class lectures, readings and student/faculty discussions help to advance each student's knowledge of the subject matter and provide relevant background information to inform interdisciplinary class projects.

No prerequisites for graduate students. Undergraduate students may petition to take this graduate course. Preference given to graduate students pursuing the proposed graduate certificate titled Disaster Resilient Policy, Engineering and Design
Typically offered in Spring only

LAR 565 International Landscape Architecture Design Studio (6 credit hours)
Landscape architectural problems and design solution in international setting. Exercises and projects related to design, culture and physical environment of host country. Focus on landscape architecture, gardens and urbanism through sketching and documentation, discussion, site investigation, historical context, current design examples and design applications.

Prerequisite: Graduate standing the College of Design and approval of the International Study Abroad Office
Typically offered in Fall only

LAR 582 Special Topics In Landscape Architecture (1-6 credit hours)
Topics of current interest to programs in School of Design offered by faculty in the School. Subjects offered under this number are normally used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

LAR 607 Natural Hazards, Disasters and Climate Change Adaptation Lecture Series (1 credit hours)
Invited practitioners and scholars will discuss a range of contemporary topics (bi-weekly) tied to natural hazards, disasters and climate change adaptation, including research findings, experience in practice, and the translation of knowledge to action. Speakers are drawn from federal, state, and local jurisdictions; scholars from pertinent fields of study, including physical and social scientists; private sector representatives, including corporations, insurance officials, developers, and consultants; members of the media; politicians; environmental and social justice advocates; community leaders; members of various professional associations; and others as identified. Emphasis will be placed on the role of design, broadly defined, to enhance resilience to slow- and rapid onset natural hazards and disasters, including those caused or exacerbated by a changing climate. Preference will be given for students pursuing the graduate certificate Disaster Resilient Policy, Engineering and Design once approved. Undergraduates may petition to take course.

P: Graduate Standing
Typically offered in Spring only

LAR 630 Independent Study (1-3 credit hours)
Special problems in various aspects of design developed under direction of a faculty member on a tutorial basis.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

LAR 650 Internship in Landscape Architecture (3 credit hours)
Supervised field experience in a professional landscape architecture office, related design office, or governmental agency.

Prerequisite: LAR 501 and LAR 502 and LAR 503 or department head or DGP consent.
Typically offered in Fall, Spring, and Summer

LAR 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

LAR 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall and Spring

LAR 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall and Spring

LAR 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

LAR 696 Summer Thesis Res (1 credit hours)

LAR 697 Design Research Project Independent Study (3 credit hours)
Advanced Independent study under taken by 1-4 students leading to the preparation of the Project Proposal, as a prerequisite for undertaking LAR 508-Design Research Project. (Permission to proceed with LAR 697 requires approval by department head or DGP and faculty mentor.)

Prerequisite: LAR 540 or approval from Department Head or DGP.
Typically offered in Fall, Spring, and Summer

LAR 896 Summer Dissert Res (1 credit hours)

Leadership in the Public Sector (LPS)

LPS 200 Introduction to Public Leadership (3 credit hours)
This introductory course is designed for students who are interested in exploring public sector leadership. Students will be introduced to fundamental concepts and assumptions of leadership, will evaluate methods for conducting adequate academic research on leadership, and will assess skills and approaches for good public and non-profit sector leadership, with a focus on leadership self-assessment.

Typically offered in Fall, Spring, and Summer

LPS 201 The Humanitarian Response to Conflict (3 credit hours)
LPS 201 offers up an introduction to the ideals and paradoxes of humanitarian intervention, with a special emphasis on military responses to humanitarian crises. This course explores the history, animating ideals and contemporary paradoxes of humanitarian action and related military interventions. Throughout history and ever increasingly in the present, there is an intersection between military and humanitarian operations in conflict zones.

Typically offered in Fall, Spring, and Summer

LPS 202 Essentials of Fundraising for Leaders in Public and Non-Profit Institutions (3 credit hours)
The course covers the basics of fundraising for public and non-profit agencies which include the agencies history, board development, event planning, and the motivation of the giver. In addition, the students will learn the elements of grant proposals related to public sector agencies. The work will include case studies, weekly lectures, discussion assignments, final exam and a special event planning proposal.

Typically offered in Fall only

LPS 205 International Leadership in Global Politics (3 credit hours)
Perspectives on leadership dilemmas and strategies in a globalized, knowledge-based, network-dependent environment. Challenges of state and nation-building abroad. Trans-border policy concerns for the national, state, and local governments. Applications of soft power and public diplomacy. International interactions of non-profit and non-governmental organizations. International aspects of informal and grass roots activism.

Typically offered in Fall only

LPS 210 LPS Career Development (1 credit hours)
This course is designed for senior status LPS students who are considering a career change and are interested in exploring job opportunities related to the public sector field. Students will learn about their personal strengths, values, skills, and understand how these self-assessments will affect their career choices. Explorations of these areas include specific emphasis on developing and refining interviewing skills, professional and personal networks, and job application and selection.

Restriction: LPS Senior Status Only
Typically offered in Spring only

LPS 302 Diversity and Leadership in the Public Sector (3 credit hours)
This course provides students with information regarding diversity and leadership in history as well as material and activities that foster an understanding of how diversity and leadership intersect in the public sector and how diversity can improve organizational effectiveness and performance. The concept of cultural competency is defined and evaluated as an important component of effective public sector leadership. Students will learn what it means to be a more culturally competent leader.

GEP U.S. Diversity
Typically offered in Fall and Spring

LPS 304 Grant Writing (3 credit hours)
The focus of this course is on obtaining grant funding for nonprofit and government organizations. This course covers the skills and strategies essential to the grants development process including basic strategies for researching funding sources and developing successful grant proposals.

Typically offered in Spring only

LPS 308 Terrorism, Political Violence and the Public Response (3 credit hours)
In this course, students will examine the phenomena of political conflict and terrorism in the modern world. We will examine these questions through a mix of theoretical readings and in-depth case studies of sectarian violence, terrorism, state failure and collapse, riots, and racial tensions commonly considered political conflict and terrorism. Students will learn the basic details of political violence and terrorism and understand the implications of these acts for those living in the region and the rest of the world. We will examine a range of armed violence globally and develop approaches to explain violence in different cases and context. Students will learn about the use of terror as a means of influencing public policy decisions and discuss the implications of counterterrorism policies at a societal and individual level.

Typically offered in Fall and Summer

LPS 315 Public Leadership (3 credit hours)
Nature and varieties of political leadership by elected and appointed officials in government, officials and volunteers in nonprofit organizations, and leaders of political movements and community groups. The course draws on literature in political science, self-assessment of student's leadership characteristics, and examination of outlets for political leadership activity.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

LPS 320 Research Methodology for the Public Sector (3 credit hours)
This course will teach students to investigate political and policy related questions in a systematic and scientifically rigorous fashion. Students will become familiar with the basic toolkit of social science methodology, practice basic data analysis, and develop a research project. They will acquire the skills essential for evaluating the claims of others and for advancing sound arguments of their own. This knowledge is applicable in a wide variety of organizational research, needs assessment, program and performance evaluation.

Typically offered in Fall, Spring, and Summer

LPS 398 Special Topics in Leadership in the Public Sector (3 credit hours)
For topics not part of regular course offerings, or offering of new courses on a trial basis. May be taken up to three times provided the topics are different.

Typically offered in Fall, Spring, and Summer

LPS 400 Decisive Leadership (3 credit hours)
Decisive Leadership is a challenging course that will study, practice, and apply the fundamentals of leadership, values and ethics, personal development, decision-making, influencing and motivating others and team tactics in problem solving and mission accomplishment. Military officers, especially, enrolled in the LPS program will gain immediate benefit from the leadership self-assessments and new leadership strategies.

Typically offered in Fall and Summer

LPS 425 Leadership in the Public & Nonprofit Sectors Capstone (3 credit hours)
Leadership is a critical topic in public, nonprofit, and business administration. Leadership is what we expect of U.S. presidents, association directors, and CEOs, as well as of mid-level and frontline supervisors. Clearly, leaders are awarded the accolades when the organization succeeds and given the blame for its failures. But organizations succeed not just because of the top leader's actions; a positive leadership climate that pervades the organization helps it to learn, adapt, and perform at a high level. Only LPS major students must complete LPS 200 Introduction to Public Leadership course prior to enrolling in LPS 425.

Prerequisite: LPS Majors need to have passed LPS 200
Typically offered in Spring only

LPS 490 Undergraduate Internship in Leadership in the Public Sector (1-3 credit hours)
Students can earn 1-3 credits for completing internships in the public sector or non-profit agencies. Emphasis is placed on gaining work experience needed to explore and plan careers in the public and non-profit sector. Students must prepare an internship proposal. Students must provide own transportation for internship. Intern liability insurance is required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: LPS 200
Typically offered in Fall, Spring, and Summer

Liberal Studies (MLS)

MLS 501 Seminar In Liberal Studies (3 credit hours)
Intensive study of an interdisciplinary issue or area. Seminars, varying each semester, address such topics as arts studies, history and literature, sociobiology and social sciences, world trade and world conflict, and technology and social change.

Prerequisite: Admission to M.A. in liberal studies
Typically offered in Fall, Spring, and Summer

MLS 630 Independent Study (1-3 credit hours)
Advanced independent study of an interdisciplinary topic under supervision of a faculty member.

Prerequisite: Admission to M.A. in liberal studies
Typically offered in Fall, Spring, and Summer

MLS 676 Independent Project (1-3 credit hours)
Advanced independent research on an interdisciplinary project under supervision of a faculty member.

Prerequisite: Admission to M.A. in liberal studies
Typically offered in Fall, Spring, and Summer

MLS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MLS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

Life Sciences First Year (LSC)

LSC 101 Critical and Creative Thinking in the Life Sciences (2 credit hours)
Through case studies and discussion-based classes, this course guides students through a metacognitive approach to (1) critical and creative thinking, (2) the nature and practice of science, (3) the rhetoric of science, and (4) the process of learning. This course will challenge students to apply the standards of critical and creative thinking in critiquing their own work and the work of others; guide students to an understanding and appreciation of the rhetoric of science; help students gain an understanding of fundamental principles of the nature and conduct of science within the life science disciplines; and encourage students to become active, engaged learners through an understanding of effective approaches to learning with an emphasis on the neurobiology of learning. Incoming freshmen admitted to the Life Sciences First Year Program (will open available seats to other FR in the spring semester section).

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

LSC 103 Exploring Opportunities in the Life Sciences (1 credit hours)
The overarching goal of this course is to help students create a solid foundation on which they can build to enhance their success in college and especially in their studies within the life sciences. Students will be challenged to think intentionally about how they will approach learning inside and outside the classroom and what factors might influence their college experience. Through this course, students will think about their transition from high school to college; identify campus resources and explore academic policies; research potential majors in the life sciences and potential minors; attend and reflect upon cultural and educational events across campus; and create a "plan for success" for their time at NC State. Cannot get credit for both LSC 103, and BCH 103, or MB 103, or PB 103. Restricted to incoming freshmen admitted to the Life Sciences First Year Program.

R: 11LSFY or 17LSFY
Typically offered in Fall and Spring

LSC 170 First Year Seminar in the Life Sciences (1 credit hours)
Topical problems in the life sciences. LSC 170 provides an opportunity for LSFY students to work in a small group setting with a faculty member to explore a topic within the faculty member's area of expertise. Emphasis will be placed on active, collaborative learning; effective communication skills; higher order cognitive skills; and applying the intellectual standards of critical thinking. Topics and instructors will vary from section to section and from semester to semester. Students can repeat LSC 170 once as long as the two sections are on different topics.

R: 11LSFY or 17LSFY
Typically offered in Fall and Spring

LSC 205 Class Assistant Experience (1 credit hours)
LSC 205 provides an opportunity for students to gain experience as Class Assistants within the Life Sciences First Year Program and to reflect on that experience as it relates to their own college experiences, personal growth, and professional development. Expectations, to be detailed in the LSC 205 contract, will include attendance at all LSC 205 class meetings, attendance at all class meetings of the section for which you are working as Class Assistant, and completion of written reflection assignments. Instructor consent required.

Typically offered in Fall only

LSC 295 Special Topics in Life Science (1-3 credit hours)
New courses offered on a temporary or trial basis for Life Sciences First Year students.

R: 11LSFY or 17LSFY
Typically offered in Fall, Spring, and Summer

Logic (LOG)

LOG 201 Logic (3 credit hours)
Introduction to methods of deductive inference. Concepts of inconsistency and entailment. Truth Functional Statement Logic and Quantifier and Predicate Logic. Representation of logically significant forms of statements and arguments. Construction of proofs using methods of natural deduction.

GEP Mathematical Sciences
Typically offered in Fall and Spring

LOG 335/MA 335 Symbolic Logic (3 credit hours)
Intermediate level introduction to modern symbolic logic focusing on standard first-order logic; topics include proofs, interpretations, applications and basic metalogical results.

Prerequisite: LOG 201 or MA 225 or CSC 226
GEP Mathematical Sciences
Typically offered in Fall only

LOG 430 Varieties of Logic (3 credit hours)
Study of various non-classical logics such as modal logic, many-valued logic, paraconsistent logic, second-order logic, and intuitionistic logic. Emphasizes their applications in fields such as philosophy, linguistics, mathematics, computer science, and artificial intelligence. Students cannot receive credit for both LOG 430 and LOG 530.

P: LOG 201 or LOG 335 or MA 335 or MA 225 or CSC 226
Typically offered in Spring only

LOG 435 Advanced Logic & Metamathematics (3 credit hours)
Advanced topics in logic and metamathematics: proof procedures, first-order theories, soundness and completeness theorems, recursive functions, the formalization of arithmetic, the Goedel Incompleteness Theorems. Emphasis on mathematical study of logic and mathematics. Students cannot receive credit for both LOG 435 and LOG 535

Prerequisite: LOG 335. Credit is not allowed for both LOG 435 and LOG 535.

LOG 498/LOG 598 Special Topics in Logic (1-6 credit hours)
Detailed investigation of selected topics in logic. Topics determined in consultation with head of the department. Course may be used for individualized study. Students cannot receive credit for both LOG 498 and LOG 598 unless the topic is different.

Prerequisite: One of the following: (MA/LOG 335, LOG 435, LOG 437, MA 403, MA 407, MA 408, MA 410, MA/CSC 416, MA 421, MA 425, MA 426, CSC 333, CSC 411, or CSC 417)
Typically offered in Fall and Spring

LOG 530 Varieties of Logic (3 credit hours)
Study of various non-classical logics such as modal logic, many-valued logic, paraconsistent logic, second-order logic, and intuitionistic logic. Emphasizes their applications in fields such as philosophy, linguistics, mathematics, computer science, and artificial intelligence. Students cannot receive credit for both LOG 430 and LOG 530.

Prerequisite: Graduate standing
Typically offered in Spring only

LOG 535 Advanced Logic and Metamathematics (3 credit hours)
Advanced topics in logic and metamathematics: proof procedures, first-order theories, soundness and completeness theorems, recursive functions, the formalization of arithmetic, the Goedel Incompleteness Theorems. Emphasis on mathematical study of logic and mathematics. Students cannot receive credit for both LOG 435 and LOG 535

Prerequisite: LOG 335. Credit is not allowed for both LOG 435 and LOG 535.

LOG 598/LOG 498 Special Topics in Logic (1-6 credit hours)
Detailed investigation of selected topics in logic. Topics determined in consultation with head of the department. Course may be used for individualized study. Students cannot receive credit for both LOG 498 and LOG 598 unless the topic is different.

Prerequisite: One of the following: (MA/LOG 335, LOG 435, LOG 437, MA 403, MA 407, MA 408, MA 410, MA/CSC 416, MA 421, MA 425, MA 426, CSC 333, CSC 411, or CSC 417)
Typically offered in Fall and Spring

Management Innovation Entrepreneurship (MIE)

MIE 201 Introduction to Business Processes (3 credit hours)
Cross-functional treatment of major activities of business, such as product design, distribution, production, and marketing. Description of specific tasks, via lectures and case studies, in support of major business activities. Interactions among various functional areas of business.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

MIE 295 Special Topics in MIE (1-6 credit hours)
Presentation of material at the 200-level not normally available in regular course offerings, or offering of new courses on a trial basis. Course may be taken multiple times only if topic is different.

Typically offered in Fall, Spring, and Summer

MIE 305 Legal and Regulatory Environment (3 credit hours)
Introduction to fundamental subfields, rules, and concepts of law that are regularly significant to business operations. Emphasis on the law of contracts, torts, property and intellectual property rights, business organizations, and agency. Includes principals of constitutional, administrative and criminal law in a business context, and issues of ethics, fiduciary duty, civil procedure and legal risk management generally. Credit is not allowed for both BUS 305 and MIE 305.

Typically offered in Fall, Spring, and Summer

MIE 306 Managing Ethics in Organizations (3 credit hours)
Management practices to define, communicate, and implement ethical conduct in business organizations. Normative and applied analysis of current ethical dilemmas of corporations in free markets, techniques for effective management of corporate social responsibility, and formulation and implementation of ethics management programs. College of Management majors only.

Prerequisite: MIE 201
Typically offered in Fall and Spring

MIE 310 Introduction to Entrepreneurship (3 credit hours)
Introduction to planning, formation, and management of entrepreneurial ventures. Fundamental business concepts and managerial skills applied to entrepreneurial ventures. Course projects support experiential learning of critical skills. Some individual off-campus travel is required.

Typically offered in Fall, Spring, and Summer

MIE 330 Human Resource Management (3 credit hours)
The systematic principles for managing the human resource component of organizations. Topics include: environmental influences on planning, recruitment, and selection; managing workforce diversity; developing effectiveness and enhancing productivity; compensation, benefits, and security; and strengthening employee-management relations.

Prerequisite:MIE 201, Sophomore standing
Typically offered in Fall, Spring, and Summer

MIE 335 Organizational Behavior (3 credit hours)
Survey of contemporary managerial applications for managing people in modern organizations. Topics include: motivation, group dynamics, team development, ethics, communications, organizational politics, leadership, power, organizational development, organizational design and structure. Current managerial issues include total quality management and technology management.

Prerequisite: 9 hrs. of social science or 6 hours of social science plus MIE 201
Typically offered in Spring only

MIE 410 Business Opportunity Analysis (3 credit hours)
Issues and management processes related to the identification of new business opportunities with emphasis on commercializing new technologies. Students will analyze and develop individual plans for commercialization of a new technology or other innovation. New venture formation is the primary focus, but the processes and skills students develop are relevant to new product introductions by existing firms.

Prerequisite: MIE 310
Typically offered in Fall, Spring, and Summer

MIE 411 Managing the Growth Venture (3 credit hours)
Managing a growth venture with emphasis on entrepreneurial planning in the dynamic context of rapidly growing ventures and the development of managerial skills necessary for successful leadership in high growth ventures. Fundamental concepts, issues and skills are taught through an integrated combination of readings, lectures, discussions, cases analyses, and applied project with a local venture. Students need to provide their own transportation to off-campus sites.

Prerequisite: MIE 310
Typically offered in Spring only

MIE 412 Finance and Accounting for Entrepreneurs (3 credit hours)
Financial planning for new ventures including financial reporting conventions and projection of critical financial amounts for new ventures. Introduction to fundamental accounting and finance concepts applied in the context of entrepreneurial ventures. Topics include projection of revenues, expenses, capital expenditures, cash flows, and balance sheet amounts; and the creation of pro-forma financial statements. Individual student projects integrate financial projections and pro-forma financial statements with the preparation of a complete business plan. Some individual off-campus travel is required.

Prerequisite: MIE 410
Typically offered in Fall and Spring

MIE 413 New Venture Planning (3 credit hours)
Developing the business plan for a new venture and the entrepreneurial process of executing the first phases of new venture creation. Topics include idea conception, entrepreneurship, business planning, market research, entrepreneurial opportunitiesand strategies. Emphasis is placed on high growth business opportunities. The final deliverable is a complete business plan for a high growth venture and formal presentation of the plan to mock investors. Some individual off-campus travel is required.

Prerequisite: MIE 410
Typically offered in Fall and Spring

MIE 416 The Legal Dynamics of Entrepreneurship (3 credit hours)
Overview of important legal and regulatory issues facing entrepreneurs and start-up entities including legal structure of the organization, intellectual property protection, human resource requirements, product liability, and risk management.

Prerequisite: MIE 310
Typically offered in Spring only

MIE 418 Social Entrepreneurship Practicum (3 credit hours)
Application of entrepreneurship skills and knowledge to plan a social entrepreneurial venture envisioned by the student. This course is a capstone course for the Minor in Entrepreneurship and the Concentration in Entrepreneurship. The deliverablesinclude an evaluation of the venture and a formal presentation including a summary of work completed and the implications of the work for each student's project. Students need to provide their own transportation to off-campus sites.

Prerequisite: MIE 410
Typically offered in Fall and Spring

MIE 419 Entrepreneurship Practicum (3 credit hours)
Application of entrepreneurship skills and knowledge to plan an entrepreneurial venture envisioned by the student. This course is the capstone course for the Minor in Entrepreneurship. The final deliverable includes an evaluation of the project and a formal presentation that includes a summary of the work completed and the implications of that work each student's project. Some individual off-campus travel is required.

Prerequisite: MIE 410
Typically offered in Fall and Spring

MIE 430 Teamwork in Organizations (3 credit hours)
This course will impart cutting edge thinking on leading in team-based organizations including the organizational changes required to move to a team-based structure and the organizational factors required to create successful work teams.

Prerequisite: MIE 330
Typically offered in Fall and Spring

MIE 432 Labor and Employee Relations (3 credit hours)
Utilizing textbook, readings, lectures, and practitioner presentations, students will become familiar with Employee Relations. Concepts in maintaining positive employer-employee relationships to promote productivity, morale, motivation and engagement will be reviewed. The course will explore the history of labor unions and the regulations that impact present day domestic and international business. The course will review approaches to negotiations.

Prerequisite: MIE 330
Typically offered in Spring only

MIE 434 Compensation Systems (3 credit hours)
Compensation philosophy, strategy, and policy. Earnings, individual and group incentive plans, voluntary and mandated benefits. Legal, regulatory, economic, and strategic issues affecting compensation and benefits. Strategies for developing the structure and level of compensation to enhance organizational performance.

Prerequisite: MIE 330
Typically offered in Fall and Spring

MIE 435 Leadership and Management (3 credit hours)
Development of leadership and management skills for organizational settings. Self-awareness: interpersonal needs, attitudes toward change; cognitive styles, ethics and values; listening; communicating; interviewing; time and stress management; creativity and managing creativity. Team building and group dynamics. Leadership and followership: theory and case studies (Churchill, Antigone; Henry V; Machiavelli); the use of power and authority; women and leadership the use of language in leadership embodiment of leadership traits; effective traits and characteristics of great leaders.

Prerequisite: MIE 330
Typically offered in Spring only

MIE 436 Training and Development (3 credit hours)
Training and development functions in organizations. Needs assessment, legal issues, training program design, learning, training methods, transfer of training, effectiveness and utility of training programs, and executive development.

Prerequisite: MIE 330
Typically offered in Fall and Spring

MIE 437 Human Resources Analytics (3 credit hours)
This course is an introduction to common analytical approaches used in human resource management. Various methods and analyses are helpful for HR professionals to evaluate questions and issues. Students in this course will learn statistical techniques that are often used to interpret organizational situations and information decision making. At the end of the course, students will be able to (a) develop and test research questions relevant for the organizational context; (b) critically evaluate quantitative information and illustrations you encounter; (c) communicate your understanding of statistics to others; and (d) perform common statistical analysis in Microsoft Excel, SAS, and/or R.

Prerequisite: MIE 330
Typically offered in Fall and Spring

MIE 438 Staffing (3 credit hours)
Staffing of contemporary organizations including strategic and environmental influences on: HR planning, job analysis, measurement, recruitment, assessment and selection, decision making, employment, and termination. Considerable emphasis on employment and labor recruitment, assessment and selection, decision making, employment, and termination. Considerable emphasis on employment and labor legislation.

Prerequisite: MIE 330
Typically offered in Fall and Spring

MIE 439 Human Resources Practicum (3 credit hours)
Utilizing textbooks, readings, lectures, and practitioner presentations, and an extended study of an organization's Human Resources practice and identified problem area, students will gain practical experience with diagnosing needs and then planning and recommending interventions to address identified needs. Experience with identifying needs will occur through needs assessment interviews with company representatives and analysis and interpretation of key demographic and relevant operational and HR metric data. Student groups need to provide their own transportation to off-campus sites.

Prerequisite: MIE 330
Typically offered in Spring only

MIE 480 Business Policy and Strategy (3 credit hours)
Comprehensive analysis of administrative policy-making from the point of view of the general manager. Integration of perspectives from marketing, finance, and other functional areas of management. Use of case analyses and written reports to develop decision making skills.

Corequisites: MIE 305, MIE 330, BUS 320, BUS 340, BUS 360, BUS 370, and (BUS/ST 350 or ST 305 or ST 312 or ST 370 or ST 372), and (ENG 331 or ENG 332 or ENG 333)
Typically offered in Fall, Spring, and Summer

MIE 495 Special Topics in MIE (1-6 credit hours)
Presentation of material normally not available in regular course offerings, or offering of new courses on a trial basis.

MIE 498 Independent Study in MIE (1-6 credit hours)
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction on a tutorial basis. Credits and content determined by faculty member in consultation with Department Head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

Management (M)

M 100 Personal and Professional Identity Development (1 credit hours)
Personal and Professional Identity Development is a one-hour Poole required course which will help you learn about and develop multiple facets of your social and cultural identity, your strengths, and about how these things interrelate with leadership and career choices. By exploring the diverse components of your personal identity, you will have a better understanding of how you relate to and interact with others in a global business market. Through this course, you will learn about yourself, others and how you can use your strengths and your identity to create an action plan for future success at NC State, become engaged in your local community and engage in career path exploration.

R: Poole College of Management Students Only
GEP U.S. Diversity
Typically offered in Fall and Spring

M 120 Professional Development and Career Planning (1 credit hours)
The Professional Development Course is a one-credit hour course designed to give you the tools necessary to start your career. The course involves thoughtful self-assessment, career exploration, planning and follow-through with preliminary employment strategies. Taking advantage of the opportunities in this course will aid you in your transition from college student to intern to professional employee. The course navigates you through a more direct route to your long-term career goals by anticipating and acquiring the essential skill sets and experiences for an internship or entry-level job that will be the best starting point for your career.

R: Poole College of Management Students Only
Typically offered in Fall and Spring

M 298 Special Topics in Management (1-6 credit hours)
Presentation of material normally not available in regular course offering.

Typically offered in Fall, Spring, and Summer

M 299 Professional Internship in Management (1 credit hours)
Poole College of Management students participating in an approved internship with an organization providing no monetary compensation and where academic credit is required will have an opportunity to gain real world insight and experience into the day-to-day functions and responsibilities encountered in the professional workplace. Course may be completed only once for credit. Accounting majors completing M 299 and ACC 499 may receive a maximum of 6 credit hours for both courses. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Management Students Only
Typically offered in Fall, Spring, and Summer

M 300 Leadership and Professional Development (1 credit hours)
This course is specifically designed for new Peer Leaders and Ambassadors in the Poole College of Management. The goal of the course is to give students the necessary skills to become effective leaders and representatives both within and outside of the College. As a part of this course, students will attend Poole College of Management events/activities. Some topics we will discuss are: professional networking, communication, leadership, working in groups, and presentation skills.

Typically offered in Fall only

M 380 Doing Business Globally (3 credit hours)
International academic and cultural immersion into how business is conducted in a specific country/region abroad. Interdisciplinary exploration of political, and economic factors as they impact global business practices. Focus on key macro-environmental influences within a specific country/region as contrasted to those in the United States.

Restricted to: Study Abroad Students Only
GEP Interdisciplinary Perspectives
Typically offered in Summer only

M 399 International Business Dual Degree Student Professional Internship in Management (1-6 credit hours)
International Business Dual Degree students participating in an approved internship with an organization will have an opportunity to gain real world insight and experience into the day-to-day functions and responsibilities encountered in the professional workplace. Individualized/Independent Study and Research courses require that a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department. This course can be repeated with departmental consent and count towards a degree for students in the IBDD Program.

R: Poole College of Management major enrolled in the International Business Dual Degree Program
Typically offered in Fall, Spring, and Summer

Marine, Earth, and Atmospheric Sciences (MEA)

MEA 100 Earth System Science: Exploring the Connections (4 credit hours)
An introduction to the processes of and linkages among major components of planet Earth. Geosphere, hydrosphere, atmosphere, biosphere as dynamic and interdependent systems. Influence of human activity on earth systems. Optional weekend field trip.

Prerequisite: Competence in high school algebra and chemistry
GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 101 Geology I: Physical (3 credit hours)
Systematic consideration of processes operating on and below the earth's surface and the resulting features of landscape, earth structures, and earth materials. Occurrences and utilization of the earth's physical resources.

Corequisite: Recommended that MEA 110 be taken concurrently
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 110 Geology I Laboratory (1 credit hours)
Scientific methodology applied to the study of common rock-forming minerals, common rocks, topographic maps, geologic structures and geological maps. Field trips.

Corequisite: MEA 101 or Prerequisite: MEA 100, MEA 101, MEA 120, MEA 140 or MEA 200
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 130 Introduction to Weather and Climate (3 credit hours)
Explores the structure, physical causes, and climatology of weather systems including the jet streams, mid-latitude cyclones, hurricanes, thunderstorms, and tornadoes. Clouds and precipitation, air pollution, climate modification, optical effects (rainbows, halos) and weather instruments. Weather systems and forecasting techniques are illustrated through daily weather map discussions.

Prerequisite: For Non-Majors
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 135 Introduction to Weather and Climate Laboratory (1 credit hours)
Experiments include effects of air pressure change on temperature and density (gas law); measurement of atmospheric moisture; formation of clouds and hail; effects of variable solar heating. Graphical display and interpretation of data; weather instruments and observations; weather map analysis; forecasting principles.

Corequisite: MEA 130
GEP Natural Sciences
Typically offered in Fall and Spring

MEA 150 Environmental Issues in Water Resources (4 credit hours)
The science of current environmental concerns, particularly those related to water resources. Major topics include weather and climate, natural resource cycles, resource depletion and contamination, societal impacts. Scientific aspects of environmental issues. Required field trips.

GEP Natural Sciences
Typically offered in Fall only

MEA 200 Introduction to Oceanography (3 credit hours)
The ocean as a part of our environment including interactions between atmosphere and ocean, ocean circulation, physical and chemical properties of sea water, marine geology and marine biology.

Corequisite: Recommended that MEA 210 be taken concurrently.
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 202 Geology II: Historical (3 credit hours)
The second semester of the basic introductory sequence in geology. Utilization of the principles of geology to reconstruct and understand the earth's history. Geologic events that cause modification of the earth's crust, emphasizing North America. History of life and the environmental significance of changes in animal and plant life through geologic time.

Prerequisite: (MEA 100, MEA 101, MEA 120, MEA 140 or MEA 200)and MEA 110; Corequisite: Recommended that MEA 211 be taken concurrently
GEP Natural Sciences
Typically offered in Spring only

MEA 210 Oceanography Lab (1 credit hours)
Complements the lecture course in Oceanography. Numerous demonstrations and resource materials visualize basic oceanographic concepts such as geological processes operating in the marine realm, the chemical properties of seawater, oceanic circulation, tides and waves, as well as processes affecting the biology of the oceans.

Corequisite: MEA 200
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MEA 211 Geology II Laboratory (1 credit hours)
Reconstruction and interpretation of events in the history of the earth. Interpretation of sedimentary rocks, construction and interpretation of geological maps, identification of fossil organisms and utilization of fossils in the reconstruction of earth history.

Corequisite: MEA 202
GEP Natural Sciences
Typically offered in Spring only

MEA 215 Introduction to Atmospheric Sciences (4 credit hours)
Introduction to the Earth's atmosphere. Fundamental concepts and applications of meteorology and how they relate to daily and seasonal weather, major types of storms, and climate.

Corequisite: MA 141
Typically offered in Spring only

MEA 217 Introduction to Computing in the Geosciences (3 credit hours)
This course is for students with little or no programming experience. It provides students with programming and problem solving skills using MATLAB with emphasis on the systematic development of algorithms and programs. Topics include Boolean math, data representation and types (array, vectors, strings, structures), evaluation of expressions, program control (iteration, functions), algorithm development (pseudo code, physical problem solving, numerical algorithms), basic MATLAB graphics, and limits of computing. Problems and projects are selected from the Geosciences. Students are expected to be proficient in solving algebraic equations, solving non-calculus Physics problems, including dimensional analysis, and operating a computer.

Typically offered in Fall only

MEA 220 Marine Biology (3 credit hours)
Introduction to marine plants and animals, their adaptations to life in the sea and ecological interactions in selected marine environments (e.g. coral reefs, deep sea, salt marshes). Interactions of man with the sea: food from the seas, biology of diving. Optional trip.

Prerequisite: MEA 200 or BIO 181
GEP Natural Sciences
Typically offered in Fall only

MEA 240 The Planets of Our Solar System (3 credit hours)
This course will cover the formation mechanisms, physical properties, and processes of the vast array of bodies that compose our Solar System, and how they compare and contrast with our own world. Among the diverse range of topics we will explore are planetary formation, volcanism of Mars, the deep oceans of Jupiter's icy moons, the atmosphere of Venus, and the fate of our Sun. We will also focus on what other planetary bodies can tell us of the early and future Earth, as well as the conditions required for planetary habitability. Finally, we will consider the exciting field of exoplanet research, including the search for extraterrestrial intelligence, and discuss key milestones in the exploration of the Solar System. Delivered through lectures, in-class discussion, and associated reading, the course will be assessed through a series of quizzes, an essay, a group project, and two mid-term exams and a final exam.

GEP Natural Sciences
Typically offered in Fall only

MEA 250 Introduction to Coastal Environments (3 credit hours)
A global survey of coastal habitats, the processes that shape these dynamic environments, and the physicochemical controls that regulate their indigenous biological communities.

Prerequisite: MEA 200/210 or MEA 101/110
GEP Natural Sciences
Typically offered in Spring only

MEA 251 Introduction to Coastal Environments Laboratory (1 credit hours)
Complements the lecture course Introduction to Coastal Environments (MEA 250). Experiments involving the physical, chemical and biological processes that shape a variety of coastal environments.

Corequisite: MEA 250
Typically offered in Spring only

MEA 252 Biology of Marine Mammals (3 credit hours)
Biology of marine mammals, including cetaceans, pinnipeds, sirenians and sea otters. Topics covered include the evolution, physiology, behavior and ecology of marine mammals. We will focus on current topics in conservation and management of marine mammals. Instructor permission required.

Typically offered in Spring only

MEA 257 Visualizing Geology in 3D & 4D (1 credit hours)
MEA 257 will provide students with a strong foundation of essential spatial visualization skills needed to successfully complete courses in the geology curriculum. Students will be guided to complete activities that require them to create and interpret a variety of geological visualizations including maps, cross-sections, physical models, three-dimensional figures, and Google Earth images.

P: MEA 110 and either MEA 101 or MEA 100
Typically offered in Spring only

MEA 260 Human Dimensions of Climate Change (3 credit hours)
Climate is changing with potentially catastrophic implications for the Earth and for people. In this course we discuss how and why climate is changing and how climate change is affecting and will affect human well-being in society. We draw upon the multiple disciplinary lenses and diverse perspectives needed to evaluate, across multiple dimensions, proposed solutions to climate change and/or to assess fully the consequences of inaction.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

MEA 300 Environmental Geology (4 credit hours)
Geologic aspects of the environment. Effects of humans upon or interactions with geologic processes. Geologic considerations in land use planning, waste disposal, water resources, and natural resources. A field and lab oriented course with combined lecture/laboratory. Inquiry-based learning approach to study the basic processes of environmental geology and develop research skills. Required field trips.

Prerequisite: MEA 101 or MEA 150 or MEA 140 or SSC 200
Typically offered in Spring only

MEA 312 Atmospheric Thermodynamics (4 credit hours)
Introduction to atmospheric thermodynamics for meteorology majors. Topics include the equation of state for mixture of gases; first and second laws of thermodynamics; diabatic and adiabatic processes for dry and moist air; measurement and phase changes of water vapor. Atmospheric statics: static stability of moist air; CAPE and vertical acceleration. Focus will be on applying the rigorous framework of classical thermodynamics to derive and solve quantitatively the governing equations describing these processes.

Prerequisite: MA 141, PY 205; Corequisite: MA 241
Typically offered in Spring only

MEA 315/MA 315 Mathematics Methods in Atmospheric Sciences (4 credit hours)
For sophomore meteorology and marine science students. A complement to MA 242 designed to prepare students for quantitative atmospheric applications. Topics include an introduction to vectors and vector calculus, atmospheric waves, phase and group velocity, perturbation analysis, fourier decomposition, matrix operations, chaos and predictability. For MY, MMY, and MRM majors only.

Prerequisite: MEA 217 or MA 116 or CSC 113; Corequisite: MA 242
Typically offered in Spring only

MEA 320/ET 320 Fundamentals of Air Pollution (3 credit hours)
Students will learn fundamental concepts in air pollution and the application of those concepts for compliance with air quality regulations. Topics include air pollutants, their properties, how they are emitted, and relevant atmospheric chemistry and physics processes, National Ambient Air Quality Standards (NAAQS) and how compliance with those regulations is maintained.

Prerequisite: MA 121 or MA 131 or MA 141, CH 101/102, PY 131 or PY 201 or PY 205 or PY 211; Recommended: CH 220/222 or CH 221/222
Typically offered in Spring only

MEA 321 Fundamentals of Air Quality and Climate Change (3 credit hours)
An intermediate-level introduction, for meteorology majors, to the physical and chemical environment of the atmosphere and to climate change. Topics include the atmosphere's chemical composition; atmospheric chemical reaction processes in gas phase, liquid phase, and on particle surfaces

Prerequisite: Two semesters of chemistry (CH 101 and {CH 201, CH 220, or CH 221}), MA 141, MA 241; Corequisite: PY 205
Typically offered in Fall only

MEA 323 Geochemistry of Natural Waters (3 credit hours)
Biogeochemical processes related to water in the natural environment. Course focuses on chemical equilbria and kinetics of: precipitation and dissolution, acid-base chemistry and the carbonate system, oxidation-reduction chemistry, and organic geochemistry in lakes, rivers, estuaries, and oceans. Topics revolve around water quality and global change. Course includes in class field sampling and lab work as well as a mandatory Saturday field trip.

Restriction: MEA and ENE Majors Only. Other Majors With Permission of Instructor; Prerequisite: CH 201 or CH 203
Typically offered in Fall and Spring

MEA 350 Marine Conservation Biology (3 credit hours)
This course will focus on the field of marine conservation, including the scientific, regulatory, social and economic factors that must be considered when trying to solve complex conservation issues. Important concepts will include: (i) sampling and experimental design, (ii) modern definitions of conservation, scientific areas of expertise in conservation, (iii) priority threats to biodiversity, (iv) laws which govern conservation in the US and internationally, and (v) social and economic considerations. The class will include presentation and critical evaluation of global, regional and local case studies marine conservation actions. Optional Friday field trips. Instructor permission required.

Typically offered in Spring only

MEA 369 Life on Earth: Principles of Paleontology (3 credit hours)
This class offers an interdisciplinary introduction to the history of life on Earth and the principles of paleontology that allow for its study and application. Key topics include: fossil records and description, evolution and extinction, paleoecology and biostratigraphy, field/lab methods, and a survey of major life forms from the early Earth through the present. This course is a learning-centered program aimed at students interested in past life and using paleontology as a tool for examining the natural world. Required field trips.

P: BIO 181 or MEA 202
Typically offered in Spring only

MEA 409 Watershed Forensics (3 credit hours)
Spatial analysis of watersheds with emphasis on pollution and controversies concerning water quality and regulation issues. GIS exercises will introduce students to the latest spatial analytical techniques. Case studies and lectures will be used to examine common watershed contaminates.

Prerequisite: GIS 280
Typically offered in Fall only

MEA 410 Introduction to Mineralogy (4 credit hours)
Introduction to the basics of Mineralogy (crystallography, morphology, crystallochemistry, optics, and systematics), with an emphasis on mineral identification both at the macro (hand sample) and micro (thin section) scale. Required field trip to the North Carolina Museum of Natural Sciences. Transportation is not provided.

Prerequisite: (MEA 100, MEA 101, or MEA 200), and MEA 110 and CH 101/102
Typically offered in Fall only

MEA 411 Marine Sediment Transport (3 credit hours)
Quantitative study of sediment transport in the marine environment including an introduction to fluid mechanics and sediment transport theory. Discussion of the processes and products of sediment transport in specific marine environments from estuaries to the deep sea and interpretation of sediment transport processes from sedimentary structures. Credit not allowed for both MEA 411 and MEA 562

Prerequisite: MEA 101 or MEA 200, MA 241, PY 201 or PY 205
Typically offered in Fall only

MEA 412 Atmospheric Physics (3 credit hours)
Physical and analytical descriptions of atmospheric aerosols, clouds/fogs, and precipitation processes; size distribution and sources of atmospheric aerosols; impact of aerosols on visibility and climate; microstructure of warm and cold clouds and their interaction with solar and terrestrial radiation; collision-coalescence and ice phase mechanisms of precipitation formation; atmospheric electricity; planned and inadvertent weather modification; weather radar; atmospheric optics.

Prerequisite: MA 242, PY 205
Typically offered in Spring only

MEA 415/MEA 515 Climate Dynamics (3 credit hours)
A comprehensive look at climate integrated across terrestrial, marine, and atmospheric perspectives. Topics include an in-depth look at climate proxies, drivers of future, current and past climate change, climate monitoring approaches, and climate model projections. Students will be exposed to the quantitative aspects (chemistry, physics, theory, observations, models) scientists use to place constraints on climate conditions over broad spatial and temporal scales. MEA 415 is open to upper-level undergraduate science majors interested in learning more about Earth's climate systems and the dynamics within. MEA 515 is open to all graduate students with the expectation of an additional climate assessment course project relevant to the student's own research discipline. Students cannot receive credit for both MEA 415 and MEA 515.

Prerequisite: MA 121 or MA 131 or MA 141 and CH 101 or CH 103 and PY 201 or PY 205 or PY 211
Typically offered in Fall only

MEA 421 Atmospheric Dynamics I (3 credit hours)
Meteorological applications of fluid kinematics: divergence, vorticity, deformation, advection, mass continuity and vertical motion. Atmospheric dynamics: the equation of motion on a rotating earth; component equations in Cartesian, polar-sphericaland pressure coordinates. Scale analysis and simplifications. Cases of horizontal flow: geostrophic and gradient wind, ageostrophy and acceleration; thermal wind and vorticity.

Prerequisite: MA 242 and PY 205 and MEA 312
Typically offered in Fall only

MEA 422 Atmospheric Dynamics II (3 credit hours)
Vorticity and potential vorticity equations; dynamics of synoptic-scale motions; quasi-geostrophic theory; atmospheric waves including shallow water, internal gravity, inertia-gravity, and Rossby waves; finite difference methods; numerical weather prediction; atmospheric instabilities including static, Kelvin-Helmholtz, inertial, symmetric, barotropic, and baroclinic instabilities.

Prerequisite: MEA 421
Typically offered in Spring only

MEA 425/MEA 525 Introduction to Atmospheric Chemistry (3 credit hours)
The course covers history, regulations, sources, physics, and chemistry of major air pollutants and factors affecting their transport and fate. Emphasis is placed on atmospheric chemistry and physics underlying five major air pollutant problems including urban outdoor air pollution, indoor air pollution, acid deposition, stratospheric ozone reduction, and global climate change. Credit will not be allowed for MEA 425 and MEA 525.

Prerequisite: MA 141, CH 201, (PY 205, PY 211 or MEA 320)
Typically offered in Fall, Spring, and Summer

MEA 440 Igneous and Metamorphic Petrology (4 credit hours)
The study of rocks formed by the crystallization of magmas (igneous) and by the recrystallization of existing rocks (metamorphic), with emphasis on whole-rock and mineral compositions, classification, petrography, hand-sample and thin-section identification, and the rock origins in terms of magma genesis and emplacement and tectonics. Field trips are required.

Prerequisite: MEA 410
Typically offered in Spring only

MEA 443 Synoptic Weather Analysis and Forecasting (4 credit hours)
Analysis and forecasting of mid-latitude weather systems with emphasis on simplified models and methods. Barotropic model, Rossby waves; baroclinic structure, upper-level wave evolution, forecasting; surface cyclone evolution, Sutcliffe-Petterssen model. Numerical computation methods; numerical weather prediction and operational models, subjective and objective analysis of meteorological fields.

Prerequisite: MEA 421
Typically offered in Fall only

MEA 444 Mesoscale Analysis and Forecasting (4 credit hours)
Analysis and forecasting of mid-latitude weather systems with emphasis on mesoscale phenomena. Definition of the mesoscale, approximations to the governing equations, basic measurements and techniques; observations, basic governing dynamics, and forecasting of mesoscale phenomena, including drylines, low-level jets, conditional symmetric instability, crographically-induced circulations, thunderstorms, mesoscale convective, and severe convective weather.

Prerequisite: MEA 443
Typically offered in Spring only

MEA 449/MEA 549 Principles of Biological Oceanography (3 credit hours)
Environmental dependencies, biological productivity, and trophic relationships in plankton, nekton and benthos; Sampling methods and experimental design; Human impacts on marine systems.Credit is not allowed for both MEA 449 and MEA(ZO)549.

Typically offered in Fall only

MEA 450 Introductory Sedimentology and Stratigraphy (4 credit hours)
Properties and classification of sediments and sedimentary rocks, geologic occurrences and origin of minerals and rocks formed by physical, chemical, and biologic processes at and near the Earth's surface. Principles of the division of stratified terrains into natural units, the correlation of strata and associated data, the interpretation of depositional environments, facies, and sequences, description of burial histories, and sedimentary basin analysis. Required field trips.

Prerequisite: MEA 410
Typically offered in Spring only

MEA 451 Structural Geology (4 credit hours)
Basic principles of geometric, kinematic and dynamic analysis as applied to fractures, shear zones, folds, and fabrics of deformed rock bodies. Considers both brittle and ductile realms of the crust from microscale to regional tectonics. Required overnight field trips.

Prerequisite: MEA 410
Typically offered in Fall only

MEA 454/MEA 554 Marine Physical-Biological Interactions (3 credit hours)
Space-time relationships between physics and biology; influence of Reynolds Number on aquatic life style; aspects of physical and biological mathematical modeling; influence of biology on physical phenomena; influence of static physical/chemical properties on biology; influence of dynamic physical phenomena (turbulence, waves and advection) on biology within the water column and its boundaries. Credit is not allowed for both MEA454 and 554

Prerequisite: MEA 460 and MEA/ZO 449
Typically offered in Spring only

MEA 455 Micrometeorology (3 credit hours)
Energy budget near the earth's surface; soil temperatures and heat transfer; air temperature, humidity, and wind distribution in the planetary boundary layer; fundamentals of viscous flows and turbulence; semiempirical theories of turbulence; exchanges of momentum, heat and moisture in the atmospheric surface layer; air modification due to changes in surface properties; agricultural and forest micrometeorology.

Prerequisite: MEA 422 or MAE 308
Typically offered in Fall only

MEA 458 Introduction to Tropical Meteorology (3 credit hours)
Introduction to tropical meteorology using phenomenological examples. Thermodynamic structure of the mean tropical atmosphere, Hadley circulation, equatorial waves and the Madden Julian oscillation, El Nino-Southern oscillation, monsoons and tropical cyclones. Meteorology majors only. Meteorology majors only.

Prerequisite: MEA 422
Typically offered in Fall only

MEA 459 Field Investigation of Coastal Processes (5 credit hours)
Coastal zone processes and dynamics with emphasis on the forcing factors that regulate changing coastal landforms, the ecology and physicochemical character of coastal ocean water-masses, seabed morphologies, landscape academes, etc. Field observations and field techniques will be emphasized in tidal-freshwater coastal wetlands, estuaries, barrier island, tidal inlets, continental shelves and shelf-margin habitats. Additional fees required.

Prerequisite: MEA 250
Typically offered in Summer only

MEA 460 Principles of Physical Oceanography (3 credit hours)
Introduction to principles and practices of physical oceanography. Equation of state of seawater; energy transfer to the ocean by thermal, radiative and mechanical processes; the heat budget; oceanic density distribution; oceanic boundary conditions; conservations equation; air-sea interaction; global fluxes and general description of major ocean currents. Credit is not allowed for both MEA 460 and MEA 540

Prerequisite: MA 241 or MA 231; Corequisite: PY 203,PY 208 or PY 212.
Typically offered in Fall only

MEA 462 Observational Methods and Data Analysis in Marine Physics (3 credit hours)
Practical experience in the observational techniques used by physical oceanographers. Basic instrumentation described, emphasizing principles rather than detailed descriptions. Both direct and indirect techniques used to define the three-dimensionalcirculation of the ocean as a function of time.

Prerequisite: MEA 460
Typically offered in Spring only

MEA 463 Fluid Physics (3 credit hours)
A derivation of the basic equations governing fluid motion in a rotating coordinate system. Equations include conservation of mass or the continuity equation, momentum equations, thermodynamic energy equation and the vorticity equation. Application of equations to simplified oceanic flows which include surface gravity waves, inertial motion, geostrophic motion, Ekman dynamics and vorticity dynamics.

Prerequisite: MA 341 and PY 208
Typically offered in Fall only

MEA 464 Ocean Circulation Systems (3 credit hours)
Dynamical processes governing ocean circulation. Driving of ocean currents by the atmosphere, currents on a rotating spherical earth. Mid-ocean gyre, western boundary currents, equatorial current systems, and polar circulation. Currents in coastal regions and shallow-water processes.

Prerequisite: MEA 460
Typically offered in Spring only

MEA 465 Geologic Field Camp (4 credit hours)
Introduction to field instruments and techniques used in geological sciences. Geologic field mapping in areas ranging from undeformed sedimentary rocks to complexly deformed crystalline rocks. May include field techniques specific to engineering geology, geophysics, hydrogeology, and paleontology. Preparation of maps and reports. Four-week course taught off-campus, typically out-of-state. Additional fees required.

Prerequisite: MEA 450 and MEA 451
Typically offered in Summer only

MEA 466 Preparatory Course for Field Camp (1 credit hours)
Introduction to theory, instruments, and techniques used in MEA 465 geologic field camp. Geologic context of the area where field camp will be held. Students will supply their own graph paper for a map cross-section exercise. Credit for this course cannot be used to fulfill elective credits in any Geology curricula.

Typically offered in Spring only

MEA 467 Marine Meteorology (3 credit hours)
Basic equation and concepts. Review of ocean and atmospheric circulations. Ocean mixed layer, air-sea interaction and coastal ocean and meteorological processes, marine boundary layer and cloud processes.

Prerequisite: MA 241 and PY 205
Typically offered in Spring only

MEA 468/MEA 568 Aquatic Microbiology (3 credit hours)
Aquatic microbes are key drivers of biogeochemistry on Earth. They also influence the 'health' of valuable ecosystems, e.g. estuaries, coasts, lakes, as well as, larger organisms (e.g. shellfish, humans). In this course, multiple facets of aquatic microbiology will be covered, including (not limited to): population diversity, spatial and temporal dynamics, sampling methodologies, metabolisms, and their environmental and societal importance. A primary goal for this course is for students to be exposed to key paradigms and current challenges within the field of aquatic microbiology, but also a general perspective on how aquatic microbes thrive in nature. Although largely a classroom-based course, select class periods will be devoted to hands-on activities and/or measurements providing students with methodological experience or in-depth exposure to key topics.

Prerequisite: BIO 183
Typically offered in Fall only

MEA 469 Ecology of coastal Resources (3 credit hours)
Anthropogenic impacts on estuarine and coastal marine ecosystems. Survey of basic biological, physical, chemical and geological mechanisms underlying habitat-specific functioning, followed by discussion, in-class presentation, and critique of real and hypothetical case studies involving anthropogenic impacts.

Prerequisite: MEA 250 and MEA 220 or MEA 449
Typically offered in Spring only

MEA 470 Introduction to Geophysics (3 credit hours)
Structure of the earth, a dynamic and evolving entity, as inferred from seismology, gravity, magnetism and heat flow. Geodynamic processes responsible for continental drift; plate tectonic theory; regional geophysics of selected areas.

Prerequisite: PY 208 or 212

MEA 471 Exploration and Engineering Geophysics (3 credit hours)
Geophysical methods applied to exploring the earth's shallow sub-surface. Principles of gravity, magnetic, electrical, and seismic exploration surveys. Planning, conducting, and interpreting geophysical surveys.

Prerequisite: PY 208 or PY 211

MEA 473/MEA 573 Principles of Chemical Oceanography (3 credit hours)
Chemical processes controlling the composition of oceans, including discussions of chemical equilibria, biological cycling of nutrients and use of chemical tracers in marine environment; consideration of origin and chemical history of oceans. Creditis not allowed for both MEA 473 and MEA 573

Prerequisite: CH 201 or CH 203
Typically offered in Fall only

MEA 476 Worldwide River and Delta Systems: Their Evolution and Human Impacts (3 credit hours)
Survey of major world rivers and deltas, such as the Amazon, Mississippi, Yello, Yangtze, Mekong, Ganges-Brahmaputra, Indus, Nile, etc. Descriptions of their initiation, development, and evolution processes. Definitions of the impacts caused by climate changes and human activities. Examination of the river-ocean interactions and sedimentary and geochemical processes in terms of sea-level change, monsoon, and sediment dispersal and deposition.

Prerequisite:Senior undergraduate or Graduate standing
Typically offered in Fall only

MEA 479/CE 479 Air Quality (3 credit hours)
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain: problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579.

CE 282 and CE 373; or CHE 311(CHE Majors); or MEA 421 (MEA Majors); Corequisite: ST 370; or ST 380 (MEA Majors)
Typically offered in Spring only

MEA 481 Geomorphology: Earth's Dynamic Surface (3 credit hours)
Landforms and the processes responsible for their origin. Emphasis on the geologic principles involved in interpreting the origin and evolution of various landforms, and discussion of North American geomorphic process.

Prerequisite: (MEA 100 or MEA 101 or MEA 200) and MEA 110
Typically offered in Spring only

MEA 485 Introduction to Hydrogeology (3 credit hours)
Basic science of groundwater flow in geological media. Saturated and unsaturated flow, Darcy's equation, heterogeneity and anisotrophy, flownets, storage properties of geological materials, effective stress, equations for steady and unsteady flow, recharge, groundwater exchange with surface water, groundwater flow to pumping wells, estimation of hydraulic properties of aquifers, contaminant plumes and chemical transport in groundwater.

Prerequisite: (MEA 101 or MEA 202), (MA 131 or MA 141), (CH 201 or CH 203), and (PY 201, PY 205, or PY 211)
Typically offered in Fall only

MEA 488 Meteorology for Media (3 credit hours)
Communication of weather and climate information with the public, including examination of communication theory, public communication of science, and geoscience communication research. Production techniques for television and digital graphics, presentation to camera, and audio recordings.

Prerequisite: One of the following ENG 331, ENG 332, ENG 333, or COM 110
Typically offered in Fall only

MEA 493 Special Topics in MEAS (1-6 credit hours)
Directed individual study or experimental course offering.

Typically offered in Fall, Spring, and Summer

MEA 495 Junior Seminar in the Marine, Earth, and Atmospheric Sciences (1 credit hours)
Emphasis on student professional development. Discussions of professional opportunities, resources, and ethics. Professionals from the public and private sectors introduce students to career options in marine, earth and atmospheric sciences. Strategies for finding jobs and graduate programs. Students reflect on future career goals and plans. For MEAS majors only.

R: MEAS Majors Only
Typically offered in Spring only

MEA 498 Internship in MEAS (1-6 credit hours)
Awards academic credit for learning that occurs during internships. Requires daily journal and written summary report. Successful completion of the course based on review of summary report by an MEAS faculty, who shall be identified by the studentprior to the internship. Transportation expenses may be incurred. MEAS majors only. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

MEA 507 Discipline-based Education Research in the Geosciences (3 credit hours)
This course will prepare students to explain the conditions necessary for learning to occur in college geoscience classes; plan lessons that address geoscience literacy standards and incorporate activities that feature multiple levels of Bloom's taxonomy; describe how they would determine if student work meets defined learning goals; create effective geoscience learning environments for lecture and lab settings; analyze the teaching of others using validated instruments; and design a geoscience teaching and learning research project.

Typically offered in Spring only

MEA 510 Air Pollution Meteorology (3 credit hours)
Wind structure in atmospheric surface layer and planetary boundary layer; temperature structure and stability; mixed layer and inversions; turbulence intensity and scale; meteorological factors affecting dispersion of pollutants; diffusion theories and models; diffusion and transport experiments; plume rise, fumigation and trapping; removal processes; effects of buildings and hills; effects of local winds.

Prerequisite: MAE 308 or MEA 455 or MEA 700
Typically offered in Spring only

MEA 511 Introduction to Meteorological Remote Sensing (3 credit hours)
Meteorological remote sensing data sets used in operational forecast and research applications. Sensor physical principles. Emphasis is on understanding the strengths and weaknesses of the different types of observational data so that the student can judge adequacy of purpose for their applications.

Typically offered in Fall only

MEA 514 Advanced Physical Meteorology (3 credit hours)
Fundamental laws and concepts of thermodynamics and electromagnetic radiative transfer considered in an atmospheric context. Application of these principles to a number of meteorological problems, including radiative climate models, the global energy balance, atmospheric aerosols, lidar/radar backscatter and remotely sensed temperature fields.

Prerequisite: MEA 412, MEA 421
Typically offered in Fall only

MEA 515/MEA 415 Climate Dynamics (3 credit hours)
A comprehensive look at climate integrated across terrestrial, marine, and atmospheric perspectives. Topics include an in-depth look at climate proxies, drivers of future, current and past climate change, climate monitoring approaches, and climate model projections. Students will be exposed to the quantitative aspects (chemistry, physics, theory, observations, models) scientists use to place constraints on climate conditions over broad spatial and temporal scales. MEA 415 is open to upper-level undergraduate science majors interested in learning more about Earth's climate systems and the dynamics within. MEA 515 is open to all graduate students with the expectation of an additional climate assessment course project relevant to the student's own research discipline. Students cannot receive credit for both MEA 415 and MEA 515.

Prerequisite: MA 121 or MA 131 or MA 141 and CH 101 or CH 103 and PY 201 or PY 205 or PY 211
Typically offered in Fall only

MEA 516 Climate Risk Analysis (3 credit hours)
Prepares students to analyze climate data for decision making under uncertainties in climate conditions and projections. Diverse observational and model generated climate data sets are considered. For observed data, the assumptions and statistical methods used to assess trends are explored and critically analyzed. Subsequent course work focuses on spatial analyses of climate-related anomalies and trends and on ensemble predictions, including their application to climate sensitive systems. Students become proficient in the visualization of climate information. This course requires permission from the instructor to join.

Prerequisites: MEA 517 (or equivalent), ST 305 (or equivalent) or MA 141 (or equivalent)
Typically offered in Spring only

MEA 517 Fundamentals of Climate Change Science (3 credit hours)
This course will present the basic science of climate change, including chemical and physical systems and processes. The students will be introduced to how the climate system works and the role of greenhouse gases in the climate system. Students will learn about climatological data, climate models and how predictions/projections are made. Emphasis will be placed upon relating predicted/projected changes to manifestations such as sea level rise and changes in the distribution and character of precipitation. Topics include the primary climate components, ocean-atmospheric teleconnections, decadal and multi-decadal climate indices, natural and anthropogenic climate variability, and climate model projections.

Prerequisite: Graduate standing
Typically offered in Fall only

MEA 518 Adaptation to Climate Change (3 credit hours)
Climate Adaptation investigates the technological, economic, communication, scientific and legal challenges inherent to adaptation to climate change. This course provides practical hands-on experience for professionals in developing adaptation strategies in climate sensitive sectors. Content draws heavily on case studies in international development, infrastructure, health, energy, and transportation sectors.

Prerequisites: MEA 517 or permission from instructor
Typically offered in Spring only

MEA 519 Barriers to Climate Change Literacy (3 credit hours)
Investigates the discipline-based geoscience education lenses of the cognitive, affective, and behavioral barriers to climate literacy and the practical interventions for addressing them. Critically analyzes key aspects of climate science, common misconceptions, mental models, cultural influences, and risk perceptions about climate change. Students engage with the public and design projects for overcoming barriers to climate change literacy. The course features relevant readings, classroom discussions, student peer-review, and summative and formative course feedback though course assignments and exams. Minimum of 50% seats reserved for Climate Change and Society Certificate program students.

Prerequisite: Graduate standing
Typically offered in Fall only

MEA 525/MEA 425 Introduction to Atmospheric Chemistry (3 credit hours)
The course covers history, regulations, sources, physics, and chemistry of major air pollutants and factors affecting their transport and fate. Emphasis is placed on atmospheric chemistry and physics underlying five major air pollutant problems including urban outdoor air pollution, indoor air pollution, acid deposition, stratospheric ozone reduction, and global climate change. Credit will not be allowed for MEA 425 and MEA 525.

Prerequisite: MA 141, CH 201, (PY 205, PY 211 or MEA 320)
Typically offered in Spring only

MEA 540 Principles of Physical Oceanography (3 credit hours)
Introduction to principles and practice of physical oceanography. The equation of state of seawater; energy transfer to the ocean by thermal, radiative and mechanical processes; the heat budget; oceanic boundary conditions; geographical distributionof oceanic properties; observational methods; conservation equations; simple waves and tides; physical oceanography of North Carolina coastal zone. Application of Fourier analysis techniques to interpretation of low-frequency motions in ocean and atmosphere. Review of Fourier method. Filtering of tidal signals. Spectral estimates and calculation of current ellipses. Identification of coherent motions and their empirical orthogonal modes. Data from field experiments used in lectures and homeworkassignments. Credit is not allowed for both MEA 460 and MEA 540

Prerequisite: MA 231 and PY 212
Typically offered in Spring only

MEA 549/MEA 449 Principles of Biological Oceanography (3 credit hours)
Environmental dependencies, biological productivity, and trophic relationships in plankton, nekton and benthos; Sampling methods and experimental design; Human impacts on marine systems.Credit is not allowed for both MEA 449 and MEA(ZO)549.

Typically offered in Fall only

MEA 553 Estuarine Biogeochemistry (3 credit hours)
Biogeochemical cycles of carbon, nitrogen, and phosphorus in coastal rivers and estuaries with selected topics on the origin, physics, and chemistry of estuarine waters and sediments. Emphasis is placed on organic matter and nutrient cycling in estuaries within the context of anthropogenic effects and climate change.

Typically offered in Spring only

MEA 554/MEA 454 Marine Physical-Biological Interactions (3 credit hours)
Space-time relationships between physics and biology; influence of Reynolds Number on aquatic life style; aspects of physical and biological mathematical modeling; influence of biology on physical phenomena; influence of static physical/chemical properties on biology; influence of dynamic physical phenomena (turbulence, waves and advection) on biology within the water column and its boundaries. Credit is not allowed for both MEA454 and 554

Prerequisite: MEA 460 and MEA/ZO 449
Typically offered in Spring only

MEA 562 Marine Sediment Transport (3 credit hours)
Quantitative study of sediment transportation in the marine environment including introduction to fluid mechanics and sediment transportation theory. Processes and products of sediment transportation in specific marine environments from estuaries todeep sea and the interpretation of sediment transport processes from sedimentary structures. Credit not allowed for both MEA 411 and MEA 562

Prerequisite: MEA 101 or MEA 200, MA 241, PY 201 or PY 205
Typically offered in Fall only

MEA 568/MEA 468 Aquatic Microbiology (3 credit hours)
Aquatic microbes are key drivers of biogeochemistry on Earth. They also influence the 'health' of valuable ecosystems, e.g. estuaries, coasts, lakes, as well as, larger organisms (e.g. shellfish, humans). In this course, multiple facets of aquatic microbiology will be covered, including (not limited to): population diversity, spatial and temporal dynamics, sampling methodologies, metabolisms, and their environmental and societal importance. A primary goal for this course is for students to be exposed to key paradigms and current challenges within the field of aquatic microbiology, but also a general perspective on how aquatic microbes thrive in nature. Although largely a classroom-based course, select class periods will be devoted to hands-on activities and/or measurements providing students with methodological experience or in-depth exposure to key topics.

Prerequisite: BIO 183
Typically offered in Fall only

MEA 570 Geological Oceanography (3 credit hours)
A comprehensive overview of the geological aspects of oceanography. Topics include: a) marine geophysics and the evolution of ocean basins, b) sedimentological processes and the formation of marine deposits, c) marine geochemistry and authigenic sedimentation, d) paleoceanography and the interpretation of marine stratigraphy.

Typically offered in Spring only

MEA 573/MEA 473 Principles of Chemical Oceanography (3 credit hours)
Chemical processes controlling the composition of oceans, including discussions of chemical equilibria, biological cycling of nutrients and use of chemical tracers in marine environment; consideration of origin and chemical history of oceans. Creditis not allowed for both MEA 473 and MEA 573

Prerequisite: CH 201 or CH 203
Typically offered in Fall only

MEA 574 Advanced Igneous Petrology (3 credit hours)
Physicochemical principles related to igneous petrogenesis. General principles and specific problems including origin, differentiation and emplacement of magmas and the possible relationships of igneous processes to global tectonics.

Prerequisite: MEA 440
Typically offered in Spring only

MEA 577 Electron Microprobe Analysis of Geologic Material (2 credit hours)
Theory of quantitative analysis of geologic material by electron beam application; laboratory operation of electron microprobe to acquire chemical composition and x-ray images of geologic material.

Prerequisite: MEA 410
Typically offered in Fall only

MEA 579 Principles of Air Quality Engineering (3 credit hours)
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain" problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579

Prerequisite: CE 373,CE 282; or CHE 311(CHE Majors); or MEA 421(MEA Majors), Corequisite: ST 370; ST 380(MEA Majors)
Typically offered in Spring only

MEA 580 Air Quality Modeling and Forecasting (4 credit hours)
Topics include numerical solutions to ODEs/PDEs, atmospheric chemistry, cloud and aerosol microphysics, emission modeling, meteorological modeling, and model design, applications, and evaluation. It is targeted for students who would like to learn about air quality modeling and who are prospective air quality model users.

Prerequisite: CSC 112, MEA 425/525, CE 479/579
Typically offered in Fall and Spring

MEA 581/CE 581 Fluid Mechanics in Natural Environments (3 credit hours)
Free surface flows of water and air occurring in natural fluid systems and influencing environmental transport and mixing. Review of fundamental principles of fluids, covering the scales relevant to both engineering and geo-physical applications. Topics and examples include waves, instability, stratification, turbulent boundary layers, jets and plumes, and open channel flows. Cannot receive credit for both CE 581 and MEA 581.

Prerequisite: CE 282 or MEA 463 or permission of instructor
Typically offered in Fall only

MEA 582/GIS 582 Geospatial Modeling (3 credit hours)
The course provides foundations in methods for GIS-based surface analysis and modeling. The topics include proximity analysis with cost surfaces and least cost paths, multivariate spatial interpolation and 3D surface visualization. Special focus is on terrain modeling, geomorphometry, solar irradiation, visibility, and watershed analysis. Students are also introduced to the basic concepts of landscape process modeling with GIS and to the principles of open source GIS. Introductory level knowledge of GIS or surveying/ geomatics principles is required.

Typically offered in Fall and Spring

MEA 584/GIS 584 Mapping and Analysis Using UAS (3 credit hours)
The course provides an overview of UAS mapping technology and its rules and regulations. The principles of UAS data collection are explained along with optional hands-on practice with in flight planning and execution. The main focus is on processing imagery collected from UAS using structure from motion techniques and deriving orthophoto mosaics and ultra-high resolution digital elevation models of land surface, vegetation and structures. More advanced topics include multi-temporal 3D data analysis, fusion with lidar data and 3D visualization.

Prerequisite: GIS 510 or GIS/MEA 582 or Permission of Instructor
Typically offered in Summer only

MEA 585 Physical Hydrogeology (3 credit hours)
Physical aspects of groundwater flow in geological media. Saturated and unsaturated flow, Darcy's equation, heterogeneity and anisotropy, storage properties of geological materials, effective stress, governing equations for steady and unsteady flow, recharge, groundwater exchange with surface water, groundwater flow to well,s estimation of hydraulic properties of aquifers.

Prerequisite: MEA 101, MEA 110, MA 241, and PY 201 or PY 205
Typically offered in Spring only

MEA 591 Special Topics in Marine Science (1-6 credit hours)
Opportunity for advanced undergraduate and graduate students to study timely special problem areas in Marine Science and Engineering

Typically offered in Fall, Spring, and Summer

MEA 592 Special Topics in Earth Sciences (1-6 credit hours)
Special topics in earth sciences, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 593 Special Topics in Atmospheric Science (1-6 credit hours)
Special topics in atmospheric science, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 599 Regional Geology of North America (1-6 credit hours)
Field study of classic geologic localities and geomorphic processes not indigenous to North Carolina. Typical areas: New England and adjacent Canada, northern Mexico and southwestern United States and Pacific Northwest. Representative subjects include Canadian Shield, Precambrian mineral deposits, San Andreas fault, desert geomorphology, Grand Canyon stratigraphy, modern and ancient reefs and glaciated volcanoes. Mineral, rock and fossil collecting. Required student reports.

Prerequisite: MEA 101 or MEA 120, Senior standing
Typically offered in Fall only

MEA 601 Seminar (1 credit hours)
Presentation by each student of one seminar on his/her current research.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

MEA 611 Special Topics in Marine Sciences (1-6 credit hours)
Special topics in earth sciences, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 612 Special Topics in Earth Sciences (1-6 credit hours)
Special topics in atmospheric science, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 613 Special Topics Atmospheric Sciences (1-6 credit hours)
Typically offered in Fall and Spring

MEA 630 Independent Study (3 credit hours)
Capstone project for the Climate Change and Society program. Students will carry out research in collaboration with an on-campus or off-campus partner in a climate-related sector. Students will address a real-world climate adaptation problem or issue and will prepare a written report describing the outcome of their research.

P: MEA 516, MEA 517, MEA 518, MEA 519, GIS 510
Typically offered in Fall, Spring, and Summer

MEA 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MEA 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MEA 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

MEA 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

MEA 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

MEA 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MEA 700 Environmental Fluid Mechanics (3 credit hours)
Basic concepts and laws governing motion of atmosphere and oceans developed from first principles, including approximations valid for environmental flows, kinematics, dynamics and thermodynamics of fluid flows as well as introduction to environmental turbulence. Credit is not allowed for both MEA 463 and MEA 700

Prerequisite: MA 241, PY 208
Typically offered in Fall only

MEA 703 Atmospheric Aerosols (3 credit hours)
An understanding of aerosols as primary air pollutants, indoor versus outdoor pollution, transformation processes, prediction of atmospheric concentrations, scavenging of aerosols, transport of air pollutants on a regional scale, discussion of national experiments to characterize and study impact of urban-industrial pollution, tropospheric aerosol and weather, stratospheric aerosol, effect of aerosols on atmospheric warming and cooling and air-quality models.

Prerequisite: (CH 201 or CH 203) and (PY 205 or PY 211), Corequisite: MEA 412
Typically offered in Spring only

MEA 705 Dynamic Meteorology (3 credit hours)
Brief review of classical and physical hydrodynamics; scale analysis of dynamic equations; atmospheric instabilities; dynamics of tropical convections; perturbation theory and approximations for atmospheric wave motions.

Prerequisite: MEA 422
Typically offered in Spring only

MEA 707 Planetary Boundary Layer (3 credit hours)
Review of basic equations and concepts of planetary boundary layers. The closure problem and semi-empirical theories of turbulence, buoyancy effects on mean flow and turbulence, instrumentation and observational platforms for PBL experiments, observed characteristics of atmospheric boundary layers, numerical and physical modeling of PBL and its parameterization in large-scale atmospheric circulation models.

Prerequisite: MEA 455 or MEA 721
Typically offered in Fall and Spring

MEA 708 Atmospheric Turbulence (3 credit hours)
Statistical description of turbulence, including probability, correlation and spectrum functions. Statistical theory of homogeneous turbulence, spectral dynamics and Kolmogorov's local similarity hypotheses. Effects of shear, thermal stratification and earth's rotation. Observed structure and scales of turbulence in PBL and free atmosphere. Higher-order closure models and large eddy simulations of atmospheric turbulence.

Prerequisite: MAE 550 or MEA 700 or MEA 707
Typically offered in Spring only

MEA 710 Atmospheric Dispersion (3 credit hours)
Lagrangian vs. Eulerian descriptions of turbulence and diffusion. Statistical theories of absolute and relative diffusion from continuous and instantaneous releases. Effects of shear, thermal stratification and earth's rotation on atmospheric dispersion. Lagrangian similarity theories of diffusion in the surface layer and mixed layer. Random walk, Monte Carlo and large eddy simulations of atmospheric dispersion. Urban and regional dispersion models.

Prerequisite: MAE 550 or MEA 700 or MEA 510
Typically offered in Fall only

MEA 712 Mesoscale Modeling (3 credit hours)
Modeling mesoscale weather phenomena including midlatitude cyclones, mesoscale convective complexes and squall lines. Application of finite difference, spectral and implicit methods and coordinate transforms to these problems. Utilization of explicit representations of moist processes. Development of parameterizations of convective clouds, planetary boundary layer and moist processes.

Prerequisite: MEA 705
Typically offered in Fall only

MEA 713 Mesoscale Dynamics (3 credit hours)
Inertia-gravity waves. Mechanical and thermally forced waves. Generation, circulation and maintenance of mesoscale convective storms and systems. Symmetric instability. Wave-CISK, quasi-geostrophic and semi-geostrophic fronts and fronto-genesis. Meso-B/Y frontogenesis. Lee and coastal cyclogenesis.

Prerequisite: MEA 700 and MEA 705
Typically offered in Fall only

MEA 714 Atmospheric Convection (3 credit hours)
Structure, physics and dynamics of convective clouds and cloud systems; fundamental equations for modeling convection; microphysical parameterization schemes; influence of instabilities on convective cloud systems; severe thunderstorms dynamics; tornadogenesis theories; mesoscale convective systems; upscale feedback effects of convection; cumulus parameterization schemes.

Prerequisite: MEA 412, MEA 700, MEA 705
Typically offered in Fall only

MEA 715 Dynamics of Mesoscale Precipitation System (3 credit hours)
Frontogenesis theory; inertial and conditional symmetric instability; mesoscale gravity waves and wave-CISK; conveyor belts; seeder-feeder processes and precipitation generating cells; classification and dynamics of precipitation band types.

Prerequisite: MEA 444
Typically offered in Fall only

MEA 716 Numerical Weather Prediction (3 credit hours)
Parameterization of physical processes in atmospheric modeling, including numerous hands-on experiments to allow evaluation and analysis of process representation in models. Emphasis on experimental design: Using numerical models as a tool with which to test scientific hypotheses. Investigation of data assimilation and ensemble prediction techniques. Journal discussion and student presentations are featured prominently. A semester project allows students to apply knowledge to thesis projects, and synthesize class concepts. Some comfort level with Linux computing environment, shell scripting, and programming languages such as FORTRAN required.

Typically offered in Fall and Spring

MEA 717 Advanced Weather Analysis (3 credit hours)
Evolution of physical and dynamic structure of synoptic and sesoscale storm systems occurring in middle and high latitudes. Recent advances in understanding these storm systems through intensive field experiments and computer modeling. Introduction to contemporary analysis techniques through laboratory exercises shedding light on storm structure, dynamics and scale interaction.

Prerequisite: MEA 444, MEA 705
Typically offered in Fall only

MEA 719 Climate Modeling (3 credit hours)
Climate system. Fundamental equations and time scales. Atmosphere, ocean, biosphere, cryosphere, lithosphere and hydrosphere subsystems. Computational numerical methods. Physical processes; atmosphere-ocean coupling, role of radiation, clouds and land surface processes. Climate anomalies due to changes in atmospheric composition, boundary conditions and extra-terrestrial forcing. Model validation, climate change detection, past climates and future climate scenarios.

Prerequisite: MEA 705
Typically offered in Fall only

MEA 721 Air-Sea Interaction (3 credit hours)
Review of basic equations and concepts of turbulent transfer in geophysical flows, air-sea interaction processes and their importance to man's activities, theory and observation of wind-generated ocean surface waves, turbulent transfers in planetaryboundary layer of marine atmosphere, oceanic mixed layer, development of thermocline and inversion.

Prerequisite: MEA 422 or MEA 560
Typically offered in Spring only

MEA 735 Fourier Analysis of Geophysical Data (3 credit hours)
Application of Fourier analysis to interpretation of low-frequency motions in ocean and atmosphere. Review of Fourier method. Filtering of tidal signals. Spectral estimates and calculation of current ellipses. Identification of coherent motions and their empirical orthogonal modes. Data from field experiments used in lectures and homework assignments.

Prerequisite: MA 341 and ST 511
Typically offered in Spring only

MEA 741 Synpotic Physical Oceanography (3 credit hours)
Basic discussion of the techniques and terminology of synoptic physical oceanography; focus on water characteristics and their relationship to currents in the individual oceans; a systematic quantitative description of the character of ocean waters and their movements.

Prerequisite: MEA 560
Typically offered in Spring only

MEA 743 Ocean Circulation (3 credit hours)
Basic study of mechanics of ocean circulation with emphasis on various simple models of circulation systems.

Prerequisite: MEA 700 or PY 411
Typically offered in Fall only

MEA 744 Dynamics of Shelf Circulation (3 credit hours)
Description and models of dynamic processes on the shelf, including seiches and tides in gulfs, propagation of tides and storm surges, wind-induced coastal upwelling, continental shelf waves and coastally trapped waves. Steady circulation driven by winds, river plumes and density forcing, formation of shelf-break fronts; and influence from deep-ocean currents.

Prerequisite: MEA 700
Typically offered in Fall only

MEA 752 Marine Plankton Ecology (3 credit hours)
Examination of worldwide relationships between physical-chemical environment and planktonic organisms. Organism descriptions; effects of light, temperature, salinity, density, water motion and chemical constituents on organisms; interactions among different organisms emphasizing competition and predation; community structure, distribution and succession; and mathematics models of distribution, production and interaction.

Prerequisite: BCH 451 and MA 121 and ZO 419
Typically offered in Fall only

MEA 759 Organic Geochemistry (3 credit hours)
Sources and fates of organic material in the geochemical environment. Microbial transformations of organic compounds. The use of biomarkers to study depositional environments. Petroleum, natural gas and coal formation. Extraterrestrial organic geochemistry.

Typically offered in Fall only

MEA 760 Biogeochemistry (3 credit hours)
Processes involved in the biogeochemical cycling of C, N, S and related biogenic elements. Stable isotopic and other geochemical signatures of biological processes. Introduction to modeling chemical distributions in sediments. The impact of biogeochemical processes on atmospheric chemistry.

Typically offered in Fall only

MEA 762 Marine Geochemistry (3 credit hours)
Detailed examination of chemical processes occurring in marine environment. Chemical evolution of the oceans, continental and submarine weathering, particle scavenging of reactive elements from water, column, formation of biogenic and metaliiferousdeposits, sediment diagenesis and marine geochronology.

Prerequisite: CH 331, MEA 560
Typically offered in Spring only

MEA 763 Isotope Geochemistry (3 credit hours)
This class offers an interdisciplinary introduction to the principles of isotope chemistry and its application to geological, atmospheric, and biological systems. Key topics include: isotope systematics; isotope measurements and analyses; common radiogenic (U, Ar, Pb, Sr, C, Be) and stable (H, O, C, N, S) isotope systems; applications to geochronology, paleobiology, paleoclimatology, environmental tracking, archeology, and more. This course is aimed at graduate students interested in using isotopes as a tool for examining the natural world.

Restriction: Graduate Standing or Permission of the Instructor
Typically offered in Spring only

MEA 779 Advanced Air Quality (3 credit hours)
Local, regional and global scale chemical interactions, transport and behavior of trace gases (sulfur carbon, nitrogen, hydrocarbon, and photo-chemical oxidants) in the atmosphere. covers three primary elements of air quality: anthropogenic and natural emissions of trace gases; interactions of the pollutants in the atmosphere; and monitoring and sampling of gaseous and particulate pollutants.

Prerequisite: (CH 201 or CH 203) and MEA(CE) 479
Typically offered in Spring only

MEA 785 Chemical Hydrogeology (3 credit hours)
Quantitative analysis of hydrological, geological, and geochemical factors controlling the transport and fate of organic and inorganic chemicals in groundwater. Acid-base, precipitation-dissolution, weathering, redox, complexation, sorption, and gas exchange reactions. Advection, diffusion, and dispersion in porous media, analytical solutions to the advection-dispersion equation. Non-aqueous-phase (organic) liquids.

Prerequisite: (CH 201 or CH 203) and (MEA 585 or CE 584)
Typically offered in Spring only

MEA 788 Advanced Structural Geology (3 credit hours)
Principles of rock mechanics and their application in solving geologic problems; finite strain analysis of deformed rocks; advanced techniques of structural analysis; petrofabrics; development of various geologic structures. Emphasis upon application of principles and techniques in the field.

Prerequisite: MEA 451
Typically offered in Fall only

MEA 789 Topics In Appalachian Geology (3 credit hours)
Examination of geology of areas within Appalachian orogenic belt. Lectures, discussions, reading and review of current literature and consideration of ideas concerning geological evolution of region. Required field trips.

Prerequisite: MEA 440, 450 and 451
Typically offered in Fall only

MEA 790 Geotectonics (3 credit hours)
In-depth examination of current ideas in plate tectonic theory. Plate tectonic controls on orogeny, orogenic belts, magmatism and metallogeny.

Prerequisite: MEA 440, 450, 451
Typically offered in Fall only

MEA 791 Advanced Special Topics in Marine Science (1-6 credit hours)
Opportunity for advanced undergraduate and graduate students to study timely special problem areas in Marine Science and Engineering

Typically offered in Fall, Spring, and Summer

MEA 792 Advanced Special Topics in Earth Sciences (1-6 credit hours)
Special topics in earth sciences, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 793 Advanced Special Topics in Atmospheric Science (1-6 credit hours)
Special topics in atmospheric science, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 796 Exploration And Engineering Geophysics (3 credit hours)
Geophysical methods as applies to exploring the earth's mineral and energy resources and to investigating subsurface geological structure and physical properties. Principles, measurements, analyses, and interpretations of gravity, magnetic, electric, electromagnetic, seismic methods. Required research paper.

Prerequisite: MEA 470 or PY 208
Typically offered in Spring only

MEA 801 Seminar (1 credit hours)
Presentation by each student of one seminar on his/her current research.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

MEA 810 Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

MEA 811 Special Topics in Marine Sciences (1-6 credit hours)
Special topics in earth sciences, provided to groups or to individuals.

Typically offered in Fall, Spring, and Summer

MEA 812 Special Topics in Earth Sciences (1-6 credit hours)
Special topics in atmospheric science, provided to groups or to individuals.

Typically offered in Fall and Spring

MEA 813 Special Topics in Atmospheric Sciences (1-6 credit hours)
Special topics in earth sciences, provided to groups or to individuals.

Typically offered in Fall and Spring

MEA 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planing for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MEA 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MEA 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Typically offered in Fall, Spring, and Summer

MEA 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

MEA 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Materials Science and Engineering (MSE)

MSE 200 Mechanical Properties of Structural Materials (3 credit hours)
An introduction to the atomic and grain structure of structural materials emphasizing the mechanical properties. Effects of mechanical and heat treatments on structure and properties. Fatigue and creep of materials, fracture toughness, mechanical and non-destructive evaluation, effects of environment. Design considerations, characteristics of metals, ceramics, polymers and composites. Not for Materials majors

Prerequisite: Grade of C or better in CH 101
Typically offered in Fall, Spring, and Summer

MSE 201 Structure and Properties of Engineering Materials (3 credit hours)
Introduction to the fundamental physical principles governing the structure and constitution of metallic and nonmetallic materials and the relationships among these principles and the mechanical, physical and chemical properties of engineering materials.

Prerequisite: Grade of C or better in CH 101
Typically offered in Fall, Spring, and Summer

MSE 255 Experimental Methods for Structural Analysis of Materials (2 credit hours)
Principles and application of basic techniques for characterizing the structure of materials at different length scales. Optical microscopy, electron microscopy, scanning probe microscopy, X-ray diffraction and spectroscopic methods applied to metals, ceramics, polymers and semiconducting materials.

Corequisite: MSE 201
Typically offered in Spring only

MSE 260 Mathematical Methods for Materials Engineers (3 credit hours)
Use of MATLAB programming environment to illustrate and discuss principles and applications of analytical and numerical mathematical methods that are central to materials science and engineering. Data plotting, curve fitting, complex numbers and series, Fourier series and transforms, numerical integration and differentiation, linear algebra and matrix manipulation, initial and boundary value problems, numerical solution to ordinary differential equations and transport simulation through the use of partial differential equations.

Corequisite:MA 242
Typically offered in Spring only

MSE 270 Materials Science and Engineering Seminar (1 credit hours)
This course surveys the field of materials science and engineering and introduces students to contemporary issues. Job and career opportunities at the BS and graduate degree levels are presented. Students are introduced to opportunities for laboratory assistant jobs in the MSE department, summer internships, co-ops and summer research experiences at NCSU and other institutions. Students will learn to prepare effective resumes, technical reports and oral presentations.

Corequisite: MSE 201
Typically offered in Spring only

MSE 300 Structure of Materials at the Nanoscale (3 credit hours)
This course covers the structure of materials at the nanometer scale. Structure includes the periodic arrangements of atoms and ions in crystalline solids, the amorphous networks of atoms, ions, and molecules in glassy materials, and the molecular structure of polymeric and biological materials. The typical means of characterizing nanostructure are also reviewed. Finally, the course will introduce the structure of novel nanomaterials like nanotubes, buckyballs and self assembled monolayers.

P: C or better in MSE 201 or MSE 200
Typically offered in Fall only

MSE 301 Introduction to Thermodynamics of Materials (3 credit hours)
Review of classical thermodynamics and thermodynamic relationships. Use of statistical methods of describe entropy and other thermodynamic properties. Description of vapor-, liquid-, and solid-phase equilibrium in unary and other multicomponent material systems. Treatment of ideal and nonideal solution behavior in inorganic alloys and organic polymers. Application of gas-phase reaction kinetics and identification of the criteria required for reaction equilbria.

P: C or better in MSE 201 and MA 242
Typically offered in Fall only

MSE 320 Introduction to Defects in Solids (3 credit hours)
Classification of defects as point, line, surface or volume types. Geometrical and crystallographic aspects of defects. Defects in metallic, ionic and covalently bonded crystal structures. Physical, chemical, electronic and magnetic aspects of defects. Field quantities and forces associated with defects. Novel defects in nanostructured materials and semicrystalline materials.

Prerequisite: C or better in MSE 201
Typically offered in Fall only

MSE 335 Experimental Methods for Analysis of Material Properties (2 credit hours)
Principles and application of basic techniques for characterizing the properties of materials. Mechanical, thermal, electrical, optical and magnetic property measurements applied to metals, ceramics, polymers and semiconducting materials.

Prerequisite: C- or better in MSE 201
Typically offered in Fall only

MSE 355 Electrical, Magnetic and Optical Properties of Materials (3 credit hours)
Fundamental treatment of the electronic properties of materials, including the electrical, magnetic and optical characteristics. The role of electrons, band structure, and Bruillouin zones on the various classes of materials is discussed from the semiclassical and quantum mechanical viewpoints. Applications of these principles to specific technological devices is also covered.

Prerequisite: PY 208 and MA 341
Typically offered in Spring only

MSE 360 Kinetic Processes in Materials (3 credit hours)
Types, mechanisms, and kinetics of solid state phase transformations are covered with selected applications to all classes of materials. Mechanisms of diffusion and techniques for diffusion calculations are presented. The role of surface energy and strain in the evolution of structure during transformation is presented. Phenomena at different size scales (atomic, nano, micro) are described relative to the evolution of structure during transformation.

Prerequisite: MA 341 and MSE 301
Typically offered in Spring only

MSE 370 Microstructure of Inorganic Materials (3 credit hours)
Structure-property relationships in metallic and ceramic materials. Crystal structures of important metallic and ceramic elements, alloys, and compounds. Binary and ternary phase diagrams for notable systems will be presented. Microstructural features to be covered include grain size and distribution, multiphase microstructures, and defects. Examples of important metallic and ceramic systems for structural, electrical, optical and magnetic applications will be given.

Prerequisites: MSE 300, MSE 301, and MSE 320
Typically offered in Spring only

MSE 380 Microstructure of Organic Materials (3 credit hours)
Covers microstructure and properties of soft materials including polymer molecular weight distributions, amorphous polymers, semicrystalline polymers, copolymers, elastomers, biopolymers, soft tissue, bone and cellular structure. The design and function of implantable biomaterials are also covered.

Prerequisite: (CH 220 or CH 221) and MSE 300
Typically offered in Spring only

MSE 409/NE 509/MSE 509/NE 409 Nuclear Materials (3 credit hours)
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

Prerequisite: MSE 201
Typically offered in Fall only

MSE 420 Mechanical Properties of Materials (3 credit hours)
Basic concepts for mechanical properties of materials, elasticity, plasticity, viscoelasticity, rubber elasticity, strengthening mechanisms, creep, fracture and fatigue. Includes metals, ceramics, polymers and composites. Describes mechanical properties for nanostructured materials and biomaterials.

Prerequisite: MSE 370 and MSE 380
Typically offered in Fall only

MSE 423 Introduction to Materials Engineering Design (1 credit hours)
Materials selection in engineering design involving lecture, cooperative and problem-based learning techniques. Course stresses creative thinking, problem solving methodology, interdependence of design with analysis and evaluation, teamwork and sharpening of communication skills. Real industrial problems are introduced which are analyzed by student teams. This a half-semester course. The classroom lectures end at mid-semester. In the second half of the semester, student teams develop a proposal which is submitted to the industrial sponsors at the end of the semester. The proposal defines future work to be conducted under MSE 470. Senior standing in MSE.

Prerequisite: Senior standing in MSE
Typically offered in Fall only

MSE 440/MSE 540 Processing of Metallic Materials (3 credit hours)
Fundamental concepts of solidification and their application to foundry and welding practices; metal forming concepts applied to forging, rolling, extrusion, drawing, and sheet forming operations; machining mechanisms and methods; powder metallurgy;advanced processing methods including rapid solidification and mechanical alloying. Credit for both MSE 440 and MSE 540 is not allowed

Prerequisite: MSE 360 and MSE 370. Corequisite: MSE 420
Typically offered in Fall only

MSE 445/MSE 545 Ceramic Processing (3 credit hours)
Ceramic processing of powders includes powder synthesis, characterization, mixing, and size reduction. Theoretical aspects include particle packing, particles in suspension, and some aspects of surface chemistry. Forming methods include compaction, casting, and extrusion. Firing and sintering are examined. Credit for both MSE 445 and MSE 545 is not allowed

Prerequisite: MSE 370
Typically offered in Fall only

MSE 455 Polymer Technology and Engineering (3 credit hours)
This course will cover commercial polymers, polymer blends and miscibility, dynamic mechanical behavior, Boltzmann superposition principle, ultimate properties of polymers, polymer rheology and processing, recycling and design and selection of polymeric materials. Guest instructors from industry will give presentations on contemporary topics in polymer technology and engineering. Field trips are required.

Prerequisite: MSE 380
Typically offered in Spring only

MSE 456/MSE 556 Composite Materials (3 credit hours)
The course covers the basic principles underlying properties of composite materials as related to the properties of individual constituents and their interactions. Polymer, metal and ceramic matrix composites are included. Property averaging and micromechanics of composites are covered at an introductory level. Emphasis is placed on design and processing of composite systems to yield desired combinations of properties. Credit for both MSE 456 and MSE 556 is not allowed.

Prerequisite: MSE 420
Typically offered in Spring only

MSE 460 Microelectronic Materials (3 credit hours)
Processes and characterization techniques relevant to microelectronic materials science and technology. Boule growth, wafer preparation, oxidation, epitaxial growth, doping techniques, metallization, and device applications of elemental and compound semiconductors. Electrical, structural and chemical characterization of semiconductors is included as well as materials considerations relevant to device fabrication. Credit for both MSE 460 and MSE 560 is not allowed

Prerequisite: MSE 355
Typically offered in Fall only

MSE 465/MSE 565 Introduction to Nanomaterials (3 credit hours)
Introduction to nanoparticles, nanotubes, nanowires, and nanostructured films, emphasizing their synthesis, structural and property characterization, novel physical and chemical properties, applications and contemporary literature.

Prerequisite: MSE 201
Typically offered in Spring only

MSE 470 Materials Science and Engineering Senior Design Project (3 credit hours)
Design project in materials science and engineering requiring problem definition and analysis, synthesis, and presentation of a designed solution. Students work in groups with a faculty adviser on problems submitted by local industrial sponsors or emerging research issues that represent the major specialty areas including ceramics, metals, polymers, or electronic materials.

Prerequisite: MSE 423
Typically offered in Spring only

MSE 480/MSE 580 Materials Forensics and Degradation (3 credit hours)
Covers principles and prevention of the degradation of materials. The topics will include dissolution of polymer and ceramic materials, electrochemical corrosion, oxidation of metals and polymers, degradation of polymers, friction and wear, degradation of electrical device components, bio-deterioration of materials, and failure analysis. The general practice in failure analysis will be applied to a variety of case studies to illustrate important failure mechanisms. Credit will not be given for both MSE 480 and MSE 580.

Prerequisite: MSE 370 and MSE 380
Typically offered in Spring only

MSE 485 Biomaterials (3 credit hours)
The course introduces fundamental aspects associated with synthesis, properties, processing/fabrication and application of materials derived from or associated with bio-entities. The course focuses on biomaterials with broad applications beyond medical or clinical uses. The course emphasizes the biological systems unique machinery and function in the context of desired outcome that utilizes a material or materials' systems. Fundamental concepts covered in the course include: differences among classes of biomaterials; toxicity vs biocompatibility of biomaterials; bulk vs surface properties of biomaterials; interactions of biomaterials with different environments; biomaterials stability and degradation; biomaterials for sensing and bioelectronics applications; biomaterials for energy, soft robotics and responsive materials applications; and biomaterials for drug delivery.

Prerequisite: MSE 201 and BIO 183
Typically offered in Spring only

MSE 489/MSE 589/PY 489/PY 589/ECE 489/ECE 589 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

MSE 490 Special Topics in Materials Engineering (1-4 credit hours)
Offered as needed for the development of new courses in materials engineering, including areas such as metals, ceramics, polymers, or microelectronic materials.

MSE 495 Materials Engineering Projects (1-6 credit hours)
Application of engineering principles to a specific materials engineering project by a student or small group of students under supervision of a faculty member. A written report required.

Prerequisite: Junior standing or Senior standing
Typically offered in Fall, Spring, and Summer

MSE 500 Modern Concepts in Materials Science (3 credit hours)
Fundamentals of structure, structure modification and properties of materials with emphasis on structure-property relationships and modern theory of solids.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

MSE 509/NE 409/MSE 409/NE 509 Nuclear Materials (3 credit hours)
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

Prerequisite: MSE 201
Typically offered in Fall only

MSE 531 Physical Metallurgy (3 credit hours)
Application and design of selected metals and alloys in a theoretical and practical context. Relationships between mechanical behavior, and alloy chemistry, microstructure, and processing. Corrosion resistance; fatigue failure; creep; brittle fracture. Design of specific microstructures. Credit for both MAT 431 and MSE 531 is not allowed

Prerequisite: MAT 321, MAT 450, Corequisite: MAT 430
Typically offered in Fall only

MSE 539/MAE 539 Advanced Materials (3 credit hours)
Introduces production/structure/property/function relation and application of a number of materials mainly for biomedical, mechanical and aerospace applications. Topics include ultra light materials (production, processing and applications of cellular solids), biomaterials (classes and application of materials in medicine and dentistry), composites (classes and application), refractory materials and coatings for high temperature applications, thin film shape memory alloys for micro-electro mechanical systems (MEMS).

Prerequisite: MSE 201 and MAE 314
Typically offered in Fall only

MSE 540/MSE 440 Processing of Metallic Materials (3 credit hours)
Fundamental concepts of solidification and their application to foundry and welding practices; metal forming concepts applied to forging, rolling, extrusion, drawing, and sheet forming operations; machining mechanisms and methods; powder metallurgy;advanced processing methods including rapid solidification and mechanical alloying. Credit for both MSE 440 and MSE 540 is not allowed

Prerequisite: MSE 360 and MSE 370. Corequisite: MSE 420
Typically offered in Fall only

MSE 545/MSE 445 Ceramic Processing (3 credit hours)
Ceramic processing of powders includes powder synthesis, characterization, mixing, and size reduction. Theoretical aspects include particle packing, particles in suspension, and some aspects of surface chemistry. Forming methods include compaction, casting, and extrusion. Firing and sintering are examined. Credit for both MSE 445 and MSE 545 is not allowed

Prerequisite: MSE 370
Typically offered in Fall only

MSE 555 Polymer Technology and Engineering (3 credit hours)
Classes of commercially important polymers, advanced topics in phase behavior, viscoelasticity, fracture and ultimate properties of polymers; polymer rheology, and processing; design of polymeric materials. Credit for both MSE 455 and MSE 555 is not allowed.

Prerequisite: MSE 424 or equivalent
Typically offered in Spring and Summer

MSE 556/MSE 456 Composite Materials (3 credit hours)
The course covers the basic principles underlying properties of composite materials as related to the properties of individual constituents and their interactions. Polymer, metal and ceramic matrix composites are included. Property averaging and micromechanics of composites are covered at an introductory level. Emphasis is placed on design and processing of composite systems to yield desired combinations of properties. Credit for both MSE 456 and MSE 556 is not allowed.

Prerequisite: MSE 420
Typically offered in Spring and Summer

MSE 560 Microelectronic Materials Science and Technology (3 credit hours)
Processes and characterization techniques relevant to microelectronic materials science and technology. Boule growth, water preparation, oxidation, epitaxial growth, doping techniques, metallization, and device applications of elemental and compound semiconductors. Electrical, structural and chemical characterization of semiconductors as well as materials considerations relevant to device fabrication. Credit for both MAT 460 and MSE 560 is not allowed

Prerequisite: MAT 331, Corequisite: MAT 431
Typically offered in Fall only

MSE 561/TC 561 Organic Chemistry Of Polymers (3 credit hours)
Principles of step reaction and addition polymerizations; copolymerization; emulsion polymerization; ionic polymerization; characterization of polymers; molecular structure and properties.

Prerequisite: TC 461 and CH 231 or CH 431

MSE 565/MSE 465 Introduction to Nanomaterials (3 credit hours)
Introduction to nanoparticles, nanotubes, nanowires, and nanostructured films, emphasizing their synthesis, structural and property characterization, novel physical and chemical properties, applications and contemporary literature.

Prerequisite: MSE 201
Typically offered in Spring only

MSE 566 Mechanical Properties of Nanostructured Materials (3 credit hours)
The course covers mechanical behavior that is unique to nanostructured materials Â¿ typically nanocrystalline metals and alloys. The various methods for processing nanostructured materials will be presented, emphasizing those that are suitable for mechanical property studies. The thermal stability of nanocrystalline microstructures will be covered and strategies for inhibiting grain growth described. Mechanical testing methods for uniaxial loading, creep, fracture and fatigue will be covered. Testing methods will also be discussed in context with structure-property relations, deformation mechanisms and failure modes.

Prerequisite: MSE 500 or an instructor approved equivalent.
Typically offered in Spring only

MSE 576/MBA 576 Technology Entrepreneurship and Commercialization I (3 credit hours)
First course in a two-course entrepreneurship sequence focusing on opportunities for technology commercialization. Evaluation of commercialization of technologies in the context of new business startups. Emphasis is placed on creating value through technology portfolio evaluation and fundamentals of technology-based new business startups. This includes development of value propositions and strong technology-product-market linkages. The process based approach is appropriate for new business startup as well as entrepreneurship in existing organizations through spinoffs, licensing, or new product development. Credit not allowed for MBA 576 if the student has already taken MBA 570 or MBA 571.

Credit not allowed in MBA 576 if the student has already taken MBA 570 or MBA 571
Typically offered in Fall and Spring

MSE 577/MBA 577 Technology Entrepreneurship and Commercialization II (3 credit hours)
Continuation of evaluation of technologies for commercialization through new business startups. Emphasis is placed on creating value through strong technology-products-markets linkages using the TEC algorithm. Topics include industry and market testing of assumptions, legal forms of new business startups, funding sources and creating a quality, integrative new business startup plan. Credit not allowed in 577 for students who have already taken 570 or 571.

Prerequisite: MBA/MSE 576. Credit not allowed in 577 for students who have already taken 570 or 571.
Typically offered in Spring only

MSE 580/MSE 480 Materials Forensics and Degradation (3 credit hours)
Covers principles and prevention of the degradation of materials. The topics will include dissolution of polymer and ceramic materials, electrochemical corrosion, oxidation of metals and polymers, degradation of polymers, friction and wear, degradation of electrical device components, bio-deterioration of materials, and failure analysis. The general practice in failure analysis will be applied to a variety of case studies to illustrate important failure mechanisms. Credit will not be given for both MSE 480 and MSE 580.

Prerequisite: MSE 370 and MSE 380
Typically offered in Spring only

MSE 589/PY 489/PY 589/ECE 489/ECE 589/MSE 489 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

MSE 591 Special Topics In Materials Science and Engineering (1-4 credit hours)
Topics of current interest in Materials Science and Engineering not covered in existing courses.

Typically offered in Fall and Spring

MSE 601 Seminar (1 credit hours)
Reports and discussion of special topics in materials science and engineering and allied fields.

Typically offered in Fall and Spring

MSE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MSE 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Summer only

MSE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MSE 695 Master's Thesis Research (1-9 credit hours)
Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MSE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

MSE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MSE 702 Defects In Solids (3 credit hours)
Prerequisite: MSE 500
Typically offered in Spring only

MSE 703 Interaction of Electrons with Materials (3 credit hours)
This course reviews basic interaction of electrons with solids through the free electron theory, quantum mechanics and quantum phenomena, and band theory. The course provides a practical foundation for understanding of electrical behavior of metals, semiconductors, dielectrics and non-crystalline materials and how this behavior relates to structure and materials processing. Graduate standing in MSE, CBME, ECE, PY, CH, or consent of the instructor required.

Prerequisite: MSE 500
Typically offered in Fall only

MSE 704 Interaction of Photons with Materials (3 credit hours)
This course will answer basic questions on photon-matter interaction: Why do materials appear the way we see them? How can we change and control that? How can we apply their optical properties in various optical elements and optoelectronic devices? The course provides a practical foundation for working with and developing of materials for modern optoelectronic and photonic technologies. Graduate standing in MSE, CBME, ECE, PY, CH, or consent of the instructor required.

Prerequisite: MSE 703
Typically offered in Spring only

MSE 705 Mechanical Behavior Of Engineering Materials (3 credit hours)
Coverage of both fundamental and engineering aspects of mechanical behavior of materials. Elasticity, plasticity and dislocation theory concepts used to describe phenomenological behavior and micro-mechanical mechanisms. Strengthening mechanisms in crystals, high-temperature deformation, fracture mechanics, fracture toughening mechanisms and cyclic deformation.

Prerequisite: MAT 450, MAT 702
Typically offered in Spring only

MSE 706 Phase Transformations and Kinetics (3 credit hours)
Homogeneous and heterogeneous nucleation, spinodal decomposition, interface and diffusion-controlled growth, formal theory of transformation kinetics, precipitation, coarsening, order-disorder, and martensitic transformations.

Prerequisite: MAT 700, MAT 710, and MSE 500
Typically offered in Spring only

MSE 708 Thermodynamics Of Materials (3 credit hours)
Review of first and second laws of thermodynamics, equilibrium and irreversible processes, open and closed systems, partition functions and particle distribution functions. Applications include extension of thermodynamic potentials to situations where electrical, magnetic and stress fields present, heat capacity of crystals, electron gas in metals, solution models, binary phase diagrams and rubber elasticity in polymers.

Prerequisite: MAT 301 and MSE 500
Typically offered in Fall only

MSE 709 Metastable Materials: Processing, Structure, and Properties (3 credit hours)
The thermodynamics and kinetics of the synthesis and stability of a variety of important metastable materials - those materials that are not in the lowest free energy state for the composition and structure - will be described. The common methods for non-equilibrium processing will be covered. A significant part of the course will be devoted to amorphous materials, including their synthesis, structure, and properties. Other topics will include quasi-crystalline materials, metastable crystalline materials, and shape memory alloys. As background for shape memory alloys, diffusionless phase transformations with emphasis on martensitic transformations will be reviewed.

Prerequisite: MSE 500 or Instructor Consent
Typically offered in Fall only

MSE 710 Elements Of Crystallography and Diffraction (3 credit hours)
Crystal symmetry, lattices and space groups; elementary diffraction by crystalline matter; experimental methods of x-ray diffraction.

Typically offered in Fall only

MSE 712 Scanning Electron Microscopy (3 credit hours)
Electron optics, sources and detectors. Beam specimen interactions, secondary and backscattered electrons, and EDS. Resolution limits, experimental conditions, related techniques, beam-induced damage and materials modifications.

Typically offered in Fall only

MSE 715 Fundamentals Of Transmission Electron Microscopy (4 credit hours)
Electron optics, electron-solid interactions, electron diffraction, image contrast, defect characterization, analytical and high resolution microscopy. Parallel laboratory demonstrations and exercises. Laboratory enrollment limited to twelve, but laboratory may be waived with consent of instructor.

Prerequisite: MAT 710
Typically offered in Spring only

MSE 718 Advanced Transmission Electron Microscopy (3 credit hours)
This course provides the advanced graduate student with a detailed knowledge of transmission electron microscopy covering: advanced topics in electron sources, details of electron optics and aberrations, aberration corrected electron microscopy, modeling and simulating interactions of electrons with the specimen, image processing and analysis, and analytical techniques (EELS and EDX). Graduate standing in MSE, CHE, ECE, PHY, CH required or consent of the instructor.

Prerequisite: MSE 715
Typically offered in Fall only

MSE 721 Nanoscale Simulations and Modeling (3 credit hours)
The course is designed to assist engineering students in learning the fundamentals and cutting-edge nature of various simulations methods. The modeling tools range from accurate first principles quantum-based approaches to multi-scale approaches that combine atomic and continuum modeling. Previous knowledge of simulations is not required. The course is appropriate for graduate students in materials science, engineering, chemistry, physics and biomedical fields.

Typically offered in Fall only

MSE 723 Materials Informatics (3 credit hours)
The course aims to introduce the emergent field of materials informatics and current approaches that employ informatics and experimental and computational data to accelerate the process of materials optimization, discovery and development. An emphasis will be placed on practical implementation of machine learning techniques to various materials science problems.

Typically offered in Fall only

MSE 731/MAE 731 Materials Processing by Deformation (3 credit hours)
Presentation of mechanical and metallurgical fundamentals of materials processing by deformation. Principles of metal working, friction, forging, rolling, extrusion, drawing, high energy rate forming, chipless forming techniques, manufacturing system concept in production.

Prerequisite: Six hrs. of solid mechanics and/or materials
Typically offered in Fall only

MSE 741 Principles of Corrosion (3 credit hours)
Fundamentals of metallic corrosion and passivity. Electro-chemical nature of corrosive attack, basic forms of corrosion, corrosion rate factors, methods of corrosion protection. Laboratory work included.

Prerequisite: MAT 201 and CH 431 or MAT 301

MSE 751 Thin Film and Coating Science and Technology I (3 credit hours)
Vacuum science and technology including gas kinetics, gas flow calculations, system design and use of various pumps, materials and components. Atomistics of solid surfaces. Nucleation and growth of films and coatings.

Prerequisite: MAT 700
Typically offered in Spring only

MSE 752 Thin Film and Coating Science and Technology II (3 credit hours)
Techniques for thin films and coatings deposition and their applications. Interfaces, adhesion and surface modification. Artificially structured and chemically modulated layered materials. Pseudomorphic structures. Characterization of thin films andcoatings.

Prerequisite: MSE 751
Typically offered in Spring only

MSE 757 Radiation Effects on Materials (3 credit hours)
Interaction of radiation with matter with emphasis on microstructural modification, physical and mechanical effects. Defects generation and annealing, void swelling, irradiation growth and creep, and irradiation induced effects in reactor materialsare discussed. Current theories and experimental techniques are discussed.

Typically offered in Spring only

MSE 760 Materials Science in Processing of Semiconductor Devices (3 credit hours)
Ion implantation and doping for advanced semiconductor devices, thin films and epitaxy, silicides, ohmic contacts and interconnection metallurgy, oxidation and nitridation, gettering of impurities and dopant segregation phenomena, electromigration, electronic packaging materials science and advanced device concepts.

Prerequisite: MAT 460 and MSE 500
Typically offered in Fall only

MSE 761/CHE 761 Polymer Blends and Alloys (3 credit hours)
Thermodynamics, morphological characteristics and properties of multiphase polymer systems composed of homopolymers or copolymers. Interfacial characteristics and modification of multicomponent polymer blends through emulsification and reactive blending. Microphase ordering in block copolymers, and emerging technolgies employing these nanostructured materials. Conformational properties and dynamics of macromolecules constrained near an interface.

Prerequisite: CHE 316 or MAT 301
Typically offered in Fall only

MSE 763/TMS 763 Characterization Of Structure Of Fiber Forming Polymers (3 credit hours)
Theories, experimental evidence and characterization methods of the molecular fine structure of fiber forming polymers in the solid state. Characterization methods include X-ray diffraction, microscopy, infrared, thermal and magnetic resonance.

Prerequisite: Graduate standing
Typically offered in Fall only

MSE 770 Defects, Diffusion and Ion Implantation In Semiconductors (3 credit hours)
Thermodynamics of vacancies and interstitials, defect complexes, electronic defects, defect annealing processes, self diffusion, dopant and impurity diffusion, substitutional/interstitial diffusion, diffusion in amorphous solids, electro transport, fundamentals of ion-solid interactions, semiconductor doping atomic structure of defects, damage annealing processes, supersaturated alloys, laser annealing, ion beam mixing phenomena, ion implantation and rapid thermal annealing processes, shallow junctions and devices.

Prerequisite: MAT 701
Typically offered in Spring only

MSE 771 Materials Science of Nanoelectronics (3 credit hours)
Effects of scale less than 100 nm on the electrical properties & processing of all materials (metals, semiconductors, ceramics, polymers and biomaterials). Current status and future prospects for the semiconductor industry summarized by invited scientists and by review and discussion of selected current literature. Student presentations and research proposals are required.

Prerequisite: MSE 500
Typically offered in Fall only

MSE 775 Structure of Semicrystalline Polymers (3 credit hours)
Structure and organization of semicrystalline polymers, from molecular scale to bulk state, including chain configuration, unit cell geometries, polymer crystallography, single crystals, spherulites, epitaxial crystallization, morphology, crystal defects, annealing and deformation mechanisms. Emphasis on analysis of x-ray diffraction, electron diffraction and electron microscopy data for structural characterization.

Prerequisite: MAT 425
Typically offered in Fall only

MSE 791 Advanced Topics in Materials Science and Engineering (1-3 credit hours)
Special studies of advanced topics in materials science and engineering.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

MSE 795 Advanced Materials Experiments (1-3 credit hours)
Advanced engineering principles applied to a specific experimental project dealing with materials. A seminar period provided; required written report.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall, Spring, and Summer

MSE 801 Seminar (1 credit hours)
Reports and discussion of special topics in materials science and engineering and allied fields.

Typically offered in Fall and Spring

MSE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MSE 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Summer only

MSE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MSE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MSE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

MSE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Math & Science Education (EMS)

EMS 204 Introduction to Mathematics Education (2 credit hours)
This course introduces students to the teaching of Mathematics in middle and high schools. Students will become familiar with state mathematics standards and national recommendations for teaching mathematics. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Managemnt for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

Prerequisite: ED 100; Corequisite: ED 204
Typically offered in Fall and Spring

EMS 205 Introduction to Teaching Science (2 credit hours)
Introduces perspective teachers to the teaching of science in the middle school and high school. Topics include nature of the science learner, common alternative conceptions in science, introduction to science teaching strategies, and the science curriculum in middle and high school. Sophomore status or higher is required. Sophomore status or higher is required.

Prerequisite: Sophomore standing; Corequisite: ED 204
Typically offered in Spring only

EMS 296 Special Topics in Education (1-3 credit hours)
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

EMS 350 Teaching Environmental Education (3 credit hours)
This course is designed to provide disciplinary and interdisciplinary overviews of environmental education. Students will learn a range of research-supported practices in environmental education that are effective for youth and adults. Topics include a variety of methods for teaching and assessing environmental education.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

EMS 373 Instructional Materials in Science (3 credit hours)
Development and selection of teaching materials that reflect concepts of content and emphasis in middle and secondary school science. Experimental and laboratory approaches, including use of microcomputer and video technologies.2 lecture hours and 6 lab hours per week for 7 weeks

Prerequisite or Corequisite: EMS 205 and ED 204
Typically offered in Fall only

EMS 375 Methods of Teaching Science I (3 credit hours)
Classroom, laboratory, and internship experiences for pre-service teachers to effectively prepare, plan and assess learning environments in the middle and secondary science classroom and instructional laboratory. Emphasis placed on knowledge, skills, and dispositions for inquire-based learning environments.

Prerequisite: EMS 205, ED 204
Typically offered in Spring only

EMS 470/EMS 570 Methods and Materials for Teaching Mathematics (3 credit hours)
Purposes, methods, curricula, and evaluation practices for teaching mathematics in middle and high school levels.

Prerequisite: C or better in EMS 480 and EMS 472 or EMS 474 and admittance to Teacher Candidacy.
Typically offered in Fall only

EMS 471 Student Teaching in Mathematics (1-12 credit hours)
Supervised experience in a selected middle or secondary school for the semester, to develop and practice the skills and techniques for teaching mathematics. Students are required to provide their own transportation. MED, MSM and MSD majors only.

Prerequisite: Admission to professional semester, Completion of EMS 470 with a C or better; Corequisite: EMS 495
Typically offered in Spring only

EMS 472/EMS 572 Teaching Mathematics Topics in Senior High School (3 credit hours)
Preparation for teaching mathematics in grades 9-12. This course includes a school-based field experience. Students are required to provide their own transportation. MED Majors only.

Prerequisite: Admittance to Teacher Candidacy
Typically offered in Spring only

EMS 474 Teaching Mathematics Topics in the Middle Grades (3 credit hours)
Methods of teaching arithmetic, geometry, algebra, and pre-algebra topics in grades 6-9. Emphasizes approaches that actively involve learners and relate operations on concrete and pictorial representations to mathematical symbols. This course includes a school-based field experience. Students are required to provide their own transportation. MSM Majors only.

Prerequisite: Admittance to Teacher Candidacy
Typically offered in Spring only

EMS 475 Methods of Teaching Science II (3 credit hours)
Goals, methods, curricula, and evaluation practices in teaching the physical and biological sciences at the middle and secondary school levels.Taught during the fall.

Prerequisite: EMS 375
Typically offered in Fall only

EMS 476 Student Teaching in Science (1-12 credit hours)
Supervised experience in a selected middle or secondary school for the semester, to develop and practice the skills and techniques for teaching Science. Students are required to provide their own transportation. SED and MSS majors only. Students are required to purchase internships liability insurance to participate in student teaching. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

Prerequisite: EMS 475; and Corequisite: EMS 495
Typically offered in Spring only

EMS 480/EMS 580 Teaching Mathematics with Technology (3 credit hours)
Prepares prospective mathematics teachers to use technology in their classrooms to assist students in formulating and solving math problems in the middle and high school mathematics curricula.

Prerequisite: EMS 204 with a B- or better; MA 131 or 141
Typically offered in Spring only

EMS 490 School Mathematics from an Advanced Perspective (3 credit hours)
This course will serve as a culminating experience for all students majoring in mathematics education and intending to become secondary mathematics teachers. Course content includes functions in both secondary and collegiate mathematics, development of euclidean geometry from euclid's elements, and historical overview of algebra, and other mathematics subject matter, a trigonometry review from both triangle basis and function basis, connections between linear algebra and the high school presentation of matrices, and other topics. For Math Education majors only.

Prerequisite: MA 403 or MA 407, MA 308 or MA 408, MA 205 or MA 305 or MA 405
Typically offered in Fall only

EMS 495 Senior Seminar in Mathematics and Science Education (1-3 credit hours)
In-depth investigation of one or more teaching areas in mathematics or science education.

Prerequisite: Advanced Undergraduate standing
Typically offered in Spring only

EMS 496 Special Topics in Education (1-3 credit hours)
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

Prerequisite: Junior or senior standing

EMS 505 Methods of Teaching Science I (3 credit hours)
Graduate students new to science teaching will read current research literature that defines best practices and incorporate these practices to lesson planning that enhances student learning. Classroom, laboratory, and school-based experiences in middle and secondary science classrooms and instructional laboratories will help students to effectively prepare, plan, and assess learning environments. Emphasis placed on the development of knowledge, skills, and dispositions for inquiry-based learning environments. Underlying theoretical framework is constructivism, and experiences will be discussed using current learning theory. PBS or Graduate Standing.

Typically offered in Spring only

EMS 506 Methods of Teaching Science II (3 credit hours)
This course is designed to provide graduate-level pre-service teachers with meaningful and practical learning experiences that will prepare them to create effective science learning environments for secondary school age students and to construct a vision of themselves as a teacher of secondary science. In the course, pre-service teachers will have opportunities to apply research-supported best practices to planning and enacting science lessons and to critically analyze current trends, issues and problems in science education.

Typically offered in Fall only

EMS 510 Interactions In the Mathematics Classroom (3 credit hours)
This course focuses on interactions between students and teachers in the mathematics classroom. Topics studied will include: whole class instruction, small group activity, questioning and facilitating classroom discussion. This course will include a field experience in the schools for which students will be required to provide their own transportation. Course restricted to mathematics education students in the MED, MS or MAT programs.

Typically offered in Spring only

EMS 512 Teaching and Learning Elementary and Middle Grades Mathematics (3 credit hours)
Focus on theory, research, and methodology of teaching and learning mathematics in elementary and middle grades. Emphasizes the development of a foundation for understanding and assessing mathematical growth and learning through historical and psychological sources, research, and reflective practice. Emphasis is placed upon understanding how children come to learn elementary mathematics meaningfully and what this necessarily implies about the way mathematics is taught and how elementary and middle grades education can be improved.

Prerequisite: EMS 471
Typically offered in Fall only

EMS 513 Teaching and Learning of Algebraic Thinking (3 credit hours)
Teaching and learning of algebra from a developmental perspective; research-based methods for developing students' algebraic thinking; structure and processes used in algebra. Focus on how students develop algebraic ideas from upper elementary grades through Algebra I.

Prerequisite: EMS 471 or equivalent teaching experience.
Typically offered in Fall only

EMS 514 Teaching and Learning of Geometric Thinking (3 credit hours)
Focus will be on the development of geometric thinking in grades K-12 using multiple instructional approaches, including technology, and considered using different theories of learning and frameworks (e.g., Van Hiele, SOLO taxonomy). Topics may include: measurement, similarity, congruence, properties of 2 and 3 dimensional figures, circles, non-Euclidean geometries. Synthetic, analytic and transformational, formal and informal approaches will be highlighted.

Prerequisite: EMS 471 and either MA 308 or MA 408
Typically offered in Fall only

EMS 519/ST 519 Teaching and Learning of Statistical Thinking (3 credit hours)
This course is designed to bridge theory and practice on how students develop understandings of key concepts in data analysis, statistics, and probability. Discussion of students' understandings, teaching strategies and the use of manipulatives and technology tools. Topics include distribution, measures of center and spread, sampling, sampling distribution, randomness, and law of large numbers. Must complete a first level graduate statistics course (ST 507, ST 511, or equivalent) before enrolling.

Prerequisite: ST 507 or ST 511
Typically offered in Spring only

EMS 521 Advanced Methods in Science Education I (3 credit hours)
Contemporary learning theories and current research will guide students to create effective science learning environments for all students. Students will engage in critical analysis of current trends, issues and problems in science education in terms of multiple perspectives. Students will also have opportunities to contemplate what it means to teach science, what it means to teach a diverse population of students and how to develop, interpret, and implement alternative assessment.

Prerequisite: Graduate Standing in MAT: STEM-Science Education and Doctoral Standing in Learning and Teaching in STEM
Typically offered in Fall only

EMS 522 Advanced Methods in Science Education II (3 credit hours)
Examines science instruction through analysis of curriculu, instructional practices, current research on science learning and teaching. Five areas of interest: curriculum, instruction, assessment, diversity, learning environments and technology in science education.

R: Graduate Standing in MAT: STEM-Science Education
Typically offered in Fall only

EMS 531 Introduction to Research in Science Education (3 credit hours)
Introduction to science education research, within two focal areas. One focus is to learn to read, understand, evaluate, and apply published educational research in your own practice, with scaffolding to support your understanding of techniques and designs specific to and/or in the context of science education research. Another focus is to learn to conduct research in order to improve your effectiveness as an educator or solve educational problems. You will learn about ethics connected with research and will perform and interpret quantitative and/or qualitative analyses commonly used in science education research while carrying out a research project that you designed. You will learn about how research papers are structured and organized, and communicate your research findings in both oral and written form.

Prerequisite: Graduate standing in Science Education
Typically offered in Spring only

EMS 570/EMS 470 Methods and Materials for Teaching Mathematics (3 credit hours)
Purposes, methods, curricula, and evaluation practices for teaching mathematics in middle and high school levels.

Prerequisite: C or better in EMS 480 and EMS 472 or EMS 474 and admittance to Teacher Candidacy.
Typically offered in Fall only

EMS 572/EMS 472 Teaching Mathematics Topics in Senior High School (3 credit hours)
Preparation for teaching mathematics in grades 9-12. This course includes a school-based field experience. Students are required to provide their own transportation. MED Majors only.

Prerequisite: Admittance to Teacher Candidacy
Typically offered in Spring only

EMS 573 Design of Tools and Learning Environments in STEM Education (3 credit hours)
The course aims to develop: familiarity with research related to the teaching and learning of STEM content within technological learning environments, advanced knowledge of the ways technology can support teaching and learning in STEM, and ability to design technology-enabled learning experiences. Course activities are designed to enhance understandings and applications of technological tools within and across STEM disciplines.

Restriction: Graduate standing in STEM Education
Typically offered in Fall and Spring

EMS 575 Foundations Of Science Education (3 credit hours)
Study and analysis of philosophical, historical, sociological, political and economic factors affecting science education in schools of the U.S. Implications for science education of various learning theories along with models for curriculum development and program planning.

Prerequisite: Graduate standing in Science Education
Typically offered in Spring only

EMS 577 Improving Classroom Instruction In Science (3 credit hours)
Application of major principles of education and psychology to improvement of science teaching in elementary, middle and secondary schools. Emphasis on critical analysis of research and the development of research-based classroom applications. Goalsand objectives of science teaching, instructional strategies, development or selection of science materials, evaluation of achievement and elements of a desirable classroom climate.

Prerequisite: EMS 475
Typically offered in Spring only

EMS 580/EMS 480 Teaching Mathematics with Technology (3 credit hours)
Prepares prospective mathematics teachers to use technology in their classrooms to assist students in formulating and solving math problems in the middle and high school mathematics curricula.

Prerequisite: EMS 204 with a B- or better; MA 131 or 141
Typically offered in Spring only

EMS 581 Advanced Applications of Technology in Mathematics Education (3 credit hours)
Research-based applications of technology tools in secondary and middle school mathematics. Advanced use of various technology tools for learning and teaching mathematics, including design of technology environments, appropriate investigation tasks, and professional development.

Typically offered in Spring only

EMS 592 Special Problems In Mathematics Teaching (1-6 credit hours)
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

Prerequisite: EMS 471
Typically offered in Fall, Spring, and Summer

EMS 594 Special Problems In Science Teaching (1-3 credit hours)
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

Prerequisite: EMS 476
Typically offered in Fall, Spring, and Summer

EMS 621 Special Problems In Mathematics Teaching (1-6 credit hours)
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

Prerequisite: EMS 471
Typically offered in Summer only

EMS 622 Special Problems In Science Teaching (1-6 credit hours)
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

Prerequisite: EMS 476
Typically offered in Fall, Spring, and Summer

EMS 630 Independent Study in EMS (1-3 credit hours)
Detailed investigation of topics of particular interest to graduate students under faculty direction on a tutorial basis. Determination of credits and content by faculty member in consultation with department head.

Typically offered in Fall and Spring

EMS 641 Practicum In Science and Mathematics Education (1-6 credit hours)
Supervised practicum in appropriate settings both on- and off-campus. Provision for opportunity for development, implementation and evaluation in science and mathematics in clinical environment under faculty supervision.

Prerequisite: EMS 770 or EMS 775
Typically offered in Fall and Spring

EMS 651 Internship In Mathematics And Science Education (1-9 credit hours)
Utilizing the participant-observed role, required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences of selected course of action.

Prerequisite: Nine hrs. in grad. level courses
Typically offered in Fall, Spring, and Summer

EMS 675 Portfolio Development (1 credit hours)
Techniques of portfolio construction for documenting attainment of advanced competencies in science training.For students in the last or next to last semester of coursework in the Science Education Masters Program.

Typically offered in Fall only

EMS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

EMS 686 Teaching In College (3 credit hours)
Focus on development of competencies to perform fundamental tasks of a college teacher as well as consideration of more long-range tasks such as course development and university responsibilities of a professor. In addition to attending lectures andother types of presentations, students make video tapes of their teaching, develop tests, design introductory courses in their teaching fields and consider current issues related to university and college teaching.

Typically offered in Summer only

EMS 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EMS 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring and Summer

EMS 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring only

EMS 692 Research Projects In Mathematics and Science Education (1-3 credit hours)
A project or problem in research in education for graduate students, supervised by members of the graduate faculty. The research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 532
Typically offered in Fall, Spring, and Summer

EMS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EMS 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EMS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

EMS 699/EOE 699/EAC 699/ECD 699/ECI 699/ELP 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

EMS 703 Teaching Mathematics and Science In Higher Education (3 credit hours)
Examination of collegiate mathematics and science instruction with respect to goals and objectives, design of courses and curricula, innovative programs and facilities, and methods and materials for instruction.

Prerequisite: EMS 770, 621 or 622, Graduate standing
Typically offered in Spring only

EMS 704 Curriculum Development and Evaluation In Science and Mathematics (3 credit hours)
Critical study of elements of curriculum design and theory in mathematics education and science education and examination of evaluation procedures for assessing educational innovations.

Prerequisite: 500-level statistics, PSY 535
Typically offered in Spring only

EMS 705 Education and Supervision Of Teachers Of Mathematics and Science (3 credit hours)
Critical analysis of theories, programs and techniques designed to promote interpersonal interactions leading to more effective teaching of science and mathematics.

Prerequisite: EMS 770 or 621 or 622
Typically offered in Spring only

EMS 711 Research on the Teaching and Learning of Math at Secondary and Early College Levels (3 credit hours)
This course familiarizes students with theories and research related to mathematical thinking, learning and teaching at the secondary and early college levels with a focus on the following topics: function, expressions and equations, geometry, proof, limit, calculus, differential equations, and linear algebra. Students will apply theories to analyze secondary and freshmen/sophomore standing mathematical thinking, synthesize research findings, explain difficulties students experience, and design and conduct research. Restriction: at least 18 hrs of 400-500 level mathematics and a PhD student in Mathematics Education.

Typically offered in Spring only

EMS 712 Teaching Mathematics In Elementary and Junior High School (3 credit hours)
Comprehensive study of teaching mathematics in elementary and junior high schools. Major emphasis on building skills in teaching arithmetic, elementary algebra and intuitive geometry. Thorough search of literature relative to mathematics curricula conducted, designing and sequencing of learning activities, teaching mathematical concepts and relationships, building skill in computation, reading mathematics, problem solving and measurement.

Prerequisite: EMS 471
Typically offered in Spring and Summer

EMS 730 Trends and Issues in Science Education (3 credit hours)
Provides an in-depth examination and analysis of literature and research in science education as well as current trends in science education reform. Emphasis is placed on the analysis of theoretical models of inquiry. Course includes the development of a review of literature and the formation of research questions specific to science education.

Prerequisite: Graduate standing
Typically offered in Fall only

EMS 731 Fundamentals of Research in Science Education: Qualitative and Quantitative Inqu (3 credit hours)
Analyze the range of research designs currently utilized by science education reseachers. Develop an understanding of the assumptions and frameworks of different types of inquiry in science education. A brief history of research in science education is examined as a means to orient students to the trends that have taken place. Read, comprehend, and critically analyze qualitative and quantitative designs in science education.

Prerequisite: Graduate standing and ST 507 or 511, Corequisite: ST 508 or 512
Typically offered in Spring only

EMS 732 Theoretical and Critical Perspectives of Science Education (3 credit hours)
Examines current theoretical and critical perspectives of science education. Examines a variety of approaches which re-assess cultural notions of meaning, identity, power, and representation in the sciences and science education. Applies research theory to reform in science education.

Prerequisite: Graduate standing
Typically offered in Fall only

EMS 770 Foundations Of Mathematics Education (3 credit hours)
The current status of mathematics education with special emphasis on study and critical analysis of current practices in mathematics instruction from elementary school through college.

Prerequisite: EMS 471
Typically offered in Spring only

EMS 775 Foundations Of Science Education (3 credit hours)
Study and analysis of philosophical, historical, sociological, political and economic factors affecting science education in schools of the U.S. Implications for science education of various learning theories along with models for curriculum development and program planning. Critical analysis of current trends, issues and problems in science education in terms of multiple perspectives.

Prerequisite: EMS 475
Typically offered in Spring only

EMS 777 Improving Classroom Instruction In Science (3 credit hours)
Application of major principles of education and psychology to improvement of science teaching in elementary, middle and secondary schools. Emphasis on critical analysis of research and the development of research-based classroom applications. Goalsand objectives of science teaching, instructional strategies, development or selection of science materials, evaluation of achievement and elements of a desirable classroom climate.

Prerequisite: EMS 475
Typically offered in Spring only

EMS 780 Foundational Learning Theories in STEM Education (3 credit hours)
This course is an introduction to the field of learning sciences related to STEM education. Students examine the learning theories as they relate to STEM disciplines and apply the theories to the design of research. Applications of learning theory to STEM education reform will be discussed.

Restriction: Doctoral Standing in Learning and Teaching in STEM
Typically offered in Spring only

EMS 786/EAC 786 Teaching in College (3 credit hours)
Focus on development of competencies to perform fundamental tasks of a college teacher as well as consideration of more long-range tasks such as course development and university responsibilities of a professor. In addition to attending lectures andother types of presentations, students make video tapes of their teaching, develop tests, design introductory courses in their teaching fields and consider current issues related to university and college teaching.

Typically offered in Fall and Summer

EMS 791 Contemporary Research and Critical Issues in STEM Education (3 credit hours)
This course is designed to provide disciplinary and interdisciplinary overviews of STEM issues and trends that will help graduate students construct their own theoretical foundations and practical understanding of STEM education. In the course, students will discuss a wide range of current issues, movements, and research-supported practices in STEM education not only in K-16 classrooms but also informal education settings. Students will also have opportunities to conceptualize their own framework for quality STEM education connecting research and practice in the field. A main course activity will be reading, analysis, and discussion of selected readings in each topic area. Students will share the responsibility of guiding class discussions, write up reflection and conceptualization, and conduct individual project that relates directly to the main topics explored in the course.

Prerequisites: Doctoral Standing in Learning and Teaching in STEM
Typically offered in Fall only

EMS 792 Special Problems in Math Teaching (3-6 credit hours)
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

Typically offered in Fall, Spring, and Summer

EMS 794 Special Problems in Science Teaching (3-6 credit hours)
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

Prerequisite: EMS 476
Typically offered in Fall, Spring, and Summer

EMS 802 Seminar In Mathematics Education (1-12 credit hours)
In-depth examination and analysis of literature and research in a particular topic(s) in mathematics education.

Prerequisite: Departmental Majors
Typically offered in Fall and Spring

EMS 803 Seminar In Science Education (2 credit hours)
In-depth examination and analysis of literature and research in a particular topic(s) in science education.

Prerequisite: Department Majors
Typically offered in Fall and Spring

EMS 821 Special Problems In Mathematics Teaching (1-6 credit hours)
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

Prerequisite: EMS 471
Typically offered in Summer only

EMS 822 Special Problems In Science Teaching (1-6 credit hours)
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

Prerequisite: EMS 476
Typically offered in Fall, Spring, and Summer

EMS 832 Research Applications in Science Education (3 credit hours)
Provides students with the opportunity to design science education research including formulating research questions, designing the methodologies to be used in the study, selecting assessments and protocols, and identifying appropriate analyses. Theoretical frameworks and associated assumptions are identified and critiqued. Develop advanced skills in reviewing different types of science education research and identifying issues of validity and reliability.

Prerequisite: EMS 730, EMS 731, ST 508
Typically offered in Spring only

EMS 841 Practicum In Science and Mathematics Education (1-6 credit hours)
Supervised practicum in appropriate settings both on- and off-campus. Provision for opportunity for development, implementation and evaluation in science and mathematics in clinical environment under faculty supervision.

Prerequisite: EMS 770 or EMS 775
Typically offered in Fall, Spring, and Summer

EMS 851 Internship In Mathematics and Science Education (1-9 credit hours)
Utilizing the participant-observer role, required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences of selected course ofaction.

Prerequisite: Nine hrs. in grad. level courses
Typically offered in Fall, Spring, and Summer

EMS 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

EMS 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EMS 892 Research Projects In Mathematics and Science Education (1-3 credit hours)
A project or problem in research in education for graduate students, supervised by members of the graduate faculty. The research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 532
Typically offered in Fall, Spring, and Summer

EMS 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EMS 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

EMS 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

EMS 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Math in Agriculture and Related Sciences (MAA)

MAA 102 Mathematics in Agriculture and Related Sciences (3 credit hours)
Develops the ability to utilize skills and technology to solve problems at a level found in non-mathematics-intensive programs. Topics include applications to percent, ratio and proportions, formulas, algebra and solutions to linear equations and the elements of plane geometry. Applications include, but are not limited to, business, finance and agriculture. Restricted to Agricultural Institute Students only. C-Wall course; Prerequisite for MA 103, Topics in Contemporary Math.

Requisite: Agricultural Institute Only
Typically offered in Fall and Spring

Mathematical Sciences (MSGE)

MSGE 295 Mathematical Sciences Special Topics (3 credit hours)
Special topics course offering for the general education Mathematical Sciences category.

GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

Mathematics (MA)

MA 101 Intermediate Algebra (4 credit hours)
Preparation for MA 103, MA 105, MA 107, MA 111, and MA 114. Reviews main topics from high school Algebra I and Algebra II emphasizing functions and problem solving. Other concepts and skills covered include algebraic operations, factoring, linear equations, graphs, exponents, radicals, complex numbers, quadratic equations, radical equations, inequalities, systems of equations, compound inequalities, absolute value in equations and inequalities. MA 101 may not be counted as credit toward meeting graduation. Credit for MA 101 is not allowed if student has prior credit in any other mathematical course.

Typically offered in Summer only

MA 103/MA 103A Topics in Contemporary Mathematics (3 credit hours)
Primarily for students in Humanities and Social Sciences. Illustrations of contemporary uses of mathematics, varying from semester to semester, frequently including sets and logic, counting procedures, probability, modular arithmetic, and game theory.

Prerequisite: MA 101 or equivalent completed in high school
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 103A/MA 103 Topics in Contemporary Mathematics (3 credit hours)
Primarily for students in Humanities and Social Sciences. Illustrations of contemporary uses of mathematics, varying from semester to semester, frequently including sets and logic, counting procedures, probability, modular arithmetic, and game theory.

Prerequisite: MA 101 or equivalent completed in high school
GEP Mathematical Sciences
Typically offered in Fall and Spring

MA 105 Mathematics of Finance (3 credit hours)
Simple and compound interest, annuities and their application to amortization and sinking fund problems, installment buying, calculation of premiums of life annuities and life insurance.

Prerequisite: MA 101 or equivalent completed in high school
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 107 Precalculus I (3 credit hours)
Algebra and basic trigonometry; polynomial, rational, exponential, logarithmic and trigonometric functions and their graphs. Credit for MA 107 does not count toward graduation for students in Engineering, College of Sciences, Bio and Ag Engineering (Science Program), Bio Sci (all options), Math Edu, Sci Edu, Textiles, and B.S. degrees in CHASS. Credit is not allowed for both MA 107 and MA 111

Prerequisite: C- or better in MA 101, or a 450 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 108 Precalculus II (3 credit hours)
Algebra, analytic geometry and trigonometry; inequalities, conic sections, complex numbers, sequences and series, solving triangles, polar coordinates, and applications.Credit for MA 108 does not count toward graduation for students in Engineering, College of Sciences, Design, Bio and Ag Engineering (Science Program), Bio Sci (all options), Math Edu, Sci Edu, Textiles, and B.S. degrees in CHASS. Credit is not allowed for both MA 108 and MA 111. Also, MA 108 should not be counted toward the GER mathematical sciences.

Prerequisite: C- or better in MA 107
Typically offered in Spring only

MA 111 Precalculus Algebra and Trigonometry (3 credit hours)
Real numbers, functions and their graphs (special attention to polynomial, rational, exponential, logarithmic, and trigonometric functions), analytic trigonometry. Credit in MA 111 does not count toward graduation for students in Engr., College of Sciences., Design, Biological & Ag. Engr. (Science Program), Biological Sci.(all options),Math. Edu., Forestry, & Textiles. Credit is not allowed for both MA 111 and either MA 107 or MA 108.

Prerequisite: C- or better in MA 101, or 480 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 114 Introduction to Finite Mathematics with Applications (3 credit hours)
Elementary matrix algebra including arithmetic operations, inverses, and systems of equations; introduction to linear programming including simplex method; sets and counting techniques, elementary probability including conditional probability; Markov chains; applications in the behavioral, managerial and biological sciences. Computer use for completion of assignments.

Prerequisite: MA 101 or equivalent completed in high school.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 116 Introduction to Scientific Programming (Math) (3 credit hours)
Computer-based mathematical problem solving and simulation techniques using MATLAB. Emphasizes scientific programming constructs that utilize good practices in code development, including documentation and style. Covers user-defined functions, data abstractions, data visualization and appropriate use of pre-defined functions. Applications are from science and engineering.

Prerequisite: MA 141, and either COS 100 or E 115; Corequisite: MA 241
Typically offered in Fall and Spring

MA 121 Elements of Calculus (3 credit hours)
For students who require only a single semester of calculus. Emphasis on concepts and applications of calculus, along with basic skills. Algebra review, functions, graphs, limits, derivatives, integrals, logarithmic and exponential functions, functions of several variables, applications in management, applications in biological and social sciences. Credit is not allowed in more than one of MA 121, 131, 141. MA 121 may not be substituted for MA 131 or MA 141 as a curricular requirement

Prerequisite: MA 107 or 111 with a C- or better, or 480 on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 121 and MA 131 or MA 141.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 131 Calculus for Life and Management Sciences A (3 credit hours)
First order finite difference models; derivatives - limits, power rule, graphing, and optimization; exponential and logarithmic functions - growth and decay models; integrals - computation, area, total change; applications in life, management, and social sciences. Credit not allowed for more than one of MA 121, 131, and 141

Prerequisite: C- or better in MA 107 or MA 111, or 520 or better on the SAT Subject Test in Mathematcs Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 131 and MA 121 or MA 141.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 132 Computational Mathematics for Life and Management Sciences (1 credit hours)
Computational aspects of calculus for the life and management sciences; use of spreadsheets and a computer algebra system; applications to data models, differential equation models, and optimization.

Prerequisite: C- or better in MA 121 or MA 131
Typically offered in Fall and Spring

MA 141 Calculus I (4 credit hours)
First of three semesters in a calculus sequence for science and engineering majors. Functions, graphs, limits, derivatives, rules of differentiation, definite integrals, fundamental theorem of calculus, applications of derivatives and integrals. Use of computation tools. Credit is not allowed for more than one of MA 141, 131, 121

Prerequisite: MA 111 or MA 108 with grade of C- or better, or 550 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 141 and MA 121 or MA 131.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 151 Calculus for Elementary Education I (3 credit hours)
Calculus for Elementary Education I is the first semester of a two semester sequence of courses designed for the Elementary Education Program. Topics will include sequences, limit, and derivative. Also, topics related to teaching elementary mathematics will be discussed. Students cannot receive credit for more than one of MA 151, MA 121, MA 131, or MA 141. MA 151 is not an accepted prerequisite for MA 231 and MA 241. This course is restricted to Elementary Education majors only.

Prerequisite: C- or better in MA 107 or MA 111, or 520 or better on the SAT Subject Test in Mathematcs Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 131 and MA 121 or MA 141.
GEP Mathematical Sciences
Typically offered in Spring only

MA 152 Calculus for Elementary Education II (3 credit hours)
Calculus for Elementary Education II is the second semester of a two semester sequence of courses designed for the Elementary Education Program. Topics will include derivative, integrals, difference equations, and differential equations. Also, topics related to teaching elementary mathematics will be discussed. This course is restricted to Elementary Education majors only. Students cannot receive credit for both MA 152 and MA 121, MA 131, or MA 141. MA 152 is not an accepted prerequisite for MA 241.

Prerequisite: MA 151
GEP Mathematical Sciences
Typically offered in Fall only

MA 225 Foundations of Advanced Mathematics (3 credit hours)
Introduction to mathematical proof with focus on properties of the real number system. Elementary symbolic logic, mathematical induction, algebra of sets, relations, functions, countability. Algebraic and completeness properties of the reals.

Prerequisite: MA 241
Typically offered in Fall, Spring, and Summer

MA 231 Calculus for Life and Management Sciences B (3 credit hours)
Functions of several variables - partial derivatives, optimization, least squares, Lagrange multiplier method; differential equations - population growth, finance and investment models, systems, numerical methods; MA 121 is not an accepted prerequisite for MA 231.

Prerequisite: MA 131 or MA 141; Credit is not allowed for both MA 231 and MA 241.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 241 Calculus II (4 credit hours)
Second of three semesters in a calculus sequence for science and engineering majors. Techniques and applications of integration, elementary differential equations, sequences, series, power series, and Taylor's Theorem. Use of computational tools.

Prerequisite: MA 141 with grade of C- or better or AP Calculus credit. Credit is not allowed for both MA 241 and MA 231.
GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

MA 242 Calculus III (4 credit hours)
Third of three semesters in a calculus sequence for science and engineering majors. Vectors, vector algebra, and vector functions. Functions of several variables, partial derivatives, gradients, directional derivatives, maxima and mimima. Multiple integration. Line and surface integrals, Green's Theorem, Divergence Theorems, Stokes' Theorem, and applications. Use of computational tools.

Prerequisite: MA 241 with grade of C- or better or AP Calculus credit, or Higher Level IB credit.
Typically offered in Fall, Spring, and Summer

MA 302 Numerical Applications to Differential Equations (1 credit hours)
Numerical methods for approximating solutions for differential equations, with an emphasis on Runge-Kutta-Fehlberg methods with stepsize control. Applications to population, economic, orbital and mechanical models.

Prerequisite: MA 241
Typically offered in Fall and Spring

MA 303 Linear Analysis (3 credit hours)
Linear difference equations of first and second order, compound interest and amortization. Matrices and systems of linear equations, eigenvalues, diagonalization, systems of difference and differential equations, transform methods, population problems. Credit not allowed if credit has been obtained for MA 341 or MA 405

Prerequisite: MA 241
Typically offered in Fall and Spring

MA 305 Introductory Linear Algebra and Matrices (3 credit hours)
The course is an elementary introduction to matrix theory and linear algebra. Emphasis is given to topics that will be useful in other disciplines, including systems of equations, Euclidean vector spaces, determinants, eigenvalues and eigenvectors, linear transformations, similarity, and applications such as numerical solutions of equations and computer graphics. Compares with MA 405 Introductory Linear Algebra, more emphasis is placed on methods and calculations,. Credit is not allowed for both MA 305 and MA 405.

Prerequisite: MA 241 or MA 231 with MA 132
Typically offered in Fall, Spring, and Summer

MA 315/MEA 315 Mathematics Methods in Atmospheric Sciences (4 credit hours)
For sophomore meteorology and marine science students. A complement to MA 242 designed to prepare students for quantitative atmospheric applications. Topics include an introduction to vectors and vector calculus, atmospheric waves, phase and group velocity, perturbation analysis, fourier decomposition, matrix operations, chaos and predictability. For MY, MMY, and MRM majors only.

Prerequisite: MEA 217 or MA 116 or CSC 113; Corequisite: MA 242
Typically offered in Spring only

MA 325 Introduction to Applied Mathematics (3 credit hours)
Introduces students with multivariable calculus to five different areas of applied mathematics. These areas will be five three-week modules, which lead to higher level courses in the application areas. Topics will vary, and examples of modules areheat and mass transfer, biology and population, probability and finance, acoustic models, cryptography as well as others.

Prerequisite: (MA 231 or MA 242) and (MA 116 or CSC 112 or CSC 114 or CSC 116)
Typically offered in Spring only

MA 331 Differential Equations for the Life Sciences (3 credit hours)
This course provides students with an understanding of how mathematics and life sciences can stimulate and enrich each other. The course topics include first order differential equations, separable equations, second order systems, vector and matrix systems, eigenvectors/ eigenvalues, graphical and qualitative methods. The methods are motivated with examples from the biological sciences (growth models, kinetics and compartmental models, epidemic models, predator-prey, etc). Computational modeling will be carried out using SimBiology, a MATLAB toolbox based graphical user interface, which which automates and simplifies the process of modeling biological systems. Credit cannot be given for both MA 341 and MA 331.

P: MA 231 or MA 241; X: Credit cannot be given for both MA 341 and MA 331
Typically offered in Fall only

MA 335/LOG 335 Symbolic Logic (3 credit hours)
Intermediate level introduction to modern symbolic logic focusing on standard first-order logic; topics include proofs, interpretations, applications and basic metalogical results.

Prerequisite: LOG 201 or MA 225 or CSC 226
GEP Mathematical Sciences
Typically offered in Fall only

MA 341 Applied Differential Equations I (3 credit hours)
Differential equations and systems of differential equations. Methods for solving ordinary differential equations including Laplace transforms, phase plane analysis, and numerical methods. Matrix techniques for systems of linear ordinary differential equations. Credit is not allowed for both MA 301 and MA 341

Prerequisite: MA 242 or (MA 132 and MA 231)
Typically offered in Fall, Spring, and Summer

MA 351 Introduction to Discrete Mathematical Models (3 credit hours)
Basic concepts of discrete mathematics, including graph theory, Markov chains, game theory, with emphasis on applications; problems and models from areas such as traffic flow, genetics, population growth, economics, and ecosystem analysis.

Prerequisite: MA 224, 225, 231 or 241
Typically offered in Fall only

MA 401 Applied Differential Equations II (3 credit hours)
Wave, heat and Laplace equations. Solutions by separation of variables and expansion in Fourier Series or other appropriate orthogonal sets. Sturm-Liouville problems. Introduction to methods for solving some classical partial differential equations.Use of power series as a tool in solving ordinary differential equations. Credit for both MA 401 and MA 501 will not be given

Prerequisite: MA 341; Credit not allowed for both MA 401 and MA 501
Typically offered in Fall, Spring, and Summer

MA 402 Mathematics of Scientific Computing (3 credit hours)
This course will provide an overview of methods to solve quantitative problems and analyze data. The tools to be introduced are mathematical in nature and have links to Algebra, Analysis, Geometry, Graph Theory, Probability and Topology. Students will acquire an appreciation of (I) the fundamental role played by mathematics in countless applications and (II) the exciting challenges in mathematical research that lie ahead in the analysis of large data and uncertainties. Students will work on a project for each unit. While this is not a programming class, the students will do some programming through their projects.

P: (MA 341 or MA 405) and programming proficiency (MATLAB, C++, Java, Fortran, or other language)
Typically offered in Fall and Spring

MA 403 Introduction to Modern Algebra (3 credit hours)
Sets and mappings, equivalence relations, rings, integral domains, ordered integral domains, ring of integers. Other topics selected from fields, polynomial rings, real and complex numbers, groups, permutation groups, ideals, and quotient rings. Credit is not allowed for both MA 403 and MA 407

Prerequisite: MA 225
Typically offered in Fall only

MA 405 Introduction to Linear Algebra (3 credit hours)
This course offers a rigorous treatment of linear algebra, including systems of linear equations, matrices, determinants, abstract vector spaces, bases, linear independence, spanning sets, linear transformations, eigenvalues and eigenvectors, similarity, inner product spaces, orthogonality and orthogonal bases, factorization of matrices. Compared with MA 305 Introductory Linear Algebra, more emphasis is placed on theory and proofs. MA 225 is recommended as a prerequisite. Credit is not allowed for both MA 305 and MA 405

Prerequisite: MA 241 (MA 225 recommended); Corequisite: MA 341 is recommended
Typically offered in Fall, Spring, and Summer

MA 407 Introduction to Modern Algebra for Mathematics Majors (3 credit hours)
Elementary number theory, equivalence relations, groups, homomorphisms, cosets, Cayley's Theorem, symmetric groups, rings, polynomial rings, quotient fields, principal ideal domains, Euclidean domains. Credit is not allowed for both MA 403 and MA 407

Prerequisite: MA 225 and MA 405
Typically offered in Fall and Spring

MA 408 Foundations of Euclidean Geometry (3 credit hours)
An examination of Euclidean geometry from a modern perspective. The axiomatic approach with alternative possibilities explored using models.

Prerequisite: MA 225
Typically offered in Fall and Spring

MA 410 Theory of Numbers (3 credit hours)
Arithmetic properties of integers. Congruences, arithmetic functions, diophantine equations. Other topics chosen from quadratic residues, the quadratic reciprocity Law of Gauss, primitive roots, and algebraic number fields.

Prerequisite: One year of calculus
Typically offered in Spring only

MA 412/ST 412 Long-Term Actuarial Models (3 credit hours)
Long-term probability models for risk management systems. Theory and applications of compound interest, probability distributions of failure time random variables, present value models of future contingent cash flows, applications to insurance, health care, credit risk, environmental risk, consumer behavior and warranties.

Prerequisite: MA 241 or MA 231, Corequisite: MA 421, BUS(ST) 350, ST 301, ST 305, ST 311, ST 361, ST 370, ST 371, ST 380 or equivalent
Typically offered in Fall and Summer

MA 413/ST 413 Short-Term Actuarial Models (3 credit hours)
Short-term probability models for risk management systems. Frequency distributions, loss distributions, the individual risk model, the collective risk model, stochastic process models of solvency requirements, applications to insurance and businessdecisions.

Prerequisite: MA 241 or MA 231, and one of MA 421, ST 301, ST 305, ST 370, ST 371, ST 380, ST 421.
Typically offered in Summer only

MA 414/MA 514/CSC 414/CSC 514 Foundations of Cryptography (3 credit hours)
Cryptography is the study of mathematical techniques for securing digital information, systems and distributed computation against adversarial attacks. In this class you will learn the concepts and the algorithms behind the most used cryptographic protocols: you will learn how to formally define security properties and how to formally prove/disprove that a cryptographic protocol achieves a certain security property. You will also discover that cryptography has a much broader range of applications. It solves absolutely paradoxical problems such as proving knowledge of a secret without ever revealing the secret (zero-knowledge proof), or computing the output of a function without ever knowing the input of the function (secure computation). Finally, we will look closely at one of the recent popular application of cryptography: the blockchain technology. Additionally, graduate students will study some of the topics in greater depth.

Prerequisite: (CSC 226 AND CSC 333) OR MA 225
Typically offered in Fall only

MA 416/CSC 416 Introduction to Combinatorics (3 credit hours)
Basic principles of counting: addition and multiplication principles, generating functions, recursive methods, inclusion-exclusion, pigeonhole principle; basic concepts of graph theory: graphs, digraphs, connectedness, trees; additional topics from:Polya theory of counting, Ramsey theory; combinatorial optimization - matching and covering, minimum spanning trees, minimum distance, maximum flow; sieves; mobius inversion; partitions; Gaussian numbers and q-analogues; bijections and involutions; partially ordered sets.

Prerequisite: Grade of C or better in either MA 225 or CSC 226
Typically offered in Spring only

MA 421 Introduction to Probability (3 credit hours)
Axioms of probability, conditional probability and independence, basic combinatorics, discrete and continuous random variables, joint densities and mass functions, expectation, central, limit theorem, simple stochastic processes.

Prerequisite: MA 242
Typically offered in Fall, Spring, and Summer

MA 425 Mathematical Analysis I (3 credit hours)
Real number system, functions and limits, topology on the real line, continuity, differential and integral calculus for functions of one variable. Infinite series, uniform convergence. Credit is not allowed for both MA 425 and MA 511.

Prerequisite: MA 225 (MA 407 desirable)
Typically offered in Fall and Spring

MA 426 Mathematical Analysis II (3 credit hours)
Calculus of several variables, topology in n-dimensions, limits, continuity, differentiability, implicit functions, integration. Credit is not allowed for both MA 426 and MA 512.

Prerequisite: MA 425 and 405
Typically offered in Fall and Spring

MA 427/CSC 427 Introduction to Numerical Analysis I (3 credit hours)
Theory and practice of computational procedures including approximation of functions by interpolating polynomials, numerical differentiation and integration, and solution of ordinary differential equations including both initial value and boundary value problems. Computer applications and techniques.

Prerequisite: (MA 341 or MA 301) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or MA 116 or PY 251 or ST 114 or ECE 209)
Typically offered in Fall only

MA 428/CSC 428 Introduction to Numerical Analysis II (3 credit hours)
Computational procedures including direct and iterative solution of linear and nonlinear equations, matrices and eigenvalue calculations, function approximation by least squares, smoothing functions, and minimax approximations.

Prerequisite: (MA 305 or MA 405) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or MA 116 or PY 251 or ST 114 or ECE 209)
Typically offered in Spring only

MA 430 Mathematical Models in the Physical Sciences (3 credit hours)
Application of mathematical techniques to topics in the physical sciences. Problems from such areas as conservative and dissipative dynamics, calculus of variations, control theory, and crystallography.

Prerequisite: MA 341 and MA 405
Typically offered in Fall only

MA 432 Mathematical Models in Life and Social Sciences (3 credit hours)
Topics from differential and difference equations, probability, and matrix algebra applied to formulation and analysis of mathematical models in biological and social science (e.g., population growth).

Prerequisite: MA 341, (MA 305 or MA 405), and programming proficiency; Corequisite: (MA 421 or ST 371)
Typically offered in Spring only

MA 437 Applications of Algebra (3 credit hours)
Error correcting codes, cryptography, crystallography, enumeration techniques, exact solutions of linear equations, and block designs.

Prerequisite: MA 403 or 407, MA 405
Typically offered in Fall and Spring

MA 444 Problem Solving Strategies for Competitions (1 credit hours)
Analyze the most common problem-solving techniques and illustrate their use by interesting examples from past Putnam and Virginia Tech math competitions. Problem solving methods are divided into groups and taught by professors of the math department. After the lecture, students practice writing the solutions for the assignment and have informal discussions in the next class.

Typically offered in Fall only

MA 450 Methods of Applied Mathematics I (3 credit hours)
Mathematical methods covered include dimensional analysis, asymptotics, continuum modeling and traffic flow analysis. These topics are discussed in the context of applications and real data. This course is independent of MA 451 Methods of Applied Mathematics II.

Prerequisite: MA 341
Typically offered in Fall only

MA 451 Methods of Applied Mathematics II (3 credit hours)
The mathematical methods of this course give insight into physical continuum processes such as fluid flow and the deformation of solid elastic materials. Techniques include the modeling and formulation of equations of motion, the use of Lagrangian and Eulerian variables; further topics are: examples of incompressible fluid flow, calculus of variations and applications to optimal control problems. This course is independent of MA 450 Methods of Applied Mathematics I.

Prerequisite: MA 341
Typically offered in Spring only

MA 491 Reading in Honors Mathematics (1-6 credit hours)
A reading (independent study) course available as an elective for students participating in the mathematics honors program.

Prerequisite: Membership in honors program
Typically offered in Fall and Spring

MA 493 Special Topics in Mathematics (1-6 credit hours)
Directed individual study or experimental course offerings.

Typically offered in Fall and Spring

MA 494 Major Paper in Math (1 credit hours)
Introduces students to one or more forms of writing used in scientific and research environments. Students are required to take a companion math course at the 400-level or above, and adapt writing assignment(s) to the topics in the companion course.Instruction covers all phases of the writing process (planning, drafting, revising, and critiquing other people's work). Emphasis is placed on organizing for needs of a variety of readers; concise, clear expression.

Corequisite: MA class at the 400-level or above
Typically offered in Fall and Spring

MA 499 Independent Research in Mathematics (1-6 credit hours)
Study and research in mathematics. Topics for theoretical, modeling or computational investigation. Consent of Department Head. Honors Program should enroll in MA 491H. At most 6 hours total of MA 499 and 491H credit can be applied towards an undergraduate degree. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

MA 501 Advanced Mathematics for Engineers and Scientists I (3 credit hours)
Survey of mathematical methods for engineers and scientists. Ordinary differential equations and Green's functions; partial differential equations and separation of variables; special functions, Fourier series. Applications to engineering and science. May not be taken for graduate credit by Master's or Ph.D. students in Mathematics or Applied Mathematics. Credit for this course and MA 401 is not allowed.

Prerequisite: MA 341; credit not allowed for both MA 501 and MA 401
Typically offered in Fall, Spring, and Summer

MA 502 Advanced Mathematics for Engineers and Scientists II (3 credit hours)
Determinants and matrices; line and surface integrals, integral theorems; complex integrals and residues; distribution functions of probability. Not for credit by mathematics majors. Any student receiving credit for MA 502 may receive credit for, atmost, one of the following: MA 405, MA 512, MA 513

Prerequisite: MA 341.
Typically offered in Fall, Spring, and Summer

MA 504/OR 504 Introduction to Mathematical Programming (3 credit hours)
Basic concepts of linear, nonlinear and dynamic programming theory. Not for majors in OR at Ph.D. level.

Prerequisite: MA 242, MA 405
Typically offered in Fall only

MA 505/OR 505/ISE 505 Linear Programming (3 credit hours)
Introduction including: applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

Prerequisite: MA 405
Typically offered in Fall only

MA 507 Survey of Real Analysis (3 credit hours)
A broad overview of topics in analysis. Historical development, logical refinement and applications of concepts such as limits, continuity, differentiation and integration. May not be taken for graduate credit by Master's or Ph.D. students in Mathematics or Applied Mathematics.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

MA 508 Survey of Geometry (3 credit hours)
A broad overview of topics in geometry. Various approaches to study of geometry, including vector geometry, transformational geometry and axiomatics. May not be taken for graduate credit by Master's or Ph.D. students in Mathematics or Applied Mathematics.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

MA 509 Survey of Abstract Algebra (3 credit hours)
A broad overview of topics in abstract algebra. Theory of equations, polynomial rings, rational functions and elementary number theory. May not be taken for graduate credit by Master's or Ph.D. students in Mathematics or Applied Mathematics.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

MA 510 Selected Topics In Mathematics For Secondary Teachers (1-6 credit hours)
Coverage of various topics in mathematics of concern to secondary teachers. Topics selected from areas such as mathematics of finance, probability, statistics, linear programming and theory of games, intuitive topology, recreational math, computers and applications of mathematics. Course may be taken for graduate credit for certification renewal by secondary school teachers. Credit towards a graduate degree may be allowed only for students in mathematics education.

Prerequisite: Graduate standing
Typically offered in Spring and Summer

MA 511 Advanced Calculus I (3 credit hours)
Fundamental theorems on continuous functions; convergence theory of sequences, series and integrals; the Riemann integral. Credit for both MA 425 and MA 511 is not allowed

Prerequisite: MA 341
Typically offered in Fall and Spring

MA 513 Introduction To Complex Variables (3 credit hours)
Operations with complex numbers, derivatives, analytic functions, integrals, definitions and properties of elementary functions, multivalued functions, power series, residue theory and applications, conformal mapping.

Prerequisite: MA 242
Typically offered in Fall and Spring

MA 514/CSC 414/CSC 514/MA 414 Foundations of Cryptography (3 credit hours)
Cryptography is the study of mathematical techniques for securing digital information, systems and distributed computation against adversarial attacks. In this class you will learn the concepts and the algorithms behind the most used cryptographic protocols: you will learn how to formally define security properties and how to formally prove/disprove that a cryptographic protocol achieves a certain security property. You will also discover that cryptography has a much broader range of applications. It solves absolutely paradoxical problems such as proving knowledge of a secret without ever revealing the secret (zero-knowledge proof), or computing the output of a function without ever knowing the input of the function (secure computation). Finally, we will look closely at one of the recent popular application of cryptography: the blockchain technology. Additionally, graduate students will study some of the topics in greater depth.

Prerequisite: (CSC 226 AND CSC 333) OR MA 225
Typically offered in Fall only

MA 515 Analysis I (3 credit hours)
Metric spaces: contraction mapping principle, Tietze extension theorem, Ascoli-Arzela lemma, Baire category theorem, Stone-Weierstrass theorem, LP spaces. Banach spaces: linear operators, Hahn-Banach theorem, open mapping and closed graph theorems. Hilbert spaces: projection theorem, Riesz representation theorem, Lax-Milgram theorem, complete orthonormal sets.

Prerequisite: MA 426
Typically offered in Fall and Spring

MA 518 Geometry of Curves and Surfaces (3 credit hours)
Geometry of curves and surfaces in space; Arclength, torsion, and curvature of curves; Tangent spaces, shape operators, and curvatures of surfaces; metrics, covariant derivatives, geodesics, and holonomy. Applications in the physical sciences and/or projects using computer algebra.

Prerequisite: MA 242 and MA 405
Typically offered in Spring only

MA 520 Linear Algebra (3 credit hours)
Vector spaces. Bases and dimension. Changes of basis. Linear transformations and their matrices. Linear functionals. Simultaneous triangularization and diagonalization. Rational and Jordan canonical forms. Bilinear forms.

Prerequisite: MA 405
Typically offered in Fall and Spring

MA 521 Abstract Algebra I (3 credit hours)
Groups, quotient groups, group actions, Sylow's Theorems. Rings, ideals and quotient rings, factorization, principal ideal domains. Fields, field extensions, Galois theory.

Prerequisite: MA 405 and MA 407
Typically offered in Fall only

MA 522 Computer Algebra (3 credit hours)
Basic techniques and algorithms of computer algebra. Integer arithmetic, primality tests and factorization of integers, polynomial arithmetic, polynomial factorization, Groebner bases, integration in finite terms.

Prerequisite: MA 405 and MA 407
Typically offered in Fall only

MA 523 Linear Transformations and Matrix Theory (3 credit hours)
Vector spaces, linear transformations and matrices, orthogonality, orthogonal transformations with emphasis on rotations and reflections, matrix norms, projectors, least squares, generalized inverses, definite matrices, singular values.

Prerequisite: MA 405
Typically offered in Fall and Spring

MA 524 Combinatorics I (3 credit hours)
Enumerative combinatorics, including placements of balls in bins, the twelvefold way, inclusion/exclusion, sign-reversing involutions and lattice path enumeration. Partically ordered sets, lattices, distributive lattices, Moebius functions, and rational generating functions.

Prerequisite: MA 405 and MA 407
Typically offered in Fall only

MA 528/ECG 528/FIM 528 Options and Derivatives Pricing (3 credit hours)
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

Prerequisites: MA 341 and MA 405 and MA 421
Typically offered in Fall only

MA 531/E 531/OR 531 Dynamic Systems and Multivariable Control I (3 credit hours)
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

Prerequisite: MA 341, MA 405
Typically offered in Fall only

MA 532 Ordinary Differential Equations I (3 credit hours)
Existence and uniqueness theorems, systems of linear equations, fundamental matrices, matrix exponential, nonlinear systems, plane autonomous systems, stability theory.

Prerequisite: MA 341, 405, 425 or 511, Corequisite: MA 426 or 512
Typically offered in Fall only

MA 534 Introduction To Partial Differential Equations (3 credit hours)
Linear first order equations, method of characteristics. Classification of second order equations. Solution techniques for the heat equation, wave equation and Laplace's equation. Maximum principles. Green's functions and fundamental solutions.

Prerequisite: MA 425 or MA 511, MA 341, Corequisite: MA 426 or 512
Typically offered in Fall only

MA 537 Nonlinear Dynamics and Chaos (3 credit hours)
Usage of computer experiments for demonstration of nonlinear dynamics and chaos and motivation of mathematical definitions and concepts. Examples from finance and ecology as well as traditional science and engineering. Difference equations and iteration of functions as nonlinear dynamical systems. Fixed points, periodic points and general orbits. Bifurcations and transition to chaos. Symbolic dynamics, chaos, Sarkovskii's Theorem, Schwarzian derivative, Newton's method and fractals.

Prerequisite: MA 341 and MA 405
Typically offered in Spring only

MA 540 Uncertainty Quantification for Physical and Biological Models (3 credit hours)
Introduction to uncertainty quantification for physical and biological models. Parameter selection techniques, Bayesian model calibration, propagation of uncertainties, surrogate model construction, local and global sensitivity analysis.

Prerequisite: MA 341 and basic knowledge of probability, linear algebra, and scientific computation
Typically offered in Fall and Spring

MA 542 Convex Optimization Methods in Data Science (3 credit hours)
Convex optimization methods and their applications in various areas of data science including, but not limited to, signal and image processing, inverse problems, statistical data analysis, machine learning and classification. Basic theory, algorithm design and concrete applications.

Prerequisite: MA 141, 241, 242, or equivalent and MA 405 or equivalent; Some notions of elementary convex analysis are an asset but are neither required nor assumed known.
Typically offered in Fall only

MA 544 Computer Experiments In Mathematical Probability (3 credit hours)
Exposure of student to practice of performing mathematical experiments on computer, with emphasis on probability. Programming in an interactive language such as APL, MATLAB or Mathematica. Mathematical treatment of random number generation and application of these tools to mathematical topics in Monte Carlo method, limit theorems and stochastic processes for purpose of gaining mathematical insight.

Prerequisite: MA 421
Typically offered in Spring only

MA 546/ST 546 Probability and Stochastic Processes I (3 credit hours)
Modern introduction to Probability Theory and Stochastic Processes. The choice of material is motivated by applications to problems such as queueing networks, filtering and financial mathematics. Topics include: review of discrete probability and continuous random variables, random walks, markov chains, martingales, stopping times, erodicity, conditional expectations, continuous-time Markov chains, laws of large numbers, central limit theorem and large deviations.

Prerequisite: MA 421 and MA 425 or MA 511
Typically offered in Fall only

MA 547/FIM 547 Stochastic Calculus for Finance (3 credit hours)
This course explores stochastics calculus with its applications in pricing and hedging problems for financial derivatives such as options. Topics to be covered in the course include 1) discrete and continuous martingales, 2) Brownian motions and Ito's stochastic calculus, and 3) Black-Scholas framework for financial derivatives pricing and hedging.

Prerequisite: FIM 528 and MA(ST) 546
Typically offered in Spring only

MA 548/FIM 548 Monte Carlo Methods for Financial Math (3 credit hours)
Monte Carlo (MC) methods for accurate option pricing, hedging and risk management. Modeling using stochastic asset models (e.g. geometric Brownian motion) and parameter estimation. Stochastic models, including use of random number generators, random paths and discretization methods (e.g. Euler-Maruyama method), and variance reduction. Implementation using Matlab. Incorporation of the latest developments regarding MC methods and their uses in Finance.

Prerequisites: (MA 421 or ST 421), MA 341, and MA 405
Typically offered in Spring only

MA 549/FIM 549 Financial Risk Analysis (3 credit hours)
This course focuses on mathematical methods to analyze and manage risks associated with financial derivatives. Topics covered include aggregate loss distributions, extreme value theory, default probabilities, Value-at-Risk and expected shortfall, coherent risk measures, correlation and copula, applications of principle component analysis and Monte Carlo simulations in financial risk management, how to use stochastic differential equations to price financial risk derivatives, and how to back-test and stress-test models.

Prerequisites: MA 405 and (MA 421 or ST 421) and (MA/ST 412 or MA/ST 413)
Typically offered in Spring only

MA 551 Introduction to Topology (3 credit hours)
Set theory, topological spaces, metric spaces, continuous functions, separation, cardinality properties, product and quotient topologies, compactness, connectedness.

Prerequisite: MA 426
Typically offered in Fall only

MA 555 Introduction to Manifold Theory (3 credit hours)
An introduction to smooth manifolds. Topics include: topological and smooth manifolds, smooth maps and differentials, vector fields and flows, Lie derivatives, vector bundles, tensors, differential forms, exterior calculus, and integration on manifolds.

Prerequisite: MA 405 and MA 426
Typically offered in Fall only

MA 561 Set Theory and Foundations Of Mathematics (3 credit hours)
Logic and axiomatic approach, the Zermelo-Fraenkel axioms and other systems, algebra of sets and order relations, equivalents of the Axiom of Choice, one-to-one correspondences, cardinal and ordinal numbers, the Continuum Hypothesis.

Prerequisite: MA 407
Typically offered in Spring only

MA 565/OR 565/CSC 565 Graph Theory (3 credit hours)
Basic concepts of graph theory. Trees and forests. Vector spaces associated with a graph. Representation of graphs by binary matrices and list structures. Traversability. Connectivity. Matchings and assignment problems. Planar graphs. Colorability. Directed graphs. Applications of graph theory with emphasis on organizing problems in a form suitable for computer solution.

Prerequisite: CSC 226 or MA 351.
Typically offered in Spring only

MA 573/BMA 573 Mathematical Modeling of Physical and Biological Processes I (3 credit hours)
Introduction to model development for physical and biological applications. Mathematical and statistical aspects of parameter estimation. Compartmental analysis and conservation laws, heat transfer, and population and disease models. Analytic and numerical solution techniques and experimental validation of models. Knowledge of high-level programming languages required.

Prerequisite: MA 341 and knowledge of high-level programming language.
Typically offered in Fall only

MA 574/BMA 574 Mathematical Modeling of Physical and Biological Processes II (3 credit hours)
Model development, using Newtonian and Hamiltonian principles, for acoustic and fluid applications, and structural systems including membranes, rods, beams, and shells. Fundamental aspects of electromagnetic theory. Analytic and numerical solution techniques and experimental validation of models.

Prerequisite: MA/BMA 573
Typically offered in Spring only

MA 580/CSC 580 Numerical Analysis I (3 credit hours)
Algorithm behavior and applicability. Effect of roundoff errors, systems of linear equations and direct methods, least squares via Givens and Householder transformations, stationary and Krylov iterative methods, the conjugate gradient and GMRES methods, convergence of method.

Prerequisite: MA 405; MA 425 or MA 511; high-level computer language
Typically offered in Fall and Spring

MA 583/CSC 583 Introduction to Parallel Computing (3 credit hours)
Introduction to basic parallel architectures, algorithms and programming paradigms; message passing collectives and communicators; parallel matrix products, domain decomposition with direct and iterative methods for linear systems; analysis of efficiency, complexity and errors; applications such as 2D heat and mass transfer.

Prerequisite: CSC 302 or MA 402 or MA/CSC 428 or MA/CSC 580
Typically offered in Spring only

MA 584 Numerical Solution of Partial Differential Equations--Finite Difference Methods (3 credit hours)
Survey of finite difference methods for partial differential equations including elliptic, parabolic and hyperbolic PDE's. Consideration of both linear and nonlinear problems. Theoretical foundations described; however, emphasis on algorithm design and implementation.

Prerequisite: MA 501; knowledge of a high level programming language
Typically offered in Fall only

MA 587 Numerical Solution of Partial Differential Equations--Finite Element Method (3 credit hours)
Introduction to finite element method. Applications to both linear and nonlinear elliptic and parabolic partial differential equations. Theoretical foundations described; however, emphasis on algorithm design and implementation.

Prerequisite: MA 501; knowledge of a high level programming language
Typically offered in Spring only

MA 591 Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

MA 601 Seminar (1 credit hours)
Review and discussion of scientific articles, progress reports on research and special problems of interest to mathematicians.

P: Graduate Standing
Typically offered in Fall and Spring

MA 676 Master's Project (3 credit hours)
Investigation of some topic in mathematics to a deeper and broader extent than typically done in a classroom situation. For the applied mathematics student the topic usually consists of a realistic application of mathematics to student's minor area.A written and oral report on the project required.

Typically offered in Fall, Spring, and Summer

MA 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

MA 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MA 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

MA 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MA 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall and Spring

MA 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

MA 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MA 706/OR 706/ST 706 Nonlinear Programming (3 credit hours)
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.

Prerequisite: OR(IE,MA) 505 and MA 425
Typically offered in Spring only

MA 708/OR 708/ISE 708 Integer Programming (3 credit hours)
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some "hands on" computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

Prerequisite: MA 405, OR (MA,IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112)
Typically offered in Spring only

MA 715 Analysis II (3 credit hours)
Integration: Legesgue measure and integration, Lebesgue-dominated convergence and monotone convergence theorems, Fubini's theorem, extension of the fundamental theorem of calculus. Banach spaces: Lp spaces, weak convergence, adjoint operators, compact linear operators, Fredholm-Fiesz Schauder theory and spectral theorem.

Prerequisite: MA 515
Typically offered in Spring only

MA 716 Advanced Functional Analysis (3 credit hours)
Advanced topics in functional analysis such as linear topological spaces; Banach algebra, spectral theory and abstract measure theory and integration.

Prerequisite: MA 715
Typically offered in Fall only

MA 719/OR 719 Vector Space Methods in System Optimization (3 credit hours)
Introduction to algebraic and function-analytic concepts used in system modeling and optimization: vector space, linear mappings, spectral decomposition, adjoints, orthogonal projection, quality, fixed points and differentials. Emphasis on geometricinsight. Topics include least square optimization of linear systems, minimum norm problems in Banach space, linearization in Hilbert space, iterative solution of system equations and optimization problems. Broad range of applications in operations research and system engineering including control theory, mathematical programming, econometrics, statistical estimation, circuit theory and numerical analysis.

Prerequisite: MA 405, 511
Typically offered in Fall only

MA 720 Lie Algebras (3 credit hours)
Definition of Lie algebras and examples. Nilpotent, solvable and semisimple Lie algebras. Engel's theorem, Lie's Theorem, Killing form and Cartan's criterion. Weyl's theorem on complete reducibility. Representations of s1(2,C). Root space decomposition of semisimple Lie algebras. Root system and Weyl group.

Prerequisite: MA 520
Typically offered in Spring only

MA 721 Abstract Algebra II (3 credit hours)
This course covers: Module theory including the structure theory of modules over a PID and primary decomposition; Tensor, exterior, and symmetric algebras; introductory homological algebra including: complexes, derived functors, Ext and Tor; and the representation theory of groups. Further topics will be covered as time permits.

Prerequisite: MA 521
Typically offered in Spring only

MA 722 Computer Algebra II (3 credit hours)
Effective algorithms for symbolic matrices, commutative algebra, real and complex algebraic geometry, and differential and difference equations. The emphasis is on the algorithmic aspects.

Prerequisite: MA 522
Typically offered in Spring only

MA 723 Theory of Matrices and Applications (3 credit hours)
Canonical forms, functions of matrices, variational methods, perturbation theory, numerical methods, nonnegative matrices, applications to differential equations, Markov chains.

Prerequisite: MA 520 or 523
Typically offered in Spring only

MA 724 Combinatorics II (3 credit hours)
Polytopes(V-polytopes and H-polytopes). Fourier-Motzkin elimination, Farkas Lemma, face numbers of polytopes, graphs of polytopes, linear programming for geometers, Balinski's Theorem, Steinitz' Theorem, Schlegel diagrams, polyhedral complexes, shellability, and face rings.

Prerequisite: MA 524
Typically offered in Spring only

MA 725 Lie Algebra Representation Theory (3 credit hours)
Semisimple Lie algebras, root systems, Weyl groups, Cartan matrices and Dynkin diagrams, universal enveloping algebras, Serre's Theorem, Kac-Moody algebras, highest weight representations of finite dimensional semisimple algebras and affine Lie algebras, Kac-Weyl character formula.

Prerequisite: MA 720
Typically offered in Fall only

MA 726 Algebraic Geometry (3 credit hours)
Abstract theory of solutions of systems of polynomial equations. Topics covered: ideals and affine varieties, the Nullstellensatz, irreducible varieties and primary decomposition, morphisms and rational maps, computational aspects including Groebner bases and elimination theory, projective varieties and homogeneous ideals, Grassmannians, graded modules, the Hilbert function, Bezout's theorem.

Prerequisite: MA 521
Typically offered in Spring only

MA 731/OR 731/E 731 Dynamic Systems and Multivariable Control II (3 credit hours)
Stability of equilibrium points for nonlinear systems. Liapunov functions. Unconstrained and constrained optimal control problems. Pontryagin's maximum principle and dynamic programming. Computation with gradient methods and Newton methods. Multidisciplinary applications.

Prerequisite: OR(E,MA) 531
Typically offered in Spring only

MA 732 Ordinary Differential Equations II (3 credit hours)
Existence-uniqueness theory, periodic solutions, invariant manifolds, bifurcations, Fredholm's alternative.

Prerequisite: MA 532, Corequisite: MA 515
Typically offered in Spring only

MA 734 Partial Differential Equations (3 credit hours)
Linear second order parabolic, elliptic and hyperbolic equations. Initial value problems and boundary value problems. Iterative and variational methods. Existence, uniqueness and regularity. Nonlinear equations and systems.

Prerequisite: MA 534, Corequisite: MA 515
Typically offered in Spring only

MA 746/ST 746 Introduction To Stochastic Processes (3 credit hours)
Markov chains and Markov processes, Poisson process, birth and death processes, queuing theory, renewal theory, stationary processes, Brownian motion.

Prerequisite: MA 405 and MA(ST) 546 or ST 521
Typically offered in Spring only

MA 747/ST 747 Probability and Stochastic Processes II (3 credit hours)
Fundamental mathematical results of probabilistic measure theory needed for advanced applications in stochastic processes. Probability measures, sigma-algebras, random variables, Lebesgue integration, expectation and conditional expectations w.r.t.sigma algebras, characteristic functions, notions of convergence of sequences of random variables, weak convergence of measures, Gaussian systems, Poisson processes, mixing properties, discrete-time martingales, continuous-time markov chains.

Prerequisite: MA(ST) 546
Typically offered in Spring only

MA 748/ST 748 Stochastic Differential Equations (3 credit hours)
Theory of stochastic differential equations driven by Brownian motions. Current techniques in filtering and financial mathematics. Construction and properties of Brownian motion, wiener measure, Ito's integrals, martingale representation theorem, stochastic differential equations and diffusion processes, Girsanov's theorem, relation to partial differential equations, the Feynman-Kac formula.

Prerequisite: MA(ST) 747
Typically offered in Fall only

MA 753 Algebraic Topology (3 credit hours)
Homotopy, fundamental group, covering spaces, classification of surfaces, homology and cohomology.

Prerequisite: MA 551 or MA 555
Typically offered in Spring only

MA 755 Introduction to Riemannian Geometry (3 credit hours)
An introduction to smooth manifolds with metric. Topics include: Riemannian metric and generalizations, connections, covariant derivatives, parallel translation, Riemannian (or Levi-Civita) connection, geodesics and distance, curvature tensor, Bianchi identities, Ricci and scalar curvatures, isometric embeddings, Riemannian submanifolds, hypersurfaces, Gauss Bonnet Theorem; applications and connections to other fields.

Prerequisite: MA 555
Typically offered in Spring only

MA 766/OR 766/ISE 766 Network Flows (3 credit hours)
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

Prerequisite: OR(IE,MA) 505
Typically offered in Spring only

MA 771/ST 771/BMA 771 Biomathematics I (3 credit hours)
Role of theory construction and model building in development of experimental science. Historical development of mathematical theories and models for growth of one-species populations (logistic and off-shoots), including considerations of age distributions (matrix models, Leslie and Lopez; continuous theory, renewal equation). Some of the more elementary theories on the growth of organisms (von Bertalanffy and others; allometric theories; cultures grown in a chemostat). Mathematical theories oftwo and more species systems (predator-prey, competition, symbosis; leading up to present-day research) and discussion of some similar models for chemical kinetics. Much emphasis on scrutiny of biological concepts as well as of mathematical structureof models in order to uncover both weak and strong points of models discussed. Mathematical treatment of differential equations in models stressing qualitative and graphical aspects, as well as certain aspects of discretization. Difference equation models.

Prerequisite: Advanced calculus, reasonable background in biology
Typically offered in Fall only

MA 772/ST 772/BMA 772 Biomathematics II (3 credit hours)
Continuation of topics of BMA 771. Some more advanced mathematical techniques concerning nonlinear differential equations of types encountered in BMA 771: several concepts of stability, asymptotic directions, Liapunov functions; different time-scales. Comparison of deterministic and stochastic models for several biological problems including birth and death processes. Discussion of various other applications of mathematics to biology, some recent research.

Prerequisite: BMA 771, elementary probability theory
Typically offered in Spring only

MA 773/OR 773/ST 773/BMA 773 Stochastic Modeling (3 credit hours)
Survey of modeling approaches and analysis methods for data from continuous state random processes. Emphasis on differential and difference equations with noisy input. Doob-Meyer decomposition of process into its signal and noise components. Examples from biological and physical sciences, and engineering. Student project.

Prerequisite: BMA 772 or ST (MA) 746
Typically offered in Spring only

MA 774/BMA 774/OR 774 Partial Differential Equation Modeling in Biology (3 credit hours)
Modeling with and analysis of partial differential equations as applied to real problems in biology. Review of diffusion and conservation laws. Waves and pattern formation. Chemotaxis and other forms of cell and organism movement. Introduction to solid and fluid mechanics/dynamics. Introductory numerical methods. Scaling. Perturbations, Asymptotics, Cartesian, polar and spherical geometries. Case studies.

Prerequisite: BMA 771 or MA/OR 731; BMA 772 or MA 401 or MA 501
Typically offered in Spring only

MA 780/CSC 780 Numerical Analysis II (3 credit hours)
Approximation and interpolation, Fast Fourier Transform, numerical differentiation and integration, numerical solution of initial value problems for ordinary differential equations.

Prerequisite: MA 580
Typically offered in Spring only

MA 784 Nonlinear Equations and Unconstrained Optimization (3 credit hours)
Newton's method and Quasi-Newton methods for nonlinear equations and optimization problems, globally convergent extensions, methods for sparse problems, applications to differential equations, integral equations and general minimization problems. Methods appropriate for boundary value problems.

Prerequisite: MA 580
Typically offered in Spring only

MA 788 Numerical Nonlinear Partial Differential Equations (3 credit hours)
Nonlinear discrete equations; Newton and monotone methods for nonlinear equations; computational algorithms and applications; finite difference method-convergence, stability and error estimates; multiplicity of solutions and bifurcation; asymptotic behavior of solutions; and coupled systems of equations.

Prerequisite: MA 405 or 520 and MA 501 or 534; knowledge of a high level programming language
Typically offered in Spring only

MA 791 Special Topics In Real Analysis (1-6 credit hours)
Typically offered in Fall and Spring

MA 792 Special Topics In Algebra (1-6 credit hours)
Typically offered in Fall and Spring

MA 793 Special Topics In Differential Equations (1-6 credit hours)

MA 796 Special Topics In Combinatorial Analysis (1-6 credit hours)

MA 797 Special Topics In Applied Mathematics (1-6 credit hours)

MA 798 Special Topics In Numerical Analysis (1-6 credit hours)

MA 810 Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

MA 812/ISE 812 Special Topics in Mathematical Programming (1-6 credit hours)
Study of special advanced topics in area of mathematical programming. Discussion of new techniques and current research in this area. The faculty responsible for this course select areas to be covered during semester according to their preference and interest. This course not necessarily taught by an individual faculty member but can, on occasion, be joint effort of several faculty members from this university as well as visiting faculty from other institutions. To date, a course of Theory of Networks and another on Integer Programming offered under the umbrella of this course. Anticipation that these two topics will be repeated in future together with other topics.

Prerequisite: IE(MA,OR) 505
Typically offered in Spring only

MA 816/ISE 816 Advanced Special Topics Sys Opt (1-6 credit hours)
Advanced topics in some phase of system optimization. Identification of various specific topics and prerequisite for each section from term to term.

Typically offered in Fall and Spring

MA 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MA 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MA 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MA 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MA 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

MA 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Mechanical & Aerospace Engr (MAE)

MAE 200 Introduction to Mechanical Engineering Design (1 credit hours)
Introduction to mechanical engineering and its application in professional practice. Includes mechanical engineering vocabulary, measurement concepts, safety training, demonstration of basic machine components and systems, dissection of mechanical engineering devices, simple drawing and sketching, 3d printing, technical communication, design, creation of Online Portfolio. (5-week course)

Restriction: Sophomore standing in Mechanical Engineering
Typically offered in Fall only

MAE 201 Engineering Thermodynamics I (3 credit hours)
Introduction to the concept of energy and the laws governing the transfers and transformations of energy. Emphasis on thermodynamic properties and the First and Second Law analysis of systems and control volumes. Integration of these concepts into the analysis of basic power cycles is introduced.

Prerequisite: MA 242, PY 208 or 202
Typically offered in Fall, Spring, and Summer

MAE 206 Engineering Statics (3 credit hours)
Basic concepts of forces in equilibrium. Distributed forces, frictional forces. Inertial properties. Application to machines, structures, and systems. Credit is not allowed for both MAE 206 and CE 214.

Prerequisite: C or better in both MA 241 and PY 205
Typically offered in Fall, Spring, and Summer

MAE 208 Engineering Dynamics (3 credit hours)
Kinematics and kinetics of particles in rectangular, cylindrical, and curvilinear coordinate systems; energy and momentum methods for particles; kinetics of systems of particles; kinematics and kinetics of rigid bodies in two and three dimensions; motion relative to rotating coordinate systems.

Prerequisite: MA 242 and C- or better in MAE 206 or CE 214
Typically offered in Fall, Spring, and Summer

MAE 214 Solid Mechanics (3 credit hours)
Concepts and theories of internal force, stress, strain, and strength of structural element under static loading conditions. Constitutive behavior for linear elastic structures. Deflection and stress analysis procedures for bars, beams, and shafts.Introduction to matrix analysis of structures.

Prerequisites: MA 242 and C- or better in (MAE 206 or CE 214)
Typically offered in Fall, Spring, and Summer

MAE 250 Introduction to Aerospace Engineering (1 credit hours)
The objective of this course is to introduce students to the fundamental concepts associated with aerospace engineering. This will be done through lectures focused on fluid flow, structures, dynamics, and complex system design. Students will also engage in hands-on mini-projects that will provide a design experience. Final efforts will culminate in a design portfolio project. 14AE BS Majors only.

Typically offered in Fall only

MAE 251 Aerospace Vehicle Performance (3 credit hours)
Introduction to the problem of performance analysis in aerospace engineering. Aircraft performance in gliding, climbing, level, and turning flight. Calculation of vehicle take-off and landing distance, range and endurance. Elementary performance design problems. Introduction to space flight.

Prerequisite: Cumulative GPA 2.0 or higher and a grade of C or better in both MA 241 and PY 205; Corequisite: CSC 113
Typically offered in Fall only

MAE 252 Aerodynamics I (3 credit hours)
Fundamentals of perfect fluid theory with applications to incompressible flows over airfoils, wings, and flight vehicle configurations.

Prerequisites: MA 242 and C- or better in MAE 251
Typically offered in Spring only

MAE 253 Experimental Aerodynamics I (1 credit hours)
Subsonic wind tunnel, instrumentation, data acquisition techniques, technical report preparation. Experiments involve pressure and force/moment measurements of various aerospace vehicle components with supplemental flow visualization.

Corequisites: MAE 252
Typically offered in Spring only

MAE 302 Engineering Thermodynamics II (3 credit hours)
Continuation of Engineering Thermodynamics I with emphasis on the analysis of power and refrigeration cycles and the application of basic principles to engineering problems with systems involving mixtures of ideal gases, psychrometrics, nonideal gases, chemical reactions, combustion, chemical equilibrium cycle analysis, and one-dimensional compressible flow.

Prerequisites: CSC 113, C- or better in MAE 201
Typically offered in Fall, Spring, and Summer

MAE 305 Mechanical Engineering Laboratory I (1 credit hours)
Theory and practice of measurement and experimental data collection. Laboratory evaluation and demonstration of components of the generalized measurement system and their effects on the final result. Applications of basic methods of data analysis aswell as basic instrumentation for sensing, conditioning and displaying experimental qualities. (Instruction and practice in technical report writing.)

Typically offered in Fall, Spring, and Summer

MAE 306 Mechanical Engineering Laboratory II (1 credit hours)
Continuation of MAE 305 into specific types of measurements. Students evaluate and compare different types of instrumentation for measuring the same physical quantity on the basis of cost, time required, accuracy, etc. (Oral and written presentation of technical material).

Prerequisite: MAE 305
Typically offered in Fall, Spring, and Summer

MAE 308 Fluid Mechanics (3 credit hours)
Development of the basic equations of fluid mechanics in general and specialized form. Application to a variety of topics including fluid statics; inviscid, incompressible fluid flow; design of Fluid dynamic system.

Prerequisite: MA 242 and C- or better in MAE 208
Typically offered in Fall, Spring, and Summer

MAE 310 Heat Transfer Fundamentals (3 credit hours)
Analysis of steady state and transient one and multidimensional heat conduction employing both analytical methods and numerical techniques. Integration of principles and concepts of thermodynamics and fluid mechanics to the development of practicalconvective heat transfer relations relevant to mechanical engineers. Heat transfer by the mechanism of radiation heat transfer.

Prerequisite: MA 341 and C- or better in MAE 201
Typically offered in Fall, Spring, and Summer

MAE 315 Dynamics of Machines (3 credit hours)
Application of dynamics to the analysis and design of machine and mechanical components. Motions resulting from applied loads, and the forces required to produce specified motions. Introduction to mechanical vibration, free and forced response of discrete and continuous systems.

Prerequisite: MA 341 and C- or better in MAE 208
Typically offered in Fall, Spring, and Summer

MAE 316 Strength of Mechanical Components (3 credit hours)
Analysis and design of mechanical components based on deflection, material, static strength and fatigue requirements. Typical components include beams, shafts, pressure vessels and bolted and welded joints. Classical and modern analysis and design techniques. Computer analysis using the finite element method. Material and manufacturing considerations in design.

Prerequisite: C- or better in MAE 214 or CE 313
Typically offered in Fall, Spring, and Summer

MAE 342 Introduction to Automotive Engineering (3 credit hours)
Fundamental aspects of automotive engineering. Examines various automotive systems [engine, brakes, suspension etc.] as well as their interactions in such areas as safety and performance. Current practices and development for the future.

Prerequisite: MAE 206, MAE 208, MAE 201, MAE 308, MAE 315
Typically offered in Spring only

MAE 351 Aerodynamics II (3 credit hours)
Concepts of thermodynamics, compressible fluid flow, and shock waves with application to computing the aerodynamic characteristics of airfoils, wings and flight configurations at high speed.

Prerequisites: MAE 252 and C- or better in MAE 201
Typically offered in Spring only

MAE 352 Experimental Aerodynamics II (1 credit hours)
Advanced stability and control experiments in the subsonic wind tunnel and external compressible flow experiments in the supersonic wind tunnel.

Prerequisite: MAE 253, Corequisite: MAE 351
Typically offered in Spring only

MAE 361 Dynamics & Controls (3 credit hours)
Dynamics and linear feedback control of aerospace and mechanical systems. Concepts from linear system theory, kinematics, particle dynamics, first- and second-order systems, system dynamics, vibrations, and computational techniques. Feedback controlby root-locus, Nyquist, Bode plots, servo-mechanisms, gain and phase margin, and compensation. Control system design emphasized.

Prerequisite: MA 341 and C- or better in MAE 208
Typically offered in Fall only

MAE 371 Aerospace Structures I (3 credit hours)
Determination of appropriate analysis techniques for Aerospace Structures. Introduction of governing equations and selected solutions for typical structures. Use of these concepts in the design of a representative structural component.

Prerequisite: C- or better in MAE 214 or CE 313
Typically offered in Fall only

MAE 372 Aerospace Vehicle Structures Lab (1 credit hours)
Demonstration and application of the concepts that have been presented in MAE 371 and MAE 472. Fabrication techniques and the design and construction of a structural component will be emphasized.

Corequisite: MAE 371
Typically offered in Fall only

MAE 403 Air Conditioning (3 credit hours)
Design of a complete air conditioning system for a building. Introduction, Design Objectives - Building Description, Review of Psychrometrics and Air Conditioning Processes, Cooling and Heating Load Calculation, Space Air diffusion, Duct Lay-out and Design, Equipment Selection, Pipe Sizing, Life-cycle Cost Analysis.

Prerequisite: MAE 302, MAE 310, MAE 308
Typically offered in Spring only

MAE 405 Controls Lab (1 credit hours)
Laboratory experiments demonstrate the essential features of classical and modern control theory for single-input and single-output systems.

Corequisite: MAE 435
Typically offered in Fall, Spring, and Summer

MAE 406 Energy Conservation in Industry (3 credit hours)
Application of energy conservation principles to a broad range of industrial situations with emphasis on typical equipment encountered as well as the effect of recent environmental regulations. Topics covered include: steam generators, pollution control, work minimization, heat recovery, steam traps, industrial ventilation, electrical energy management, and economics. Field trip to conduct tests and evaluate operation at three NCSU steam plants.

Prerequisite: MAE 302, MAE 310
Typically offered in Fall only

MAE 407 Steam and Gas Turbines (3 credit hours)
Fundamental analysis of the theory and design of turbomachinery flow passages; control and performance of turbomachinery; gas-turbine engine processes.

Prerequisite: MAE 302 and (MAE 308 or MAE 252)
Typically offered in Spring only

MAE 408 Internal Combustion Engine Fundamentals (3 credit hours)
Fundamentals common to internal combustion engine cycles of operation. Otto engine: carburetion, combustion, knock, exhaust emissions and engine characteristics. Diesel engine: fuel metering, combustion, knock, and performance. Conventional and alternative fuels used in internal combustion engines.

Prerequisite: MAE 302
Typically offered in Fall only

MAE 410 Modern Manufacturing Processes (3 credit hours)
Introduction to modern manufacturing processes and technologies. Topics to be covered include traditional machining, laser and electrochemical machining, electro-discharge machining, geometric dimensioning & tolerancing, tolerance chart, statistical process control, metal forming, metal casting, rapid prototyping, welding, micro-fabrication, hybrid processes, and computer aided manufacturing. To relate theory taught in class with practice, the course includes mini projects on machining, rapid prototyping, and material testing.

Prerequisite: MAE 316 or MAE 371
Typically offered in Fall only

MAE 412 Design of Thermal System (3 credit hours)
Applications of thermodynamics, fluid mechanics, and heat transfer to thermal systems with an emphasis on system design and optimization. Design of heat exchangers. Analysis of engineering economics, including time value of money, present and future worth, payback period, internal rates of return, and cost benefit analysis. Review of component model for pipes, pumps, fans, compressors, turbines, evaporators, condensers and refrigerators. Simulation methods for finding the operating point for thermal systems. Design of thermal systems through methods of optimization.

Prerequisite: MAE 302, MAE 308, MAE 310
Typically offered in Fall and Spring

MAE 413 Design of Mechanical Systems (3 credit hours)
Integration of the physical sciences, mathematics, and engineering to solve real-world mechanical engineering design problems. Design of mechanical elements including: fasteners, welds, springs, bearings, gears, belts, brakes, clutches, flywheels, shafts. Emphasis on open-ended problems which contain superfluous information and/or insufficient data. Solution techniques focus on problem definition,reduction to a solvable system, and development of a design response. Team based projects. Formal written communication of results.

Prerequisite: MAE 315 and MAE 316
Typically offered in Fall only

MAE 415 Mechanical Engineering Design I (3 credit hours)
The first course in the sequence of a two-semester capstone senior design project. Teamwork, independent learning and communication skills are emphasized. Team of students practice engineering design process through: problem definition, research, brainstorming, optimization, critical review and analysis. Lectures focus on conceptual design, embodiment design, and quality. Communication skills are developed through reports and presentations.

Prerequisite: MAE 315, MAE 316, MAE 302, MAE 308 and MAE 310
Typically offered in Fall only

MAE 416 Mechanical Engineering Design II (4 credit hours)
The second course in the sequence of a two-semester capstone senior design project. Teamwork, independent learning and communication skills are emphasized. Building on the experience and knowledge from Mechanical Engineering Design I, teams of students extend engineering design process through: investigation, critical review, analysis, and prototype construction and testing. Communication skills are developed through reports and presentations.

Prerequisite: MAE 415
Typically offered in Spring only

MAE 420/MAE 520 Dynamic Analysis of Human Movement (3 credit hours)
Topics in movement biomechanics and computational analyses of movement, including muscle physiology and mechanics, advanced muscle modeling, neural control of muscle and motor control theories, and dynamic simulation and optimization. Discussion of fundamental research underpinnings and clinical and sports applications.

P: MAE208 or equivalent
Typically offered in Spring only

MAE 421 Design of Solar Thermal Systems (3 credit hours)
Analysis and design of active and passive solar thermal systems for residential and small commercial buildings. Solar insulation, flat plate collectors, thermal storage, heat exchanges, controls, design, performance calculations, economics. Site evaluation, shading, suncharts, types of passive systems. Heating load analysis. Overview of photovoltaics. On-site evaluation of NCSU Solar House.

Prerequisite: MAE 302, MAE 310
Typically offered in Spring only

MAE 426/MAE 526 Fundamentals of Product Design (3 credit hours)
Many think of design as more of an art than a science. However, the growing body of research in the engineering design community teaches us ways to navigate the design of consumer products using interdisciplinary design tools and rational decision making. This course introduces students to scientific design techniques that are more effective than "ad hoc" tactics. By exploring how engineering principles integrate with "real world" design challenges, students will learn to solve product design problems that encompass heterogeneous markets, multiple disciplines, and large-scale complex systems.

Prerequisite: MA 241
Typically offered in Spring only

MAE 430 Applied Finite Element Analysis (3 credit hours)
Finite element modeling techniques for solving real-world engineering problems are discussed. Theory of finite element discretization is highlighted follow by software implementation, emphasis is given on accurate prescription of boundary conditions that represent actual physical systems, modeling exercises and projects include solid structural problems, heat transfer, structural vibrations, fluid dynamics and contact problems, modeling is carried out using commercial software packages.

Prerequisite: MAE 201 and (MAE 316 or MAE 371)
Typically offered in Spring only

MAE 435 Principles of Automatic Control (3 credit hours)
Study of linear feedback control systems using transfer functions. Transient and steady state responses. Stability and dynamic analyses using time response and frequency response techniques. Compensation methods. Classical control theory techniquesfor determination and modification of the dynamic response of a system. Synthesis and design applications to typical mechanical engineering control systems. Introduction to modern control theory.

Prerequisites: MAE 315 or MAE 361
Typically offered in Fall, Spring, and Summer

MAE 440 Non-Destructive Testing and Evaluation (3 credit hours)
NDT/NDE is a 3-credit elective course covering the general defect and damage types in materials and structures, principles of NDT/NDE techniques, and NDT/NDE applications. Associated lab modules (3 weeks) provide hands-on opportunities to students on often used NDT/NDE methods including magnetic particle, ultrasonics, and eddy current methods. A final project team will work on research and industrial NDT/NDE solutions.

Junior or Senior standing in the College of Engineering
Typically offered in Fall only

MAE 451 Experimental Aerodynamics III (1 credit hours)
Laboratory experiments in internal compressible flow and boundary layers in conjunction with MAE 458 or MAE 459. Topics include nozzle flows, constant area duct flows, component/overall performance of a gas turbine, and boundary layer analysis.

Prerequisite: MAE 352, Corequisite: MAE 458 or MAE 459
Typically offered in Fall only

MAE 452 Aerodynamics of V/STOL Vehicles (3 credit hours)
Introduction to the aerodynamics and performance of vertical and short take-off and landing vehicles. Aerodynamics of propellers and rotors. High lift devices.

Typically offered in Fall only

MAE 455 Boundary Layer Theory (3 credit hours)
Introduction to the Navier-Stokes Equations and boundary layer approximations for incompressible flow. Calculation techniques for laminar and turbulent boundary layer parameters which affect lift, drag, and heat transfer on aerospace vehicles. Discussions of compressible flows.

Prerequisite: MAE 252 or MAE 308
Typically offered in Fall only

MAE 456 Computational Methods in Aerodynamics (3 credit hours)
Introduction to computational methods for solving exact fluid equations. Emphasis on development of the fundamentals of finite difference methods and their application to viscous and inviscid flows.

Prerequisite: MAE 252
Typically offered in Spring only

MAE 457 Flight Vehicle Stability and Control (3 credit hours)
Longitudinal, directional and lateral static stability and control of aerospace vehicles. Lineralized dynamic analysis of the motion of a six degree-of-freedom flight vehicle in response to control inputs and disturbance through use of the transfer function concept. Control of static and dynamic behavior by vehicle design (stability derivatives) and/or flight control systems.

Prerequisite: MAE 252 and (MAE 361 or MAE 315)
Typically offered in Spring only

MAE 458 Propulsion (3 credit hours)
One-dimensional, internal, compressible flow including: isentropic flow, normal shocks, flow with friction and simple heat addition. Applications to air-breathing aircraft propulsion systems. Performance, analysis and design of components and overall performance of air-breathing engines.

Prerequisite: MAE 351
Typically offered in Fall only

MAE 459 Rocket Propulsion (3 credit hours)
Study of chemical rockets. This includes nozzle theory, flight performance, thermochemical calculations, and component and system analysis and design.

Prerequisite: MAE 351or MAE 302
Typically offered in Fall only

MAE 467 Introduction to Space Flight (3 credit hours)
Fundamental aspects of space flight including launch vehicle performance and design, spacecraft characteristics, two-body orbital mechanics, earth satellites, interplanetary trajectories, atmospheric entry, and atmospheric heating.

Prerequisites: MAE 361 or MAE 315
Typically offered in Spring only

MAE 470/MAE 570 Space Exploration Systems (3 credit hours)
This course will cover topics related to space exploration systems. In particular, the basic concepts of orbital mechanics needed for space mission planning will be covered, along with the essential subsystems found on a typical spacecraft.

Prerequisite: MAE 467 Introduction to Space Flight or Graduate Standing and Consent of Instructor
Typically offered in Fall only

MAE 472 Aerospace Structures II (3 credit hours)
A continuation of MAE 371; deflection of structures, indeterminate structures, minimum weight design fatigue analysis and use of matrix methods in structural analysis. Selection of materials for aircraft construction based on mechanical, physical, and chemical properties.

Prerequisite: MAE 371
Typically offered in Spring only

MAE 480 Aerospace Vehicle Design I (3 credit hours)
A synthesis of previously acquired theoretical and empirical knowledge and application to the design of practical aerospace vehicle systems.

Prerequisites: (MAE 457 or MAE 467) and MAE 252 and MAE 371; Restrictions: Senior standing and Aerospace Engineering Majors
Typically offered in Fall only

MAE 481 Aerospace Vehicle Design II (3 credit hours)
A continuation of MAE 480. Designs are refined and vehicles constructed and instrumented by students. A flight test program is designed and carried out in cooperation with MAE 525 students.

Prerequisite: MAE 480
Typically offered in Spring only

MAE 482/ECE 482 Engineering Entrepreneurship and New Product Development I (3 credit hours)
Applications of engineering, mathematics, basic sciences, finance, and business to the design and development of prototype engineering products. This course requires a complete written report and an end-of-course presentation. This is the first course in a two semester sequence. Students taking this course will implement their designed prototype in ECE 483: Senior Design Project in Electrical Engineering and Computer Engineering II-Engineering Entrepreneurs. Departmental approval required.

Typically offered in Fall only

MAE 483/ECE 483 Engineering Entrepreneurship and New Product Development II (3 credit hours)
Applications of engineering, science, management and entrepreneurship to the design, development and prototyping of new product ideas. Based on their own new product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as 'virtual' startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the university that agree to participate as eTeam members. Departmental approval required.

Prerequisite: ECE 482
Typically offered in Fall and Spring

MAE 484 Engineering Entrepreneurship Senior Design Lab (1 credit hours)
This is the lab for MAE 483. Applications of engineering, science, management, and entrepreneurship to the design, development, and prototyping of new product ideas. Based on their own product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as 'virtual' startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the University that agree to participate as eTeam members. Departmental approval required.

Prerequisite: MAE/ECE 482; C: MAE/ECE 483
Typically offered in Spring only

MAE 495 Special Topics in Mechanical and Aerospace Engineering (1-3 credit hours)
Offered as needed to present new or special MAE subject matter.

MAE 496 Undergraduate Project Work in Mechanical and Aerospace Engineering (1-6 credit hours)
Individual or small group project in engineering, comprising the design of an equipment or system stemming from a mutual student-faculty interest; a substantial final report (project) containing calculations, drawings and specifications must be produced. Alternatively, individual or small group undergraduate research evolving from a mutual student-faculty interest; a conference or scientific journal paper must be submitted for publication. Departmental approval required

Prerequisite: Completion of all required MAE-300 level courses, Corequisite: MAE 415 or MAE 478
Typically offered in Fall, Spring, and Summer

MAE 501 Advanced Engineering Thermodynamics (3 credit hours)
Classical thermodynamics of a general reactive system; conservation of energy and principles of increase of entropy; fundamental relation of thermodynamics; Legendre transformations; phase transitions and critical phenomena; equilibrium and stability criteria in different representation; irreversible thermodynamics. Introduction to statistical thermodynamics.

Prerequisite: MAE 302; MA 401 or MA 511
Typically offered in Spring only

MAE 504 Fluid Dynamics Of Combustion I (3 credit hours)
Gas-phase thermochemistry including chemical equilibrium and introductory chemical kinetics. Homogeneous reaction phenomena. Subsonic and supersonic combustion waves in premixed reactants (deflagration and detonation). Effects of turbulence. Introduction to diffusion flame theory.

Prerequisite: MAE 201 or MAE 252 or MAE 308
Typically offered in Fall only

MAE 505 Heat Transfer Theory and Applications (3 credit hours)
Development of basic equations for steady and transient heat and mass transfer processes. Emphasis on application of basic equations to engineering problems in areas of conduction, convection, mass transfer and thermal radiation.

Prerequisite: MAE 310
Typically offered in Fall only

MAE 508 Automotive Power Systems (3 credit hours)
This course will cover topics related to automotive power systems. In particular, this course provides fundamental concepts and knowledge on different power station options for automotive applications including internal combustion engines, battery electrical vehicles, engine/battery hybrid vehicles, and fuel cell powered vehicles.

P: Graduate Standing
Typically offered in Spring only

MAE 511 Advanced Dynamics with Applications to Aerospace Systems (3 credit hours)
Basic topics in advanced dynamics and with applications to aerospace systems. Rotating coordinate systems, Euler angles, three-dimensional kinematics and kinetics, angular momentum methods and an introduction to analytical mechanics. Examples are concentrated in the area of aerospace vehicles, but the methods learned will be applicable to land-based vehicles and any engineering system undergoing rigid body rotation, e.g. wind turbines, biomechanical systems, machine tools, robotic systems, etc.

Prerequisite: (MAE 208 or PY 205) and MA 242 and (MA 301 or MA 341)
Typically offered in Fall and Summer

MAE 513 Principles of Structural Vibration (3 credit hours)
Principles of structural vibration beginning from single and multi-degree of freedom systems and extending to distributed systems. Forced system response, vibration of strings, bars, shafts and beams and an introduction to approximate methods.

Prerequisite: MAE 315
Typically offered in Fall only

MAE 515 Advanced Automotive Vehicle Dynamics (3 credit hours)
This course covers advanced materials related to mathematical models and designs in automotive vehicles as multiple degrees of freedom systems for dynamic behaviors in acceleration, braking, rollover, aerodynamics, suspections, tire, and drive train.

Prerequisite: MAE 208 or MAE 315 or MAE 472 or equivalent; or consent of the instructor
Typically offered in Spring only

MAE 517 Advanced Precision Manufacturing for Products, Systems and Processes (3 credit hours)
This is a graduate level course designed for graduate students and undergraduate seniors. This course examines precision issues for products, manufacturing machines, processes, and instruments. Modern manufacturing technologies are distinct in their multifarious nature in product sizes, materials, energy forms, theories, and information types; however, the key to their success relies on the management of precision. This course discusses issues critical to both existing precision manufacturing and future sub-micron/nano technology. Important topics include fundamental mechanical accuracies; manufacturing systems and processes; geometric dimensioning and tolerancing; process planning, tolerance charts, and statistical process control; principles of accuracy, repeatability, and resolution; error assessment and calibration; error budget; reversal principles; joint design and stiffness consideration; precision sensing and control; precision laser material processing.

Prerequisite: MAE 496 or MAE 415 or equivalent or instructor permission
Typically offered in Fall only

MAE 518 Acoustic Radiation I (3 credit hours)
Introduction to principles of acoustic radiation from vibrating bodies and their related fields. The radiation of simple sources, propagation of sound waves in confined spaces and transmission through different media.

Prerequisite: MA 301 and MAE 308 or MAE 356
Typically offered in Fall and Spring

MAE 520/MAE 420 Dynamic Analysis of Human Movement (3 credit hours)
Topics in movement biomechanics and computational analyses of movement, including muscle physiology and mechanics, advanced muscle modeling, neural control of muscle and motor control theories, and dynamic simulation and optimization. Discussion of fundamental research underpinnings and clinical and sports applications.

P: MAE208 or equivalent
Typically offered in Spring only

MAE 521 Linear Control and Design For Mimo Systems (3 credit hours)
Linear Multivariable control and design for multibody engineering systems (robotics) and aircraft controls and navigation. Emphasis on multi-input and multi-output (MIMO) system analysis and design using frequency-based approach. Controllability andobservability, transmission zeroes and pole-zero cancellation, eigenstructures, singular value decomposition in frequency domain, stability and performance robustness of MIMO systems.

Prerequisite: MAE 435, MA 341

MAE 522 Non Linear System Analysis and Control (3 credit hours)
Nonlinear system analysis, Lyapunov stability theory, absolute stability, feedback linearization, sliding mode control, backstepping control technique, as well as various advanced nonlinear control methods.

Prerequisite: MAE 521 or equivalent

MAE 525 Advanced Flight Vehicle Stability and Control (3 credit hours)
Preliminary analysis and design of flight control systems to include autopilots and stability augmentation systems. Study of effects of inertial cross-coupling and nonrigid bodies on vehicle dynamics.

Prerequisite: MAE 457
Typically offered in Fall only

MAE 526/MAE 426 Fundamentals of Product Design (3 credit hours)
Many think of design as more of an art than a science. However, the growing body of research in the engineering design community teaches us ways to navigate the design of consumer products using interdisciplinary design tools and rational decision making. This course introduces students to scientific design techniques that are more effective than "ad hoc" tactics. By exploring how engineering principles integrate with "real world" design challenges, students will learn to solve product design problems that encompass heterogeneous markets, multiple disciplines, and large-scale complex systems.

Prerequisite: MA 241
Typically offered in Spring and Summer

MAE 528 Experimental Flight Testing (3 credit hours)
Application of engineering methods to experimental flight testing of fixed-wing aircraft for determination of performance and handling qualities of air vehicles. Risk minimization techniques are included in the formulation of a flight test plan. Collected flight test data is corrected for standard day and analyzed.

Prerequisite: Graduate standing, Aerospace Engineering Majors, MAE 525
Typically offered in Spring only

MAE 531 Engineering Design Optimization (3 credit hours)
Nonlinear optimization techniques with applications in various aspects of engineering design. Terminology, problem formulation, single and multiple design variables, constraints, classical and heuristic approaches, single and multiobjective problems, response surface modeling, and tradeoffs in complex engineering systems. Numerical optimization algorithms and implementation of these optimization techniques. Graduate standing in engineering recommended.

Prerequisite: Graduate standing in Engineering is recommended.
Typically offered in Fall only

MAE 532 Smart Structures and Micro-Transducers (3 credit hours)
This course is designed for graduate students who wish to learn fundamentals and applications of smart structures and micro transducers. The course focuses on materials, structures, design, fabrication, and characterization of micro transducers. It also covers the recent progress in applications of micro transducers in aerospace, biomedical, civil, electrical and mechanical engineering.

Prerequisite: MAE 314, MAE 315, or equivalent.
Typically offered in Fall only

MAE 533 Finite Element Analysis I (3 credit hours)
Fundamental concepts of the finite element method for linear stress and deformation analysis of mechanical components. Development of truss, beam, frame, plane stress, plane strain, axisymmetric and solid elements. Isoparametric formulations. Introduction to structural dynamics. Practical modeling techniques and use of general-purpose codes for solving practical stress analysis problems.

Prerequisite: MAE 316 or MAE 472
Typically offered in Fall only

MAE 534 Mechatronics Design (3 credit hours)
Principles of Mechatronics Design, review of logic gates, microprocessor architecture, sensors and actuators, A/D and D/A conversion techniques, real-time multi-tasking programming concepts, direct digital control implementation. "Hands-on" experience through several laboratory assignments and final team project.

Prerequisite: Structured Programming Experience, Senior/Graduate Standing in WPS/MAE.
Typically offered in Fall and Spring

MAE 535/ECE 535 Design of Electromechanical Systems (3 credit hours)
A practical introduction to electromechanical systems with emphasis on modeling, analysis, design, and control techniques. Provides theory and practical tools for the design of electric machines (standard motors, linear actuators, magnetic bearings, etc). Involves some self-directed laboratory work and culuminates in an industrial design project. Topics include Maxwell's equations, electromechanical energy conversion, finite element analysis, design and control techniques.

Prerequisite: MA 341
Typically offered in Spring and Summer

MAE 536 Micro/Nano Electromechanical Systems (3 credit hours)
Fundamentals and applications of micro/nano sensors and actuators. Emphasis upon MEMS/NEMS design, microfabrication techniques, and case studies of MEMS devices. Nanomaterials and NEMS devices also covered. Students have opportunity to learn commercial software packages on design and simulation of MEMS and hear from experts from leading MEMS companies through guest lectures. Previous knowledge of MEMS and nanotechnology is not required. The course is restricted to advanced undergrads and graduate students in engineering, materials science, physics and biomedical fields.

Typically offered in Fall only

MAE 537 Mechanics Of Composite Structures (3 credit hours)
Manufacturing techniques with emphasis on selection of those producing most favorable end result. Classical plate theory, materials properties and failure theories. Micromechanics, repair, plate solutions and elasticity solutions covered as requiredto meet special interests of students.

Prerequisite: MAE 316 or MAE 472
Typically offered in Spring only

MAE 538 Smart Structures and Materials (3 credit hours)
An application-oriented introduction to smart structures and materials with examples from mechanical, aerospace and biomedical engineering. Experimentally observed phenomena, micromechanisms, and models for material behavior. Team work developing simulation tools for typical applications. Validating results experimentally using PC-based data acquisition systems.

Prerequisite: MAE 415 or MAE 472
Typically offered in Spring only

MAE 539/MSE 539 Advanced Materials (3 credit hours)
Introduces production/structure/property/function relation and application of a number of materials mainly for biomedical, mechanical and aerospace applications. Topics include ultra light materials (production, processing and applications of cellular solids), biomaterials (classes and application of materials in medicine and dentistry), composites (classes and application), refractory materials and coatings for high temperature applications, thin film shape memory alloys for micro-electro mechanical systems (MEMS).

Prerequisite: MSE 201 and MAE 314
Typically offered in Fall only

MAE 540 Advanced Air Conditioning Design (3 credit hours)
Psychrometric process representations. Heating and cooling coil design. Heat pump design. Air washer design. Direct contact heat and mass transfer systems. Ventilation requirements, air dilution calculations. Cooling load calculations; CLTD, CLF andtransfer functions methods. Room air distribution.

Prerequisite: MAE 403, 404
Typically offered in Spring only

MAE 541 Advanced Solid Mechanics I (3 credit hours)
Development of principles of advanced strength of materials and elasticity theory leading to solution of practical engineering problems concerned with stress and deformation analysis. Tensor analysis, coordinate transformations, alternative measures of strain, elastic constitutive equations, stress measures, formulation and solution of two and three dimensional elasticity problems. Examples include advanced beam theory for shear deformation and large deformation, contact mechanics, stress concentration, pressure vessels and compound cylinders, thermal stress analysis, and stresses in layered microelectronic devices.

Prerequisite: MAE 316
Typically offered in Fall only

MAE 543 Fracture Mechanics (3 credit hours)
Concept of elastic stress intensity factor, Griffith energy balance, determination of the elastic field at a sharp crack tip via eigenfunction expansion methods, J integrals analysis, experimental determination of fracture toughness, fatigue crack growth, elastic-plastic crack tip fields. Emphasis on modern numerical methods for determination of stress intensity factors, critical crack sizes and fatigue crack propagation rate predictions.

Prerequisite: MAE 316
Typically offered in Spring and Summer

MAE 544 Real Time Robotics (3 credit hours)
Real-time programming for servo control using an embedded controller. Software and hardware interfacing for control of a D.C. servo device. Introduction of multi-tasking to establish concurrent control of several processes, transforming servo loop into a process executing concurrently on single board computer. Provision for hands-on development systems and software emulators.

Prerequisite: Pascal, C, FORTRAN or Assembly language experience

MAE 545 Metrology For Precision Manufacturing (3 credit hours)
Foundations of dimensional metrology and error analysis as applied to accuracy and repeatability in machine design. Plane, length, angle, and roundness metrology. Design of precision systems, Abbe' principle, error analysis, measurement, and compensation. Precision instruments and operating principles. Hands-on experience with measurement instruments and techniques.

Prerequisite: Senior standing in MAE or BS in other curriculum
Typically offered in Spring only

MAE 546 Photonic Sensor Applications in Structure (3 credit hours)
Use of optical fiber and other photonic device based sensors to measure strain, temperature and other measurands in aerospace, mechanical, civil and biomedical applications. An introduction to optical waveguide analysis will be provided at the beginning of the course.

Prerequisite: MAE 371 or MAE 316
Typically offered in Fall only

MAE 550 Foundations Of Fluid Dynamics (3 credit hours)
Review of basic thermodynamics pertinent to gas dynamics. Detailed development of general equations governing fluid motion in both differential and integral forms. Simplification of the equations to those for specialized flow regimes. Similarity parameters. Applications to simple problems in various flow regimes.

Prerequisite: MAE 201 or MAE 252 or MAE 308
Typically offered in Fall and Summer

MAE 551 Airfoil Theory (3 credit hours)
Development of fundamental aerodynamic theory. Emphasis upon mathematical analysis and derivation of equations of motion, airfoil theory and comparison with experimental results. Introduction to super sonic flow theory.

Prerequisite: MAE 252

MAE 552 Introduction to Experimental Fluid Dynamics and Measurement Systems (3 credit hours)
This course educates graduate students in the design of experiments and basis for model testing and scaling laws; uncertainty and error analysis in selecting measurement systems for experiments; qualitative and quantitative technologies for obtaining measurements; analysis, post-processing and visualization techniques of data.

Prerequisite: MAE 308 and MAE 451 or equivalent
Typically offered in Spring only

MAE 553 Compressible Fluid Flow (3 credit hours)
Equations of motion in supersonic flow; unsteady wave motion, velocity potential equation; linearized flow; conical flow. Slender body theory. Methods of characteristics. Shockwave/ boundary layer interactions.

Prerequisite: MAE 351 or MAE 550
Typically offered in Spring only

MAE 554 Hypersonic Aerodynamics (3 credit hours)
Fundamentals of inviscid and viscous hypersonic flowfields. Classical and modern techniques for calculating shock wave shapes, expansions, surface pressures, heat transfer and skin friction. Applications to high speed aircraft, rockets and spacecraft.

Prerequisite: MAE 553

MAE 555 Applications of Acoustic and Elastic Wave Propagation (3 credit hours)
This course covers the principles for acoustic and elastic propagation in fluids and solids. Diffraction theory is developed for finite sources. The notions of wavepacket, dispersion and waveguiding are reviewed. The fundamentals of the theory of elasticity and elastic propagation in solids are introduced, based on tensor analysis. Time reversal of acoustic waves is presented, as well as applications to underwater acoustics, medical imaging and therapy, nondestructive testing, elasticity imaging.

Typically offered in Spring only

MAE 558 Microfluidics and Nanofluidics (3 credit hours)
Macroscale fluid mechanics, heat and mass transfer. Theories of microfluidics and nanofluidics. Applications in mechanical, biomedical, and chemical engineering. Discussions of journal articles and modern fluid dynamics projects. Expert guest lectures on advanced micro/nanotechnology topics.

Prerequisite: MAE 310 and MA 427
Typically offered in Spring only

MAE 560 Computational Fluid Mechanics and Heat Transfer (3 credit hours)
Introduction to integration of the governing partial differential equations of fluid flow and heat transfer by numerical finite difference and finite volume means. Methods for parabolic, hyper-bolic and elliptical equations and application to model equations. Error analysis and physical considerations.

Prerequisite: MA 501 or MA 512, MAE 550 or MAE 557, proficiency in the FORTRAN programming language is required
Typically offered in Fall only

MAE 561 Wing Theory (3 credit hours)
Discussion of inviscid flow fields over wings in subsonic flow. Vortex lattice methods, lifting surface theories and panel methods developed for wings with attached flow and leading-edge separation. Calculation of aerodynamic characteristics and determination of effects of planform and airfoil shapes.

Prerequisite: MAE 551
Typically offered in Spring only

MAE 562 Physical Gas Dynamics (3 credit hours)
Introduction to kinetic theory, statistical mechanics and chemical thermodynamics. Law of Action. Vibrational and chemical rate processes. Application to equilibrium and nonequilibrium flows.

Prerequisite: MAE 550
Typically offered in Fall only

MAE 570/MAE 470 Space Exploration Systems (3 credit hours)
This course will cover topics related to space exploration systems. In particular, the basic concepts of orbital mechanics needed for space mission planning will be covered, along with the essential subsystems found on a typical spacecraft.

Prerequisite: MAE 467 Introduction to Space Flight or Graduate Standing and Consent of Instructor
Typically offered in Fall only

MAE 573 Hydrodynamic Stability and Transition (3 credit hours)
Conceptual framework and development of hydrodynamic stability theory. Application of the theory to two-dimensional incompressible and compressible subsonic, transonic, supersonic and hypersonic flows. Results for three-dimensional flows. Introduction of mechanisms of transition and discussion of transition models in numerical methods.

Prerequisite: MAE 550
Typically offered in Spring only

MAE 575 Advanced Propulsion Systems (3 credit hours)
The course will focus on non-turbomachinery, air-breathing hypersonic aeropropulsion applications. Specific propulsion systems to be covered include ramjets and scramjets, pulsed detonation engines, and combined cycle engines, with historical perspective.

Prerequisite: Both MAE 458 and MAE 459 or both MAE 302 and MAE 308

MAE 577/NE 577 Multiscale Two-phase Flow Simulations (3 credit hours)
Modeling and simulation of two-phase flows using interface tracking approach and ensemble averaging approaches. Model validation and verification based on interface-tracking data, boiling models. Nuclear reactor applications. The course focuses on interface tracking methods understanding as applied to bubbly flow simulations. Students will develop a simplified solver to track 2D bubbles/droplets throughout the course homework assignments and will learn how to apply this approach for better understanding of multi-phase flow as part of the course project.

Typically offered in Spring only

MAE 586 Project Work In Mechanical Engineering (1-6 credit hours)
Individual or small group investigation of a problem stemming from a mutual student-faculty interest. Emphasis on providing a situation for exploiting student curiosity.

Typically offered in Fall, Spring, and Summer

MAE 589 Special Topics In Mechanical Engineering (1-6 credit hours)
Faculty and student discussions of special topics in mechanical engineering.

Prerequisite: Advanced Undergraduate standing or Graduate standing
Typically offered in Fall and Spring

MAE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MAE 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MAE 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MAE 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

MAE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

MAE 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MAE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

MAE 699 Master's Thesis Preparation (1-9 credit hours)
Individual research in the field of mechanical engineering.

Prerequisite: Graduate standing in Mechanical Engineering, Consent of Adviser
Typically offered in Fall, Spring, and Summer

MAE 702 Statistical Thermodynamics (3 credit hours)
Analysis and establishment of conclusions of classical thermodynamics from the microscopic viewpoint. Topics include: ensemble methods, partition functions, translational, rotational and vibrational energy modes of an ideal gas, chemical equilibrium, imperfect gases, dense fluids, critical-point theories, mean free path concepts, Boltzmann equation, hydrodynamic equations from kinetic theory and properties of disordered composite media.

Prerequisite: MAE 501
Typically offered in Spring only

MAE 703 Direct Energy Conversion (3 credit hours)
The course is intended to be an introduction to fundamentals of energy transport and energy conversion concepts from nano to macro scales. The course will cover the state of energy carriers (photons, electrons, and phonons) and their transport characteristics. A focus will be on material properties that dictate energy related processes. The foundational concepts will then be applied to direct energy conversion devices including thermoelectrics and photovoltaics. Finally, the course will cover system analysis of solid-state energy conversion applications.

Typically offered in Spring only

MAE 704 Fluid Dynamics of Combustion II (3 credit hours)
Advanced theory of detonation and deflagration. Ignition criteria. Direct initiation of detonation including blast-wave theory. Transition from deflagration to detonation. Combustion wave structure and stability. Liquid droplet and solid particle combustion.

Prerequisite: MAE 504
Typically offered in Spring only

MAE 707 Advanced Conductive Heat Transfer (3 credit hours)
Comprehensive, unified treatment of methodologies for solving multidimensional transient and steady heat conduction. Approximate and exact methods of solving nonlinear problems, including phase and temperature-dependent thermal properties, nonlinearboundary conditions. Heat conduction in composite media and anisotropic solids. Use of finite integral transform and Green's function techniques.

Prerequisite: MAE 505 or MA 501
Typically offered in Spring only

MAE 708 Advanced Convective Heat Transfer (3 credit hours)
Advanced topics in steady and transient, natural and forced convective heat transfer for laminar and turbulent flow through conduits and over surfaces. Mass transfer in laminar and turbulent flow. Inclusion of topics on compressible flow with heat and mass transfer.

Prerequisite: MAE 550
Typically offered in Spring only

MAE 709 Advanced Radiative Heat Transfer (3 credit hours)
Comprehensive and unified treatment of basic theories; exact and approximate methods of solution of radiative heat transfer and the interaction of radiation with conductive and convective modes of heat transfer in participating and non-participatingmedia.

Prerequisite: MAE 505
Typically offered in Fall only

MAE 718 Acoustic Radiation II (3 credit hours)
Advanced treatment of the theory of sound generation and transmission. Topics include: techniques for solution of the wave equation, radiation from spheres, cylinders and plates, sound propagation in ducts, scattering.

Prerequisite: MAE 518
Typically offered in Spring only

MAE 721 Robust Control with Convex Methods (3 credit hours)
This course emphasizes on control design techniques which result in closed-loop systems that are insensitive to modeling errors and which achieve a prespecified level of performance. Robustness margins against model uncertainty. Robust control design techniques based on linear matrix inequalities. Topics include uncertainty modeling, robust stability and performance, H_inf control, convex optimization technique (LMI), mu-analysis and synthesis, computer-aided analysis and control design.

Prerequisite: Graduate standing in Engineering and Applied Mathematics, MAE 521 or ECE 716
Typically offered in Spring only

MAE 725 Geophysical Fluid Mechanics (3 credit hours)
The principles of fluid mechanics applied to geophysical systems. Special emphasis placed on those features of these systems, such as almost rigid rotation and stable stratification, which produce unique and important effects. The effects of almost rigid rotations on homogeneous and stratified flows examined in detail.

Prerequisite: MAE 501
Typically offered in Fall only

MAE 726 Advanced Geophysical Fluid Mechanics (3 credit hours)
Principles of fluid mechanics applied to geophysical systems. Special emphasis on role of stable stratification on the flows in these systems. Detailed study of generation, interaction, propagation and dissipation of internal gravity waves. Studyof other geophysically important flows.

Prerequisite: MAE 725 or equivalent
Typically offered in Spring only

MAE 730 Modem Plasticity (3 credit hours)
Classical theories of plasticity and solutions pertaining to rate-independent and -dependent deformations modes in metals, geomaterials and concrete. Ductile failure modes, i.e., shear-strain localization and other failure modes associated with large deformation modes. Inelastic wave propagation, crystalline constitutive formulations and computational aspects of quasi-static and dynamic plasticity.

Prerequisite: Grad. course in elasticity or strength of materials
Typically offered in Fall only

MAE 731/MSE 731 Materials Processing by Deformation (3 credit hours)
Presentation of mechanical and metallurgical fundamentals of materials processing by deformation. Principles of metal working, friction, forging, rolling, extrusion, drawing, high energy rate forming, chipless forming techniques, manufacturing system concept in production.

Prerequisite: Six hrs. of solid mechanics and/or materials
Typically offered in Fall only

MAE 734 Finite Element Analysis II (3 credit hours)
Advanced treatment of finite element analysis for non-linear mechanics problems, including most recent developments in efficient solution procedures. Plate bending and shell elements, computational plasticity and viscoplastic materials, large deformation formulations, initial stability and buckling, structural vibrations, incompressible elasticity, contact problems, flow in incompressible media, weighted residuals and field problems. Development of efficient algorithms for practical application.

Prerequisite: MAE 533
Typically offered in Spring only

MAE 742 Mechanical Design for Automated Assembly (3 credit hours)
Mechanical design principles important in high volume production using modern automated assembly technology. Production and component design for ease of assembly as dictated by part handling, feeding, orientation, insertion and fastening requirements. Existing product evaluation and redesign for improved assemblage.

Prerequisite: Graduate standing or PBS status in Engineering
Typically offered in Fall only

MAE 766 Computational Fluid Dynamics (3 credit hours)
Advanced computational methods for integrating, by use of finite differences, and finite volume discretizations, non-linear governing equations of fluid flow; the Euler equations and the Navier-Stokes equations. Topics from current literature.

Prerequisite: MAE 560; proficiency in the FORTRAN programming language is required
Typically offered in Spring only

MAE 770 Computation of Reacting Flows (3 credit hours)
Development of governing equations for chemically and thermally nonequilibrium flows. Numerical formulation with application to planetary entry flows and supersonic combustion. Numerical examples. Computational problems.

Prerequisite: MAE 560, MAE 766
Typically offered in Spring only

MAE 776 Turbulence (3 credit hours)
Development of basic concepts and governing equations for turbulence and turbulent field motion. Formulations of various correlation tensors and energy spectra for isotropic and nonisotropic turbulence. Introduction to turbulent transport processes,free turbulence, and wall turbulence.

Prerequisite: MAE 550
Typically offered in Spring only

MAE 787 Structural Health Monitoring (3 credit hours)
The course will provide the students with in-depth knowledge of technologies in structural health monitoring using smart materials as sensing and actuating elements to interrogate the structures. Damage detection techniques such as wave, impedance, and vibration-based damage detection techniques will be discussed and applied to different types of structures. Advanced signal processing techniques such as wavelet, neural network, principal component analysis will be used to make the damage more quantifiable.

Prerequisite: MAE 541 or MAE 513 or equivalent
Typically offered in Spring only

MAE 789 Advanced Topics In Mechanical Engineering (1-3 credit hours)
Faculty and graduate student discussions of advanced topics in contemporary mechanical engineering.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

MAE 801 Mechanical Engineering Seminar (1 credit hours)
Faculty and graduate student discussions centered around current research problems and advanced engineering theories.

Typically offered in Fall and Spring

MAE 830 Doctoral Independent Study (1-3 credit hours)
Individual investigation of advanced topics under the direction of member(s) of the graduate faculty.

Typically offered in Spring only

MAE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MAE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MAE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

MAE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MAE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

MAE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Typically offered in Fall, Spring, and Summer

Mechanical Engineering Systems (MES)

MES 200 Introduction to Mechanical Engineering Systems (2 credit hours)
This course introduces students to mechanical engineering systems and its application in real-world problem solving. Using Excel and MATLAB, students will structure and solve problems. Through hands-on activities, students will become familiar with basic mechanical components, tools and machines. Students will be introduced to professionalism in engineering and develop a personal professional development plan. This course requires a field trip to a local business and students will be required to provide or arrange for their own transportation. Course contains a required laboratory component.

Corequisite: MAE 206
Typically offered in Fall only

MES 201 Mechanical Engineering Systems Lab I (2 credit hours)
Course provides an introduction to the theory and practice of manual and computer assisted laboratory measurement techniques, data analysis, design of experiments and technical report writing. Students learn to successfully conduct and document an engineering experiment. This course requires a field trip to a local business and students will be required to provide or arrange for their own transportation.

Prerequisite: MAE 206
Typically offered in Spring only

MES 300 Systems Engineering (3 credit hours)
This course introduces the theory and practice of formal systems engineering. Students are exposed to systems thinking, systems modeling and performing engineering design within a formal systems engineering framework. They will perform requirements definition and analysis, system architecting, test and integration plan development, and formal technical reviews.

Prerequisite: MES 200 and C or better in MAE 206
Typically offered in Spring only

MES 301 Mechanical Engineering Systems Lab II (2 credit hours)
This is the first course in a series of three upper level laboratory courses MES 301, 302, and 400. In each course, students apply the measurement and experimental techniques learned in MES 201 to explore, experience and verify key theoretical mechanical engineering concepts. MES 301 focuses on the fields of fluid mechanics, dynamics of machines, digital design, and electrical engineering. Course requires a field trip to a local business and students will be required to provide or arrange for their own transportation.

Prerequisite: MES 201; Corequisite: MAE 308 and MAE 315
Typically offered in Fall only

MES 302 Mechanical Engineering Systems Lab III (2 credit hours)
This is the second course in a series of three upper level laboratory courses. MES 302 focuses on the fields of fluid mechanics, dynamic systems controls, and instrumentation. Students also experience engineering design by designing, building and testing an instrumentation device for engineering measurements. Course requires a field trip to a local business and students will be required to provide or arrange for their own transportation.

Prerequisite: MES 301; Corequisite: MAE 435
Typically offered in Spring only

MES 305 Mechanical Engineering Systems Lab I (1 credit hours)
Course provides an introduction to the theory and practice of manual and computer assisted laboratory measurement techniques, data analysis, design of experiments and technical report writing. Students learn to successfully conduct and document an engineering experiment. For MES Majors only.

Prerequisite: MSE 201 and MAE 206
Typically offered in Spring only

MES 400 Mechanical Engineering Systems Lab IV (2 credit hours)
This is the final course in a series of three upper level laboratory courses. MES 400 focuses on the fields of fluid mechanics, heat transfer, digital design, and solid mechanics. Students also finish the design experience started in MES 302. Course requires a field trip to a local business and students will be required to provide or arrange for their own transportation.

Prerequisite: MES 302; Corequisite: MAE 310
Typically offered in Fall only

MES 401 MES Capstone Design I (3 credit hours)
This course is first of a two-semester engineering design and manufacturing experience which is the culmination of the MES student's undergraduate education experience. In teams, students design, cost, and build a working prototype to solve a real-world engineering problem supplied by an industry partner. Students follow a systems engineering approach to manage their project through a requirements definition review, a preliminary design review, and the completion of detailed design. Students develop communication skills through reports and presentations and gain insight into engineering design through guest lectures. Students must provide any transportation needed for this class. MES students only.

Prerequisite: MES 300 and MAE 316; Corequisite: MAE 310 and MAE 415
Typically offered in Fall only

MES 402 MES Capstone Design II (4 credit hours)
This course is second in a two semester engineering design and manufacturing experience which is the culmination of the MES student's undergraduate education experience. In teams, students solve a real-world engineering problem supplied by an industry partner. In the two courses, students follow a formal systems engineering approach to manage their project through the following reviews: System Requirements, Conceptual Design, Preliminary Design, and Critical Design. Students develop written and verbal communication skills and gain insight into engineering design practices through guest lectures from local engineers. Students must provide any transportation needed for this class. MES students only.

Prerequisite: MES 401
Typically offered in Spring only

MES 403 MES Capstone Design II (3 credit hours)
This course sequence is the second in the senior capstone engineering design experience. This capstone experience is the culmination of the MES student's undergraduate education experience. Working in teams, students perform engineering design to solve a real-world engineering problem supplied by an industry partner. In MES 401 & MES 403, students follow a formal systems engineering approach to manage their design project through the completion of a System Requirements Review, a Conceptual Design Review, a Preliminary Design Review, a Detailed Design Review, and a Critical Design Review. Students develop written and verbal communication skills through reports and presentations. Students also gain insight into engineering design practices through guest lectures from local engineers. Course requires travel to sponsor and students are required to provide or arrange for their own transportation.

Prerequisite: MES 401
Typically offered in Spring only

MES 405 Mechanical Engineering Systems Lab II (2 credit hours)
In this course, students apply the measurement and experimental techniques learned in MES 305 to explore, experience and verify key theoretical concepts from the fields of thermal science, fluid mechanics, solid mechanics, and dynamics and controls. Students learn to successfully design, conduct, analyze, document and present a statistically sound engineering experiment. For MES students only.

Prerequisite: MES 305 and MAE 314 and MAE 308; Corequisite: MAE 435 and MAE 310
Typically offered in Fall only

Medical Textiles (MT)

MT 105 Introduction to Medical Textiles (3 credit hours)
Introduction to the structures and methods of production of polymers, fibers, yarns and fabrics used in medical applications. Survey of the performance requirements of current medical textiles and healthcare products used in health centers, as surgical implants and as consumer products. Overview of the structure, organization and integration of the medical textile, medical device and pharmaceutical industries within the healthcare sector. Credit not allowed if previous credit for TT 105

Typically offered in Fall and Spring

MT 323 Introduction to Theory and Practice of Medical Fiber and Yarn Formation (3 credit hours)
Introduction to the manufacture of fibers and filament yarns used in medical textiles. It includes the flow behavior of polymeric materials as it relates to fiber formation. It also includes the application of fiber forming theories to synthetic and biopolymeric fibers used in medical textiles. The common methods of yarn manufacture are introduced.

Prerequisite: (PY 211 or (PY 205 and PY 206)) and (PCC 203 or CH 221 or CH 225 or TE 200)
Typically offered in Fall and Spring

MT 366 Biotextile Product Development (3 credit hours)
Overview of the product development process for medical textiles and implantable biotextile devices. FDA classification system for medical and healthcare products. Review steps in identification of healthcare needs, market size and demand, product specifications and design, prototype fabrication and sterilization, in vitro testing of mechanical, chemical, surface and biological properties, in vivo animal testing, regulatory issues, consumer and clinical trials and explant analysis. Examples of medical textiles for personal hygiene, wound care, external support, orthopedic, general surgery, dental and tissue engineering applications. The student will be introduced to the process of new product development as it applies to medical textiles and biotextiles.

Prerequisite: (TT 105 or MT 105 or PCC 105), (TE 200 or CH 223 or 227), and TT 327: Co-requisite: TT 404, TT 341, and TT 351
Typically offered in Spring only

MT 381 Medical Textile and the Regulatory Environment (3 credit hours)
The course will focus on the legal and regulatory environment as it impacts the design, manufacture, marketing and distribution of medical textiles and healthcare products. Fundamentals of legal theory, contract law, intellectual property, licensing, product liability and the Food and Drug Administration will be covered, providing the student with the ability to recognize and understand the legal issues involved with the medical textile supply chain.

Prerequisite: Junior standing.
Typically offered in Fall and Spring

MT 432 Biotextiles Evaluation (3 credit hours)
Evaluation of the performance of biotextiles and medical polymers in biological and microbiological environments, with an emphasis on in vitro and in vivo techniques for testing the biocompatibility and biostability of implantable biomedical products. Related issues will deal with quality assurance systems, inspection and sampling plans, ISO certification, good manufacturing practices, reference materials and organisms, and the use of accelerated tests and animal trials so as to meet regulatory requirements.

Prerequisite: TT 327 or MT 323 and BIO 183; Corequisite: MT 366 or TE 466
Typically offered in Fall only

MT 471/PCC 471 The Chemistry of Synthetic and Natural Bipolymers (3 credit hours)
Introduction to natural and synthetic biopolymers used for biomedical applications. Goals and challenges of biomaterials selection for biomedical engineering. Polymer concepts of polymerization and characterization. Sources/synthesis, chemical and physical properties and degradation mechanisms are described. Polymer classes include: polysaccharides, proteins, polyesters, polyurethanes, polyanhydrides and polyethers.

Prerequisite: CH 220 or 221 or 225
Typically offered in Spring only

Microbiology (MB)

MB 101/BCH 101 Introduction to Microbiology and Biochemistry Laboratory Practices (3 credit hours)
Curricular bridge between high school and college for high school and transitional students. A "hands on" introduction to fundamentals in Microbiology and Biochemistry. Bacterial isolation, identification and growth using aseptic technique, microscopy, and metabolic analysis. Experiments with DNA isolation and analysis, protein isolation, and purification, and enzyme kinetics. Lectures and readings on background, theory and applications of these techniques. Field trips to university and industry research laboratories. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS) as well as other pre-college, transitional and early-college programs and is offered as 4 week intensive course. Applicants should have completed high school courses in biology and chemistry. Students must have completed no more than 30 credit hours. Departmental approval is required for current NCSU students.

Typically offered in Summer only

MB 103 Introductory Topics in Microbiology (1 credit hours)
Introduction to scope and objectives of university education. Emphasis on microbiology. Career opportunities, computers, university resources.

Typically offered in Fall only

MB 180 Introduction to Microbial Bioprocessing (3 credit hours)
Curricular bridge between high school and college for high school and transitional students. Fundamental cell biology concepts pertaining to biomanufacturing. Students gain an understanding of the basic principles of microbiology, culture preparation, physiology, and genetics of microbial cell cultures. Team-based decisions, collaborations and consideration of multiple perspectives are emphasized. Practical experience in laboratory and culture techniques used in biomanufacturing. Transportation will be provided for field trips. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS), as well as other pre-college, transitional and early-college programs. Suitable for students with less than 30 credit hours.

Typically offered in Summer only

MB 200 The Fourth Horseman: Plagues that Changed the World (3 credit hours)
An integrated and in-depth study of select microbial pathogens and their influence on history, public health, and human affairs. Five major pathogens will be examined to identify causative agents of disease, modes of transmission, prevention, and treatment. These pathogens will be framed in the power of plagues to shape human history and their impact on public health.

GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MB 210/BIT 210 Phage Hunters (3 credit hours)
This course offers first-year students an opportunity for mentored research. Students will apply the scientific method to make novel discoveries. Students will isolate and characterize naturally-occurring bacteriophage (viruses that infect bacteria, but not humans) from the environment. They will present their data to each other, and the genome of one phage will be sequenced. Students have the option to continue in a second semester to annotate that genome, culminating in a submission to genbank and a poster presentation. Students in the course are part of the National Genome Research Initiative funded by The Howard Hughes Medical Institute. Student should have had a high school biology course before taking this course.

GEP Natural Sciences
Typically offered in Fall only

MB 211/BIT 211 Phage Genomics (2 credit hours)
This course offers first-year students an opportunity for mentored research. Student will apply the scientific method to make novel discoveries. Students will build on the work they began in BIT/MB 210; The novel phage isolated in the previous semester will undergo genome sequencing over winter break, and in this course students will learn to analyze and annotate the genome sequence. This semester will culminate in a submission to genbank and a poster presentation. Students in the course are part of the national genome research initiative funded by the Howard Hughes Medical Institute.

Prerequisite: BIT(MB) 210
GEP Natural Sciences
Typically offered in Spring only

MB 351 General Microbiology (3 credit hours)
Rigorous introduction to basic principles of microbiology for students in biological and agricultural sciences and for all students planning to take further courses in microbiology.

Prerequisite: One Biology course (BIO 181, BIO 183, ZO 150 or ZO 160) and one Organic Chemistry course (CH 221 or CH 220)
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

MB 352 General Microbiology Laboratory (1 credit hours)
Laboratory experience in general microbiology. Aseptic technique, isolation and identification of bacteria, staining and microscopy. Enumeration of bacteria and viruses. Students who have completed either MB (BEC) 320 or MB 354 may not take this course for credit.

Corequisite: MB 351
Typically offered in Fall, Spring, and Summer

MB 354 Inquiry-Guided Microbiology Lab (1 credit hours)
Inquiry-guided laboratory experience in general microbiology, for microbiology majors and honors students, and those desiring a more rigorous exposure to this topic. Aseptic technique, isolation and identification of bacteria, staining and microscopy, and Koch's postulates. Restricted to microbiology majors and honor's students. Others require departmental permission. Credit is not allowed for both MB 354 and either Mb 320 or MB 352.

Corequisite: MB 351
Typically offered in Fall and Spring

MB 360 Scientific Inquiry in Microbiology: At the Bench (3 credit hours)
Scientific questions, controls and variables, designing, preparing for and carrying out experiments, keeping a notebook, interpreting results, and presenting their findings: i.e. the pragmatic things a student must know in order to work efficiently in a research lab regardless of the discipline. Prior or current enrollment in MB 352 or MB 354 recommended.

Prerequisite:CH 101 and BIO 183 (both with a C- or better)
Typically offered in Fall only

MB 405/FS 505/MB 505/FS 405 Food Microbiology (3 credit hours)
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

Prerequisite: MB 351
Typically offered in Spring only

MB 406/FS 506/MB 506/FS 406 Food Microbiology Lab (1 credit hours)
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

Prerequisite: MB 351 and Corequisite: FS 405 or FS 505
Typically offered in Spring only

MB 411 Medical Microbiology (3 credit hours)
Comprehensive study of microbial pathogenesis and mammalian host resistance. Diagnosis, prevention, and therapy of common human diseases of microbial origin.

Prerequisite: MB 351
Typically offered in Fall and Spring

MB 412 Medical Microbiology Laboratory (1 credit hours)
Laboratory experience to complement MB 411. Techniques of detection, growth and identification of bacteria and viruses relevant in clinical microbiology laboratories. Good laboratory practices (GLP) and safety stressed.

Prerequisite: MB 352 or MB 354 and Corequisite: MB 411
Typically offered in Spring only

MB 414 Microbial Metabolic Regulation (3 credit hours)
An integrative perspective on bacterial physiology and metabolism through an analysis of metabolic regulatory functions.

Prerequisite: MB 351 and either BCH 351 or 451
Typically offered in Fall only

MB 420/MB 520 Fundamentals of Microbial Cell Biotransformations (2 credit hours)
This is a half-semester course. Basic microbial cell culture theory and practice: cell physiology, mass balances, and metabolic control as seen in a dynamic bioreactor process to be scalable, consistent, and robust. The lab portion of the course provides students with hands-on experience in culture techniques using bioreactors. Students who have completed MB(BEC) 520 may not take BEC (MB) 420 for credit.

Prerequisite: MB 352 OR Corequisite of BEC(MB) 320
Typically offered in Fall only

MB 435/MB 535 Bacterial Pathogenesis (3 credit hours)
Focuses on basic principles of bacterial pathogenesis, including mechanisms utilized by these microbes to attach/adhere, internalize or invade, and disseminate through their animal hosts. Bacterial strategies to subvert hos defenses and persist within their animal hosts defense mechanisms, and virulence gene regulation will also be discussed. Students cannot get credit for both MB 435 and MB 535. Graduate status required for MB 535.

Prerequisite: MB 411, Graduate standing
Typically offered in Spring only

MB 441 Immunology (3 credit hours)
Introduction to principles of molecular immunology. Overview of immune system development and function, and discussions of ongoing scientific research regarding immune regulation.

P: C- or better in (MB 351 or BCH 351 or BCH 451 or BIO 414 or PB 414 or BIO 421)
Typically offered in Fall and Spring

MB 451 Microbial Diversity (3 credit hours)
Molecular, biochemical, and evolutionary diversity of the microbial world, including Bacteria, Archaea, and Eukaryotes. Evolutionary perspective on microbial relationships, molecular methods of study and classical and modern biotechnological methods utilizing this genetic diversity to explore the microbial world and use the resulting insight to meet the needs of our own species.

Prerequisite: MB 411 and (GN 311 or BCH 351 or BCH 451)
Typically offered in Fall and Spring

MB 452 Microbial Diversity Lab (2 credit hours)
This lab course is project-oriented. Students perform a series of classical enrichments and isolations, starting from environmental samples collected by the students themselves. Some of these isolations serve as the starting materials for a series of modern molecular biology experiments, in which students purify DNA, amplify ribosomal DNA by PCR, and have a portion of this gene sequenced. This sequence information is the starting point for the term project, a detailed molecular phylogenetic analysis of the isolated organisms. Students will be required to provide their own transportation during non-scheduled class time for local field sample collection.

Prerequisite: MB 412; Corequisite: MB 451
Typically offered in Fall only

MB 455 Microbial Biotechnology (3 credit hours)
Introduction to industrial microbiology with focus on biotechnology including developments employing recombinant nucleic acid and monoclonal antibody techniques. Bioremediation, industrial enzymes, transgenic plants, biopesticides, medical diagnostics, recombinant vaccines production of important secondary metabolites, and other topics. Field trips to local biotechnology companies.

Prerequisite: MB 351 and GN 311
Typically offered in Spring only

MB 461 Molecular Virology (3 credit hours)
Introduction to principles of molecular virology. Overview of classification and nomenclature, virus structure, interaction of viruses with cells, organisms (immunology, pathology), and populations (epidemiology). Detailed case studies from major groups of viruses; picornaviruses, togaviruses, orthomyxoviruses, retroviruses, polyomaviruses, and herpesviruses.

Prerequisite: MB 351, MB 411
Typically offered in Spring only

MB 470 Emerging and Re-emerging Infectious Diseases (3 credit hours)
Human behavior plays a big part in the emergence and reemergence of infectious diseases. Humanity encroaches consistently into previously uninhabited parts of the planet increasing the risk of exposure to novel pathogens that have the potential to jump into the human host or livestock. In addition to exposure to new diseases the complexities of politics and global relations often create opportunities for the re-emergence of infections that were once thought to be under control. This course aims to provide students interested in the health sciences with a foundation to understand the principles governing emergence of diseases.

Prerequisite: MB 351
Typically offered in Spring only

MB 479/MB 579 Microbial Symbiosis & Microbiomes (3 credit hours)
Microbial symbioses affect all life on earth. A recent surge of research has identified the critical role of microbial symbionts in maintaining host health and well-being, for example by mediating the breakdown of food for host nutrition, priming the immune system and directly fighting off pathogenic bacteria, and triggering key physiological outcomes associated with behavior and development. This course explores core topics in the study of microbial symbioses, including partner recognition and communication, adaptations to host association, the role of symbiosis in genome evolution and ecology, and the effects of microbial symbiosis on host health. Lectures and discussions will draw heavily from the primary literature in the field of microbiome/symbiosis research, focusing on the most recent discoveries, key methodological advancements, and on diverse associations ranging from marine symbioses to the human microbiome.

Prerequisite: MB 351 General Microbiology
Typically offered in Fall only

MB 480 Current Issues in Microbiology (1 credit hours)
Library research on current topics in all areas of microbiology. Presentation of research results orally and in the form of a major term paper.

Prerequisite: SMB majors or minors, Senior standing, and MB 351
Typically offered in Fall and Spring

MB 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

MB 501/PP 501/PB 501 Biology of Plant Pathogens (3 credit hours)
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

Prerequisite: PP 315, or PP 318, or an introductory course in microbiology
Typically offered in Fall only

MB 505/FS 405/MB 405/FS 505 Food Microbiology (3 credit hours)
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

Prerequisite: MB 351
Typically offered in Spring only

MB 506/FS 406/MB 406/FS 506 Food Microbiology Lab (1 credit hours)
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

Prerequisite: MB 351 and Corequisite: FS 405 or FS 505
Typically offered in Spring only

MB 520/MB 420 Fundamentals of Microbial Cell Biotransformations (2 credit hours)
This is a half-semester course. Basic microbial cell culture theory and practice: cell physiology, mass balances, and metabolic control as seen in a dynamic bioreactor process to be scalable, consistent, and robust. The lab portion of the course provides students with hands-on experience in culture techniques using bioreactors. Students who have completed MB(BEC) 520 may not take BEC (MB) 420 for credit.

Prerequisite: MB 352 OR Corequisite of BEC(MB) 320
Typically offered in Fall only

MB 532/SSC 532 Soil Microbiology (4 credit hours)
Soil as a medium for microbial growth, the relation of microbes to important mineral transformations in soil, the importance of biological equilibrium and significance of soil microbes to environmental quality.

Prerequisite: MB 351, CH 220

MB 535/MB 435 Bacterial Pathogenesis (3 credit hours)
Focuses on basic principles of bacterial pathogenesis, including mechanisms utilized by these microbes to attach/adhere, internalize or invade, and disseminate through their animal hosts. Bacterial strategies to subvert hos defenses and persist within their animal hosts defense mechanisms, and virulence gene regulation will also be discussed. Students cannot get credit for both MB 435 and MB 535. Graduate status required for MB 535.

Prerequisite: MB 411, Graduate standing
Typically offered in Spring only

MB 555 Microbial Biotechnology (3 credit hours)
Overview of industrial microbiology focusing on current biotechnology methods (bacteria, yeast, fungi) employing rDNA, optimization of heterologous gene expression, microbial metabolic pathway engineering, metabolomics, protein engineering and recombinant antibodies. Genetic and pathway engineering strategies for developing new microbes to screen for new therapeutic compounds or overproduce: primary metabolites, antibiotics, biotherapeutic proteins, industrially useful enzymes, medical diagnostics, recombinant vaccines, biopolymers. Utilization of biofilms, methods to immobilize biocatalysts, and microbial kinetics are also covered. Field trip to local biotechnology company. Students cannot receive credit for both 455 and 555.

Prerequisite: Undergraduate microbiology, genetics, and biochemistry course: MB351, BCH 351, and GN 311
Typically offered in Spring only

MB 575/PP 575/PB 575 Introduction to Mycology (4 credit hours)
A survey of the fungal kingdom in context of phyla and classes. Systematics, ecology, biology and utilization. Illustrative material, cultural techniques in laboratories. Collection and paper required.

Prerequisite: BS 125 or BS 181 and 183 or BO 200 or PP 315 or PP 318
Typically offered in Fall only

MB 579/MB 479 Microbial Symbiosis & Microbiomes (3 credit hours)
Microbial symbioses affect all life on earth. A recent surge of research has identified the critical role of microbial symbionts in maintaining host health and well-being, for example by mediating the breakdown of food for host nutrition, priming the immune system and directly fighting off pathogenic bacteria, and triggering key physiological outcomes associated with behavior and development. This course explores core topics in the study of microbial symbioses, including partner recognition and communication, adaptations to host association, the role of symbiosis in genome evolution and ecology, and the effects of microbial symbiosis on host health. Lectures and discussions will draw heavily from the primary literature in the field of microbiome/symbiosis research, focusing on the most recent discoveries, key methodological advancements, and on diverse associations ranging from marine symbioses to the human microbiome.

Prerequisite: MB 351 General Microbiology
Typically offered in Fall only

MB 585 Industry Case Studies in Microbial Biotechnology (3 credit hours)
Project-based course directly working with biotechnology and pharmaceutical companies. Students work in teams on a company-specific project. Projects range from developing business or marketing plans for new products; writing Small Business Innovation Research (SBIR) grants or white papers; creating procedures, protocols, and/or process improvements for a company-specific process; and studying intellectual property issues. Written and oral communication skills as well as teamwork, flexibility, and ambiguity management are emphasized. Restricted to MBT students.

Typically offered in Fall and Spring

MB 590 Topical Problems (1-3 credit hours)
Informal group discussion of prepared topics assigned by instructor.

Prerequisite: Graduate standing

MB 601 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

MB 610 Special Topics Microbiology (1-6 credit hours)
The study of special problems and selected topics of current interest in microbiology and related fields.

Typically offered in Fall, Spring, and Summer

MB 620 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in microbiology.

Typically offered in Fall, Spring, and Summer

MB 624 Topical Problems (1-3 credit hours)
Prerequisite: Graduate standing
Typically offered in Spring only

MB 670 Laboratory Research Methods (1-3 credit hours)
Directed research of microbiology graduate students in departmental laboratories prior to selecting thesis research topic. Selection of a minimum of three laboratories for research experience lasting 3 to 5 weeks. Acquisition of research methods relevant to each laboratory. Microbiology graduate students only.

Typically offered in Fall only

MB 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MB 686 Teaching Experience (1 credit hours)
Faculty mentoring in didactic and methodological aspects of teaching, including instructional technology as well as design and grading of assessment instruments. Provision of individual performance evaluations to encourage enhancement of teaching skills. Microbiology graduate students only.

Prerequisite: Microbiology Graduate student
Typically offered in Fall, Spring, and Summer

MB 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring and Summer

MB 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring and Summer

MB 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MB 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MB 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MB 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

MB 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

MB 714 Microbial Metabolic Regulation (3 credit hours)
An integrative perspective on bacterial physiology and metabolism through analysis of metabolic regulatory functions.

Prerequisite: MB 351 and either BCH 351 or 451
Typically offered in Fall only

MB 715/PP 715 Applied Evolutionary Analysis of Population Genetic Data (3 credit hours)
This course will introduce nonparametric and model-based methods for making inferences on population processes (mutation, migration, drift, recombination, and selection). The goal is to provide a conceptual overview of these methods and hands-on training on how to implement and interpret the results. Sample data sets in computer laboratories will integrate summary statistic, cladistic, coalescent, and bayesian approaches to examine population processes in different pathosystems with specific emphasis on eukaryotic microbes, viruses and bacteria.

MB 718 Introductory Virology (3 credit hours)
Introduction to principles of virology including: classification and nomenclature, epidemiology, structure, genome replication, gene expression strategies and cellular infection cycle. Major groups of viruses including those with DNA genomes and positive-sense or negative-sense RNA genomes.

Prerequisite: BCH 451 or GN 411 or MB 351
Typically offered in Fall only

MB 725/FS 725 Fermentation Microbiology (3 credit hours)
Fermentation bioprocessing and characteristics, function and ecology of responsible microorganisms. Fermentative activities, growth responses and culture interactions related to metabolism, physiology and genetics of lactic acid bacteria and selected yeasts and molds. Current developments in starter culture technology and genetics; application to food and industrial fermentations.

Prerequisite: BCH 451, MB 351
Typically offered in Spring only

MB 751/IMM 751 Immunology (3 credit hours)
Introduction to mechanisms of immunity in man and animals. Emphasis on interactions between cells of the immune system in production of immune responses and the molecules in control of these interactions.

Prerequisite: BCH 451, GN 411, MB 351
Typically offered in Spring only

MB 758/GN 758 Microbial Genetics & Genomics (3 credit hours)
Structure and function in microbial genetics, with emphasis on microbial genome organization, stable maintenance and evolution. DNA mutation and repair pathways, transcriptional and translational regulation, DNA replication and recombination and characterization of recombinant DNA molecules. Applications of genetic and genomic analysis methods to microbial processes, including strain construction, genome manipulation, and enhancement of gene expression.

Prerequisite: BCH 451 or GN 311
Typically offered in Spring only

MB 774/PB 774 Phycology (3 credit hours)
Introduction to taxonomy, morphology, reproduction and ecological importance of organisms which may be included in the algae. Attention to local freshwater flow and physiology of selected species in relation to algal blooms, water quality and nutrient loading in aquatic habitats.

Typically offered in Spring only

MB 783/CBS 783/IMM 783 Advanced Immunology (3 credit hours)
In depth study of the basic cellular and molecular mechanisms of immunity, including antigen processing and presentation, T cell development, initiation of the immune response, effector mechanisms, and immunological memory. The course is designed for advanced graduate students who wish to focus on the current concepts in immunology.

Prerequisite: MB (IMM) 751
Typically offered in Fall only

MB 790 Topical Problems (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

MB 801 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

MB 810 Special Topics Microbiology (1-6 credit hours)
The study of special problems and selected topics of current interest in microbiology and related fields.

Typically offered in Fall, Spring, and Summer

MB 820 Special Problems (1-6 credit hours)
Selection of a subject by each student on which to do research and write a technical report on the results. The individual may choose a subject pertaining to his or her particular interest in any area of study in microbiology.

Typically offered in Spring and Summer

MB 824 Topical Problems (1-3 credit hours)
Prerequisite: Graduate standing
Typically offered in Spring only

MB 870 Doctoral Lab Rotations (1-3 credit hours)
Directed research of microbiology graduate students in departmental laboratories prior to selecting thesis research topic. Selection of a minimum of three laboratories for research experience lasting 3 to 5 weeks. Acquisition of research methods relevant to each laboratory. Microbiology graduate students only.

Typically offered in Fall only

MB 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MB 886 Teaching Experience (1 credit hours)
Faculty mentoring in didactic and methodological aspects of teaching, including instructional technology as well as design and grading of assessment instruments. Provision of individual performance evaluations to encourage enhancement of teaching skills. Microbiology graduate students only.

Prerequisite: Microbiology Graduate student
Typically offered in Fall, Spring, and Summer

MB 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MB 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MB 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

MB 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

MB 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Military Science (MS)

MS 101 Introduction to Leadership and Values I (1 credit hours)
This course introduces students to fundamental components of service as an officer in the United State Army. Initial lessons form building blocks of progressive lessons in values, fitness, leadership and officership. Classroom instruction includes"life skills" including physical and mental fitness, communication theory, and interpersonal relationships. Upon completion, students will be prepared to receive more complex leadership instruction.

Prerequisite: Freshman standing or Sophomore standing
Typically offered in Fall only

MS 102 Basic Military Leadership (1 credit hours)
Familiarizes students with the fundamentals of map reading, land navigation techniques, small unit tactics and leadership, personal goal setting, Army Leadership and values, ethical decision making as well as Army basics.

Typically offered in Spring only

MS 201 Intermediate Leadership Theory I (2 credit hours)
Instruction is orientated on communication and leadership theory using practical exercise to apply communications and leadership concepts. Critical "life skills" and their relevance to success in the Army are stressed. Upon completion of this course, students will understand fundamental principles of leadership, and be prepared to intensity practical application in subsequent coursework.

Typically offered in Fall only

MS 202 Intermediate Leadership Theory II (2 credit hours)
This course focuses on the purpose, roles, and obligations of commissioned officers. Coursework will include origins of Army institutional values and practical application in decision making and leadership. Upon completion of this course, studentswill possess and understanding of leadership and officership, demonstrate the ability to apply these skills, and be prepared for the Advanced Military Science Program.

Prerequisite: MS 101
Typically offered in Spring only

MS 295 Special Topics in Military Leadership (3 credit hours)
Intensive supervised study in applied military leadership and management in an organization or historically applied scenario. Departmental approval required.

Typically offered in Fall and Spring

MS 301 Military Leadership and Training Management (3 credit hours)
Organizational leadership and processes in the Army; leadership activities and key management functions. Management and conduct of group training activities.

Prerequisite: ROTC advanced course cadet
Typically offered in Fall only

MS 302 Applied Leadership in Small Unit Operations (3 credit hours)
This course covers the fundamentals of Army Leadership, Officership, Army Values and Ethics, Personal Development, and small unit tactics at the platoon level. At the conclusion of this course, students will be capable of planning, coordinating, navigating, motivating and leading a squad and platoon in the execution of a mission during a classroom PE, a Leadership Lab, or during a Field Training Exercise (FTX). Students will write peer evaluations and receive feedback on his/her abilities as a leader and how to improve those leader skills that can further develop into a successful Army Officer.

Prerequisite: ROTC Advanced Course Cadets
GEP Social Sciences
Typically offered in Spring only

MS 401 Advanced Military Science - Leadership and Systems Management (3 credit hours)
A course designed to familiarize the student with the fundamentals of staff operations and procedures, military correspondence, and the U.S. Army training management system. Also included are the Officer Personnel Management and Officer Evaluation Report systems (OPMS/OER), the Army logistics system, mobilization and deployment, and intelligence/electronic warfare.

Prerequisite: MS 301, MS 302
Typically offered in Fall only

MS 402 Advanced Military Science - Military Justice, Ethics and Professionalism (3 credit hours)
The role of military justice, the Uniform Code of Military Justice (UCMJ) and the procedures for accomplishing certain legal actions. Ethics and professionalism of the officer corps. Also included are counseling techniques and continued preparation for the transition from cadet to commissioned officer. Emphasis on student interaction and small group exercise practical application.

Prerequisite: MS 401
Typically offered in Spring only

MS 495 Special Topics in Military Science (3 credit hours)
Individualized readings/research of Company Command level issues and implementation of the Uniform Code of Military Justice, DOD Policies, and additional duties required of company grade officers. Departmental approval required-advanced course students only.

Typically offered in Fall and Spring

Multidisciplinary Studies (MDS)

MDS 595 Special Topics in Multidisciplinary Studies (1-6 credit hours)
Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

Music (MUS)

MUS 103 Theory and Musicianship I (3 credit hours)
This is the first course in a sequence for students interested in a concentrated study of music theory and musicianship. In addition to the fundamental principles of pitch, rhythm, meter, scales, keys, intervals, triads, and seventh chords, this course integrates subjects on musical expression, timbre, texture, performance, and composition.

Co-requisite: Students must take MUS 103 either prior to or concurrently with MUS 104
GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 104 Theory and Musicianship Lab I (1 credit hours)
This is the first course in a sequence that develops aural perception skills in the principles of theory and musicianship through sight-singing and rhythm reading; scale, interval, and chord identification; melodic and rhythmic error detection; and melodic, rhythmic, and harmonic dictation. This course serves as a lab for MUS 103. Students may be able to test out of MUS 104 by means of a placement test.

Corequisite: MUS 103 either together with or before MUS 104. If a student withdraws from MUS 103, they must also withdraw from MUS 104.
Typically offered in Fall and Spring

MUS 105 Introduction to Music in Western Society (3 credit hours)
Introduction to the art of music in Western society, for the general student. Focuses on the western art music tradition, including stylistic periods from medieval to post-modern. Begins with the study of basic musical elements, formal principles and compositional techniques. This course may require students to provide their own transportation to and cover the cost of an on- or off-campus event.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 107 Class Piano I (1 credit hours)
Introduction to playing the piano by learning the basics of music notation, five-finger scales, and beginner's repertoire based on hand position.

Typically offered in Fall and Spring

MUS 111 University Singers (1 credit hours)
Students study, rehearse, and perform vocal music. This ensemble is dedicated to achieving musical excellence through the performance of choral works of art at the highest possible level, to the development of choral performance skills, and to the cultivation of significant aesthetic experiences through music. This course includes instruction in ensemble musicianship, rehearsal protocols, individual vocal techniques, and discussion of the historical and musical significance of assigned repertoire. There may be a charge for concert dress not to exceed $120, and students may be asked to provide individual transportation to off-campus performances. An audition is required.

Typically offered in Fall and Spring

MUS 112 Men's Choir (1 credit hours)
Rehearsal and performance of choral repertoire for men's voices. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue.

Typically offered in Fall and Spring

MUS 113 Women's Choir (1 credit hours)
Rehearsal and performance choral repertoire for women's voices. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 114 Chamber SIngers (1 credit hours)
Rehearsal and performance of choral repertoire for small vocal ensemble. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 115 State Chorale (1 credit hours)
Rehearsal and performance of advanced choral repertoire from all eras. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 116 African American Choral Ensemble (1 credit hours)
Students study and perform vocal music of the African diaspora, including spirituals, folk forms, traditional and contemporary gospel, and formally-composed choral works by composers of African descent. This course includes instruction in individual vocal techniques, rehearsal protocols, and discussion of the historical and musical significance of assigned repertoire. There may be a charge for concert dress not to exceed $100, and students may be asked to provide individual transportation to off-campus performances. This course may be taken for up to 10 semesters for credit. An audition is required.

Typically offered in Fall and Spring

MUS 120 Introduction to Music Theory (3 credit hours)
This course is designed for students interested in a fundamental study of the materials of music, including pitch, rhythm, meter, scales, keys, intervals, triads, and seventh chords. Intended for students with minimal or no music theory background, this course develops skills in reading, writing, and analyzing a wide variety of music.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

MUS 121 Raleigh Civic Symphony (1 credit hours)
Rehearsal and performance of significant repertoire for symphony orchestra from the 18th-21st centuries, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance.

Typically offered in Fall and Spring

MUS 122 Raleigh Civic Chamber Orchestra (1 credit hours)
Rehearsal and performance of significant repertoire for chamber orchestra from the 17th-21st centuries, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit . Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated for up to 10 semesters.

Typically offered in Fall and Spring

MUS 131 Marching Band (1 credit hours)
Rehearsal and performance of repertoire for marching band. Study of drill and instrumental techniques, memorization, and repertoire of varying styles for large ensemble. May be repeated for credit. There is a band uniform charge; transportation to performances will be provided. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall only

MUS 132 Varsity Band (1 credit hours)
Rehearsal and performance of repertoire for varsity or athletic band. Study of instrumental techniques and repertoire of varying styles for large ensemble. May be repeated for credit. There is a band uniform charge; transportation to performances will be provided. Audition required. May be repeated up to 10 semesters.

Typically offered in Spring only

MUS 133 British Brass Band (1 credit hours)
British Brass Band provides an ensemble performing experience in a wide range of musical styles in the British Brass Band musical medium. Music is selected to provide a challenging opportunity for musical growth. Students must provide their own transportation to off-campus events. There is a charge to the student to check out a department-owned instrument.

Prerequisite: Audition required
Typically offered in Spring only

MUS 134 Wind Ensemble (1 credit hours)
Rehearsal and performance of significant repertoire for wind ensemble, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated for up to 10 semesters.

Typically offered in Fall and Spring

MUS 135 Symphonic Band (1 credit hours)
Students rehearse and publicly perform repertoire for symphonic band, which includes a study of individual practice techniques, rehearsal and performance protocols, and the historical and musical significance of the repertoire. There may be a nominal charge for concert dress and instrument rental, and students may be asked to provide individual transportation to off-campus performances. Although auditions are not required, students must have had at least one year of lessons or performance experience on their instrument. This course may be taken for up to 10 semesters for credit.

Typically offered in Fall and Spring

MUS 140 Jazz Improvisation (1 credit hours)
Study of basic and advanced techniques for jazz improvisation, including in-class performance and study of historical models. May be repeated for credit up to ten semesters. Audition required.

Typically offered in Fall only

MUS 141 Jazz Combo II (1 credit hours)
Rehearsal and performance of basic to advanced repertoire for small jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 142 Jazz Ensemble II (1 credit hours)
Rehearsal and performance of basic to advanced repertoire for jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 143 Jazz Combo I (1 credit hours)
Rehearsal and performance of advanced repertoire for small jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 144 Jazz Ensemble I (1 credit hours)
Rehearsal and performance of advanced repertoire for jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

Typically offered in Fall and Spring

MUS 150 Vocal Techniques (1 credit hours)
Development and practice of vocal techniques suitable to solo and ensemble singing in a variety of musical styles, both historical and contemporary.

Typically offered in Fall and Spring

MUS 152 Beginning Bagpiping (1 credit hours)
Instruction in bagpiping, including individual practice techniques and traditional performance practices. Prepares students for advancement into the NC State Pipes and Drums Band. Students will be required to purchase a bagpipe chanter and to provide individual transportation to off-campus performances. The ability to read music is not required upon entry. This course may be taken up to 6 semesters for credit.

Typically offered in Fall and Spring

MUS 153 Theory and Musicianship II (3 credit hours)
This is the second course in a sequence for students interested in a concentrated study of music theory and musicianship. Topics include harmonic analysis, part-writing, seventh chords, nonharmonic tones, melodic organization, harmonic progression and expansion, harmonic rhythm, and tonicization.

Prerequisites: Placement Tests or C- or better in MUS 103 and MUS 104; Corequisites: MUS 154 either together with or after MUS 153.
Typically offered in Spring only

MUS 154 Theory and Musicianship Lab II (1 credit hours)
This is the second course in a sequence that develops aural perception skills in the principles of theory and musicianship through sight-singing and rhythm reading; interval and chord identification; melodic, rhythmic, and harmonic error detection; and melodic, rhythmic, and harmonic dictation. This course serves as a lab for MUS 153.

Prerequisite: MUS 103 and 104, or placement tests; Corequisites: MUS 153. Students must take MUS 153 either together with or before MUS 154. If a student withdraws from MUS 153, they must also withdraw from MUS 154.
Typically offered in Spring only

MUS 180 Introduction to Musical Experiences (3 credit hours)
Examination of western musical materials, forms, styles and history through the primary musical experiences of composing, performing, and listening. Course designed for students with no formal musical training.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

MUS 181 Exploring Music Theory (3 credit hours)
Exploring music theory provides the student insight into Basic theoretical elements of music from Western civilization, which are fundamental to analysis and creation of musical compositions. The course will cover tonality, rhythm, intervals, triads, composition of melodies, harmonic progressions, and lead sheets. This course will enrich the student who performs, sings, composes, and enjoys listening to music.

Prerequisite: Ability to read music
GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 190 Preparatory Applied Music Lessons (1 credit hours)
This course offers individual instruction in voice or instrumental performance that includes the development of basic technique as well as the advancement of artistry, musicianship, and repertoire. An end-of-semester evaluation serves as a measure of progress for continuation of applied study. A lesson charge of $300.00 is assessed at the beginning of each semester. Students may be required to provide their own transportation to and cover the minimal cost of an on- or off-campus event. This course may be taken for up to 2 semesters for credit.
Prerequisite: Department Approval

Typically offered in Fall and Spring

MUS 193 Applied Music Lessons I (1 credit hours)
Designed for the first two semesters of a four-semester program of study, this course offers individual instruction in voice or instrumental performance that includes the development of basic technique as well as the advancement of artistry, musicianship, and repertoire. An end-of-semester performance jury serves as a measure of progress for continuation of applied study. A lesson charge of $300.00 is assessed at the beginning of each semester. Students may be required to provide their own transportation to and cover the minimal cost of an on- or off-campus event.

Requisite: Music Minors Only
Typically offered in Fall and Spring

MUS 200 Understanding Music: Global Perspectives (3 credit hours)
Understanding Music is a semester-long exploration of music's materials, contexts, and purposes. We will consider music as a global phenomenon and commonality of human social experience. Through videos, readings and listening to both recorded and live music from diverse world regions, we will examine the occasions and purposes of music making and listening. We will explore the ways in which traditions, values, belief systems, and patterns of social change are encoded and made manifest in musical practices. The ability to read music is not expected. This course can fulfill either the Interdisciplinary Perspectives (IP) or Visual & Performing Arts (VPA) GEP requirements, and the Global Knowledge (GK) co-requisite requirement.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

MUS 201 Introduction to Music Literature I (3 credit hours)
Survey of Western art music from antiquity to the mid-18th century, with an emphasis on the characteristic forms and styles of he Medieval, Renaissance, and Baroque eras. This course examines the major composers and representative works in light of social, political, and cultural influences. The ability to read music is required.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 202 Introduction to Music Literature II (3 credit hours)
Survey of Western art music from the mid-18th century to the present, with an emphasis on the characteristic forms and styles of the late Baroque, Classical, Romantic, and Contemporary eras. This course examines the major composers and representative works in light of social, political, and cultural influences. The ability to read music is required. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 203A Theory and Musicianship III (3 credit hours)
As a continuation of MUS 153 (Theory and Musicianship II), this course examines compositional processes in chromatic harmony and musical form. Students acquire fluency in the written comprehension of these processes through analysis, problem solving, and notation. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus musical event not to exceed $20.

Prerequisite: MUS 153 (Theory and Musicianship II); Corequisite: MUS 204 either after or simultaneously with MUS 203
Typically offered in Fall only

MUS 204A Theory and Musicianship Lab III (1 credit hours)
As a continuation of MUS 154 (Theory and Musicianship Lab II), this course examines compositional processes in chromatic harmony and musical form. Students acquire fluency in the aural comprehension of these processes through rhythmic, melodic, and harmonic dictation; contextual listening and identification; composition; sight-singing; and rhythm-reading. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus musical event not to exceed $20.

Prerequisite: MUS 154 (Theory and Musicianship Lab II); Corequisite: MUS 203 either before or simultaneously with MUS 204
Typically offered in Fall only

MUS 206 America's Music (3 credit hours)
Historical survey of music in the United States, including classical and popular, secular and religious, vocal and instrumental music genres and styles from the 18th to 21st centuries, studied in the context of relevant social and cultural issues. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring only

MUS 207 Class Piano II (1 credit hours)
The study and performance of intermediate piano repertoire.

Prerequisite: MUS 107
Typically offered in Fall and Spring

MUS 208 Piano Pedagogy (2 credit hours)
This course is designed to prepare students to teach piano at the elementary level. Topics discussed are the history of piano pedagogy; principles of pedagogy; age- and level-based learning types; technical, artistic and performance problems; music pedagogy as career; reference and teaching materials; and introduction in MIDI technology. Requirement for music minors in the piano performance emphasis. Prerequisite: MUS 390, 207, or instructor's consent.

Prerequisite: MUS 390 or MUS 207; C: MUS 390
Typically offered in Spring only

MUS 210 Introduction to Popular Music: 1950s-1970s (3 credit hours)
This course examines the stylistic evolution and cultural impact of popular music in the United States from the 1950s through the 1970s. Musical styles discussed include American and British rock, R&B, country, folk, soul, funk, reggae, disco, and punk. No prior musical knowledge is necessary. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event. This course fulfills GEP requirements in Visual and Performing Arts.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall and Summer

MUS 211 Introduction to Popular Music: 1980s-Present (3 credit hours)
The course examines the stylistic development and cultural impact of popular music in the United States from the 1980s to the present. Musical styles discussed include mainstream and alternative rock, metal, pop, country, contemporary R&B, rap, hip-hop, dance music, and electronica. No prior musical knowledge is necessary. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event. This course fulfills GEP requirements in Visual and Performing Arts.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 230/AFS 230 Introduction to African-American Music (3 credit hours)
Comprehensive survey of African-American music in the United States from Colonial times to the present, with emphasis on its unique features and contributions to American culture.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 231 Music in Film and Television (3 credit hours)
This course is a survey of the history and the change over time in film and TV scores from the Silent Era until the present. It is an introduction to the interlocking studies of film, music, literature, politics, and culture in the United States in the twentieth and twenty-first centuries. Students will learn how music enhances, comments on, undermines, and directs a viewer's interpretation of a film or TV episode. Different film genres including horror, historical fiction, movie musicals, and speculative fiction will be highlighted in the course content. Through class discussions, class activities, formal, and informal writing assignments, students will evaluate films, sound recordings, scholarly publications, and primary sources about music in film. No previous musical experience is required.

GEP Humanities

MUS 240 Introduction to the Music Industry (3 credit hours)
This course provides an introduction to the commercial music industry, including its history and development in the context of multiple popular and traditional genres in the United States. Introduction to the Music Industry will increase a student's understanding of common business practices and related knowledge concerning the music industry. It will also assist those students considering further study of the music industry to effectively maintain a professional music career. Students may be required to provide their own transportation to and cover the cost of on- and off-campus events.

GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 253 Theory and Musicianship IV (3 credit hours)
As a continuation of MUS 203 (Theory and Musicianship III), this course examines compositional processes in 20th- and 21st-century music. Students acquire fluency in the written comprehension of these processes through analysis, problem solving, and notation. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus musical event not to exceed $20.

Prerequisite: MUS 203A (Theory and Musicianship III); Corequisites: MUS 254 either after or simultaneously with MUS 253
Typically offered in Spring only

MUS 254 Theory and Musicianship Lab IV (1 credit hours)
As a continuation of MUS 204 (Theory and Musicianship Lab III), this course examines compositional processes in 20th- and 21st-century music. Students acquire fluency in the aural comprehension of these processes through rhythmic, melodic, and harmonic dictation; contextual listening and identification; composition; sight-singing; and rhythm-reading. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus musical event not to exceed $20.

Prerequisite: MUS 203A (Theory and Musicianship III); Corequisite: MUS 253 either before or simultaneously with MUS 254
Typically offered in Spring only

MUS 260/AFS 260 History of Jazz (3 credit hours)
History of jazz and the contributions of major artists. Emphasis of the various styles that have contributed to this American art form. Investigation of structural forms in the jazz idiom.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring and Summer

MUS 270 Songwriting using Digital Audio Workstations (2 credit hours)
A class specifically for songwriters, musicians, beat makers, sample manipulators and scratch artists using digital audio workstations (DAWs) as composition tools. This course will also introduce basic audio engineering, gain structure, and signal flow from interface to DAW. The goal is to explore the broader DAW platform as a tool in the songwriting process. Students will explore editing, looping, effects, equalization, plugins and rack hardware. No specific prior mathematics, engineering, or computer training required. Students may be asked to provide their own transportation to and cover the cost of an on- or off-campus event.

GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 293 Applied Music Lessons II (1 credit hours)
Designed for the second two semesters of a four-semester program of study, this course offers individual instruction in voice or instrumental performance that includes the development of basic technique as well as the advancement of artistry, musicianship, and repertoire. An end-of-semester performance jury serves as a measure of progress for continuation of applied study. A lesson charge of $300.00 is assessed at the beginning of each semester. Students may be required to provide their own transportation to and cover the minimal cost of an on- or off-campus event. Prerequisite: Music Minors only; two semesters of MUS 193 or departmental approval.

Requisite: Music Minors Only and Two Semesters of MUS 193 or Departmental Approval
Typically offered in Fall and Spring

MUS 295 Special Topics in Music (1-3 credit hours)
Special Topics in Music

MUS 300 Chamber Music Performance (1 credit hours)
Performance of chamber music. Emphasis on chamber literature from the sixteen through the twentieth centuries written for a wide variety of combinations ranging from string quartets to pieces written for specific instruments and voices.

Prerequisite: Satisfactorily passing audition
Typically offered in Fall and Spring

MUS 305 Music Composition (3 credit hours)
Study and creation of musical works. Emphasis on writing original music and works imitative of conventional and contemporary musical styles. Students may have to provide their own transportation to an on- or off-campus event and to cover the cost of that event.

Theory I (MUS 103) or consent of instructor
GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 306/ARS 306 Music Composition with Computers (3 credit hours)
Survey of the theory and history of computer music, compositional algorithms, digital synthesis techniques, composition of at least one computer music work -- a computer-assisted composition for traditional instruments, a piece for computer music on tape, a real-time piece, or a piece that combines tape and instrument(s).

Prerequisite: Some knowledge of music or computer science (e.g. CSC 200)
GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 310 Music of the 17th and 18th Centuries (3 credit hours)
Evolution of European music from 1600 to 1820, with emphasis on characteristics of Baroque and Classical form and style. Examination of major composers and representative works in light of social, political and cultural influences. Students may be required to attend an on- or off-campus event at their own cost and to provide their own transportation.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 315 Music of the 19th Century (3 credit hours)
A survey of 19th century European music, including analysis of its texts, forms and composers, and its relations to other art forms of the period. This course fulfills GEP categories in Visual and Performing Arts and Global Knowledge. Students may be required to attend an on- or off-campus musical event at their own cost and to provide their own means of transportation.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall and Spring

MUS 320 Music of the 20th Century (3 credit hours)
This course is a study of Western Art Music from 1900 to the present, emphasizing significant composers, repertoire, and compositional procedures and trends, including traditional, atonal, serial, aleatoric, electronic and computer music. The ability to read music is not required. Students may be required to attend and cover the cost of an on-campus event. This course fulfills GEP categories in Visual and Performing Arts and Global Knowledge.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 330 Survey of Musical Theater (3 credit hours)
Survey of staged musical works spanning four centuries. Emphasis on large-scale dramatic works in the genres of opera, operetta, and musical. Designed for students with musical and/or theatrical experience. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 350 Music of Asia (3 credit hours)
Examination of music from a variety of Asian traditions including India and Pakistan, Japan and Korea, Thailand and Indonesia. Emphasis place on philosophical, social and religious contexts from which music emerges and in which it is experienced bynative performers and listeners. No previous formal training in music in required.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall only

MUS 360/WGS 360 Women In Music (3 credit hours)
The role of women in music as patrons, teachers, composers, and performers, placing them within the social, economic, and political framework to which they belong. Emphasis on Western Art Music and the role of women in popular music. No previous formal training in music is required.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring only

MUS 370 Intermediate Songwriting using Digital Audio Workstations (2 credit hours)
This class is designed for intermediate songwriters, musicians, beat makers, sample manipulators, and scratch artists using digital audio workstations (DAWs) as composition tools. Intended as a continuation of MUS 270, this course provides intermediate audio engineering and applied technical knowledge, such as equalization, compression, digital signal processing and mixing. Weekly assignments demonstrate command of the sonic and technical aspects of digital audio as well as the craft of songwriting. Students may be asked to provide their own transportation to and cover the minimal cost of an on- or off-campus event. Prerequisite: MUS 270 or departmental approval.

Prerequisite: MUS 270 or Departmental approval
Typically offered in Fall and Spring

MUS 393 Recital (1 credit hours)
The recital is the capstone for students in the Music Minor performance concentration. Students receive weekly individual instruction culminating in a public solo recital. Students also receive instruction in organizing the recital. A lesson charge of $300.00 is assessed at the beginning of the semester. Pending departmental approval, this course may be taken for up to two semesters for credit. Students may be required to provide their own transportation to and cover the minimal cost of an on- or off-campus event. Prerequisite: two semesters of MUS 293 or departmental approval.

Prerequisite: two semesters of MUS 293 or departmental approval
Typically offered in Fall and Spring

MUS 495 Special Topics in Music (3 credit hours)
Examination of selected topics in music.

Typically offered in Fall and Spring

MUS 498 Independent Study in Music (1-3 credit hours)
Directed independent study of selected topics for students with specialized interests in music and/or advanced musical ability. Credit and content determined by faculty member in consultation with Director of Music. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Natural Resources (NR)

NR 203/PRT 203/IDS 203 Humans and the Environment (3 credit hours)
Solutions-focused examination of the varied, complex, and evolving frameworks used to make sense of how individuals & societies connect with the biophysical environment. Emphasis on current issues and relevance of interdisciplinary training to careers including environmental planning and policy, sustainable tourism, parks and recreation management, conservation, environmental education, and climate resilience. Topics include: population dynamics, public land and common resources, renewable natural resources, pollution, water resources, energy and non-renewable resources.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

NR 219 Natural Resource Markets (3 credit hours)
A brief overview of financial markets relevant to natural resources and real assets. An introduction to traditional and non-traditional markets including timber markets, carbon and bioenergy markets, conservation banking, and wetland and stream mitigation credits. Investment analysis criteria and market and non-market valuation of natural resources.

GEP Social Sciences
Typically offered in Spring only

NR 293 Independent Study in Natural Resources (1-6 credit hours)
Independent Study for Natural Resources students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

NR 294 Independent Study in Natural Resources (1-6 credit hours)
Independent Study for Natural Resources students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

NR 295 Special Topics in Natural Resources (1-3 credit hours)
Special Topics in Natural Resources at the 200 level for offering of courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

NR 300 Natural Resource Measurements (4 credit hours)
Theory and practice of measuring, analyzing, and describing the characteristics of natural ecosystems. Surveying and mapping, inventory of vegetation, soils, wildlife habitat, and hydrology. Sampling, data analysis, and presentation of data. Use of geographic information systems to store, analyze, and present environmental data. Intensive instruction and practice in communication of technical information

Prerequisite: (PB 360 or BIO 360) and ST 311
Typically offered in Spring only

NR 301 Practicum for Professional Development I (1 credit hours)
Instruction in professional report writing and presentation, resume preparation and interview skills, professional ethics and practices, job searching skills; review and critique of professional seminars and documents from NR 301 students; preparation for summer work experience.

Prerequisite: Junior standing, NR Majors
Typically offered in Fall only

NR 350 International Sustainable Resource Use (4 credit hours)
Study of sustainable use of natural resources in a global economy with consideration of consumption choices, sustainable production issues, conservation of various managed landscapes, and cross cultural perspectives. Specific topics vary somewhat byyear and study location. Travel in North America in even years and to Sweden in odd years. Domestic or international travel overnight. Depending upon travel location, possible additional expense for passport, health certificate, insurance and domestic or international travel.

Prerequisite: Sophomore standing
Typically offered in Summer only

NR 360 Internship Experience (3 credit hours)
Internship experience with a natural resource agency or company. Most internships require working and living off-campus. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: NR 301 and Junior standing
Typically offered in Fall, Spring, and Summer

NR 400/NR 500 Natural Resource Management (4 credit hours)
Theory and practice of integrated natural resource management. Quantitative optimization, economics of multiple-use, compounding and discounting, optimal rotations, linear programming. Public and private management case studies and team projects.

Prerequisite: Senior standing in NR or ES or ETM or FOM or FWCB
Typically offered in Spring only

NR 406 Conservation of Biological Diversity (3 credit hours)
Population biology concepts fundamental to understanding the properties of the objects of conservation. Genetic diversity in agriculture, forestry, and animal breeding; the ethical and international policy issues in preservation and management.

Prerequisite: Junior standing
GEP Interdisciplinary Perspectives
Typically offered in Fall only

NR 420/FOR 520/NR 520/FOR 420 Watershed and Wetlands Hydrology (4 credit hours)
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

Prerequisite: SSC 200 and (FOR 260 or PB 360 or AEC 360)
Typically offered in Fall only

NR 421/NR 521 Wetland Assessment, Delineation and Regulation (3 credit hours)
Wetland definitions and systems of classification and functional assessment; methods for assessing ecological functions of wetlands; identification and delineation of jurisdictional wetlands in accordance with US Army Corps of Engineers procedures; application of federal and state regulatory programs. Five Saturday field trips are required. Credit will not be given for both NR 421 and NR 521

Prerequisite: SSC 200, (PB 360 or BIO 360), and (FOR 339 or PB 405)
Typically offered in Spring only

NR 460/NR 560 Renewable Natural Resource Management and Policy (3 credit hours)
The interaction of legal principles and governmental institutions in the development and implementation of natural resource policy and management. Legal principles, constitutional provisions and the location and organization of governmental programs. Examples from both historic and current case studies.

Prerequisite: Junior standing.
GEP Social Sciences
Typically offered in Fall only

NR 484 Environmental Impact Assessment (4 credit hours)
Impact assessment principles, practices, and their evolution. Lectures and field practicums concerning problems addressed by environmental assessment practitioners. Practical implications of current regulatory requirements, especially endangered species and wetlands.

Prerequisite: Senior standing
Typically offered in Fall only

NR 491/FOR 491 Special Topics in Forestry and Related Natural Resources (1-4 credit hours)
Independent (or group) study or research of a forestry or related natural resources topic with a faculty supervisor of the student's choice. Also courses offered on a trial basis.

Typically offered in Fall and Spring

NR 493 Independent Study in Natural Resources (1-6 credit hours)
Independent Study for Natural Resources students at the advanced level developed under the direction of a faculty member. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

NR 494 Independent Study in Natural Resources (1-6 credit hours)
Independent Study for Natural Resources students at the advanced level developed under the direction of a faculty member. Individualized/ Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

NR 500/NR 400 Natural Resource Management (4 credit hours)
Theory and practice of integrated natural resource management. Quantitative optimization, economics of multiple-use, compounding and discounting, optimal rotations, linear programming. Public and private management case studies and team projects.

Prerequisite: Senior standing in NR or ES or ETM or FOM or FWCB
Typically offered in Spring only

NR 510 Military Land Sustainability (3 credit hours)
An introduction and overview of the factors that influence natural resource conservation and management on Department of Defense lands within a temporal, geographic, and environmental context and perspective. Students will gain knowledge of natural resource management and military land sustainability by reviewing (1) military land uses and training/test requirements, (2) major policies/laws impacting training/testing activities on DoD lands, and (3) planning approaches to military sustainability.

Typically offered in Fall only

NR 511 Managing Natural Resources in an Arena of Conflict (3 credit hours)
Public policy issues, such as management of natural resources, are pervasive with conflicts. Surpassing political, jurisdictional, institutional, and geographic boundaries, natural resources and environmental issues can represent multiple dimensions of uncertainties and complexities. Effective management of public issues then is an important task (and topic) for natural resource professionals who are often required to develop management strategies to resolve or at best, reduce the level of the conflict. This course examines theories and approaches for managing natural resource conflict, with emphasis on the field of public or alternative dispute resolution (ADR) and its spectrum of collaborative approaches. Undergraduate degree or instructor approval required.

Typically offered in Fall only

NR 512 Land Use Policy & Management (3 credit hours)
Graduate course reviewing the history, formation and implementation of major natural resource laws and policies that impact land uses. This course will provide an overview of federal laws and policies that affect decision making by land managers. Weekly lectures will be followed by student presentations of a selected case study of their choosing in the final weeks of the course. Current natural resource / land management (including forestry, air, water, wildlife, climate change and energy) programs and institutions are discussed, analyzed and related to current land use and management policy challenges.

Restriction: undergraduate degree or instructor approval
Typically offered in Spring only

NR 520/FOR 420/NR 420/FOR 520 Watershed and Wetlands Hydrology (4 credit hours)
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

Prerequisite: SSC 200 and (FOR 260 or PB 360 or AEC 360)
Typically offered in Fall only

NR 521/NR 421 Wetland Assessment, Delineation and Regulation (3 credit hours)
Wetland definitions and systems of classification and functional assessment; methods for assessing ecological functions of wetlands; identification and delineation of jurisdictional wetlands in accordance with US Army Corps of Engineers procedures; application of federal and state regulatory programs. Five Saturday field trips are required. Credit will not be given for both NR 421 and NR 521

Prerequisite: SSC 200, (PB 360 or BIO 360), and (FOR 339 or PB 405)
Typically offered in Spring only

NR 548 Historical Environments (3 credit hours)
Course examines how we know and what we know about historical environments. Compares and contrasts contributions by various disciplines and interdisciplinary approaches to historical ecology and environmental history. Readings drawn from science, social science and humanities literature. Individual investigation projects required.

Typically offered in Spring only

NR 554 Introduction to Data Analysis in Natural Resources (3 credit hours)
Data examination, cleaning, summary and visualization, statistical analyses options using various procedures of the SAS software and R with an emphasis on natural resource applications. Interpretation of statistical analyses outputs. Discussions of individual data problems. Hands-on use of computers and the SAS and R software.

Pre or Co-requisite of ST512
Typically offered in Spring only

NR 560/NR 460 Renewable Natural Resource Management and Policy (3 credit hours)
The interaction of legal principles and governmental institutions in the development and implementation of natural resource policy and management. Legal principles, constitutional provisions and the location and organization of governmental programs. Examples from both historic and current case studies.

Prerequisite: Junior standing.
GEP Social Sciences
Typically offered in Fall only

NR 571 Current Issues in Natural Resource Policy (3 credit hours)
Seminar providing an overview of current natural resource issues for the world and the U.S. Population, sustainable development, food and agriculture, forests, rangelands, biodiversity, energy resources, water resources, atmosphere and climate, international policies and instructions.

Typically offered in Fall only

NR 595 Special Topics in Natural Resources (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore natural resources related topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems, or research not related to thesis. Also used to develop and test new 500-level courses.

Typically offered in Fall and Spring

NR 601 Graduate Seminar (1 credit hours)
Weekly seminar in which students registered for course present the results of research and special projects. Invitation to all graduate students and faculty in department to attend and join discussion.

Typically offered in Fall and Spring

NR 610 Special Topics in Natural Resources (1-6 credit hours)
Individual students or groups of students, under direction of a faculty member, may explore natural resources related topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems, or research not related to thesis. Also used to develop and test new 600-level courses.

Typically offered in Fall and Spring

NR 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NR 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NR 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NR 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

Natural Sciences (NSGE)

NSGE 295 Natural Sciences Special Topics (1-4 credit hours)
Special topics course offering for the general education Natural Sciences category.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

Natural Sciences and Global Knowledge (NSGK)

NSGK 295 Natural Sciences and Global Knowledge Special Topics (3 credit hours)
Special topics course offering for the general education Natural Sciences and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Natural Sciences (NS) requirement.

GEP Global Knowledge, GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

Naval Science (NS)

NS 100 Naval Science Lab (0 credit hours)
Military drill, courtesies and honors, elements of unit leadership, physical fitness and professional development of the prospective Naval/Marine Corps Officer. Required for all Naval ROTC students.

Typically offered in Fall and Spring

NS 110 Introduction to Naval Science (2 credit hours)
Fundamental orientation to the Naval Service emphasizing the mission, organization, regulations, customs and traditions, broad warfare components of Navy and the major challenges facing today's Navy and Marine Officers.

Typically offered in Fall only

NS 210 Leadership and Management (3 credit hours)
Assists students in acquiring knowledge and developing the cognitive processes necessary to make decisions in the practice of management. The student will learn the traditional foundations of management while developing decision skills to apply this knowledge in a real-world setting. The major focus is centered upon global management, ethics and social responsibility, total quality management, and cultural diversity.

GEP Social Sciences
Typically offered in Fall only

NS 225 Navigation (4 credit hours)
A broad yet thorough education in basic ship navigation. Course includes a study of various navigation methods, weather, the laws of the sea, and navigational rules. Practical work includes chart plotting and understanding relative motion.

Typically offered in Spring and Summer

NS 315 Naval Engineering (3 credit hours)
Introduction to the application of engineering principles in the research, development, design, construction, and operation of ships, weapons systems, and ocean structures, with emphasis on thermodynamic processes and energy conversions.

Typically offered in Spring only

NS 325 Naval Weapons Systems (3 credit hours)
An introduction to the concepts and properties of electronic, physical, electromagnetic and mechanical systems to foster an understanding of the theory and principles of operation of shipboard weapons systems, course emphasizes types of weapons and fire control systems, capabilities and limitations, theory of target acquisition, identification and tracking, trajectory and ballistics principles, and basic theory of radar and sonar.

Typically offered in Fall only

NS 330 Evolution of Warfare (3 credit hours)
A survey of the evolution of warfare through the study of selected campaigns and classic battles with special emphasis on the principles of war, the military impact of leadership, and the evolution of tactics, weapons, and weaponry.

Typically offered in Spring only

NS 415 Naval Operations (4 credit hours)
A thorough exploration of the operations conducted by the U.S. Navy. Course includes a study of U.S. Naval evolutions, operations, command & control, communication, and an introduction to naval warfare doctrine. Practical applications include the determination of advanced maneuvering methods through and in-depth understanding of relative motion.

Prerequisite: NS 225 Navigation
Typically offered in Fall only

NS 420 Naval Leadership and Ethics (3 credit hours)
An intellectual exploration of Western moral traditions and ethical philosophy with a variety of topics, such as military leadership, core values, and professional ethics; the Uniform Code of Military Justice and Navy Regulations; and discussions relating to the roles of enlisted members, junior and senior officers, command relationships, and the conduct of warfare. The course provides students with a foundation of moral traditions, combined with a discussion of actual current and historical events in the United States navy and Marine Corps, to prepare them for the role and responsibilities of leadership in the naval service of the 21st century.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

NS 430 Amphibious Warfare (3 credit hours)
A survey of the projection of sea power ashore with special emphasis on the evolution of and innovation in amphibious warfare in the 20th Century through the study of historical amphibious landings and campaigns.

Typically offered in Spring only

NC Global Training Initiative (GTI)

GTI 401 US Culture and Education Colloquium (3 credit hours)
Overview of US Culture, Higher Education in America, and Student Success Skills for degree or non-degree international students. Guest faculty lectures, media presentations, field trips, and required readings form basis for discussiong roups, assignments, and capstone paper (refleciton on issues discussed in class, personal development, and required community involvment). Includes break-out discussion groups, field trips, personal projects and research. Students may have additional travel cost associated with field trips. Enrollment limited to first year international students, participants in NC Global Training Initiative Certificate Programs, or by permission of the instructor.

Typically offered in Fall only

Nonprofit Studies (NPS)

NPS 340 Fundamentals of Grant Development for Nonprofits (3 credit hours)
The focus of this class is on obtaining grant funding for nonprofit organizations. This course covers the skills and strategies essential to the grants development process including basic strategies for researching funding sources and developing successful grant proposals.

Typically offered in Spring only

NPS 395 Special Topics in Nonprofit Studies (1-6 credit hours)
Offered as needed to present material not normally available in regular departmental course offerings or for offering of new courses on a trial basis.

NPS 490 Service Learning Internship in Nonprofit Studies (3 credit hours)
The 150 hour (3 credit hour) online service learning internship course provides students with the opportunity to apply the knowledge, skills, and abilities gained through their coursework in the Nonprofits Studies Minor to a nonprofit organizational work setting. The online course builds on previous coursework in the minor and focuses learning from these courses on application to a service learning work setting by requiring students to reflect on the applicability of the Five Leadership Challenges studied throughout the minor to their real work experience. Students are expected to be active participants in work place discussions, lending expertise, ideas and knowledge from their course work to the organizations and their leaders.

Prerequisite: PS 203 and COM 466 and HI 380. Restricted to Nonprofit Studies Minor Students Only.
Typically offered in Fall, Spring, and Summer

NPS 498 Capstone Seminar in Nonprofit Studies (1 credit hours)
This capstone seminar integrates the knowledge, skills, and abilities gained through coursework in the minor in Nonprofit Studies through class discussions and reflective writings where students draw upon previous service-learning experiences to reflect on challenges facing nonprofit leaders. Case studies and articles that focus on the themes of the minor are used to stimulate class discussions. Nonprofit leaders serve as discussants. In addition, students complete and submit a Nonprofit Studies portfolio, which documents successful achievement of program objectives. Departmental approval required

Prerequisite: PS 203, COM 466, Corequisite: NPS 490
Typically offered in Fall and Spring

Nonwovens (NW)

NW 404/TT 404/TT 504/NW 504 Introduction to Nonwovens Products and Processes (3 credit hours)
This course introduces the fundamentals of nonwoven structures, process, and products. It provides performance criteria, raw materials, manufacturing methods, and market outlooks of major nonwoven application segments including hygiene, wipes, filters, medical, automotive, and geotextile. Emphasis is placed on building basic understandings of process/structure/property relationship in nonwoven product and the economic justification for process and production.

Prerequisite: (MA 131 or 141), PY 205; Corequisite: TT 503
Typically offered in Fall only

NW 405/TT 405/TT 505/NW 505 Advanced Nonwovens Processing (3 credit hours)
Mechanisms used in the production of nonwoven materials. Design and operation of these mechanisms. Process flow, optimization of process parameters, influence of process parameters on product properties.

Prerequisite: MA 231 or MA 241, PY 211 or (PY 205 and PY 206) , TT 305 or TT 404
Typically offered in Spring only

NW 408/TT 408/TT 508/NW 508 Nonwoven Product Development (3 credit hours)
Fundamentals of nonwoven product development. In-depth knowledge of the materials, processes and nonwovens products. Design of a set of experiments intended for product development. Students work in teams to design, fabricate and evaluate nonwoven products.

Prerequisites: TT 405 and TT 407
Typically offered in Spring only

NW 497 Research Experience in Nonwoven Science and Technology (3 credit hours)
This course provides an opportunity for students to gain real-world experiences in nonwoven science and technology relevant to their academic and career goals. The course is designed to provide an academic framework for the student to learn through a nonwoven research experience and/or exploration of nonwoven industry operations while integrating their academic program experience under a faculty mentor's supervision.

P: TT404
Typically offered in Fall, Spring, and Summer

NW 503/TT 503 Materials, Polymers, and Fibers used in Nonwovens (3 credit hours)
Fundamentals of raw material used in nonwoven processes. Raw material production, chemical and physical properties of nonwoven raw materials and assessment of material properties. Introduction of structure/property relationships for these materials and how these relationships influence end use applications.

Prerequisite: MA 141, PY 205, PCC 203
Typically offered in Fall and Spring

NW 504/NW 404/TT 404/TT 504 Introduction to Nonwovens Products and Processes (3 credit hours)
This course introduces the fundamentals of nonwoven structures, process, and products. It provides performance criteria, raw materials, manufacturing methods, and market outlooks of major nonwoven application segments including hygiene, wipes, filters, medical, automotive, and geotextile. Emphasis is placed on building basic understandings of process/structure/property relationship in nonwoven product and the economic justification for process and production.

Prerequisite: (MA 131 or 141), PY 205; Corequisite: TT 503
Typically offered in Fall and Spring

NW 505/NW 405/TT 405/TT 505 Advanced Nonwovens Processing (3 credit hours)
Mechanisms used in the production of nonwoven materials. Design and operation of these mechanisms. Process flow, optimization of process parameters, influence of process parameters on product properties.

Prerequisite: MA 231 or MA 241, PY 211 or (PY 205 and PY 206) , TT 305 or TT 404
Typically offered in Spring only

NW 506 Bonding Principles in Nonwovens (3 credit hours)
Fundamentals of fluid mechanics and heat transfer mechanisms during the bonding nonwovens. Provide engineering and in-depth description of hydroentangling, thermal bonding and needle punching techniques. Modeling methods and laboratory work are assigned.

Prerequisite: MAE 308, MAE 310, TT /NW505
Typically offered in Fall and Summer

NW 507/TT 507 Nonwoven Characterization Methods (3 credit hours)
Fundamentals of methods used in evaluating properties and performance of nonwovens. Assessment of thermal, mechanical, moisture transport and barrier properties of nonwovens. Reliability and interpretation of test results.

Prerequisite: ST 361, Corequisite: TT/NW 505
Typically offered in Spring only

NW 508/NW 408/TT 408/TT 508 Nonwoven Product Development (3 credit hours)
Fundamentals of nonwoven product development. In-depth knowledge of the materials, processes and nonwovens products. Design of a set of experiments intended for product development. Students work in teams to design, fabricate and evaluate nonwoven products.

Prerequisites: TT 405 and TT 407
Typically offered in Fall and Spring

Nuclear Engineering (NE)

NE 201 Introduction to Nuclear Engineering (2 credit hours)
An introduction to the concepts, systems and application of nuclear processes. Topics include radioactivity, fission, fusion, reactor concepts, biological effects of radiation, nuclear propulsion, and radioactive waste disposal. Designed to give students a broad perspective of nuclear engineering and an introduction to fundamentals and applications of nuclear energy.

Prerequisite: Grade of C or better in MA 241, PY 205
Typically offered in Fall only

NE 202 Radiation Sources, Interaction and Detection (4 credit hours)
Introduction to nuclear energy. Topics include radioactivity, radiation detection, interaction of radiation with matter, nuclear reactions, fission, fusion, nuclear reactors, radiation safety and protection, and laboratory measurement of nuclear radiation.

Prerequisites: C- or better in MA 242 and PY 208
Typically offered in Spring only

NE 235 Nuclear Reactor Operations Training (2 credit hours)
Principles of nuclear reactor operations. Lectures to cover basic nuclear engineering theory pertaining to fission reactor operations; laboratory sessions to provide hands on training with the PULSTAR nuclear reactor including facility pre-startup checks, approach to criticality, steady state operations, and measurement of various operating parameters. Qualified students may opt to enter training and study for the U.S. Nuclear Regulatory Commission exam to become federally licensed nuclear Reactor Operators. Does not count towards NE graduation requirements

Typically offered in Fall only

NE 290 Introduction to Health Physics (3 credit hours)
Fundamentals of ionizing radiation safety. The course will review basic physical principles, radiation sources, introductory radiation dosimetry, radiation safety guidelines, evaluation of safety measures, and basic radiation control principles for contamination and radioactive material safety to include measurement physics, counting statistics and basic radiobiology principles.

Prerequisite: MA 111 or MA 108 with grade of C- or better, or 550 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam.
GEP Interdisciplinary Perspectives, GEP Natural Sciences
Typically offered in Fall only

NE 301 Fundamentals of Nuclear Engineering (3 credit hours)
Introductory course in nuclear engineering. Neutron physics, reactor operation, and reactor dynamics. Basic principles underlying the design and operation of nuclear systems, facilities and applications.

Prerequisite: MA 341 and (CSC 112 or CSC 113) and C- or better in NE 202
Typically offered in Fall only

NE 400 Nuclear Reactor Energy Conversion (4 credit hours)
Introduction to the concepts and principles of heat generation and removal in reactor systems. Power cycles, reactor heat sources, analytic and numerical solutions to conduction problems in reactor components and fuel elements, heat transfer in reactor fuel bundles and heat exchangers. Problem sets emphasize design principles. Heat transfer lab included. Credit will not be given for both NE 400 and NE 500.

Prerequisite: MAE 201 and a C- or better in NE 301
Typically offered in Spring only

NE 401/NE 501 Reactor Analysis and Design (3 credit hours)
Elements of nuclear reactor theory for reactor core design and operation. Includes one-group neutron transport and mutigroup diffusion models, analytical and numerical criticality search, and flux distribution and calculations for homogeneous and heterogeneous reactors, slowing down models, introduction to perturbation theory.

Prerequisites: MA 401 and C- or better in NE 301
Typically offered in Spring only

NE 402 Reactor Engineering (4 credit hours)
A course in thermal-hydraulic design and analysis of nuclear systems. Single and two-phase flow, boiling heat transfer, modeling of fluid systems. Design constraints imposed by thermal-hydraulic considerations are discussed. A thermal-hydraulics laboratory included. Credit will not be given for both NE 402 and NE 502.

Prerequisite: MAE 308 and either NE 400 or MAE 310
Typically offered in Fall only

NE 403 Nuclear Reactor Laboratory (2 credit hours)
Nuclear reactor laboratory. A laboratory course performed on the NCSU PULSTAR reactor. Topics include reactor startup and approach to critical. Neutron flux distributions. Reactivity balances. Control rod worth and power coefficients of reactivity.

Prerequisite: C- or better in NE 301 Co-requisite: NE 401
Typically offered in Spring only

NE 404 Radiation Safety and Shielding (3 credit hours)
Radiation safety and environmental aspects of nuclear power generation. Radiation interaction, photon attenuation, shielding theory and design project, external and internal dose evaluation, reactor effluents and release of radioactivity into the environment, transportation and disposal of radioactive waste; and environmental impact of nuclear power plants.

Prerequisite: NE 301 with a grade of C- or better or NE 419
Typically offered in Fall only

NE 405 Reactor Systems (3 credit hours)
Nuclear power plant systems: design criteria, design parameters, and economics. Topics covered include: PWR, BWR, core design, primary loops, auxiliary and emergency systems; containment, reactor control and protection systems, accident and transient behaviors.

Prerequisite: NE 401, NE 402
Typically offered in Spring only

NE 406 Nuclear Engineering Senior Design Preparation (1 credit hours)
Preliminary design phase in nuclear engineering systems to prepare for the final phase design. Preliminary designs developed by teams with advice of faculty, with reports presented in oral and written form. Current and future systems emphasized, and use of computers encouraged.

Prerequisite: NE 401, Corequisite: NE 402
Typically offered in Fall only

NE 408 Nuclear Engineering Design Project (3 credit hours)
Projects in design of practical nuclear engineering systems. Preliminary designs developed by teams with advice by faculty as needed, with reports presented in oral and written form. Current and future systems emphasized, and use of computers encouraged.

Prerequisite: NE 406
Typically offered in Spring only

NE 409/MSE 409/NE 509/MSE 509 Nuclear Materials (3 credit hours)
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

Prerequisite: MSE 201
Typically offered in Fall only

NE 412 Nuclear Fuel Cycles (3 credit hours)
Processing of nuclear fuel with descriptions of mining, milling, conversion, enrichment, fabrication, irradiation, reprocessing, and waste disposal. In-core and out-of-core nuclear fuel management design, including objectives, constraints, decisionsand methodologies. Nuclear power plant and fuel cycle economics.

Prerequisite: NE 401
Typically offered in Fall only

NE 418 Nuclear Power Plant Instrumentation (3 credit hours)
Instrumentation and supporting systems required for control and protection of a nuclear power plant. Radiation measurement, process measurement, and reactor operating principles used to develop instrumentation requirements and characteristics. Requirements and implementations of instrumentation, control and protection systems for pressurized and boiling water reactors. Design and implementation issues include power supplies, signal transmission, redundancy and diversity, response time, and reliability.

Prerequisite: ECE 221 or ECE 331
Typically offered in Spring only

NE 419 Introduction to Nuclear Energy (3 credit hours)
Electrical power generation from nuclear fission, fundamental aspects of fission chain reaction, and reactor design. Reactor types, their static and dynamic characteristics and instrumentation. Reactor operation and safety. Nuclear fusion and fusionreactor development.Not open to majors in Nuclear Engineering

Prerequisite: PY 202 or PY 208
Typically offered in Fall and Spring

NE 431/NE 531 Nuclear Waste Management (3 credit hours)
Scientific and engineering aspects of nuclear waste management. Management of spent fuel, high-level waste, uranium mill tailings, low-level waste and decommissioning wastes. Fundamental processes for the evaluation of waste management systems with emphasis on the safety assessment of waste disposal facilities to include nuclear criticality safety, free release and transportation. There is also a required research project for the graduate version of the course.

Prerequisite: MA 341 and PY208 (or any equivalent)
Typically offered in Fall only

NE 460 Probabilistic Risk Assessment and Management of Nuclear Systems (3 credit hours)
A course which introduces principles of probabilistic risk assessment and management of complex engineering systems, with a particular focus on nuclear power applications. Fundamental safety and risk concepts, accidents and risk management, a review of major probabilistic risk assessment studies, hazard analysis, qualitative and quantitative systems analysis, human and software reliability, uncertainty quantification, and risk-informed and performance-based design and licensing of advanced nuclear reactors under development. Risk and safety principles are emphasized in homework and in-class problems. Course project is required. Credit will not be given for both NE 460 and NE 560.

Typically offered in Fall only

NE 490/NE 590 Health Physics and Radiological Emergency Response (3 credit hours)
This is an advanced health physics course encompassing internal and external radiological dosimetry along with control of radiation fields including airborne radioactivity. Students will learn basic interactions and response functions, biological effects as well as natural and manmade sources allowing emphasis on the final coverage of nuclear emergency response.

Prerequisite: MA 341 and PY 208 (or equivalent)
Typically offered in Fall only

NE 491 Special Topics in Nuclear Engineering (1-4 credit hours)
Detailed coverage of special topics.

NE 500 Advanced Energy Conversion in Nuclear Reactors (3 credit hours)
A course which introduces concepts and principles of heat generation and removal in reactor systems. Power cycles, reactor heat sources, analytic and numerical solutions to conduction problems in reactor components and fuel elements, heat transfer in reactor fuel bundles and heat exchangers. Design principles are emphasized in homework and in-class problems. Course project is required. Credit will not be given for both NE 400 and NE 500.

Prerequisite: MAE 201
Typically offered in Spring only

NE 501/NE 401 Reactor Analysis and Design (3 credit hours)
Elements of nuclear reactor theory for reactor core design and operation. Includes one-group neutron transport and mutigroup diffusion models, analytical and numerical criticality search, and flux distribution and calculations for homogeneous and heterogeneous reactors, slowing down models, introduction to perturbation theory.

Prerequisites: MA 401 and C- or better in NE 301
Typically offered in Spring only

NE 502 Reactor Engineering (3 credit hours)
Thermal-hydraulic design and analysis of nuclear systems. Single and two-phase flow, boiling heat transfer, modeling of fluid systems. Design constraints imposed by thermal-hydraulic considerations are discussed. Credit will not be given for bothNE 402 and NE 502.

Prerequisite: MAE 308
Typically offered in Fall only

NE 504 Radiation Safety and Shielding (3 credit hours)
A basic course in radiation safety and environmental aspects of nuclear power generation. Topics include radiation interaction, photon attenuation, shielding, internal and external dose evaluation, reactor effluents and release of radioactivity into the environment, transportation and disposal of radioactive waste; and environmental impact of nuclear power plants. Term-long project.

Prerequisite: NE 401 or NE 520
Typically offered in Fall only

NE 505 Reactor Systems (3 credit hours)
Nuclear power plant systems: PWR, BWR and advanced concepts. Design criteria, design parameters, economics, primary and secondary loops, safety systems, reactor control and protection systems, containment, accident and transient behaviors, core design, and reactivity control mechanisms. Term-long project. Credit for both NE 405 and NE 505 is not allowed

Prerequisite: NE 401, NE 402
Typically offered in Spring only

NE 509/MSE 509/NE 409/MSE 409 Nuclear Materials (3 credit hours)
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

Prerequisite: MSE 201
Typically offered in Fall only

NE 512 Nuclear Fuel Cycles (3 credit hours)
Processing of nuclear fuel with description of mining, milling, conversion, enrichment, fabrication, irradiation, shipping, reprocessing and waste disposal. Fuel cycle economics and fuel cost calculation. In-core and out-of-core nuclear fuel management, engineering concepts and methodology. Term-long project. Credit for both NE 412 and NE 512 is not allowed

Prerequisite: NE 401
Typically offered in Fall only

NE 520 Radiation and Reactor Fundamentals (3 credit hours)
Basics of nuclear physics and reactor physics that are needed for graduate studies in nuclear engineering. Concepts covered include, atomic and nuclear models, nuclear reactions, nuclear fission, radioactive decay, neutron interactions, nuclear reactors, neutron diffusion in non-multiplying and multiplying systems, and basic nuclear reactor kinetics.

Prerequisite: MA 341 and PY 208
Typically offered in Fall only

NE 521 Principles of Radiation Measurement (3 credit hours)
Radiation detection measurement methods employed in nuclear engineering. Topics include: physics of nuclear decay and nuclear reactions, interaction of charged particles, photons, and neutrons with matter, fundamental properties of radiation measurement systems, statistical analysis of radiation measurements, common radiation detectors (gas-filled detectors, scintillators, and semiconductor detectors), data acquisition and processing methods, and radiation measurement applications.

Prerequisites: Graduate standing in Nuclear Engineering or instructor permission
Typically offered in Fall only

NE 523 Computational Transport Theory (3 credit hours)
Derivation of the nonlinear Boltzmann equation for a rarefied gas and linearization to the equation of transport of neutral particles. Deterministic methods for solving the neutron transport equation: Multigroup energy discretization; Discrete Ordinates angular discretization; various spatial discretization methods. Convergence of numerical solutions with discretization refinement. Iterative solution algorithms: inner, outer, and power iterations. Spectral analysis of inner iterations convergence and acceleration. Selection of advanced topics.

NE 401/501: Reactor Analysis and Design Advanced math & moderate programming skills are necessary. Permissible programming languages: Fortran or C++
Typically offered in Spring only

NE 528/PY 528 Introduction to Plasma Physics and Fusion Energy (3 credit hours)
Concepts in plasma physics, basics of thermonuclear reactions; charged particle collisions, single particle motions and drifts, radiation from plasmas and plasma waves, fluid theory of plasmas, formation and heating of plasmas, plasma confinement, fusion devices and other plasma applications.

Prerequisite: MA 401 and PY 208
Typically offered in Fall only

NE 529/PY 529 Plasma Physics and Fusion Energy II (3 credit hours)
This course expands on the treatment of plasmas as a system of coupled fluids and introduces the foundations of plasma kinetic theory. Derivation of the plasma kinetic equation and the Vlasov equation serve as the starting point to introduce the kinetic study of plasma systems. From this introduction of the governing equations for full kinetic treatment, methods for analyzing plasma response to electromagnetic and electrostatic perturbations using the linearized Vlasov model for uncorrelated plasmas are introduced. Kinetic stability of Vlasov plasmas is introduced and the Nyquist method is used to determine conditions for kinetic stability. The concept of correlated plasmas is then introduced through the introduction of reduced distribution functions and the BBGKY heirarchy. Finally, simple correlated systems and the Liouville model for two-system correlation is covered to look at the impact of particle correlation due to collisions and coulomb interaction.

Prerequisite: NE 528
Typically offered in Spring only

NE 531/NE 431 Nuclear Waste Management (3 credit hours)
Scientific and engineering aspects of nuclear waste management. Management of spent fuel, high-level waste, uranium mill tailings, low-level waste and decommissioning wastes. Fundamental processes for the evaluation of waste management systems with emphasis on the safety assessment of waste disposal facilities to include nuclear criticality safety, free release and transportation. There is also a required research project for the graduate version of the course.

Prerequisite: MA 341 and PY208 (or any equivalent)
Typically offered in Fall only

NE 533 Nuclear Fuel Performance (3 credit hours)
In this course we will study the basic role of fuel in reactor operation and understand how the fuel impacts heat generation and transport to the coolant. The course will begin with an overview of different fuels and the fabrication processes required to construct nuclear fuel. This will include various fuel types and geometries, with a focus on light water reactor fuel and cladding. Thermal transport, mechanics, and thermomechanics affecting fuel behavior will be introduced, and methods to solve the governing equations numerically and analytically will be developed. Subsequently, changes in the fuel and cladding material that degrade the performance of the fuel will be examined. Finally, the knowledge gained throughout the course will be utilized to conduct fuel performance simulations with MOOSE.

Prerequisite: NE 409 or equivalent
Typically offered in Spring only

NE 541 Nuclear Nonproliferation Technology and Policy (3 credit hours)
Technology and policy challenges and solutions to prevent the spread of nuclear weapons. Topics include: issues of nuclear proliferation inherent to civilian nuclear power development; technologies, processes, and policies for safeguarding nuclear materials and technology; integrating the preceding subjects to strengthen the global nuclear nonproliferation regime. Includes a field trip to Oak Ridge National Laboratory during Spring Break to gain hands-on experience with safeguards measurements of nuclear material. The field trip is required; there is no cost to the student.

Graduate standing in Nuclear Engineering or instructor consent.
Typically offered in Spring only

NE 550 Introduction to Atomistic Simulations (3 credit hours)
NE 550 is an introductory course on molecular dynamics simulations. The course covers the principles of classical and statistical mechanics that underpin the simulation methods. Emphasis is placed on writing computer programs for determining thermodynamic, structural and transport properties of different types of materials.

Typically offered in Spring only

NE 577/MAE 577 Multiscale Two-phase Flow Simulations (3 credit hours)
Modeling and simulation of two-phase flows using interface tracking approach and ensemble averaging approaches. Model validation and verification based on interface-tracking data, boiling models. Nuclear reactor applications. The course focuses on interface tracking methods understanding as applied to bubbly flow simulations. Students will develop a simplified solver to track 2D bubbles/droplets throughout the course homework assignments and will learn how to apply this approach for better understanding of multi-phase flow as part of the course project.

Typically offered in Spring only

NE 590/NE 490 Health Physics and Radiological Emergency Response (3 credit hours)
This is an advanced health physics course encompassing internal and external radiological dosimetry along with control of radiation fields including airborne radioactivity. Students will learn basic interactions and response functions, biological effects as well as natural and manmade sources allowing emphasis on the final coverage of nuclear emergency response.

Prerequisite: MA 341 and PY 208 (or equivalent)
Typically offered in Fall only

NE 591 Special Topics In Nuclear Engineering I (1-6 credit hours)
Credits Arranged

Typically offered in Fall and Spring

NE 592 Special Topics In Nuclear Engineering II (1-6 credit hours)
Credits Arranged

Typically offered in Fall and Spring

NE 601 Seminar (1 credit hours)
Discussion of selected topics in nuclear engineering.

Typically offered in Fall and Spring

NE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NE 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall only

NE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NE 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

NE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NE 721 Nuclear Laboratory Fundamentals (3 credit hours)
Labratory experiments and techniques that are useful and instructive to a Nuclear Engineer. The labs include experiments on radiation detectors and detection techniques, Gamma-and X-ray spectroscopy, and use of the thermal neutron beam of the nuclear reactor for neutron imaging. All state-of-the art radiation detectors are taught and used. Restricted to Nuclear Engineering Graduate Students.

Prerequisite: MA 401 and NE 401
Typically offered in Spring only

NE 722 Reactor Dynamics and Control (3 credit hours)
Methods of describing and analyzing dynamic behavior of systems. These methods applied to reactor systems and the effects of feedbacks studies. Methods of measuring the behavior of reactor systems and development of logic systems for control and safety.

Prerequisite: NE 401 or NE 520
Typically offered in Fall only

NE 723 Neutron Transport Theory (3 credit hours)
Advanced theory of neutron transport and computational methods of solving particle transport (linear Boltzmann) equation for reactor physics problems. Principle topics: models of neutron transport; analytic methods for solving transport equation; asymptotic diffusion limit; PN and SPN methods, homogenization methodology; numerical methods for multidimensional problems; computational methods for multiphysics problems. Objective is to enable students to read literature and perform relevant analysis of neutron transport and reactor-physics problems.

P:NE 520 or NE 401/501
Typically offered in Fall only

NE 724 Reactor Heat Transfer (3 credit hours)
Consideration of heat generation and transfer in nuclear power reactors. Topics include reactor heat generation, steady-state and transient heat combustion in reactor fuel elements, boiling heat transfer and single and two-phase flow.

Prerequisite: NE 402 and NE 401 or NE 520
Typically offered in Spring only

NE 726 Radioisotopes Measurement Applications (3 credit hours)
Introduction the student to measurement applications using radioisotopes and radiation. Discussion of all major tracing, gauging and analyzer principles and treatment of several specific applications in detail. Objective is to familiarize student with design and analysis of industrial measurement systems using radioisotopes and/or radiation.

Prerequisite: NE 401 or NE 520
Typically offered in Spring only

NE 727 Nuclear Engineering Analysis (3 credit hours)
Fundamental material on: (1) numerical methods for solving the partial differential equations pertinent to nuclear engineering problems, (2) Monte Carlo simulation of radiation transport and (3) data and error analysis techniques including estimation of linear and nonlinear model parameters from experimental data.

Prerequisite: NE 401 or NE 520
Typically offered in Fall only

NE 729 Reactor Theory and Analysis (3 credit hours)
Theoretical aspects of neutron diffusion and transport related to the design computation and performance analysis of nuclear reactors. Principal topics: a unified view of the neutron cycle including slowing down, resonance capture and thermalization; reactor dynamics and control; fuel cycle studies; and neutron transport methods. Background provided for research in power and test reactor analysis.

Prerequisite: NE 723, NE 727
Typically offered in Spring only

NE 732 Principles of Industrial Plasmas (3 credit hours)
Theory and fundamental physical principles of industrial plasmas. Applications in plasma processing, plasma manufacturing technology, arcs and torches, plasma sprayers, high-voltage high-current switching devices, plasma-driven devices and plasma-aided technology. Emphasis on particle transport and plasma flow.

Prerequisite: NE/PY 528
Typically offered in Spring only

NE 740 Laboratory Projects In Nuclear Engineering (3 credit hours)
Enhancement of laboratory skills pertinent to nuclear engineering research through projects that requiring student to design the experiment, assemble equipment, carry out the measurements and analyze and interpret data. Students work in groups of two and perform to completion two laboratory projects.

Prerequisite: NE 721
Typically offered in Spring only

NE 745 Plasma Laboratory (3 credit hours)
Experimental plasma generation and plasma diagnostic techniques. Lecture topics include high vacuum techniques, perturbing and non-perturbing probe techniques, and laser and emission spectroscopy. Laboratories utilize various methods of measuring plasma parameters discussed in lectures.

Prerequisite: NE 528 or PY 508 or PY 509
Typically offered in Spring only

NE 746 Fusion Energy Engineering (3 credit hours)
Description and analysis of the technologies of devices necessary to produce fusion energy including vacuum technology, plasma heating and fueling, magnetics, special energy conversion, neutronics, materials, environment and safety. Stress upon design integration and ensuing technological constraints.

Prerequisite: NE 528
Typically offered in Fall only

NE 751 Nuclear Reactor Design Calculations (3 credit hours)
Application of digital computer to problems in reactor core nuclear design. Study and exercise of available reactor core physics computer modules. Description of systems and programs used by industry for power reactor core design and core follow. A review of relevant analytic and numerical methods facilitates computer program development by students.

Prerequisite: NE 723
Typically offered in Spring only

NE 752 Thermal Hydraulic Design Calculations (3 credit hours)
Advanced presentation of thermal-hydraulic analysis of nuclear power systems. Topics including development of single phase and two-phase fluid flow equations, subchannel analysis, interphase phenomena and numerical solution methods relevant to design and safety analysis codes.

Prerequisite: NE 724
Typically offered in Fall only

NE 753 Reactor Kinetics and Control (3 credit hours)
The control of nuclear reactor systems. Development of basic control theory including the use of Bode, Nyquist and S-plane diagrams and state-variable methods. Analysis of reactor and reactor systems by these methods and development of control methods and optimum-control methods. Discussion of models of reactors and reactor-associated units, such as heat exchangers. Presentation of effects of nonlinearities.

Prerequisite: NE 722
Typically offered in Spring only

NE 755 Reactor Theory and Analysis (3 credit hours)
Theoretical aspects of neutron diffusion and transport related to the design computation and performance analysis of nuclear reactors. Principal topics: a unified view of the neutron cycle including slowing down, resonance capture and thermalization; reactor dynamics and control; fuel cycle studies; and neutron transport methods. Background provided for research in power and test reactor analysis.

Prerequisite: NE 723, NE 727
Typically offered in Spring only

NE 757 Radiation Effects On Materials (3 credit hours)
Interaction of radiation with matter with emphasis on microstructural modification, physical and mechanical effects. Defects generation and annealing, void swelling, irradiation growth and creep, and irradiation induced effects in reactor materialsare discussed. Current theories and experimental techniques are discussed.

Typically offered in Spring only

NE 761 Radiation Detection (3 credit hours)
Advanced aspects of radiation detection such as computer methods applied to gamma-ray spectroscopy, absolute detector efficiencies by experimental and Monte Carlo techniques, the use and theory of solid state detectors, time-of-flight detection experiments and MÂ¿ssbauer and other resonance phenomena.

Prerequisite: NE 726
Typically offered in Spring only

NE 762 Radioisotope Applications (3 credit hours)
Presentation of advanced principles and techniques of radioisotope applications. Topics include radiotracer principles; radiotracer applications to engineering processes; radioisotope gauging principles; charged particle, gamma ray and neutron radioisotope gauges.

Prerequisite: NE 726
Typically offered in Fall only

NE 765 Verification and Validation in Scientific Computing (3 credit hours)
Advances in scientific computing have made modeling and simulation an important part of engineering and science. This course provides students with understanding and knowledge of comprehensive and systematic development of concepts, principles and procedures for verification, and validation of models and simulations. The methods discussed in class will be applied to wide range of technical fields of engineering (including nuclear and mechanical engineering) and technology. The theory lectures and assignments will be complemented with demonstration computer exercises, examples, and a computer project on uncertainty propagation in modeling.

Restriction: Graduate Standing in College of Engineering or College of Science
Typically offered in Fall only

NE 770 Nuclear Radiation Attenuation (3 credit hours)
Advanced course in computational methods for neutron and photon transport. Methods include Monte Carlo and deterministic solutions to the transport equation for both fixed source and eigenvalue problems. Digital computers employed in the solution of practical problems.

Prerequisite: NE 723 or equivalent
Typically offered in Fall only

NE 772/CE 772 Environmental Exposure and Risk Analysis (3 credit hours)
Course covers the identification, transport, and fate of hazardous substances in the environment; quantification of human exposures to such substances; dose-response analysis; and uncertainty and variability analysis. The general risk assessment framework, study design aspects for exposure assessment, and quantitative methods for estimating the consequences and probablity of adverse health outcomes are emphasized.

Prerequisite: ST 511 or 515
Typically offered in Spring only

NE 777 Radiological Assessment (3 credit hours)
Principles of analyzing environmental radiation transport and resulting human exposure and dose and dose management. Source terms of radiation exposure, the radon problem, transport or radionuclides in the atmosphere, effluent pathways modeling, radiation dosimetry, probabilistic models for environmental assessment, uncertainty analysis, and radiation risk management. A laboratory research project report will be developed as an outcome of this course.

Prerequisite: NE520 & NE504 or NE590 and a semester long statistics course or permission by instructor
Typically offered in Spring only

NE 780 Magnetohydrodynamics & Transport in Plasmas (3 credit hours)
Advanced fluid description of plasmas for magnetic fusion, space and industrial plasmas, and other applications. Emphasis on a first principles approach to transport, equilibria, and stability.

Prerequisite: NE 528, NE/PY 414 and 415
Typically offered in Fall only

NE 781 Kinetic Theory, Waves, & Non-Linear Effects in Plasmas (3 credit hours)
Kinetic theory, waves, and non-linear phenomena in magnetized plasmas. First principles approach to the treatment of instabilities and other collective effects.

Prerequisite: NE 528, NE/PY 414 and 415, Corequisite: MA 775
Typically offered in Fall only

NE 795 Advanced Topics In Nuclear Engineering I (1-3 credit hours)
A study of recent developments in nuclear engineering theory and practice.

Typically offered in Fall and Spring

NE 796 Advanced Topics In Nuclear Engineering II (3 credit hours)
A study of recent developments in nuclear engineering theory and practice.

Typically offered in Fall and Spring

NE 801 Seminar (1 credit hours)
Discussion of selected topics in nuclear engineering.

Typically offered in Fall and Spring

NE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

NE 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

NE 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

NE 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

NE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

NE 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

Nutrition (NTR)

NTR 210 Introduction to Community Food Security (3 credit hours)
This introductory interdisciplinary course teaches students about the many facets of food security in the United States, including historical impacts of race and social class on food security; food justice and food accessibility; the roles of non-profit organizations, government agencies, and disciplinary experts in developing food security efforts; and approaches to developing programs and policies, federal to local, to address the problem. In addition, service-learning experiences in students own communities allow them to gain knowledge about the specific agencies approaches to community food security, critically reflecting upon the experience and creating their own community food security action plan.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Summer only

NTR 220 Food and Culture (3 credit hours)
This course explores traditional food cultures around the world; highlighting foodways, flavor profiles, and commonly used ingredients. This course focuses on how and to what extent traditional foodways of US immigrants are impacted by the majority culture and how regional cuisines have been impacted by historical migration patterns. Students will examine their own food culture, biases, and how these impact personal interactions with others through a semester-long project. Food tastings and sensory experiences will expose students to a variety of global and US regional cuisines allowing students to compare and contrast flavor profiles and commonly used ingredients. Course is available to all majors.

GEP Global Knowledge
Typically offered in Summer only

NTR 301/FS 301 Introduction to Human Nutrition (3 credit hours)
Functions, dietary sources, digestion and absorption, deficiencies and excesses of essential nutrients in humans; dietary guidelines; food labels; the study of diet-disease relationships; the role of diet in heart disease, diabetes, hypertension, osteoporosis; energy balance and weight control; dietary supplement regulation; diet and athletic performance.

Prerequisite: Sophomore standing
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

NTR 302 Introduction to Nutrition Research, Communication, and Careers (3 credit hours)
This course exposes students to scientific literature, communication, and careers in the field of nutrition. Students will learn how to critically evaluate scientific literature and communicate that information both orally and in writing. Course topics include: research design, nutritional epidemiology, statistics, scientific writing, professionalism, and current nutrition-related "hot topics." Class time will be a combination of lecture and small or large group discussions and individual or group in-class assignments. Student evaluations include in-class assignments, writing assignments, oral presentations, and exams.

Prerequisite: NTR 301
Typically offered in Fall and Summer

NTR 330 Public Health Nutrition (3 credit hours)
Students will explore factors that affect the health and nutrition of the population as well as how those factors are identified, studied, and applied to improve health issues. Students will identify services and programs available to address nutrition and health issues. Students will analyze current events related to public health, evaluate nutrition related policy, and advocate for issues related to nutrition.

Typically offered in Fall and Summer

NTR 401/FS 401/NTR 501/FS 501 Advanced Nutrition and Metabolism (3 credit hours)
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225)
Typically offered in Fall and Summer

NTR 410/NTR 510 Maternal and Infant Nutrition (3 credit hours)
Students will explore the current research, controversies, and biological mechanisms related to nutrition for women before, during, and after pregnancy, as well as for infants in utero and after birth.

Prerequisite: NTR 301
Typically offered in Spring and Summer

NTR 411/NTR 511 Public Health Perspectives in Infant Feeding (3 credit hours)
This course is designed to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). In this course, students will learn the basics and importance of infant and young child feeding from a public health perspective. Some of the topics that are covered in this course include the public health considerations of breastfeeding and formula feeding in the US and globally, breastfeeding initiation and infant behavior, lifestyle practices and infant feeding, family challenges related to infant feeding, infant feeding research and global impacts, cultural humility for health care providers, and collaboration among healthcare professionals.

Typically offered in Fall and Summer

NTR 412/NTR 512 Clinical Concepts in Infant Feeding (3 credit hours)
This course is designed to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). Students will learn skills and content required for entry level clinical support for infant feeding. Students will learn the fundamentals of infant positioning, latch, and suckle, assessment skills required to evaluate physical development of both the mother and the infant, milk synthesis, milk production, and milk transfer. This course will also prepare the learner to manage the feeding needs of infants across the age spectrum, from the premature infant to the toddler and older child. We will discuss complicated scenarios, to include breastfeeding with physical anomalies, infant hyperbilirubinemia, hypoglycemia, slow weight gain, failure to thrive, and many others. Students will be required to provide their own transportation for field trips.

P: NTR 411 or NTR 511 and BIO 240
Typically offered in Spring and Summer

NTR 413/NTR 513 Clinical Concepts in Infant Feeding Laboratory (1 credit hours)
The laboratory course is designed to complement course content to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). Students will learn and practice skills required for entry-level clinical support for infant feeding. Students will learn the fundamentals of infant positioning, latch, and suckle, and assessment skills required to evaluate physical development of both the mother and the infant, milk synthesis, milk production, and milk transfer. This course will also prepare the learner to manage the feeding needs of infants across the age spectrum, from the premature infant to the toddler and older child. Students will be expected to provide their own transportation for off-campus experiences.

P: BIO 240 and NTR 411 or NTR 511; C: NTR 412 or NTR 512
Typically offered in Spring only

NTR 415/PO 415/PO 515/NTR 515/ANS 515/ANS 415 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

NTR 419 Human Nutrition and Chronic Disease (3 credit hours)
Current concepts regarding, and physiological bases of the roles of nutrition in the prevention and treatment of acute and chronic disease states in humans with emphasis on the process of scientific discovery, reading of original research and transformation of research findings to public policy.

Prerequisite: Junior standing, ANS 230, or ANS/FS/NTR 301 or ANS/NTR/PO 415
Typically offered in Spring only

NTR 421/NTR 521 Life Cycle Nutrition (3 credit hours)
This course focuses on the physiologic changes and nutritional needs throughout the life cycle. Additionally, students will explore psychosocial and environmental influencers on food consumption and diet quality at each stage of life. Pregnancy and lactation, fetal development, infancy, early childhood, childhood, adolescence, young and middle adulthood, and geriatrics will be examined. Student will apply course content to real-world settings through individual and/or group service-learning projects. Credit will not be given for both NTR 421 and NTR 521.

Prerequisite: NTR 301 and junior standing required
Typically offered in Spring only

NTR 425/ANS 425/FM 425/PO 425/NTR 525/FM 525/ANS 525/PO 525 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall, Spring, and Summer

NTR 440/NTR 540 Child & Adolescent Nutrition (3 credit hours)
In this course, students will gain an in-depth understanding of human nutritional needs during early and middle childhood and adolescence. Students will consider how child development affects nutrition and eating behaviors, explore common nutrition concerns that emerge throughout childhood, and evaluate interventions and policies to improve child and adolescent nutrition. The course also includes an introduction to special topics such as food allergies, disordered eating, child obesity, and vegetarian diets. Assessments are designed to evaluate students' mastery of content knowledge, critical thinking, and communication skills. The course content will be delivered in a variety of ways, including lectures, readings, videos, in-class activities, and guest lectures.

P: NTR 301
Typically offered in Fall and Spring

NTR 454/ANS 554/ANS 454 Lactation, Milk and Nutrition (3 credit hours)
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421
Typically offered in Spring only

NTR 490 Senior Capstone Experience in Nutrition (4 credit hours)
In this capstone course, students will work in groups to complete research and service projects for community partners while gaining professional experiences in nutrition. Students will be expected to apply their knowledge and skills gained throughout their nutrition coursework to develop solutions to problems in public health and community nutrition. Students will complete comprehensive written and poster presentations about their work as a group, in addition to individual reflection(s) about their learnings. Students must provide their own transportation when visiting their community partner site. Students should complete this course in the last semester (or year) of their degree. NTS and NTA Majors only; Senior status required.

Prerequisite: NTR 301, NTR 302, and NTR 401; Nutrition Science majors only; Senior status required
Typically offered in Fall and Spring

NTR 492 Professional Internship Experience in Nutrition Science (1-3 credit hours)
This course provides an opportunity for students to gain real-world experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Undergraduate Teaching Coordinator for Nutrition prior to the start of the experience. To gain approval, a student must submit the completed NTR 492 contract and have it approved by his/her experience supervisor, academic advisor and the undergraduate teaching coordinator/course instructor. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

NTR 493 Research Experience in Nutrition Science (1-3 credit hours)
This course provides an opportunity for students to gain real-world experience in a scientific research program. A minimum of 42 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Undergraduate Teaching Coordinator for Nutrition prior to the start of the experience. To gain approval, a student must submit the completed NTR 493 contract and have it approved by his/her research supervisor, academic advisor and the NTR 493 coordinator. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

NTR 494 Teaching Experience in Nutrition Science (1-3 credit hours)
This course provides an opportunity for students to gain teaching experience relevant to their academic and career goals. A minimum of 45 hours must be completed for each credit hour earned, with 3 credit hours maximum for each experience. The experience must be arranged by the student and approved by the Undergraduate Teaching Coordinator for Nutrition prior to the start of the experience. To gain approval, a student must submit the completed NTR 494 contract and have it approved by his/her experience supervisor, academic advisor and the undergraduate teaching coordinator/course instructor. In addition to the work described in the contract, a student will complete a series of reflective assignments during and at the end of the experience.

Typically offered in Fall, Spring, and Summer

NTR 495 Special Topics in Nutrition (1-6 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

NTR 500 Principles of Human Nutrition (3 credit hours)
Overview of fields of Nutritional Sciences; functions of nutrients in the human body; sources and properties of nutrients; relationships of food industry practices to nutrition. Credit will not be given for both NTR (FS)400 and NTR 500

Prerequisite: CH 220 and (CH 221 or CH 223) and (ZO 160 or BIO 181/183)
Typically offered in Summer only

NTR 501/FS 501/NTR 401/FS 401 Advanced Nutrition and Metabolism (3 credit hours)
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225)
Typically offered in Fall and Summer

NTR 510/NTR 410 Maternal and Infant Nutrition (3 credit hours)
Students will explore the current research, controversies, and biological mechanisms related to nutrition for women before, during, and after pregnancy, as well as for infants in utero and after birth.

Prerequisite: NTR 301
Typically offered in Spring and Summer

NTR 511/NTR 411 Public Health Perspectives in Infant Feeding (3 credit hours)
This course is designed to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). In this course, students will learn the basics and importance of infant and young child feeding from a public health perspective. Some of the topics that are covered in this course include the public health considerations of breastfeeding and formula feeding in the US and globally, breastfeeding initiation and infant behavior, lifestyle practices and infant feeding, family challenges related to infant feeding, infant feeding research and global impacts, cultural humility for health care providers, and collaboration among healthcare professionals.

Typically offered in Fall and Summer

NTR 512/NTR 412 Clinical Concepts in Infant Feeding (3 credit hours)
This course is designed to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). Students will learn skills and content required for entry level clinical support for infant feeding. Students will learn the fundamentals of infant positioning, latch, and suckle, assessment skills required to evaluate physical development of both the mother and the infant, milk synthesis, milk production, and milk transfer. This course will also prepare the learner to manage the feeding needs of infants across the age spectrum, from the premature infant to the toddler and older child. We will discuss complicated scenarios, to include breastfeeding with physical anomalies, infant hyperbilirubinemia, hypoglycemia, slow weight gain, failure to thrive, and many others. Students will be required to provide their own transportation for field trips.

P: NTR 411 or NTR 511 and BIO 240
Typically offered in Spring and Summer

NTR 513/NTR 413 Clinical Concepts in Infant Feeding Laboratory (1 credit hours)
The laboratory course is designed to complement course content to help prepare learners to become International Board Certified Lactation Consultants (IBCLC). Students will learn and practice skills required for entry-level clinical support for infant feeding. Students will learn the fundamentals of infant positioning, latch, and suckle, and assessment skills required to evaluate physical development of both the mother and the infant, milk synthesis, milk production, and milk transfer. This course will also prepare the learner to manage the feeding needs of infants across the age spectrum, from the premature infant to the toddler and older child. Students will be expected to provide their own transportation for off-campus experiences.

P: BIO 240 and NTR 411 or NTR 511; C: NTR 412 or NTR 512
Typically offered in Spring only

NTR 515/ANS 515/ANS 415/NTR 415/PO 415/PO 515 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

NTR 521/NTR 421 Life Cycle Nutrition (3 credit hours)
This course focuses on the physiologic changes and nutritional needs throughout the life cycle. Additionally, students will explore psychosocial and environmental influencers on food consumption and diet quality at each stage of life. Pregnancy and lactation, fetal development, infancy, early childhood, childhood, adolescence, young and middle adulthood, and geriatrics will be examined. Student will apply course content to real-world settings through individual and/or group service-learning projects. Credit will not be given for both NTR 421 and NTR 521.

Prerequisite: NTR 301 and junior standing required
Typically offered in Spring only

NTR 525/FM 525/ANS 525/PO 525/NTR 425/ANS 425/FM 425/PO 425 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall and Spring

NTR 540/NTR 440 Child & Adolescent Nutrition (3 credit hours)
In this course, students will gain an in-depth understanding of human nutritional needs during early and middle childhood and adolescence. Students will consider how child development affects nutrition and eating behaviors, explore common nutrition concerns that emerge throughout childhood, and evaluate interventions and policies to improve child and adolescent nutrition. The course also includes an introduction to special topics such as food allergies, disordered eating, child obesity, and vegetarian diets. Assessments are designed to evaluate students' mastery of content knowledge, critical thinking, and communication skills. The course content will be delivered in a variety of ways, including lectures, readings, videos, in-class activities, and guest lectures.

P: NTR 301
Typically offered in Fall and Spring

NTR 550/ANS 550 Applied Ruminant Nutrition (3 credit hours)
Applied concepts in ruminant nutrition for the practicing agricultural professional. Protein, energy, vitamin and mineral nutrition in relation to the nutritional needs and practical feeding of beef cattle, dairy cattle, sheep, and goats. New developments in feeding systems, feed additives and the prevention and treatment of metabolic disorders. Emphasis on solving problems in case studies. Permission given to undergraduates

Prerequisite: ANS 230 or ANS(NTR,PO) 415. Permission given to undergraduates
Typically offered in Fall only

NTR 554/FS 554 Lactation, Milk, and Nutrition (3 credit hours)
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421
Typically offered in Spring only

NTR 555/FS 555 Exercise Nutrition (3 credit hours)
Metabolism of macro- and micronutrients as affected by exercise and physical activity. Effects of dietary patterns, specific foods, dietary supplements and ergogenic aids on sports performance. Reading and discussion of current literature and individual or group projects.

Prerequisite: NTR 400/500
Typically offered in Spring only

NTR 557/FS 557 Nutraceuticals and Functional Foods (3 credit hours)
This course evaluates the weight of evidence from peer-reviewed scientific literature relating food bioactives, whole foods, and diets to disease prevention, athletic performance, and cognitive development/enhancement. Data are viewed in the context of processing effects, global food and supplement regulations, as well as commercial marketing claims. Key concepts include dose-response, signal transduction, and the use of advanced technologies such as genomics, proteomics and metabolomics. Students will work in teams to develop and write a critical review manuscript suitable for publication.

Typically offered in Fall only

NTR 561/ANS 561 Equine Nutrition (3 credit hours)
This course explores concepts in equine nutrition including digestive physiology of horses, nutrient requirements for different classes of horses and feed management. Ration evaluation and balancing, as well as problem solving will be a core component to this course.

Prerequisite:NTR 500 or NTR/FS 501 or NTR/PO 515
Typically offered in Spring only

NTR 565/ANS 565 Advanced Canine and Feline Nutrition (3 credit hours)
This course is about the advanced principles of nutrition within canines and felines. The course focuses on the unique gastro- intestinal tracts for the two species as well as their specific nutrient requirements and how the animal industry addresses these needs.

Restriction: Graduate Student or Senior with 3.35 GPA; Prerequisite: 400-level Nutrition Course
Typically offered in Fall only

NTR 594 Special Topics in Nutrition (1-6 credit hours)
The study of special problems and selected topics of current interest in nutrition and related fields.

Typically offered in Fall, Spring, and Summer

NTR 601 Master's Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

NTR 624 Topical Problems In Nutrition (1-6 credit hours)
Analysis of current problems in nutrition. Also entails the scientific appraisal and solution of a selected problem designed to provide training and experience in research.

Prerequisite: Graduate standing or Senior standing
Typically offered in Fall, Spring, and Summer

NTR 625 Advanced Special Problems In Nutrition (1-6 credit hours)
Directed research in a specialized phase of nutrition designed to provide experience in research methodology and philosophy.

Prerequisite: Graduate standing
Typically offered in Spring only

NTR 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

NTR 690 Advanced Special Problems In Nutrition (1-6 credit hours)
Directed research in a specialized phase of nutrition designed to provide experience in research methodology and philosophy.

Prerequisite: Graduate standing
Typically offered in Fall only

NTR 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NTR 695 Master's Thesis Research (1-9 credit hours)
Thesis research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

NTR 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

NTR 699 Research In Nutrition (1-9 credit hours)
Original research preparatory to the thesis for Master of Science or Doctor of Philosophy degree.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

NTR 701/ANS 701 Protein and Amino Acid Metabolism (3 credit hours)
Study of protein and amino acid metabolism, regulation, dietary requirements and techniques for their investigation in human and other animals.

Prerequisite: BCH 453, ZO 421, a 400-level nutrition course
Typically offered in Spring only

NTR 706/FM 706 Vitamin Metabolism (3 credit hours)
Structures, chemical and physical properties, functions, distribution, absorption, transport, metabolism, storage, excretion, deficiencies, and toxicity of vitamins in humans and domestic animals. Interactions between vitamins and other factors affecting vitamin metabolism or bioavailability as well as the nutritional significance of essential fatty acids and metabolism of prostaglandins, prostacyclins and leukotrienes. Application of knowledge will include critical review of scientific literature, experimental design, and formulation of vitamin supplements.

Prerequisite: ANS(NTR,PO) 415 and BCH 453
Typically offered in Fall only

NTR 708 Energy Metabolism (3 credit hours)
Relationship of biochemical and physiological events within the cell, tissue, organ and system with the nutrient needs as sources of energy for productive animal life. Digestion, absorption and metabolism of energy sources. Presentation of processesof energy transformations within living structures in relation to energetics, biological oxidations, coupled reactions, anabolic and catabolic systems, metabolic control, partitioning and efficiency.

Prerequisite: BCH 453 and an introductory NTR course
Typically offered in Fall only

NTR 764/PHY 764/CBS 764 Advances in Gastrointestinal Pathophysiology (3 credit hours)
This course will focus on advanced gastrointestinal physiology and the pathophysiology of deseases of relevance to scientsts involved in animal-related research. In particular, the course will cover the pathophysiology of ulceration, infectious diarrhea, ischemia, motility disorders, and inflammatory diseases of the gut. An in-depth review paper will be required based on recent literature rgarding a specific gastrointestinal disease.

Prerequisite: PHY 503, PHY 504
Typically offered in Fall only

NTR 775/PO 775 Mineral Metabolism (3 credit hours)
Requirements, function, distribution, absorption, excretion and toxicity of minerals in humans and domestic animals. Interactions between minerals and other factors affecting mineral metabolism or availability. Emphasis on mechanisms associated withmineral functions and the metabolic bases for the development of signs of deficiency.

Prerequisite: ANS(NTR,PO) 415, BCH 451 and ZO 421
Typically offered in Fall only

NTR 790/FM 790 Advanced Feed Formulation (3 credit hours)
Principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

Prerequisite: NTR(FM) 525
Typically offered in Fall only

NTR 794 Special Topics in Nutrition (1-6 credit hours)
The study of special problems and selected topics of current interest in nutrition and related fields.

Typically offered in Fall, Spring, and Summer

NTR 801 Doctoral Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

NTR 824 Topical Problems In Nutrition (1-6 credit hours)
Analysis of current problems in nutrition. Also entails the scientific appraisal and solution of a selected problem designed to provide training and experience in research.

Prerequisite: Graduate standing or Senior standing
Typically offered in Fall, Spring, and Summer

NTR 825 Advanced Special Problems In Nutrition (1-6 credit hours)
Directed research in a specialized phase of nutrition designed to provide experience in research methodology and philosophy.

Prerequisite: Graduate standing
Typically offered in Fall only

NTR 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

NTR 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

NTR 893 Doctoral Dissertation Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

NTR 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

NTR 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

NTR 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Occupational Education (EOE)

EOE 298 Special Topics in Occupational Education (1-3 credit hours)
Individual or group study of particular areas of education at the freshman and sophomore levels.

Typically offered in Fall, Spring, and Summer

EOE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

EOE 699/EAC 699/ECD 699/ECI 699/ELP 699/EMS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall and Spring

EOE 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

EOE 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

Operations Research (OR)

OR 425/OR 525/ISE 525/ISE 425 Medical Decision Making (3 credit hours)
This will focus on the use of optimization in Medicine. The main goal of this course is for you to develop an understanding of the recent methodological literature on optimization methods applied to medical decision making. We will cover a broad range of topics, both from the methodological perspective (study models using integer programming, dynamic programming, simulation, etc.) and from the public policy/public health perspective (who are the stake holders, what are the relevant questions modelers can answer, how is the patient taken into account, etc.).

P: ISE/OR 505 or equivalent and ISE 560 or equivalent or permission by instructor
Typically offered in Spring only

OR 433/OR 533/ISE 433/ISE 533 Service Systems Engineering (3 credit hours)
This course intends to provide a comprehensive treatment on the use of quantitative modeling for decision making and best practices in the service industries. The goal of this class is to teach students to able to identify, understand, and analyze services; and acquire the quantitative skills necessary to model key decisions and performance metrics associated with services. Students will be exposed both to classical and contemporary examples of challenges and opportunities that arise when working in the service sector.

Prerequisite: ISE 361
Typically offered in Spring only

OR 501/ISE 501 Introduction to Operations Research (3 credit hours)
Operations Research (OR) is a discipline that involves the development and application of advanced analytical methods to aid complex decisions. This course will provide students with the skills to be able to apply a variety of analytical methods to a diverse set of applications. Methods considered include linear and mixed-integer programming, nonlinear and combinatorial optimization, network models, and machine learning. Focus will be on how to translate real-world problems into appropriate models and then how to apply computational procedures and data so that the models can be used as aids in making decisions. Applications will include improving the operation of a variety of different production and service systems, including healthcare delivery and transportation systems, and also how OR can be used to make better decisions in areas like sports, marketing, and project management. Prerequisites include undergraduate courses in single variable differential and integral calculus and an introductory course in probability.

Prerequisites include undergraduate courses in single variable differential and integral calculus (similar to MA 421) and an introductory course in probability (similar to ST 421 or ST 371 and ST 372)
Typically offered in Fall and Spring

OR 504/MA 504 Introduction to Mathematical Programming (3 credit hours)
Basic concepts of linear, nonlinear and dynamic programming theory. Not for majors in OR at Ph.D. level.

Prerequisite: MA 242, MA 405
Typically offered in Fall only

OR 505/ISE 505/MA 505 Linear Programming (3 credit hours)
Introduction including: applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

Prerequisite: MA 405
Typically offered in Fall only

OR 506 Algorithmic Methods in Nonlinear Programming (3 credit hours)
Introduction to methods for obtaining approximate solutions to unconstrained and constrained minimization problems of moderate size. Emphasis on geometrical interpretation and actual coordinate descent, steepest descent, Newton and quasi-Newton methods, conjugate gradient search, gradient projection and penalty function methods for constrained problems. Specialized problems and algorithms treated as time permits.

Prerequisite: Linear algebra or similar coursework (similar to MA 303, MA 405), and knowledge of a computer language, such as Python, MATLAB, Julia, for example.
Typically offered in Fall only

OR 525/ISE 525/ISE 425/OR 425 Medical Decision Making (3 credit hours)
This will focus on the use of optimization in Medicine. The main goal of this course is for you to develop an understanding of the recent methodological literature on optimization methods applied to medical decision making. We will cover a broad range of topics, both from the methodological perspective (study models using integer programming, dynamic programming, simulation, etc.) and from the public policy/public health perspective (who are the stake holders, what are the relevant questions modelers can answer, how is the patient taken into account, etc.).

P: ISE/OR 505 or equivalent and ISE 560 or equivalent or permission by instructor
Typically offered in Spring only

OR 531/MA 531/E 531 Dynamic Systems and Multivariable Control I (3 credit hours)
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

Prerequisite: MA 341, MA 405
Typically offered in Fall only

OR 533/ISE 433/ISE 533/OR 433 Service Systems Engineering (3 credit hours)
This course intends to provide a comprehensive treatment on the use of quantitative modeling for decision making and best practices in the service industries. The goal of this class is to teach students to able to identify, understand, and analyze services; and acquire the quantitative skills necessary to model key decisions and performance metrics associated with services. Students will be exposed both to classical and contemporary examples of challenges and opportunities that arise when working in the service sector.

Prerequisite: ISE 361
Typically offered in Spring only

OR 537/CE 537 Computer Methods and Applications (3 credit hours)
Computational approaches to support civil planning, analysis, evaluation and design. Applications to various areas of civil engineering, including construction, structures, transportation and water resources.

Prerequisite: CSC 112 and (MA 341 or MA 305)
Typically offered in Fall only

OR 560/ISE 560 Stochastic Models in Industrial Engineering (3 credit hours)
ISE/OR 560 will introduce mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production and service systems. Methodologies covered include probability theory and stochastic processes including discrete and continuous Markov processes. Applications relate to design and analysis of problems, capacity planning, inventory control, waiting lines, and service systems.

Typically offered in Fall only

OR 562/ISE 562/TE 562 Simulation Modeling (3 credit hours)
This course concentrates on design, construction, and use of discrete/continuous simulation object-based models employing the SIMIO software, with application to manufacturing, service, and healthcare. The focus is on methods for modeling and analyzing complex problems using simulation objects. Analysis includes data-based modeling, process design, input modeling, output analysis, and the use of 3D animation with other graphical displays. Object-oriented modeling is used to extend models and enhance re-usability.

Typically offered in Spring only

OR 565/CSC 565/MA 565 Graph Theory (3 credit hours)
Basic concepts of graph theory. Trees and forests. Vector spaces associated with a graph. Representation of graphs by binary matrices and list structures. Traversability. Connectivity. Matchings and assignment problems. Planar graphs. Colorability. Directed graphs. Applications of graph theory with emphasis on organizing problems in a form suitable for computer solution.

Prerequisite: CSC 226 or MA 351.
Typically offered in Spring only

OR 579/CSC 579/ECE 579 Introduction to Computer Performance Modeling (3 credit hours)
Workload characterization, collection and analysis of performance data, instrumentation, tuning, analytic models including queuing network models and operational analysis, economic considerations.

Prerequisite: CSC 312 or ECE 206 and MA 421
Typically offered in Fall and Spring

OR 591 Special Topics in Operations Research (1-6 credit hours)
Individual or small group studies of special areas of OR which fit into students' programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

Typically offered in Fall, Spring, and Summer

OR 601 Seminar in Operations Research (1 credit hours)
Seminar discussion of operations research problems. Case analyses and reports. Graduate students with minors or majors in operations research expected to attend throughout period of their residence.

Prerequisite: OR Major or OR Minor
Typically offered in Fall and Spring

OR 610 Special Topics in Operations Research (1-6 credit hours)
Individual or small group studies of special areas of OR which fit into students' programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

Typically offered in Fall, Spring, and Summer

OR 652 Practicum in Operations Research (1-3 credit hours)
Practicum in problem solving in industry applying applicable OR methodologies. Practical experience in diagnosing and solving problems in operational systems at either an industrial site or at NC State.

Prerequisite: OR 501, OR 505, OR 709 and OR 761
Typically offered in Summer only

OR 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

OR 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

OR 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

OR 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

OR 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

OR 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

OR 699 Master's Thesis Preparation (1-9 credit hours)
For student who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

OR 705 Large-Scale Linear Programming Systems (3 credit hours)
Specialized algorithms for efficient solution of large-scale LP problems. Parametric programming, bounded variable algorithms, generalized upper bounding, decomposition, matrix factorization and sparse matrix techniques. Emphasis on gaining firsthand practical experience with current computer codes and computational procedures.

Prerequisite: OR 505 and FORTRAN programming experience
Typically offered in Spring only

OR 706/ST 706/MA 706 Nonlinear Programming (3 credit hours)
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.

Prerequisite: OR(IE,MA) 505 and MA 425
Typically offered in Spring only

OR 708/ISE 708/MA 708 Integer Programming (3 credit hours)
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some "hands on" computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

Prerequisite: MA 405, OR (MA,IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112)
Typically offered in Spring only

OR 709/ISE 709 Dynamic Programming (3 credit hours)
Introduction to theory and computational aspects of dynamic programming and its application to sequential decision problems.

Prerequisite: MA 405, ST 421
Typically offered in Spring only

OR 719/MA 719 Vector Space Methods in System Optimization (3 credit hours)
Introduction to algebraic and function-analytic concepts used in system modeling and optimization: vector space, linear mappings, spectral decomposition, adjoints, orthogonal projection, quality, fixed points and differentials. Emphasis on geometricinsight. Topics include least square optimization of linear systems, minimum norm problems in Banach space, linearization in Hilbert space, iterative solution of system equations and optimization problems. Broad range of applications in operations research and system engineering including control theory, mathematical programming, econometrics, statistical estimation, circuit theory and numerical analysis.

Prerequisite: MA 405, 511
Typically offered in Fall only

OR 731/E 731/MA 731 Dynamic Systems and Multivariable Control II (3 credit hours)
Stability of equilibrium points for nonlinear systems. Liapunov functions. Unconstrained and constrained optimal control problems. Pontryagin's maximum principle and dynamic programming. Computation with gradient methods and Newton methods. Multidisciplinary applications.

Prerequisite: OR(E,MA) 531
Typically offered in Spring only

OR 747/ISE 747 Reliability Engineering (3 credit hours)
Introduction to basic concepts of reliability engineering. Application of probability and statistics to estimate reliability of industrial systems; development of reliability measures; analysis of static and dynamic reliability models; development and analysis of fault trees; analysis of Markovian and non-Markovian models; and optimization of reliability models.

Prerequisite: ST 511
Typically offered in Fall only

OR 760/ISE 760 Applied Stochastic Models in Industrial Engineering (3 credit hours)
Formulation and analysis of stochastic models with particular emphasis on applications in industrial engineering; univariate, multivariate and conditional probability distributions; unconditional and conditional expectations; elements of stochastic processes; moment-generating functions; concepts of stochastic convergence; limit theorems; homogeneous, nonhomogeneous and compound Poisson processes; basic renewal theory; transient and steady-state properties of Markov processes in discrete and continuous time.

Prerequisite: MA 303, ST 371
Typically offered in Fall only

OR 761/ISE 761 Queues and Stochastic Service Systems (3 credit hours)
Introduction of general concepts of stochastic processes. Poisson processes, Markov processes and renewal theory. Usage of these in analysis of queues, from with a completely memoryless queue to one with general parameters. Applications to many engineering problems.

Typically offered in Spring only

OR 762/ISE 762/CSC 762 Computer Simulation Techniques (3 credit hours)
Basic discrete event simulation methodology: random number generators, generating random objects, design of discrete event simulation, validation, analysis of simulation output, variance reduction techniques, Markov chain Monte Carlo, simulation optimization. The course has computer assignments and projects.

Students should have completed a course on stochastic models (similar to ISE 560 or ISE 760) and have a working knowledge of a programming language (e.g., Python, Matlab, R, or others).
Typically offered in Fall and Spring

OR 766/ISE 766/MA 766 Network Flows (3 credit hours)
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

Prerequisite: OR(IE,MA) 505
Typically offered in Spring only

OR 772/ISE 772 Stochastic Simulation Design and Analysis (3 credit hours)
This course is methodologically focused and a continuation of ISE 762 in Monte Carlo methods. The topics include, but are not limited to, Quasi-Monte Carlo, importance sampling and other advanced variance reduction approaches, derivative estimation, and advanced simulation optimization in continuous and finite spaces. While the application of these techniques to actual simulations is practiced as assignments, the discussion on simulation software and programming will be minimal. A current topic research presentation/paper required.

Prerequisite: (CSC,ECE,IE,OR) 762 and ST 516
Typically offered in Spring only

OR 773/ST 773/BMA 773/MA 773 Stochastic Modeling (3 credit hours)
Survey of modeling approaches and analysis methods for data from continuous state random processes. Emphasis on differential and difference equations with noisy input. Doob-Meyer decomposition of process into its signal and noise components. Examples from biological and physical sciences, and engineering. Student project.

Prerequisite: BMA 772 or ST (MA) 746
Typically offered in Spring only

OR 774/MA 774/BMA 774 Partial Differential Equation Modeling in Biology (3 credit hours)
Modeling with and analysis of partial differential equations as applied to real problems in biology. Review of diffusion and conservation laws. Waves and pattern formation. Chemotaxis and other forms of cell and organism movement. Introduction to solid and fluid mechanics/dynamics. Introductory numerical methods. Scaling. Perturbations, Asymptotics, Cartesian, polar and spherical geometries. Case studies.

Prerequisite: BMA 771 or MA/OR 731; BMA 772 or MA 401 or MA 501
Typically offered in Spring only

OR 791 Advanced Special Topics (1-6 credit hours)
Typically offered in Fall and Spring

OR 801 Seminar in Operations Research (1 credit hours)
Seminar discussion of operations research problems. Case analyses and reports. Graduate students with minors or majors in operations research expected to attend throughout period of their residence.

Prerequisite: OR Major or OR Minor
Typically offered in Fall and Spring

OR 810 Special Topics in Operations Research (1-6 credit hours)
Individual or small group studies of special areas of OR which fit into students' programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

Typically offered in Fall, Spring, and Summer

OR 852 Practicum in Operations Research (1-3 credit hours)
Practicum in problem solving in industry applying applicable OR methodologies. Practical experience in diagnosing and solving problems in operational systems at either an industrial site or at NC State.

Prerequisite: OR 501, OR 505, OR 709 and OR 761
Typically offered in Summer only

OR 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

OR 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

OR 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

OR 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

OR 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Paper Science Engineering (PSE)

PSE 201 Pulping and Papermaking Technology (3 credit hours)
Survey of the pulping and papermaking processes. Covers characteristics of wood and different types of fiber, key equipment and process variables for pulping, bleaching and chemical recovery processes, with emphasis on the kraft process. Papermaking variables and equipment, particularly on a Fourdrinier machine, secondary fiber processing, and aspects of printing and coverting discussed.

Typically offered in Spring only

PSE 211 Pulp and Paper Internship (1 credit hours)
Experience in the pulp and paper industry. Problem solving in an industrial setting to gain insight of pulp and paper technology. Written report required. Engineering ethics discussed in light of the work experience.

Prerequisite: PSE 201
Typically offered in Fall only

PSE 212 Paper Properties (4 credit hours)
Measurement and characterization of the structural, mechanical, and optical properties of paper and board. Effect of raw materials and manufacturing processes on structure and properties. Basic concepts of paper physics.

Prerequisite: PSE 201
Typically offered in Fall only

PSE 220 From Papyrus to Plasma Screens: Paper and Society (2 credit hours)
The impact of paper and paper products on society, examined from the broad interdisciplinary perspectives of technology/engineering and sociology/communication. How the written word and printing affected human development and history. How paper products affect people with regard to communication, education, commerce, and comfort/hygiene. The history and development of paper making and the paper industry. Important properties of paper. Basic types of paper products, how they are manufactured, and their impacts The environmental impacts of paper and the paper industry. Current issues involving the paper industry.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

PSE 293 Independent Study in Paper Science & Engineering (1-6 credit hours)
Independent Study for Paper Science & Engineering students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PSE 294 Independent Study in Paper Science & Engineering (1-6 credit hours)
Independent Study for Paper Science & Engineering students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PSE 295 Special Topics in Paper Science & Engineering (1-3 credit hours)
Special Topics in Paper Science & Engineering at the 200 level for offering courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

PSE 322 Wet End and Polymer Chemistry (4 credit hours)
Prepares students to solve problems related to chemical usage on paper machines. Subjects include water chemistry, paper machine operations, fibers, fillers, alum, sizing agents, polyelectrolytes, colloidal interactions, strength agents, dyes, strategies to optimize retention, dewatering strategies, strategies to achieve more uniform paper, strategies to improve production rates, recycling acqueous coatings, and wet-end chemical process control.

Prerequisite: PSE 212 and (CH 221 or CH 225) and (CH 222 or CH 226)
Typically offered in Fall only

PSE 332 Wood and Pulping Chemistry (3 credit hours)
Introduction to carbohydrate chemistry focusing on the structure and reactivity of wood polysaccharides, hemicelluloses and cellulose and on the chemical structure of lignins and wood extractives. Special emphasis on the chemical reaction of wood components occurring in pulping and bleaching processes.

Prerequisite: CH 221/225 and CH 222/226 and CH 223/227 and CH 224/228
Typically offered in Spring only

PSE 335/CH 335 Principles of Green Chemistry (4 credit hours)
Introduction to the topic of green chemistry as an emerging field; Identification of hazards and classes; overview of sources; alternative solvents and reagents; sustainability of chemical reactions; alternative chemical reactions and pathways; alternative feedstocks; enzymatic catalysis; ionic liquids; re-engineering of chemical processes; chemical synthesis.

Prerequisite: Grade of C or better in CH 101/102, CH 201/202 (or equivalent general chemistry series), and CH 221/22 (or equivalent)
Typically offered in Fall only

PSE 355 Pulp and Paper Unit Processes I (3 credit hours)
Selected topics in chemical engineering as applied in the pulp and paper industry. Emphasis on computational practice.

Prerequisite: CHE 205
Typically offered in Fall only

PSE 360 Pulp and Paper Unit Processes II (3 credit hours)
Application of chemical engineering principles to the analysis of pulp and paper unit processes. Emphasis on practical problems in fluid dynamics, heat transfer, mass transfer and thermodynamics. Problem solution techniques include hand calculationand computer simulation tools.

Prerequisite: PSE 201, PSE 355 or CHE 311
Typically offered in Spring only

PSE 370 Pulp and Paper Products and Markets (3 credit hours)
Major product sectors for pulp and paper. Market outlook and analysis. Critical fiber, pulp, finished product requirements and properties. Special emphasis on packaging grades and emerging markets. Technology intelligence and techno-economic tools to identify and address challenges related to selected pulp and paper products. Laboratory session used for research and development of selected products.

Prerequisites: PSE 201 with a C- or better and PSE 212 with a C- or better
Typically offered in Spring only

PSE 371 Pulping Process Analysis (3 credit hours)
Preparation and evaluation of different types of wood pulp. A new wood raw material is selected each year with the purpose of studying and critically evaluating the principal pulping and bleaching variables.

Prerequisite: PSE 201
Typically offered in Spring only

PSE 415 Paper Industry Strategic Project Analysis (3 credit hours)
Design problems in process and project engineering are analyzed from strategic, economic, and business perspectives. Typical pulp and paper processes are computer modeled and analyzed with regard to feasibility and profitability. Specific capital projects are assessed for capital requirements, total installed cost, operating costs, payback, and cash flow. Traditional business concepts are presented, including: financial analysis; capital allocation; marketing and pricing theory; manufacturing work systems; management systems; leadership; what "good" looks like. Senior Standing.

Typically offered in Fall only

PSE 416 Process Design and Analysis (3 credit hours)
Design, management and analysis of technical projects. Emphasis on concepts and techniques used in economic analysis of projects. Use of computer simulation for process design and cost analyses. Team projects to analyze cost and operating feasibility of proposed major mill modification. Written and oral presentations required throughout the semester.

Prerequisite: PSE 415 and PSE 417
Typically offered in Spring only

PSE 417 Modeling & Simulation of Pulp & Paper Processes (3 credit hours)
Application of modeling and simulation techniques for the analysis of pulping and papermaking processes. Model development and computer simulation using existing models will allow analysis of process interactions and operating/economic feasibility of process modifications of complex manufacturing systems.

Prerequisite: PSE 360
Typically offered in Fall only

PSE 425 Bioenergy & Biomaterials Engineering (3 credit hours)
This course acquaints students with the basic science, terminology, technology, economic concepts, and engineering concepts associated with the conversion of biomass into energy and materials. Topics include: biomass types and properties; biochemical platforms; thermochemical platforms; unit operations; the biorefinery; biocomposites. Some design content is included. Targeted to engineering students with a suitable background (PSE, CHE, BAE).

Prerequisite: For PSE Majors: (MAE 201 or CHE 316) and PSE 360; For CHE Majors: CHE 312 and CHE 316; For BAE Majors: MAE 201 and BAE 402
Typically offered in Fall only

PSE 465 Process Engineering (3 credit hours)
Advanced use of process engineering tools in process design, improvement and operation. Particular emphasis is placed on pulp and paper industry. Topics include basic statistics, Lean Six Sigma/DMAIC methodology, statistical software, measurement system analysis, process mapping/value stream mapping, statistical process and quality control, control charts, process capability analysis, hypothesis testing, design of experiments, Excel modeling, and big data analysis. An independent project is required, which can lead to Lean Six Sigma Yellow Belt trained status.

Prerequisite: Senior standing in PSE or SMT
Typically offered in Spring only

PSE 472 Paper Process Analysis (3 credit hours)
Product analysis, materials selection, process planning, manufacture of various types of paper using pilot plant equipment, finished product testing and comparison with standard products. Machine unit operations, materials flow balances, energy balances performed on operations. Team assignments with written and oral presentation of results.

Prerequisite: PSE 212, PSE 322, PSE 371
Typically offered in Spring only

PSE 475 Process Control in Pulp and Paper (3 credit hours)
Overview of the various aspects of control including process modeling, design of control loops and stability analysis in pulp and paper. Emphasis on distributed digital control (DDC), including hands-on programming and control loop development on aDDC computer.

Prerequisite: Senior standing in PSE or SMT
Typically offered in Fall only

PSE 476/FB 576/PSE 576/FB 476 Environmental Life Cycle Analysis (3 credit hours)
Overview of the various aspects of conducting and interpreting an environmental life cycle analysis on a product or service. Students will learn how to construct a life cycle analysis goal and scope, inventory, assessment and interpretation. Skills in the critique and communication of a life cycle analysis will be developed. Includes an overview of the following life cycle stages: raw materials, energy, transportation, production, use, and end of life. Emphasis on systems thinking. Targeted for students in any science or engineering program. Credit not allowed for both PSE 476 and WPS 576.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

PSE 493 Independent Study in Paper Science & Engineering (1-6 credit hours)
Independent Study for Paper Science & Engineering students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PSE 494 Independent Study in Paper Science & Engineering (1-6 credit hours)
Independent Study for Paper Science & Engineering students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PSE 576/FB 476/PSE 476/FB 576 Environmental Life Cycle Analysis (3 credit hours)
Overview of the various aspects of conducting and interpreting an environmental life cycle analysis on a product or service. Students will learn how to construct a life cycle analysis goal and scope, inventory, assessment and interpretation. Skills in the critique and communication of a life cycle analysis will be developed. Includes an overview of the following life cycle stages: raw materials, energy, transportation, production, use, and end of life. Emphasis on systems thinking. Targeted for students in any science or engineering program. Credit not allowed for both PSE 476 and WPS 576.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

Park Scholars (PRK)

PRK 102 Topics in Scholarship, Leadership, and Service II (0 credit hours)
Interdisciplinary seminar with distinguished speakers and community leaders. A one-two day, off-campus trip will develop student leadership skills through examination of leadership challenges facing North Carolina. Volunteer work with an off-campus service agency will build awareness of community needs and how to address those needs. Students may need to use public transportation, which is free to NC State students with their id, to perform required public service. Restricted to Park Scholars.

Prerequisite: PRK 101, restricted to Park Scholars
Typically offered in Spring only

PRK 202 Topics in Scholarship, Leadership and Service IV (0 credit hours)
Interdisciplinary seminar includes speaker seminars and organizing Service Raleigh, a major spring service project. Planning begins for senior year enrichment activities. Students may need to use public transportation, which is free to NC State Students with their id, to perform required public service. Restricted to Park Scholars.

Prerequisite: PRK 201, restricted to Park Scholars
Typically offered in Spring only

PRK 302 Topics in Scholarship, Leadership, and Service VI (0 credit hours)
Interdisciplinary seminar to develop leadership skills through a Leadership Academy, attendance at various speaker seminars and dinners, and through continued community volunteerism. The Leadership Academy is a half-day workshop in February and builds on the skills from the fall Leadership Academy. Students may need to use public transportation, which is free to NC State Students with their id, to perform required public service. Restricted to Park Scholars.

Prerequisite: PRK 301, restricted to Park Scholars
Typically offered in Spring only

PRK 402 Topics in Scholarship, Leadership and Service VIII (0 credit hours)
Interdisciplinary seminar will promote understanding of scholarship, leadership, and service. Students hold a dinner with a William Friday Award recipient, establish their class legacy for the campus, and work with younger students on developing their leadership styles. Students continue to volunteer in the community. Students may need to use public transportation, which is free to NC State Students with their id, to perform required public service. Restricted to Park Scholars.

Prerequisite: PRK 401, restricted to Park Scholars
Typically offered in Spring only

Parks, Recreation, and Tourism Management (PRT)

PRT 150 Recreation, Sport, Tourism, and Event Management Orientation (1 credit hours)
Introduction topics related to the Department of Parks, Recreation and Tourism Management; the recreation, sport, tourism, event, and golf industries; all PRTM curricula; advising, academic skills, and teamwork; and research and personnel involved in the department and college. PRT, SPMGT, and PGM Majors Only.

Typically offered in Fall and Spring

PRT 152 Introduction to Parks, Recreation, Tourism, and Event Management (3 credit hours)
The goal of this course is to provide students with foundational knowledge of the role of recreation and leisure in our society. Facilitators, constraints, and motivational factors related to recreation and leisure behavior are discussed along with the role of recreation in community development and health and well-being across the lifespan. Topics addressed include human views and practices of recreation and leisure behavior, contemporary thinking about the relationship between time, work, and leisure, connections between recreation and wellness, and practices and methods used in the delivery of recreation, tourism, and leisure services (e.g., event planning, program planning, promoting tourism).

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PRT 156 Professional Golf Management Orientation (3 credit hours)
Overview of the golf industry and introduction to the concepts and practices of effective golf management including turfgrass management, golf shop operations, food & beverage control, customer services, personnel management, and tournament operations. Theoretical foundations for understanding leisure behavior and the parks, recreation and tourism management profession.

Prerequisite: PGM Majors
Typically offered in Fall and Spring

PRT 200 Health, Wellness and the Pursuit of Happiness (3 credit hours)
Despite having one of the highest standards of living in the world, a growing number of Americans are unhappy. The purpose of this course is to help students understand the behaviors that are personally beneficial and contribute to a healthy and happy life. Students will learn what research says about what makes us happy and healthy, and how to put those strategies into practice. Course modules focus on activities that have been proven to increase happiness along with strategies to build healthy habits.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PRT 203/IDS 203/NR 203 Humans and the Environment (3 credit hours)
Solutions-focused examination of the varied, complex, and evolving frameworks used to make sense of how individuals & societies connect with the biophysical environment. Emphasis on current issues and relevance of interdisciplinary training to careers including environmental planning and policy, sustainable tourism, parks and recreation management, conservation, environmental education, and climate resilience. Topics include: population dynamics, public land and common resources, renewable natural resources, pollution, water resources, energy and non-renewable resources.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PRT 210 Golf Management I (1 credit hours)
Emphasis on concepts, techniques, and practices of teaching golf skills; understanding the Professional Golfers' Association Constitution; rules of golf, golf tournament operations; and golf car fleet management.

Prerequisite: PGM Majors & PRT 156
Typically offered in Spring only

PRT 211 Golf Management II (1 credit hours)
Advanced concepts, techniques, and practices of teaching golf; golfer development programs, golf club design and repair.

Prerequisite: PGM Majors & PRT 210
Typically offered in Fall only

PRT 212 Golf Instructor Development (2 credit hours)
Students will learn to teach using a variety of instructional methods including various technologicalmethods. Students will also learn to teach to students with a variety of learning styles including visual, auditory and kinesthetic. The students will learn the fundamental theories and concepts of the golf swing as well as basic ball flight laws.

Prerequisite: PGM Majors and PRT 156 and PRT 210
Typically offered in Fall only

PRT 214/HESM 214 Foundations in Outdoor Leadership and Adventure Education (3 credit hours)
Foundations in outdoor leadership and adventure education topics include outdoor education history, group development models, experiential education theories, leadership styles and facilitation, risk management for groups, expedition and trip planning, employment opportunities, current trends and issues, environmental stewardship, assessment and evaluation.

Typically offered in Spring only

PRT 220 Foundations of Tourism and Event Management (3 credit hours)
An exploration of the forces driving the global industries of tourism and event management. Emphasis on using the principles of sustainability to address current challenges and future opportunities in tourism and event management.

Prerequisite: PRT 152
Typically offered in Fall and Spring

PRT 230 Foundations of Outdoor Recreation Management (3 credit hours)
This course explores concepts and methods of outdoor recreation planning and management, with emphasis on public lands. Students will examine environmental and social impacts of recreation and develop strategies that promote quality visitor experiences and sustainable resource management.

Typically offered in Fall and Spring

PRT 238 Diversity and Inclusion in Recreation and Sport (3 credit hours)
The goal of this course is to provide students with knowledge, attitude awareness, and resources needed to understand how to effectively deliver programs and services for people from diverse backgrounds. Students will gain an understanding of people's differences in terms of age, race, ethnicity, sexual identity, class, and disabilities and their barriers to participate in leisure and recreation activities. This course encourages students to cultivate cultural competency and appreciation of different perspectives as they pertain to disability, sport, and recreation. It is intended to enhance your understanding and ability to work with diverse populations. Seven to ten volunteer hours may be required. Students are responsible for providing their own transportation to and from volunteer opportunities.

GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

PRT 240 Geospatial Applications for Parks, Recreation, Tourism and Event Management (3 credit hours)
Geospatial applications have a multitude of uses in both the private and public sectors and are integral to innovative solutions in parks and recreation. Students will gain an understanding of how spatial data are collected, organized, analyzed, and displayed and learn the foundations of representing environmental and social phenomena in a geospatial environment. Student will be able to explain how geospatial tools enable spatial thinking and problem solving for parks, recreation, and tourism applications, such as siting recreation facilities, mapping health-related issues, and creating compelling maps and visuals for destination marketing. Students will apply spatial concepts to hands-on applications, gaining familiarity with commonly used software.

Typically offered in Fall and Spring

PRT 250 Facilities Management in Parks, Recreation, Tourism and Event Management (3 credit hours)
Management principles applied to park, recreation, sport areas and facilities. Emphasis on operational efficiency, quality service, fiscal responsibility and maintenance management.

Prerequisite: PRT 152
Typically offered in Fall and Spring

PRT 266 Introduction to Sport Management (3 credit hours)
Introduction to concepts and practices of effective sport programming and management at the professional, collegiate and community levels. Overview of various program delivery systems such as fitness, instructional sport, informal sport, and intramural sport. Examination of management elements of sport programming, including planning, personnel, finance, facilities, risk and liability and marketing.

Typically offered in Fall, Spring, and Summer

PRT 277 Psychological & Cultural Dimensions of Sport (3 credit hours)
The psychological behavior of the individual in physical activity and sport. The development of sport and the sports industry, political and cultural significance of sport, and sport in international relationships. The relationship between sport, gender, class, ethnicity, health, drugs, violence, education, and life long physical activity.

Prerequisite: Sport Management or PRT Majors, PRT 266
Typically offered in Fall, Spring, and Summer

PRT 286 Writing and Speaking in Sports Organizations (3 credit hours)
Concepts related to effective communication within sport organizations. Including interpersonal communication, group communication, public speaking, use of electronic media, and basic knowledge and understanding of media in sport and sport enterprises.

Prerequisite: Sport Management or PRT Majors, PRT 266
Typically offered in Fall, Spring, and Summer

PRT 292 External Learning Experience (1-3 credit hours)
Learning experience in parks, recreation, tourism, and sports within an academic framework with agencies external to the department. Contact and arrangements with prospective supervisors initiated by the student. Approval by prospective supervisor and departmental undergraduate coordinator necessary. Students can receive between 1 and 3 hours credit for the the learning experience (1 credit = 45 hours) PRT and SMT majors only.

Prerequisite: PRT 152 and Sophomore Standing
Typically offered in Fall, Spring, and Summer

PRT 293 Independent Study in Parks, Recreation, & Tourism Management (1-6 credit hours)
Independent Study for Parks, Recreation, & Tourism Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PRT 294 Independent Study in Parks, Recreation, & Tourism Management (1-6 credit hours)
Independent Study for Parks, Recreation, & Tourism Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PRT 295 Special Topics in Parks, Recreation, and Tourism Management (1-3 credit hours)
Special topics in the Department of Parks, Recreation, and Tourism Management at the 200 level for offering of courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

PRT 307 Services, Facilities and Event Marketing (3 credit hours)
Examination of marketing methods as applied to Parks, Recreation, Tourism and Sport Management facilities and programs. Aspects of advanced marketing: market research, marketing strategy and revenue-generation in both public and private settings.

Prerequisite: PRT 358
Typically offered in Fall only

PRT 311 Golf Course Turf Grass Management (3 credit hours)
Introduction to the roles and responsibilities of the golf course superintendent as well as the practices and procedures associated with golf course turfgrass management. Preparation for completion of Level II Turfgrass Management, elements of the Professional Golfers' Association of America's Professional Golf Management apprentice program. Periodically class/lab meetings require transportation to area golf facilities. Students are expected to provide their own transportation accommodations.

Prerequisite: PGM Majors and PRT 210 and PRT 211
Typically offered in Fall only

PRT 312 Golf Management III (1 credit hours)
Advanced concepts, techniques, and practices of golf management: business analysis, planning and operations, and analysis of the golf swing. Preparation for completion of PGA of America's Professional golf Management Level II knowledge tests and skills simulations.

Prerequisite: PGM Majors and PRT 210 and PRT 211
Typically offered in Spring only

PRT 315 Organization and Administration of Adventure Programs (3 credit hours)
Overview of the organizational and administration of adventure programs and services, professional standards, programming, management, staffing, budgeting, public relations, liability and risk management.

Prerequisite: PRT 152
Typically offered in Spring only

PRT 319 Sustainable Tourism (3 credit hours)
This course introduces the concepts and principles associated with sustainable tourism development, emphasizing on their implications for management and planning purposes. Topics to be addressed include: concept, justification and evolution of sustainable development; socio-cultural, economic, and environmental dimensions of sustainable tourism; positive and negative impacts of tourism development; and principles conducive to sustainable tourism planning and community development. Given that each case of tourism development is unique, examples from the U.S. and around the world will be used to examine and discuss issues and practices of sustainable tourism development within different geo-cultural contexts. This course adopts the Problem-Based Learning Format, which promotes and enhances students' analytical skills, problem solving skill and team working skills. It also adopts TH!NK intellectual standards to encourage critical and creative thinking in evaluating the work of others, solving problems related to sustainable tourism, and reflecting on personal thinking (i.e., metacognition). Junior or senior standing.

Typically offered in Spring only

PRT 342 Recreation and Park Interpretive Services (3 credit hours)
Interpretation is a form of communication in which the technical language of natural sciences and related fields is translated in a way connects people's hearts and minds to a resource. Commonly, interpretation occurs at local, county, state and national parks; state and national forests; other protected areas; as well as natural and cultural history centers and sites. However, these skills can be transferred to any setting in which you are seeking to connect people's hearts and minds to a resource. This course is designed to provide you with fundamental knowledge of environmental and cultural interpretation, as well as develop your practical skills in providing interpretive services. Students will enroll in the National Association of Interpretation Certified Interpretive Guide course and have opportunity to apply for certification ($125 fee). Certification is optional. Students completing this course will also earn a minimum of 20 hours toward NC Environmental Education Certification.

Prerequisite: Junior standing.
Typically offered in Spring only

PRT 358 Recreation Program Planning (4 credit hours)
The ultimate goal of the recreation and park profession is to improve the quality of life for the people and communities we serve. We often do this by providing programs for people. It is important for the student to realize the breadth of recreation program possibilities and to be able to analyze and apply the program planning principles to deliver services in a variety of recreation settings. As a full-immersion service-learning course, PRT 358 is designed to provide knowledge and tools to enable the student to achieve the above objectives. For many students, this should be one of the most valuable courses in the entire PRT curriculum.

Prerequisite: PRT 152
Typically offered in Fall and Spring

PRT 359 Organizational Leadership in Parks, Recreation, Tourism and Event Management (3 credit hours)
Systematic principles for managing human resource component of parks, recreation, event, and tourism organizations. Leadership, group dynamics, human resources planning and organizing, employee recruitment, selection and supervision.

Typically offered in Fall, Spring, and Summer

PRT 366 Sport Programming (3 credit hours)
Foundations, administrative support systems, delivery systems and desirable practices of sport programming. Program delivery systems overview with emphasis on problems and solutions associated with sport programs. Topics include sport league administration, youth sport delivery issues, sport tournament operations, community based sport delivery issues, college/university recreation sport delivery.

Prerequisite: Sport Management and PRT Majors, PRT 266
Typically offered in Fall and Spring

PRT 371 Risk Management in Parks, Recreation, Tourism, and Event Management (3 credit hours)
This course will introduce fundamental concepts and standards of practice related to the creation and maintenance of safe environments in tourism, events, community sport, and outdoor recreation. Topics addressed include risk management, emergency action plans, risk audits, contracts and waivers, basic employment law, and fundamental concepts related to the minimization of injury.

R: Junior standing or above
Typically offered in Fall, Spring, and Summer

PRT 375 Professional Development and Internship Orientation (2 credit hours)
The purpose of PRT 375 is to help students adequately prepare for their internship and for their career following graduation. Students will explore internship opportunities and explore the best practices for internship and/or job seeking through resume preparation, practicing interview skills, utilizing social media, and learning job negotiating skills.

Typically offered in Fall and Spring

PRT 376 Sport Administration (3 credit hours)
Concepts related to policy development, organization and management specific to sport organizations. Including theories and practices of policy development and implementation, management theories, organizational behavior, the strategic management process, organizational design, managing change, and operational planning.

P: PRT 266 and Sports Management students only.
Typically offered in Fall, Spring, and Summer

PRT 380 Evidence-based decision making in Recreation, Sport, Tourism, and Event Management (3 credit hours)
This course demonstrates the value of evidence-based decision making within parks, recreation, tourism, event, golf, and sport (hereafter PRTM) services. It provides an introduction to and application of the processes required for evaluating these services including: development of evaluation criteria, data collection, analysis, synthesis of findings, and communication of results. The course emphasizes an understanding, development, and application of various types of systematic evaluation designs. The understanding and communication of different evaluation techniques and results will be integral.

Prerequisite: 300-level Statistics course, PRT 359
Typically offered in Fall, Spring, and Summer

PRT 406 Sports Law (3 credit hours)
Fundamental principles of law, especially tort and contract law, applied to sports situations. Analysis of liability of sports personnel in various roles including participant, coach, promoter, trainer and official. Analysis of common law court decisions in sports contexts well as key state and federal statutory legislation such as civil rights and antitrust.

Prerequisite: Junior standing.
Typically offered in Fall and Summer

PRT 410 Food and Beverage Management (3 credit hours)
Introduction to practices and procedures in food and beverage service. Basics of food service needs, cost controls, legal issues affecting food and beverage service, staffing, and customer satisfaction. Critical elements of food costing, purchasing, inventory control, menu planning, and security. Preparation for completion of Level III Food and Beverage control elements of the Professional Golfers' Association of America's Professional Golf Management apprentice Program

Prerequisite: Junior standing and PRT 152
Typically offered in Spring only

PRT 411 Club Management (3 credit hours)
Introduction to practices and procedures in contemporary club management. Application of general management functions to club environments including human resources, training, financial management marketing; leadership food and beverage service operations facilities and risk management; legal issues; and career planning. Preparation for completion of Club Management elements of the Professional Golfers' Association of America's Professional Golf Management apprentice Program

Prerequisite: Junior standing, PRT 152
Typically offered in Spring only

PRT 412 Golf Course Architecture (3 credit hours)
Basic principles of golf course design. Historical architectural influences on current golf course design trends. Strategic golf course design principles, shot values, construction practices, environmental issues, and maintenance issues. Golf course design and management implications. Restricted to PGM and Landscape Arch. Majors. Junior Standing

Prerequisite: PRT 211
Typically offered in Fall only

PRT 413 Golf Management IV (1 credit hours)
Advanced concepts, techniques, and practices of golf management: swing concepts of teaching, supervising and delegating, merchandising and inventory control. Preparation for completion of PGA of America's Professional Golf Management Level III knowledge tests and skill simulations.

Prerequisite: PGM Majors and PRT 312
Typically offered in Spring only

PRT 414 PGA Apprentice Program Completion (0 credit hours)
Checkpoint mechanism to register the successful completion of the Professional Golfers' Association Apprentice requirement.

Prerequisite: PGM Majors and PRT 312
Typically offered in Fall and Spring

PRT 415 Principles and Practices of Outdoor Leadership (3 credit hours)
Principles and practices of leadership in adventure education and recreation programs: group management, trip planning, staffing, group dynamics, health and safety issues, risk management and other relevant topics.

Typically offered in Spring only

PRT 420 Destination Planning and Management (3 credit hours)
Destination planning, development, and management from a theoretical and applied perspective. Includes an examination the destination experience, destinations as they fit into the tourism system, and contributions made in the development of the tourism industry.

Prerequisite: PRT 152
Typically offered in Spring only

PRT 430 Tourism, Poverty, and Health (3 credit hours)
Students will learn about the potential role of tourism in fueling equitable development and human health in destination communities, and about the factors that lead to negative social and economic tourism impacts. Students will learn about equitable community development, human health and well-being principles; and about how micro-entrepreneurs and host communities react to the challenges and opportunities posted by tourism development. The course is grounded in scholarly knowledge and is also unreservedly engaged in real life; accordingly, students will work on new ways to help under-resourced individuals pursue dignified livelihoods through tourism. Fieldwork outside of class is required, with a fee of $50.00. PRT majors and PRT minors only.

Typically offered in Fall only

PRT 449/ES 449 Human Dimensions of Natural Resources in Australia/New Zealand (3 credit hours)
This 3.5 week study abroad program examines human dimensions of natural and environmental conservation in Australia. The course will involve an orientation and lectures from faculty at James Cook University. Students wills explore the natural environments in Australia including Great Barrier Reed, Tropical Rainforest and Outback and be introduced to Australian culture and history through interactions with communities. Educational travel, active participation, lectures, seminars, and reflective exercises facilitate learning to improve understanding of relationships between human societies and the natural environment. Students must pay program fees, airfare, some meals, and incidentals.

Corequisite: PRT 450
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Summer only

PRT 450/ES 450 Sustaining Natural Resources in Australia/New Zealand (3 credit hours)
This 3.5 week study abroad program will examine issues related to natural history and environmental conservation in Australia. This course will involve an orientation and lectures from Australian university faculty. Students will explore natural environments in Australia including the Great Barrier Reef, Tropical Rainforest and Outback; learn about sustainable development and protection of the natural environment through educational travel, field trips, active participation, lecture presentations and seminars, written assignments, research projects and reflective exercises. Students must apply through NCSU Study Abroad Office. Students must pay program fees, airfare, some meals and incidentals.

Corequisite: PRT 449
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Summer only

PRT 451 Principles of Recreation Planning and Facility Development (3 credit hours)
Planning activities analyzed as decision-making processes. Identification, interpretation, evaluation and utilization of data and resources necessary for recreation planning. Planning principles applied in the analysis of proposed and existing recreation sites.

Typically offered in Fall only

PRT 452/PRT 552 Field Experience in Nature-Based Recreation & Tourism Management (3 credit hours)
This dual-listed course provides undergraduate and graduate students with hands-on exposure to the multifaceted nature of national park management and awareness of the complex challenges facing national park managers. Examines nature based recreation and tourism management approaches from an applied and interdisciplinary perspective with applications across federal and state recreation resource management agencies. Students will practice problem-solving techniques and interact with a wide variety of staff from the National Park Service, park partner organizations, and adjacent community managers. This course culminates in a week-long field experience that may conflict with other scheduled courses. Field experience held in conjunction with five other universities in the Great Smoky Mountains National Park. A fee will be assessed for the trip that covers transportation, lodging and meals.

R: Junior or Senior Undergraduate Student Standing
Typically offered in Spring only

PRT 454 Finance and Economics of Parks, Recreation, Tourism, and Event Management (3 credit hours)
Recreation and park fiscal administration, sources of finance for operating and capital expenditures, revenue activities, financial planning, budgeting, expenditure policies, auditing and planning for recreation and park services, decision-making tools, legal aspects of administration.

Prerequisite: PRT 359
Typically offered in Fall, Spring, and Summer

PRT 458 Special Events Planning (3 credit hours)
Theoretical and applied approaches to the planning of special events. Components and considerations of event planning, applied to various recreational settings. Participation in a community special event is required. Attendance at professional conference also required.

Prerequisite: PRT 358
Typically offered in Spring only

PRT 466 Sport Finance and Economics (3 credit hours)
Concepts include sources of revenue for financing, principles of budgeting, spreadsheet utilization, and financial management of sport facilities and enterprises. Additional topics include fundraising principles and methods, economic impact principles and their application to sport venues and events, economic theory applied to sport manufacturing, service industries, professional sports, stadiums and arenas, intercollegiate sports, and the sport club industry.

Prerequisite: Sport Management and PRT Majors, PRT 266, ACC 210, and (ARE 201 or EC 201 or EC 205)
Typically offered in Fall, Spring, and Summer

PRT 475 Recreation and Park Internship (8 credit hours)
Provides prospective park, recreation and leisure service professionals a 400-hour (ten week) learning experience in a selected agency or organization, under the joint supervision of a qualified manager and a university internship supervisor. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PRT 350, PRT 358, PRT 359, PRT 375, PRT 380, 100 hours of approved work experience.
Typically offered in Fall, Spring, and Summer

PRT 476 Sport Marketing (3 credit hours)
Fundamental marketing principles and concepts related to the sport industry. Overview of marketing mix, marketing strategies and the bases of segmentation, sponsorship, licensing, fundraising and merchandising. Special emphasis on the marketing of sport and its strong relationship to research. Credit will not be given for both PRT 476 and PRT 407.

Prerequisite: PRT 486, Sport Management or PRT Majors, PRT 266
Typically offered in Fall and Spring

PRT 478 Sustainable Sport Facility Management (3 credit hours)
In this course, students will examine the development and management of sport facilities, paying particular attention to environmental concerns and the sustainability of the sport stadia. Specifically, the course first focuses on the 3 E's of sustainability (Environment, Equity, Economics) and learn about sustainable systems. From this underpinning, the course is divided into two main frameworks: 1. Development of sport facilities; and 2. Sport facility operations. Each part of the course is enhanced by guest lectures from industry experts and hands on learning experiences.

R: Sport Management Majors only
Typically offered in Fall, Spring, and Summer

PRT 485 Environmental Education in Practice (3 credit hours)
This course is designed to prepare students to enter the environmental education (EE) profession. Topics will include EE professional standards, program planning and delivery, and program evaluation. A significant portion of the course focuses on securing and completing a field placement involving at least 10 contact hours with learners through teaching or observations. In addition, students are expected to attend an EE professional conference which may require overnight travel. Completion of course activities will provide 50-80 hours toward the NC Environmental Education Certification Program. Only students who have taken EMS 350 (Environmental Education Teaching Methods) will be enrolled, except with permission from the instructor.

Typically offered in Spring only

PRT 491 Special Topics in Recreation (1-3 credit hours)
Investigation and analysis of a problem associated with recreation resources.

Typically offered in Fall, Spring, and Summer

PRT 493 Independent Study in Parks, Recreation, and Tourism Management (1-6 credit hours)
Independent Study for Parks, Recreation, and Tourism Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PRT 494 Independent Study in Parks, Recreation, and Tourism Management (1-6 credit hours)
Independent Study for Parks, Recreation, and Tourism Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PRT 500 Conceptual Foundations of Recreation (3 credit hours)
Exploration of the conceptual foundations of leisure, recreations, sport, play, and work, the history of ideas in the field and the relationships of these ideas to contemporary professional and social problems. Restricted to PRTM masters and students and others by consent of the instructor. This course will be offered in an accelerated seven-week format.

Restriction: PRT Grad Students Only
Typically offered in Fall only

PRT 501 Research Methods In Recreation (3 credit hours)
Examination and understanding of advanced scientific investigative methods in their application toward explaining recreation and leisure behavioral phenomena and for resolution of recreation management problems.

Restricted to: Graduate-level Statistics
Typically offered in Spring only

PRT 503 Advanced Fiscal Management for Parks, Recreation, Tourism and Sport Organizations (3 credit hours)
This course is intended to provide students with advanced concepts of fiscal management as applied to the unique industries of parks, recreation, tourism and sport management. Emphasis will be placed on understanding how the receipt, disbursement, and utilization of funds can foster sustainability within these types of organizations. Additionally, this course will focus on developing the skills necessary to apply ethical financial analysis principles through financial risk management. This course is restricted to PRTM masters students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

Typically offered in Fall only

PRT 504 Data Management and Applications in Parks, Recreation, Tourism and Sport Management (3 credit hours)
Introduction to procedures and techniques used in research and evaluation in parks, recreation, sport, and tourism settings to solve management problems. The course emphasizes techniques for data collection, management, analysis, and communication of research findings. This course is restricted to PRTM masters students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

Typically offered in Fall only

PRT 505 GIS and Spatial Analysis in PRTS (3 credit hours)
Introduction to spatial reasoning and spatial analysis as implemented in geographic information systems (GIS) to perform evaluation and research in parks, recreation, tourism, and sport settings. This course is restricted to PRTM master's degree students or others with consent of the instructor.

Prerequisite: Graduate Standing and MPRTSM
Typically offered in Spring only

PRT 506 Organizational Behavior and Leadership in Parks, Recreation, Tourism and Sport (3 credit hours)
This course will focus on the organization and administration of public, private and not-for-profit park, recreation, tourism and sports (PRTS) agencies. Emphasis will be placed on understanding the structural, human, political, and cultural factors that impact organizational efficiency and effectiveness - specifically focusing on these environments. The course will primarily address issues related to organization, management, ethical leadership, human personnel supervision, theory, and research. This course is restricted to PRTM master's degree students or by permission of instructor. This course will be offered online in an accelerated seven-week format.

Typically offered in Fall only

PRT 507 Strategic Marketing Management in Parks, Recreation, Tourism and Sport Organizations (3 credit hours)
This course examines the theoretical principles and applications of marketing and promotion strategies for recreational sport and key marketing concepts and strategies using case studies. There is significant discussion on marketing activation, leveraging strategies of sport/event sponsor brands/ companies, and developing a marketing plan. This course is restricted to PRTM master's degree students and others with the content of the instructor. This course will be offered online in an accelerated seven-week format.

Typically offered in Spring only

PRT 508 Risk Management for Parks, Recreation, Tourism and Sport Organizations (3 credit hours)
This course explores risk management in PRTs organizations with an emphasis on ethical managerial strategies. The topics include legal concepts related to specific managerial functions, impacts on functions in recreation environments that result in more efficient and successful operation and protection for the organization. In addition, effective strategies for risk management related to facilitating active-healthy lifestyles and sustainable communities will be explored. This course is restricted to PRT master's degree students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

Typically offered in Summer only

PRT 509 Program Evaluation for Parks, Recreation, Tourism and Sport Organizations (3 credit hours)
This course focuses on the development of a working knowledge of the rationale, procedures and tools for conducting sound program evaluation assessments in parks, recreation, tourism, and sport organizations. Effective skills for mastering comprehensive program evaluation strategies including formative, summative, and knowledge building strategies are taught. Students explore social science methods specifically appropriate for evaluation of youth programs.

Typically offered in Summer only

PRT 510 Active Recreation and Community Health (3 credit hours)
This course focuses on the association of active recreation in communities and community health. Students explore individual, social, community, environmental, and policy factors that affect community health and the contribution of recreation and park programs and facilities. This is a seven week course.

Typically offered in Spring only

PRT 511 Sport and Entertainment Venue Management - Facilities (3 credit hours)
In this course, students will examine the management of sport facilities, paying particular attention to environmental concerns and the sustainability of the event venue. Specifically, we will first focus on the three E's of sustainability (Environment, Equity, Economics) and learn about sustainable systems. From this underpinning, the class will be divided into six critical topic areas of sport facility managment: 1. History and role of venues 2. Venue Safety and Security 3. Venue Policy and Procedures 4. Food and Beverage Operations 5. Transportation and Parking Management 6. Ancillary Revenue Sources

Typically offered in Fall only

PRT 512 Sport and Entertainment Venue Management - Operations and Services (3 credit hours)
A thorough background on operations and services is essential for sport and entertainment venue managers. This course examines venue management by covering essential managerial functions. These include management and human resources, customer service and crowd management, managing volunteers, scheduling and booking venues, and ticket office operations.

Typically offered in Spring only

PRT 550 Human Behavior and the Environment (3 credit hours)
This course helps students understand the variety of cognitive, social, affective, and environmental factors that influence human behavior in natural resource contexts, with an emphasis on nature-based recreation experiences and conservation behaviors. Students will explore behavioral models from different disciplines, examine pathways to promote behavior change, and assess implications for park management, environmental stewardship, and natural resource conservation.

Typically offered in Fall only

PRT 552/PRT 452 Field Experience in Nature-Based Recreation & Tourism Management (3 credit hours)
This dual-listed course provides undergraduate and graduate students with hands-on exposure to the multifaceted nature of national park management and awareness of the complex challenges facing national park managers. Examines nature based recreation and tourism management approaches from an applied and interdisciplinary perspective with applications across federal and state recreation resource management agencies. Students will practice problem-solving techniques and interact with a wide variety of staff from the National Park Service, park partner organizations, and adjacent community managers. This course culminates in a week-long field experience that may conflict with other scheduled courses. Field experience held in conjunction with five other universities in the Great Smoky Mountains National Park. A fee will be assessed for the trip that covers transportation, lodging and meals.

R: Junior or Senior Undergraduate Student Standing
Typically offered in Spring only

PRT 555 Environmental Impacts of Recreation and Tourism (3 credit hours)
Understanding of environmental impacts of recreation and tourism, and different methods for assessing and managing such impacts. Examination of the scientific and management literature and application of impact assessment techniques.

Typically offered in Fall only

PRT 560 Theory and Practice of Partnerships for Conservation and Community Sustainability (3 credit hours)
Understanding of collaborative processes and the role of partnerships in public land management, community based conservation, tourism development, and community health and recreation. Examination of literature and evaluation of collaboration and partnerships in practice.

Typically offered in Spring only

PRT 575 Children and Nature (3 credit hours)
In recent decades, there has been an explosion of research around the benefits of nature, supporting measures of happiness, health, attention spans, social cohesion, and others. In parallel to these studies on how nature benefits people (especially children), work has emerged on how children may also be good for nature. Children are leading global movements to combat climate change, becoming civically active to ensure access to nature for all, and proving to be an avenue to bring even the most politically divided communities together to work toward a sustainable future. In this course, students will gain an overview of this rapidly growing literature, meet some of the researchers behind it, and find ways to contribute to it. Perspectives of graduate students from natural resources, education, landscape architecture, or others who are interested in exploring how nature can benefit kids and kids can benefit nature are most welcome.

R: Graduate Standing or Permission of Instructor
Typically offered in Fall only

PRT 595 Special Topics In Recreation Resources (1-6 credit hours)
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PRT 610 Special Topics In Recreation Resources (1-6 credit hours)
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PRT 620 Recreation Resources Problems (1-4 credit hours)
Assigned or selected problems in field of recreation administration, planning, supervision, maintenance, operations, financing or program. Special research problems selected on basis of interest of students and supervised by members of graduate faculty.

Prerequisite: Advanced Undergraduate standing or Graduate standing
Typically offered in Fall, Spring, and Summer

PRT 650 Professional Electronic Portfolio for Parks, Recreation and Tourism Management (1 credit hours)
Students will develop a personalized digital portfolio of the work completed in all required courses in the Masters of Parks, Recreation & Tourism Management program. The portfolio should include evidence, reflection, and critical analysis of core competencies achieved throughout their academic course of study. This course must be taken during a student's last semester after he or she has completed all the required courses.

Prerequisite: Graduate Standing and PRT 500 and PRT 504 and PRT 505 and PRT 506 and PRT 508 and PRT 503 and PRT 507.
Typically offered in Fall and Spring

PRT 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PRT 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

PRT 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PRT 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

PRT 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged

Prerequisite: Master's student
Typically offered in Summer only

PRT 700 Advanced Theories of Leisure (3 credit hours)
This course is designed to examine theory as it can be applied to understanding of leisure behavior and parks, recreation, and tourism management research. The goal is to provide a foundation for identifying, evaluating, and applying theoretical perspectives to PRTM research. Students are expected to engage in a critical analysis of theory in PRTM. Ph.D. student

Typically offered in Fall only

PRT 701 Research Methods in Parks, Recreation, & Tourism Management (3 credit hours)
The overall goal of this course is to provide students with a background in advanced social science research methods commonly used in PRTM-related fields as well as strategies for planning, designing, evaluating, and applying research using the social science framework. This course will also be designed in a way to guide students through the phases of the research design and to develop a research proposal.

Completion of PRT 500/700 or concurrently enrolled; Graduate Status
Typically offered in Fall only

PRT 705 Qualitative Research Methods in Conservation & Community Sustainability (3 credit hours)
Examination of qualitative research methods and designs in the contexts of human dimensions of natural resources, equitable and sustainable tourism development, and community health and well-being, including data generation, organization, analysis, quality and presentation. A research project will be conducted with the application of qualitative data organization software.

P: Doctoral student status, or with consent of instructor.
Typically offered in Spring only

PRT 730 Tourism, Community Health, and Sustainability (3 credit hours)
In this course students will examine the potential role of tourism in mitigating or exacerbating health disparities and environmental degradation in rural poor areas. The course endorses an academic ethic of engaged scholarship. Students will be asked to make original contributions to participatory development scholarship, and they will be asked to collaborate with community partners on an applied project addressing tourism, health disparities and environmental degradation in an economically depressed rural community. Consistent with the engaged nature of this course, we will travel to rural communities to meet stakeholders, collect data, and provide coaching/training to tourism micro-entrepreneurs.

Typically offered in Spring only

PRT 795 Special Topics in Recreation Resources (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

PRT 801 Doctoral Seminar in Parks, Recreation and Tourism Research (1 credit hours)
Research studies, scientific articles and progress reports on research effects presented and critically evaluated. Each student pursuing a doctoral degree is expected to take this offering four times for one hour of credit each time.

Typically offered in Fall and Spring

PRT 810 Special Topics In Recreation Resources (1-6 credit hours)
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PRT 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PRT 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PRT 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PRT 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PRT 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Philosophy (PHI)

PHI 205 Introduction to Philosophy (3 credit hours)
Introduction to selected problems of enduring philosophical importance, including such topics as the nature of morality, knowledge, human freedom, and the existence of God. Content varies with different sections.

Credit is not allowed for both PHI 205 and PHI 210.
GEP Humanities
Typically offered in Fall, Spring, and Summer

PHI 210 Representation, Reason and Reality (3 credit hours)
This course is an introduction to philosophical issues concerning topics such as language, thought, knowledge, reason, truth, and reality through the study of problems, puzzles, and paradoxes. Not both PHI 205 and PHI 210 may be used towards satisfaction on PHI major or PHI minor requirements.

Credit is not allowed for both PHI 210 and PHI 205
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

PHI 214 Issues in Business Ethics (3 credit hours)
An analysis and evaluation of major issues in business ethics. Topics include the social responsibility of business; social justice and free enterprise; the rights and duties of employers, employees, manufacturers, and consumers; duties to the environment, the world's poor, future generations, and the victims of past injustices; the moral status of the corporation; and the ethics of advertising.

GEP Humanities
Typically offered in Fall, Spring, and Summer

PHI 221 Contemporary Moral Issues (3 credit hours)
Philosophical analysis and theory applied to a broad range of contemporary moral issues, including euthanasia, suicide, capital punishment, abortion, war, famine relief, and environmental concerns.

GEP Humanities
Typically offered in Fall, Spring, and Summer

PHI 227 Data Ethics (3 credit hours)
Application of theories of moral right to issues such as free speech and "information pollution"; privacy and security; and algorithmic fairness, inequality and transparency.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PHI 250 Thinking Logically (3 credit hours)
Deductive arguments attempt to guarantee their conclusions. Inductive arguments attempt to make their conclusions more probable. Using a small number of simple, powerful logical techniques, this course teaches you how to find, analyze and evaluate deductive and inductive arguments, and thus how to avoid the most common errors in reasoning.

GEP Mathematical Sciences
Typically offered in Fall and Spring

PHI 298 Special Topics in Philosophy (3 credit hours)
Selected studies in philosophy that do not appear regularly in the curriculum. Topics will be announced for each semester in which the course is offered.

PHI 300 Ancient Philosophy (3 credit hours)
Western philosophy of the ancient world, with special emphasis on Plato and Aristotle.

GEP Humanities
Typically offered in Fall and Spring

PHI 301 Early Modern Philosophy (3 credit hours)
Western philosophy of the 17th and 18th centuries, including such philosophers as Descartes, Hobbes, Leibniz, Locke, Berkeley, Hume, and Kant.

GEP Humanities
Typically offered in Fall and Spring

PHI 302 19th Century Philosophy (3 credit hours)
Western philosophy of the 19th century, including such philosophers as Kant, Hegel, Schopenhauer, Kierkegaard, Marx, and Nietzsche.

GEP Humanities
Typically offered in Fall only

PHI 305 Philosophy of Religion (3 credit hours)
The existence and nature of God, including such topics as traditional proofs of God, skeptical challenges to religious belief, miracles, the problem of evil, faith and reason, and religious experience.

GEP Humanities
Typically offered in Fall and Spring

PHI 309 Political Philosophy (3 credit hours)
Philosophical study of important political ideas and values such as liberty, equality, justice, rights, and democracy. May include readings from classical and contemporary sources.

Prerequisite: One PHI course
GEP Humanities
Typically offered in Spring only

PHI 310 Existentialism (3 credit hours)
Philosophy of Existentialism, including such thinkers as Kierkegaard, Nietzsche, Doestoevsky, Sartre, Heidegger, and Camus.

GEP Humanities
Typically offered in Spring only

PHI 312 Philosophy of Law (3 credit hours)
Fundamental legal issues such as what constitutes a law or legal system. Justifications of legal interference with individual liberty. Philosophical legal issues illustrated by specific legal cases.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

PHI 313 Ethical Problems in the Law (3 credit hours)
Explores uses of the legal system, including such topics as the death penalty, plea bargaining, legalizing euthanasia, censorship, Good Samaritan laws, the insanity defense, civil disobedience, preferential treatment.

Prerequisite: PHI 221 or PHI 375 or PHI 376
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

PHI 319 Black Political Philosophy (3 credit hours)
Black thought on central issues in political philosophy such as justice, equality and state authority. Readings will be selected from the works of several Black thinkers, including figures such as W. E. B. Du Bois, Kwame Nkrumah, Charles Mills and Angela Davis.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

PHI 320 Philosophy of Race (3 credit hours)
Fundamental philosophical questions raised by the concept of race, such as whether race is a legitimate category for identifying human beings, and whether the category of race reinforces racism.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

PHI 325/STS 325 Bio-Medical Ethics (3 credit hours)
Interdisciplinary examination and appraisal of emerging ethical and social issues resulting from recent advances in the biological and medical sciences. Abortion, euthanasia, physician-assisted suicide, compromised infants, aids, reproductive technologies, and health care. Focus on factual details and value questions, fact-value questions, fact-value interplay, and questions of impact assessment and policy formulation.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PHI 330 Metaphysics (3 credit hours)
Problems of metaphysics, including such topics as: possibility and necessity, paradoxes of time travel, nature of space and time, free will and determinism, causation, mind-body problem and identity-over-time.

Prerequisite: One PHI course
GEP Humanities
Typically offered in Spring only

PHI 331 Philosophy of Language (3 credit hours)
Introduction to traditional and modern accounts of the relations between language and reality, the nature of truth, problems of intentionality and propositional attitudes.

Prerequisite: One PHI course
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

PHI 332 Philosophy of Psychology (3 credit hours)
Problems and controversies that overlap the boundary between philosophy and psychology: the mind/body problem, behaviorism vs. cognitivism, the prospects for artificial intelligence, and language and the questions of innate knowledge.

Prerequisite: One PHI course or one PSY course
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

PHI 333 Knowledge and Skepticism (3 credit hours)
Analysis of such central concepts as knowledge, belief, and truth, and the investigation of the principles by which claims to knowledge may be justified.

Prerequisite: One PHI course
GEP Humanities
Typically offered in Spring only

PHI 340 Philosophy of Science (3 credit hours)
Nature of science highlighted by differences between science and pseudoscience, relationships between science and religion, and roles of purpose-directed (teleological) and causal explanation in physical, life and social sciences.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PHI 347 Neuroscience and Philosophy (3 credit hours)
Introduction to principal theoretical, empirical and normative issues at the intersection of neuroscience and philosophy, including such issues as: consciousness, the mind's I and the brain's I: free will, moral responsibility and neuroscience; the ethics of personal enhancement; brains, human nature and personal identity; neuroscientifically informed evaluation of well-being.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

PHI 375 Ethics (3 credit hours)
Examination of traditional questions of philosophical ethics: What are the principles of moral conduct? What sort of life is worthy of a human being? Includes both classic and contemporary literature.

GEP Humanities
Typically offered in Fall and Spring

PHI 376 History of Ethics (3 credit hours)
Topics in the history of ethics. Philosophers to be studied may include Plato, Aristotle, Aquinas, Butler, Hume, Kant, Sidgwick and Nietzsche.

Prerequisite: One PHI course
GEP Humanities
Typically offered in Fall only

PHI 401 Kant's Critique of Pure Reason (3 credit hours)
A text-based critical study of Kant's Critique of Pure Reason Focusing on such topics as perception, judgment, knowledge, space, time, substance, causation and reality. Students cannot receive credit for both PHI 401 and PHI 501.

Prerequisite: 6 credits in PHI. Credit is not allowed for both PHI 401 and PHI 501.
GEP Humanities

PHI 403 Continental Philosophy After 1900 (3 credit hours)
Key themes in continental European philosophy after 1900. Work studied will include selections from writings of authors in at least two major traditions, e.g., phenomenology, hermeneutics, structuralism, and critical theory. Junior standing or above required. Students may not receive credit for both PHI 403 and PHI 503.

R: Junior standing or above
GEP Humanities
Typically offered in Spring only

PHI 420 Global Justice (3 credit hours)
The applications of the ideas of justice and right beyond and across the borders of individual nation states, attending to the facts of globalization and their consequences for political and economic justice and human rights. Topics: skepticism about global justice; transnational distributive justice, pollution, and poverty; national sovereignty, self-determination, and intervention; the ethics of war; international human rights; and global democracy. No one can receive credit for both PHI 420 and PHI 520.

Prerequisite: One PHI course. Credit is not allowed for both PHI 420 and PHI 520.
GEP Humanities

PHI 425/PSY 425 Introduction to Cognitive Science (3 credit hours)
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

Prerequisite: One upper-level PHI, PSY, CSC or Linguistics course. Credit is not allowed for PHI 425 and PHI/PSY 525.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

PHI 440 The Scientific Method (3 credit hours)
Detailed examination of core issues in the philosophy of science: the confirmation of scientific theories, falsification, projectibility, the nature of scientific explanation, laws of nature, and causation. Students cannot receive credit for both PHI 440 and PHI 540.

Prerequisite: One PHI course. Credit is not allowed for both PHI 440 and PHI 540.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

PHI 447 Philosophy, Evolution and Human Nature (3 credit hours)
This course covers philosophical issues in the evolutionary study of human cognition: the role of adaptationism; the values of psychological vs. behavioral approaches; the phenotypic gambit; the evolution of morality and altruism; the nature of culture and the possibility of cultural evolution; innateness, genetic determinism and development; and case studies of evolutionary explanation of human behavior or psychology. Students cannot receive credit for both PHI 447 and PHI 547.

Prerequisite: One 300 level or higher course in Philosophy, Biology, Psychology or Anthropology. Credit is not allowed for PHI 447 and PHI 547.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

PHI 475 Ethical Theory (3 credit hours)
An introduction to some central themes and issues in ethical theory. Topics in normative and meta-ethics such as consequentialism, deontology, virtue ethics, constructivism, realism, relativism, subjectivism, and expressivism. Readings primarily from contemporary literature.

Prerequisite: PHI 375 or PHI 376. Credit is not allowed for both PHI 475 and PHI 575.
Typically offered in Spring only

PHI 494 Research and Writing in Ethics (1 credit hours)
A substantial paper in ethics, assigned by the instructor of the corequisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PHI 250 or LOG/MA 201 or LOG/MA 335 and one other (non PHI 250) PHI course. Corequisite: One of (PHI 298, 302, 309, 310, 313, 319, 325, 375, 376, 403, 420, 475, or 498)
Typically offered in Fall, Spring, and Summer

PHI 495 Research and Writing in History of Philosophy (1 credit hours)
A substantial paper in history of philosophy, assigned by the instructor of the co-requisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PHI 250, LOG 201 or 335 and one other (non-PHI 250) PHI course; Co-requisite: One of PHI 298, 300, 301, 302, 310, 401, 403 or 498
Typically offered in Fall, Spring, and Summer

PHI 496 Research and Writing in Contemporary Philosophy (1 credit hours)
A substantial paper in contemporary philosophy, assigned by the instructor of the corequisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: (PHI 250 or LOG 201 or LOG 335) and one other PHI course; Corequisite: One of PHI 298, 305, 310, 320, 330, 331, 332, 333, 340, 347, 403 425, 440, 447 or 498
Typically offered in Fall, Spring, and Summer

PHI 497 Research and Writing in Logic, Representation and Reasoning (1 credit hours)
A substantial paper in logic, representation and reasoning, assigned by the instructor of the corequisite. enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: LOG 201 or 335, and one other PHI course, not PHI 250, Corequisite: One of LOG/MA 335, LOG 430/530, 435/535, PHI 298, 330, 331, 332, 333, 347, 340, 425/525, 440/540 or 447/547
Typically offered in Fall, Spring, and Summer

PHI 498 Special Topics in Philosophy (1-6 credit hours)
Detailed investigation of selected topics in philosophy. Topics determined by faculty members in consultation with head of the department. Course may be used for individualized study.

Prerequisite: Six credits in PHI courses
Typically offered in Fall and Spring

PHI 501 Kant's Critique of Pure Reason (3 credit hours)
A text-based critical study of Kant's Critique of Pure Reason focusing on topics such as perception, judgment, knowledge, space, time, substance, causation, and reality. Students cannot receive credit for both PHI 401 and PHI 501.

Prerequisite: Graduate Standing. Credit is not allowed for both PHI 501 and PHI 401.

PHI 503 Continental Philosophy After 1900 (3 credit hours)
Key themes in continental European philosophy after 1900. Work studied will include selections from writings of authors in at least two major traditions, e.g., phenomenology, hermeneutics, structuralism, and critical theory. Students cannot receive credit for both PHI 403 and PHI 503. Junior standing is required for PHI 403. Graduate standing is required for PHI 503.

R: Graduate Standing
Typically offered in Spring only

PHI 520 Global Justice (3 credit hours)
The applications of the ideas of justice and right beyond and across the borders of individual nation states, attending to the facts of globalization and their consequences for political and economic justice and human rights. Topics: skepticism about global justice; transnational distributive justice, pollution, and poverty; national sovereignty, self-determination, and intervention; the ethics of war; international human rights; and global democracy. No one can receive credit for both PHI 420 and PHI 520.

Prerequisite: Graduate standing. Credit is not allowed for both PHI 520 and PHI 420.

PHI 525/PSY 525 Introduction To Cognitive Science (3 credit hours)
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

Prerequisite: Graduate standing. Credit is not allowed for PHI 525 and PHI/PSY 425.
Typically offered in Spring only

PHI 540 The Scientific Method (3 credit hours)
Detailed examination of core issues in the philosophy of science: the confirmation of scientific theories, falsification, projectibility, the nature of scientific explanation, laws of nature, and causation. Students cannot receive credit for both PHI 440 and PHI 540.

Prerequisite: Graduate standing. Credit is not allowed for both PHI 540 and PHI 440.
Typically offered in Fall only

PHI 547 Philosophy, Evolution and Human Nature (3 credit hours)
This course covers philosophical issues in the evolutionary study of human cognition: the role of adaptationism; the values of psychological vs. behavioral approaches; the phenotypic gambit; the evolution of morality and altruism; the nature of culture and the possibility of cultural evolution; innateness, genetic determinism and development; and case studies of evolutionary explanation of human behavior or psychology. Students cannot receive credit for both PHI 447 and PHI 547.

Credit is not allowed for both PHI 547 and PHI 447. Graduate Standing Required.
Typically offered in Fall only

PHI 575 Ethical Theory (3 credit hours)
An introduction to some central themes and issues in ethical theory. Topics in normative and meta-ethics such as consequentialism, deontology, virtue ethics, constructivism, realism, relativism, subjectivism, and expressivism. Readings primarily from contemporary literature.

Prerequisite: Graduate Standing. Credit is not allowed for both PHI 575 and PHI 475.
Typically offered in Spring only

PHI 598 Special Topics in Philosophy (3-6 credit hours)
Typically offered in Fall and Spring

PHI 696 Summer Thesis Res (1 credit hours)

PHI 816 Introduction to Research Ethics (1 credit hours)
Institutional rules guiding the responsible conduct of research (RCR) and their philosophical justification. Rudiments of moral reasoning and their application to RCR. Topics: plagiarism, falsification and fabrication of data, and ethics versus custom, law, science, and religion.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PHI 896 Summer Dissert Res (1 credit hours)

Physics (PY)

PY 123 Stellar and Galactic Astronomy (3 credit hours)
Introductory, descriptive survey of stars, galaxies and cosmology, designed primarily for non-science majors. Exotic recent discoveries such as quasars, pulsars, and black holes will be included. Complements PY 124, Solar System Astronomy. Companion laboratory course PY 125.

GEP Natural Sciences
Typically offered in Fall and Spring

PY 124 Solar System Astronomy (3 credit hours)
Introductory, descriptive survey of the solar system designed primarily for non-science majors, including current results from space probes, history of astronomy, and the motions of the moon, stars, and planets in the night sky. Complementary course covering stars, galaxies and cosmology (PY 123). Companion laboratory course (PY 125).

GEP Natural Sciences
Typically offered in Fall and Spring

PY 125 Astronomy Laboratory (1 credit hours)
Introduction to astronomical observing. Twelve exercises include astronomical instruments; the nature of light; Kepler's and Newton's laws of motion; the constellations, planets, binary stars, stellar clusters, and galaxies. Use of small telescopes to observe celestial objects.

Corequisite: PY 123 or 124
GEP Natural Sciences
Typically offered in Fall and Spring

PY 131 Conceptual Physics (4 credit hours)
Fundamentals of physics from a conceptual rather than a mathematical viewpoint. Applications of physics to everyday phenomena and experiences. Numerous demonstrations and discovery-based laboratory. Mechanics, properties of matter, heat, sound, electricity and magnetism, light and relativity.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 201 University Physics I (4 credit hours)
First course of three semester sequence for students majoring in physical and mathematical sciences. Calculus used throughout. Principles of classical Newtonian mechanics covered in detail.

Corequisite: MA 141. Credit is not allowed for both PY 201 and PY 205 or PY 211.
Typically offered in Fall only

PY 202 University Physics II (4 credit hours)
Second course of three semester sequence designed primarily for students majoring in physical and mathematical sciences. Calculus used throughout. Principles of electricity and magnetism covered in detail.

Prerequisite: PY 201, MA 141, Corequisite: MA 241. Credit is not allowed for both PY 202 and PY 208 or PY 211.
Typically offered in Spring only

PY 203 University Physics III (4 credit hours)
Third course of three semester sequence designed primarily for students majoring in physical and mathematical sciences. Calculus is used throughout. Principles of wave optics and modern physics are covered in detail.

Prerequisite: PY 202, MA 241, Corequisite: MA 242
Typically offered in Fall only

PY 205 Physics for Engineers and Scientists I (3 credit hours)
First semester of a two-semester sequence in introductory physics, with coordinated problem-solving experiences. A calculus-based study of mechanics, sound and heat. Credit not allowed for more than one of PY 205, PY 201, and PY 211.

Prerequisite: MA 141 with a grade of C- or better or MA 241PL. Credit is not allowed for both PY 205 and PY 201 or PY 211. Co-requisite: PY 206. ADD BOTH PY 205 and PY 206 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 206 Physics for Engineers and Scientists I Laboratory (1 credit hours)
Laboratory course to accompany the PY 205 lecture course. A calculus-based study of mechanics, sound and heat.

Prerequisite: MA 141 with a grade of C- or better or MA 241 Placement. Co-requisite: PY 205. ADD BOTH PY 205 and PY 206 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 208 Physics for Engineers and Scientists II (3 credit hours)
Second semester of a two-semester sequence in introductory physics. A calculus-based study of electricity, magnetism, optics and modern physics. Credit not allowed for more than one of PY 208,PY 202, and PY 212

Prerequisite: C- or better in PY 205 and C- or better in MA 241. Credit is not allowed for both PY 208 and PY 202 or PY 212. Co-requisite: PY 209. ADD BOTH PY 208 and PY 209 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 209 Physics for Engineers and Scientists II Laboratory (1 credit hours)
Laboratory course to accompany the PY 208 lecture course. A calculus-based study of electricity, magnetism, optics and modern physics.

Pre-requisite: PY 205 with grade of C- or better, MA 241 with grade of C- or better, PY 206 with grade of C- or better. Co-requisite: PY 208. ADD BOTH PY 208 and PY 209 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 211 College Physics I (4 credit hours)
First semester of a two-semester introductory sequence in non-calculus physics, with laboratory. Mechanics, heat, wave motion and sound. Credit not allowed for more than one of PY 211, PY 201 or PY 205

Prerequisite: MA 107 or 111 or 121 or 131 or 108 or 141 with a C- or better, or 480 on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calc exam. Credit is not allowed for both PY 211 & PY 201 or PY 205
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PY 212 College Physics II (4 credit hours)
Second semester of a two-semester introductory sequence in non-calculus physics, with laboratory. Electricity, and magnetism, light, modern physics. Credit not allowed for more than one of PY 212, PY 202, and PY 208

Prerequisite: PY 211 or PY 205. Credit is not allowed for both PY 212 and PY 202 or PY 208.
Typically offered in Fall, Spring, and Summer

PY 251 Introduction to Scientific Computing (3 credit hours)
An introductory course in scientific computing for the physical and mathematical sciences using python and other open-source tools. Using a problem-oriented approach, students will learn the basic computing skills needed to conduct scientific research and to prepare for upper-level courses in science and engineering. Topics will include algorithm development, numerical methods, elements of programming, data analysis, and data visualization.

Prerequisite: MA 241; Corequisite: PY 202 or PY 208
Typically offered in Fall and Spring

PY 252 Instrumental and Data Analysis for Physics (2 credit hours)
Digital data acquisition and lab computers (e.g. using LabView or MatLab) are tools used in nearly all current physics research labs. By using both analysis and thorough lab experimental investigation the student will learn basic skills with electronic devices (oscilloscope, power supplies, function generator, op-amps, high & low-pass filters, feedback circuits), electronic noise (measurement and analysis), and basic circuit construction methods (such as shielding/grounding, soldering).

Prerequisite: PY 202 or PY 208
Typically offered in Fall, Spring, and Summer

PY 299 Special Problems in Physics (1-3 credit hours)
Study in experimental or analytical topics in classical and modern physics.

Typically offered in Fall, Spring, and Summer

PY 301 Introduction to Quantum Mechanics (3 credit hours)
An introduction to wave mechanics and quantum phenomena including the Schroedinger equation for simple systems, the Hamiltonian operator, the use of commutator relations, and the application of angular momentum operators. Emphasis on mathematical tools used in wave mechanics, including complex numbers, function operators, eigenvalues and eigenvectors.

Prerequisite: C- or better in PY 203 or PY 407
Typically offered in Fall only

PY 328 Stellar and Galactic Astrophysics (3 credit hours)
Introduction to the study of stars, galaxies, and the universe. Stars and stellar evolution; interstellar medium; galaxies and galaxy clusters; cosmology. Recent developments in the understanding of neutron stars, black holes, active galaxies, quasars and inflationary cosmologies.

Prerequisite: PY 202 or PY 208
Typically offered in Fall only

PY 341 Relativity, Gravitation and Cosmology (3 credit hours)
Introduction to relativity, gravitation and cosmology in accordance with Einstein's special and general theories of relativity. Flat spacetime: Minkowski metric, time dilation, length contraction, doppler effect, twin paradox, and space travel. Curved spacetime: Schwarzchild metric, black holes and event horizons, particle and light motion, Global positioning system, precession of planetary orbits. Cosmology: hubble law, expansion of the universe, Friedman-Robertson-Walker metric, big bang, cosmological redshift, dark matter and dark energy.

Prerequisite: C- or better in PY 203 or PY 407
Typically offered in Spring only

PY 401 Quantum Physics I (3 credit hours)
An introduction to the basic principles of quantum physics with an emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles.

Prerequisite: Grade of C- or better in PY 411 and grade of C- or better in PY 203.
Typically offered in Spring only

PY 402 Quantum Physics II (3 credit hours)
An introduction to the basic principles of quantum physics with an emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles.

Prerequisite: C- or better in PY 401
Typically offered in Fall only

PY 407 Introduction to Modern Physics (3 credit hours)
Major developments in modern physics: special relativity, origin of the quantum theory, atomic and molecular structure, radioactivity, properties of nuclei. Credit not allowed for both PY 203 and PY 407

Prerequisite: MA 242, PY 208
Typically offered in Spring only

PY 411/PY 511 Mechanics I (3 credit hours)
First semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on single-particle dynamics: Elementary Newtonian mechanics, harmonic oscillator, central force motion, conservation laws, motion in non-inertial frames, Coriolis and centrifugal forces, Lagrangian dynamics, Hamilton's equations.

Prerequisite: C- or better in PY 203 or C- or better in PY 407 Co-requisite: MA 341
Typically offered in Spring only

PY 412/PY 512 Mechanics II (3 credit hours)
Second semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on dynamics of systems of particles and continua: Center of mass, collisions, rigid bodies, inertia tensor, principal axes, stress andstrain tensors, mechanical properties of fluids and solids; Waves in discrete and continuum systems, coupled oscillators, normal modes, elements of special relativity.

Prerequisite: C- or better in PY 411
Typically offered in Fall only

PY 413 Thermal Physics (3 credit hours)
An introduction to statistical mechanics and thermodynamics. The statistical study of physical systems emphasizing the connection between the statistical description of macroscopic systems and classical thermodynamics. Concepts of heat, internal energy, temperature and entropy. Classical and quantum statistical distributions.

Prerequisite: PY 203 or PY 407; Corequisite: MA 341
Typically offered in Spring only

PY 414/PY 514 Electromagnetism I (3 credit hours)
First semester of a two-semester sequence. An intermediate course in electromagnetic theory using the methods of vector calculus. Electrostatic field and potential, dielectrics, solution to Laplace's and Poisson's equations, magnetic fields of steady currents.

Prerequisite: C- or better in PY 203 or C- or better in PY 407, and MA 341
Typically offered in Fall only

PY 415/PY 515 Electromagnetism II (3 credit hours)
A continuation of PY 414. Electromagnetic induction, magnetic fields in matter, Maxwell's equations, wave guides, radiation.

Prerequisite: C- o better in PY 414
Typically offered in Spring only

PY 452 Advanced Physics Laboratory (3 credit hours)
Introduction to laboratory electronics and instrumentation. Experiments in mechanics; electromagnetism; electronics; optics; and atomic, nuclear, plasma and solid state physics. Senior Physics students only

Prerequisite: Senior standing, Physics Majors
Typically offered in Fall and Spring

PY 489/PY 589/ECE 489/ECE 589/MSE 489/MSE 589 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

PY 495 Special Topics in Physics (1-4 credit hours)
Special Topics in theoretical, experimental, or computational physics at the advanced undergraduate level. Course offerings vary from semester to semester. Course may be repeated if course content varies.

Typically offered in Fall, Spring, and Summer

PY 499 Independent Research in Physics (1-6 credit hours)
Study and research in physics. Topics for experimental or theoretical investigation. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PY 501 Quantum Physics I (3 credit hours)
Basic principles of quantum physics with emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles. PY 501 - first semester in two-semester sequence in quantum mechanics; PY 501 - second semester of sequence. Credit for both PY 401 and PY 501 is not allowed

Prerequisite: Graduate Level Status in Physics or Physics Departmental Approval
Typically offered in Spring only

PY 502 Quantum Physics II (3 credit hours)
Basic principles of quantum physics with emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles. PY 502 - second semester in two-semester sequence in quantum mechanics; PY 501, first semester of sequence. Credit for both PY 402 and PY 502 is not allowed.

Prerequisite: PY 501
Typically offered in Fall only

PY 506 Nuclear and Subatomic Physics (3 credit hours)
Introduction to nuclear and subatomic phenomena: properties of nuclear radiations and detectors, accelerators, nuclear forces and nuclear structure, elementary particles, fundamental symmetries and conservation laws.

Prerequisite: PY 203 or 407; PY 412
Typically offered in Fall only

PY 507 Elementary Particle Physics (3 credit hours)
Introduction to fundamental symmetries and dynamics of quarks and leptons. The Standard Model, Dirac equation, Feynman rules in QED and QCD, the Higgs mechanism and electroweak unification.

Prerequisite: PY 401 and PY 506
Typically offered in Spring only

PY 509 General Relativity (3 credit hours)
This course provides in-depth knowledge of general relativity covering: Einstein's equation, Schwarzschild metric, Kerr metric, Friedman-Robertson-Walker metric, Christoffel symbols, Killing vectors, Riemann curvature,and Ricci tensors. Theoretical computations are compared with experimental data including the precession rate of the perihelion for Mercury and the deflection in the solar eclipse, the geodelic affect and the frame dragging effect measured in Gravity Probe B experiment.

P: MA 401 and MA 405 and PY 412 and PY 415; R: Graduate Standing
Typically offered in Spring only

PY 511/PY 411 Mechanics I (3 credit hours)
First semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on single-particle dynamics: Elementary Newtonian mechanics, harmonic oscillator, central force motion, conservation laws, motion in non-inertial frames, Coriolis and centrifugal forces, Lagrangian dynamics, Hamilton's equations.

Prerequisite: C- or better in PY 203 or C- or better in PY 407 Co-requisite: MA 341
Typically offered in Spring only

PY 512/PY 412 Mechanics II (3 credit hours)
Second semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on dynamics of systems of particles and continua: Center of mass, collisions, rigid bodies, inertia tensor, principal axes, stress andstrain tensors, mechanical properties of fluids and solids; Waves in discrete and continuum systems, coupled oscillators, normal modes, elements of special relativity.

Prerequisite: C- or better in PY 411
Typically offered in Fall only

PY 514/PY 414 Electromagnetism I (3 credit hours)
First semester of a two-semester sequence. An intermediate course in electromagnetic theory using the methods of vector calculus. Electrostatic field and potential, dielectrics, solution to Laplace's and Poisson's equations, magnetic fields of steady currents.

Prerequisite: C- or better in PY 203 or C- or better in PY 407, and MA 341
Typically offered in Fall only

PY 515/PY 415 Electromagnetism II (3 credit hours)
A continuation of PY 414. Electromagnetic induction, magnetic fields in matter, Maxwell's equations, wave guides, radiation.

Prerequisite: C- o better in PY 414
Typically offered in Spring only

PY 516 Physical Optics (3 credit hours)
Physical optics with major emphasis on wave properties of light. Boundary conditions, interference and diffraction, optics of thin films, fiber optics and applications to absorption, scattering and laser operation. A background in Maxwell's equations and vector analysis required.

Prerequisite: PY 415
Typically offered in Fall only

PY 517 Atomic and Molecular Physics (3 credit hours)
The quantum mechanical treatment of structure and spectra for atoms and molecules. The hydrogen atom, helium atom, multielectron atoms, selection rules, diatomic and simple polyatomic molecules and nuclear magnetic resonance spectroscopy.

Prerequisite: PY 401, 412
Typically offered in Spring only

PY 519 Biological Physics (3 credit hours)
This course presents the application of physics principles and methods to problems in biological systems. Important biological molecules, their structures and their processes are introduced for physical scientists. Functional mechanisms are analyzed with concepts from thermodynamics, statistical mechanics, fluid mechanics, and electrostatics. Modern experimental methods and computational approaches to molecular and cellular level biological phenomena are emphasized.

Prerequisite: PY 413 or Graduate Standing
Typically offered in Spring only

PY 525 Computational Physics (3 credit hours)
Computational approach to physics problem solving using standard software relevant for physicists. Electrostatic potentials, data analysis, Monte Carlo simulations, Fourier optics, particle orbits, Schrodinger's equation. Examples and assignments for each topic chosen to complement other physics courses.

Prerequisite: CSC 112 or equivalent; Corequisite: of PY 401
Typically offered in Fall only

PY 528/NE 528 Introduction to Plasma Physics and Fusion Energy (3 credit hours)
Concepts in plasma physics, basics of thermonuclear reactions; charged particle collisions, single particle motions and drifts, radiation from plasmas and plasma waves, fluid theory of plasmas, formation and heating of plasmas, plasma confinement, fusion devices and other plasma applications.

Prerequisite: MA 401 and PY 208
Typically offered in Fall only

PY 529/NE 529 Plasma Physics and Fusion Energy II (3 credit hours)
This course expands on the treatment of plasmas as a system of coupled fluids and introduces the foundations of plasma kinetic theory. Derivation of the plasma kinetic equation and the Vlasov equation serve as the starting point to introduce the kinetic study of plasma systems. From this introduction of the governing equations for full kinetic treatment, methods for analyzing plasma response to electromagnetic and electrostatic perturbations using the linearized Vlasov model for uncorrelated plasmas are introduced. Kinetic stability of Vlasov plasmas is introduced and the Nyquist method is used to determine conditions for kinetic stability. The concept of correlated plasmas is then introduced through the introduction of reduced distribution functions and the BBGKY heirarchy. Finally, simple correlated systems and the Liouville model for two-system correlation is covered to look at the impact of particle correlation due to collisions and coulomb interaction.

Prerequisite: NE 528
Typically offered in Spring only

PY 543 Astrophysics (3 credit hours)
Basic physics necessary to investigate, from observational data, internal conditions and evolution of stars. The formation and structure of spectral lines, methods of energy generation and transport, stellar structure, degeneracy, white dwarfs and neutron stars.

Prerequisite: PY 203 or 407; PY 411
Typically offered in Spring only

PY 552 Condensed Matter Physics I (3 credit hours)
Basic considerations of crystalline solids, metals, conductors and semiconductors.

Prerequisite: C- or better in PY 401
Typically offered in Spring only

PY 570/TE 570 Polymer Physics (3 credit hours)
Polymer microstructures, polymer solutions, polymer physical states (including amorphous polymers, crystalline polymers, polymer melts, melting of polymers, glass-transition, and other transitions), polymer blends, polymer mechanical properties, polymer viscoelasticity and flow, multicomponent polymer systems, and modern polymer topics. The physics of polymer fibers. Graduate standing or permission of instructor.

Typically offered in Fall only

PY 581 Matter & Interactions for Teachers I (3 credit hours)
First semester (mechanics) of a two-semester sequence intended to broaden and deepen in high school physics teachers their knowledge of introductory-level physics from a contemporary point of view. Includes an introduction to computational physics.Departmental permission required: normally restricted to in-service high school physics teachers.

Typically offered in Spring only

PY 582 Matter & Interactions for Teachers II (3 credit hours)
Second semester (electricity and magnetism) of a two-semester sequence intended to broaden and deepen in high school physics teachers their knowledge of introductory-level physics from a contemporary point of view. Includes an introduction to computational physics. Departmental permission required: normally restricted to in-service high school physics teachers. PY 581 prerequisite may be waived with strong background in physics and mathematics.

Typically offered in Fall only

PY 589/ECE 489/ECE 589/MSE 489/MSE 589/PY 489 Solid State Solar and Thermal Energy Harvesting (3 credit hours)
This course studies the fundamental and recent advances of energy harvesting from two of the most abundant sources, namely solar and thermal energies. The first part of the course focuses on photovoltaic science and technology. The characteristics and design of common types of solar cells is discussed, and the known approaches to increasing solar cell efficiency will be introduced. After the review of the physics of solar cells, we will discuss advanced topics and recent progresses in solar cell technology. The second part of the course is focused on thermoelectric effect. The basic physical properties, Seebeck coefficient, electrical and thermal conductivities, are discussed and analyzed through the Boltzmann transport formalism. Advanced subject such as carrier scattering time approximations in relation to dimensionality and the density of states are studied. Different approaches for further increasing efficiencies are discussed including energy filtering, quantum confinement, size effects, band structure engineering, and phonon confinement.

P: ECE 302 or E 304 or MSE 355 or PY 407
Typically offered in Spring only

PY 590 Special Topics In Physics (1-6 credit hours)
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged

Typically offered in Fall, Spring, and Summer

PY 599 Special Topics in Physics (1-6 credit hours)
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits arranged

Typically offered in Fall, Spring, and Summer

PY 601 Seminar (1 credit hours)
Reports on topics of current interest in physics. Several sections offered so that students with common research interests may be grouped together.

Typically offered in Fall and Spring

PY 610 Special Topics (1-6 credit hours)
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged.

Typically offered in Fall and Spring

PY 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Spring only

PY 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PY 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PY 711 Advanced Quantum Mechanics I (3 credit hours)
Introduction to relativistic quantum theory of Dirac particles and the positron. Other topics including second quantization technique and its application to many-body problems, radiation theory and quantization of the electromagnetic field.

Prerequisite: MA 512, PY 782
Typically offered in Fall only

PY 712 Advanced Quantum Mechanics II (3 credit hours)
A general propagator treatment of Dirac particles, photons and scalar and vector mesons. Applications of Feynman graphs and rules illustrating basic techniques employed in treatment of electromagnetic, weak and strong interactions. Renormalization theory, the effects of radiative corrections and aspects of the general Lorentz covariant theory of quantized fields.

Prerequisite: PY 711
Typically offered in Spring only

PY 721 Statistical Physics I (3 credit hours)
Basic elements of kinetic theory and equilibrium statistical mechanics, both classical and quantum; applications of the techniques developed to various ideal models of noninteracting particles.

Prerequisite: PY 401, PY 413
Typically offered in Spring only

PY 722 Statistical Physics II (3 credit hours)
A continuation of PY 721, with emphasis on the static and dynamic properties of real (interacting) systems. Topics including equilibrium theory of fluids and linear response theory of time-dependent phenomena.

Prerequisite: PY 721
Typically offered in Fall only

PY 753 Condensed Matter Physics II (3 credit hours)
The properties of semiconductors, superconductors, magnets, ferroelectrics and crystalline defects and dislocations.

Prerequisite: PY 552
Typically offered in Fall only

PY 781 Quantum Mechanics I (3 credit hours)
Fundamental concepts and formulations, including interpretation and techniques, and the application of theory to simple physical systems, such as the free particle, the harmonic oscillator, the particle in a potential well and central force problems. Other topics including approximation methods, identical particles and spin, transformation theory, symmetries and invariance, and an introduction to quantum theory of scattering and angular momentum.

Prerequisite: MA 512; PY 411 or 414; Graduate standing
Typically offered in Fall only

PY 782 Quantum Mechanics II (3 credit hours)
Fundamental concepts and formulations, including interpretation and techniques, and the application of theory to simple physical systems, such as the free particle, the harmonic oscillator, the particle in a potential well and central force problems. Other topics including approximation methods, identical particles and spin, transformation theory, symmetries and invariance, and an introduction to quantum theory of scattering and angular momentum.

Prerequisite: MA 512; PY 411 or 414; Graduate standing
Typically offered in Spring only

PY 783 Advanced Classical Mechanics I (3 credit hours)
Introduction to theoretical physics in preparation for advanced study. Emphasis on classical mechanics, special relativity and the motion of charged particles. Topics including variational principles, Hamiltonian dynamics and canonical transformation theory, structure of the Lorentz group and elementary dynamics of unquantized fields.

Prerequisite: MA 512, PY 412, PY 414; Graduate standing
Typically offered in Fall only

PY 785 Advanced Electricity and Magnetism I (3 credit hours)
Topics including techniques for solution of potential problems, development of Maxwell's equations; wave equations, energy, force and momentum relations of an electromagnetic field; covariant formulation of electrodynamics; radiation from accelerated charges.

Prerequisite: PY 415; Graduate standing
Typically offered in Fall only

PY 786 Advanced Electricity and Magnetism II (3 credit hours)
Topics including techniques for solution of potential problems, development of Maxwell's equations; wave equations, energy, force and momentum relations of an electromagnetic field; covariant formulation of electrodynamics; radiation from accelerated charges.

Prerequisite: PY 415; Graduate standing
Typically offered in Spring only

PY 790 Special Topics in Physics (1-99 credit hours)

PY 801 Seminar (1 credit hours)
Reports on topics of current interest in physics. Several sections offered so that students with common research interests may be grouped together.

Typically offered in Fall and Spring

PY 810 Special Topics In Physics (1-6 credit hours)
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged

Typically offered in Fall and Spring

PY 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Spring only

PY 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Spring only

PY 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PY 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PY 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Physiology (PHY)

PHY 452/ANS 452/ANS 552/PHY 552 Comparative Reproductive Physiology and Biotechnology (3 credit hours)
Comparative approach to examining aspects of reproductive physiology in selected vertebrate species. Detailed examination of current reproductive biotechnologies and ethical issues associated with the application of reproductive biotechnologies. Credit will not be given for both ANS 452 and ANS (PHY) 552.

Prerequisite: ANS 220
Typically offered in Fall only

PHY 503 General Physiology I (3 credit hours)
Physiology is the study of the how living systems function from the molecular to organismal level. As such, this course will build on your knowledge of anatomy, biochemistry, and cell biology and also presumes a working knowledge of the basics of college level physics and chemistry. Students will learn the fundamental mechanisms underlying normal function of cells, tissues, organs, and organ systems of the human body and be able to integrate knowledge and concepts from various organ systems to explain function in the human body. In this course, we will address cellular, neural, muscular, and gastrointestinal physiology in humans.

P: BCH451 and BCH553 (or equivalents) and one year each of college-level physics and chemistry
Typically offered in Fall only

PHY 504 General Physiology II (3 credit hours)
Physiology is the study of the how living systems function from the molecular to organismal level. As such, this course will build on your knowledge of anatomy, biochemistry, and cell biology and also presumes a working knowledge of the basics of college level physics and chemistry. Students will learn the fundamental mechanisms underlying normal function of cells, tissues, organs, and organ systems of the human body and be able to integrate knowledge and concepts from various organ systems to explain function in the human body. In this course, we will address cardiovascular, respiratory, and renal physiology in humans.

P: BCH451 and BCH553 (or equivalents) and one year each of college-level physics and chemistry
Typically offered in Spring only

PHY 505 Pathophysiology (2 credit hours)
Pathophysiology is one of the bridge courses between basic medical science and clinical medicine: it plays an important role in basic medical courses, concerning the etiology and pathogenesis of disease as well as the mechanisms of functional and metabolic alterations in disease. Different from pathology, which emphasizes the morphological changes, pathophysiology focuses on the functional and metabolic alterations and mechanisms underlying the development of diseases. This discussion- and presentation-based course will focus on developing written and oral communication skills through the use of case studies.

R: Physiology Program Students Only
Typically offered in Spring only

PHY 524/PO 524/ZO 524 Comparative Endocrinology (3 credit hours)
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

Prerequisite: BIO 421 or PO 405
Typically offered in Spring only

PHY 552/PHY 452/ANS 452/ANS 552 Comparative Reproductive Physiology and Biotechnology (3 credit hours)
Comparative approach to examining aspects of reproductive physiology in selected vertebrate species. Detailed examination of current reproductive biotechnologies and ethical issues associated with the application of reproductive biotechnologies. Credit will not be given for both ANS 452 and ANS (PHY) 552.

Prerequisite: ANS 220
Typically offered in Fall only

PHY 595 Special Topics in Physiology (1-6 credit hours)
The study of special problems and selected topics of current interest in physiology and related fields.

Typically offered in Spring only

PHY 601 Physiology Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Prerequisite: Graduate standing
Typically offered in Spring only

PHY 610 Special Topics In Physiology (1-6 credit hours)
The study of special problems and selected topics of current interest in physiology and related fields.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PHY 620 Special Problems In Physiology (1-6 credit hours)
Credits Arranged

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PHY 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PHY 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Summer only

PHY 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PHY 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PHY 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

PHY 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PHY 702/ANS 702 Reproductive Physiology of Mammals (3 credit hours)
Survey of reproductive strategies among vertebrates; in-depth coverage of mammalian reproductive physiology; gametogenesis, fertilization, embryonic and fetal development, parturition, puberty, neuroendrocrine control mechanisms in male and female mammals.

Prerequisite: ZO 421
Typically offered in Fall and Spring

PHY 764/CBS 764/NTR 764 Advances in Gastrointestinal Pathophysiology (3 credit hours)
This course will focus on advanced gastrointestinal physiology and the pathophysiology of deseases of relevance to scientsts involved in animal-related research. In particular, the course will cover the pathophysiology of ulceration, infectious diarrhea, ischemia, motility disorders, and inflammatory diseases of the gut. An in-depth review paper will be required based on recent literature rgarding a specific gastrointestinal disease.

Prerequisite: PHY 503, PHY 504
Typically offered in Fall only

PHY 780/ANS 780 Mammalian Endocrinology (3 credit hours)
Mammalian endocrine system with emphasis on ontogeny and anatomy of key organs; synthesis and action of hormones. Role of hormones in regulation of physiological processes such as metabolism, exocrine function, digestion, ion balance, behavior, lactation, growth and reproduction.

Prerequisite: BCH 451, ZO 421

PHY 795 Special Topics in Physiology (1-9 credit hours)
The study of special problems and selected topics of current interest in physiology and related fields.

Typically offered in Fall and Spring

PHY 801 Physiology Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Prerequisite: Graduate standing
Typically offered in Spring only

PHY 810 Speical Topics In Physiology (1-4 credit hours)
The study of special problems and selected topics of current interest in physiology and related fields.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PHY 820 Special Problems In Physiology (1-6 credit hours)
Credits Arranged

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PHY 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planing for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Summer only

PHY 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PHY 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PHY 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PHY 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PHY 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Plant Biology (PB)

PB 103 Perspectives on Botany (1 credit hours)
Orientation to modern botany, including discussions of historical background, relation to other sciences, the nature of modern subdisciplines, professionalism and ethics, local resources of personnel and facilities, educational opportunities, and career possibilities.

Typically offered in Fall only

PB 200 Plant Life (4 credit hours)
An introduction to the structure, processes, and reproduction of higher plants, including the diversity of the plant kingdom and principles of inheritance, ecology, and evolution. Students cannot receive credit for both PB 200 and PB 250.

GEP Natural Sciences
Typically offered in Fall and Spring

PB 205 Our Green World (3 credit hours)
Awareness and understanding of plants in the world for the non-science student. Essential fundamental concepts of plant structure, growth, processes, uses, biotechnology, evolution, environmental issues and ecology. Short field trips will be held that may require students to provide their own transportation. Credit cannot be received for both PB 205 and (PB 200 or PB 250).

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

PB 208/AEE 208/ANS 208 Agricultural Biotechnology: Issues and Implications (3 credit hours)
Trends and issues of agricultural biotechnology in today's society are addressed while covering the basic biological science behind the technology. Applications of and policy issues associated with plant, animal, and environmental biotechnology used in the agricultural industry are examined from an interdisciplinary approach.

Prerequisite: (BIO 105 or BIO 115 or BIO 181 or BIO 183)
GEP Interdisciplinary Perspectives
Typically offered in Spring only

PB 213 Plants and Civilization (3 credit hours)
This course covers plant use in ancient civilizations, including the economic, social, political, religious, culinary and medical roles of plants and plant products.Plant use in ancient cultures, including but not limited to, Amazonian, Celtic, Chinese, Egyptian, Greek, Inca, Indian, Maya, Mesopotamian, Nubian, Persian, and Roman will be discussed. Topics include foods, beverages, medicines, fibers, construction materials, psychoactive drugs, and religious symbols.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

PB 215 Medicinal Plants (3 credit hours)
Plants and their derived pharmaceuticals in Western medicine and in herbal medicine.

Prerequisite: CH 101 and any one of the following courses: BIO 125,BIO 181,PB 200,ZO 150,ZO 160
Typically offered in Fall only

PB 219 Plants in Folklore, Myth, and religion (3 credit hours)
The structural and functional biology of plants and cultural inclusions in folklore, myth, and religion. The myth/religion-plant-human culture nexus. Mythical and religious themes covered, but not limited to, are: the world tree and cosmic order; plants and the creation of Earth; the unity of plants and divine entities; the tree of life; life-giving waters and human immortality; human descent from plants; origin of food plants from humans; plants of witchcraft and magic; psychoactive plants and access to deities; solidarity between humans and plants; death and resurrection of plants and humans.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

PB 220 Local Flora (3 credit hours)
Structural terminology of vascular plants, field identification of plant species by sight and using taxonomic keys, description of natural community types, including their soil and topographic features. Two Saturday field trips required.

Prerequisite: BIO 105 or BIO 181 or PB 200
GEP Natural Sciences
Typically offered in Fall only

PB 250 Plant Biology (4 credit hours)
An introduction for Life Science majors to the ecology, structure, function, processes, reproduction and evolution of higher plants. Students may not receive credit for both PB 200 and PB 250.

Prerequisite: BIO 181 and BIO 183
Typically offered in Fall only

PB 277 Space Biology (3 credit hours)
Overview of the biology of plants, animals, and humans in the space environment, including gravitational biology, aerospace medicine, astrobiology, search for extraterrestrial life, terraforming, and life support.

Prerequisite: BIO 105 or BIO 181 or BIO 183 or PB 200
GEP Natural Sciences
Typically offered in Fall only

PB 295 Special Topics in Botany (1-4 credit hours)
Trial offerings of new or experimental courses in Botany at the early undergraduate level.

Typically offered in Fall, Spring, and Summer

PB 321 Introduction to Whole Plant Physiology (3 credit hours)
Physiology of higher plants with emphasis on whole plant aspects including structure-function relationships, water and solute movement, energy sources and needs, plant growth and development, and the impact of plant physiology findings on agriculture. Students cannot receive credit for both PB 321 and PB 421.

Prerequisite: (BIO 183 or PB 200 or PB 250) and CH 101/102
Typically offered in Spring only

PB 325 Culinary Botany (3 credit hours)
This course explores the ethnobotany, taxonomic diversity, and unique physical and chemical characteristics of important food and beverage plants used by peoples in different regions of the world. After an introduction to plant domestication and agricultural origins, most course weeks are spent examining the culturally significant edible flora of a different geographic region, combining short lectures on the botany of selected species, discussions about the uses of plant biocultural diversity, and, when feasible, hands-on activities where course participants can sample plant-based foods from each region. One Saturday field trip required.

Prerequisite: CS 213 or HS 201 or PB 200 or PB 250
Typically offered in Fall only

PB 345 Economic Botany (3 credit hours)
This course covers plants of economic importance that have been valued by societies regionally, nationally and globally from the modern era to the present day. Topics include, but are not limited to, plant species used as food, spices, beverages, oils, fibers, paper, dyes, perfumes, body care, construction materials, fuels and ornamentals. Aspects related to the botany and ethnobotany of economically important plant species will be discussed including taxonomy, anatomy, physiology, ecology, conservation, human uses, social and environmental issues, and roles in the economy.

Prerequisite: BIO 181 or PB 200 or PB 250
Typically offered in Spring only

PB 346 Economic Botany Lab (1 credit hours)
This lab course explores plants and plant products of economic importance through hands-on activities. Aspects related to the botany and ethnobotany of economically important plant species will be covered including taxonomy, anatomy, physiology, ecology, conservation, human uses, social and environmental issues, and roles in the economy.

Prerequisite: BIO 181 or PB 200 or PB 250; Co-requisite: PB 345
Typically offered in Spring only

PB 360/AEC 360 Ecology (4 credit hours)
The science of ecology, including factors which control distribution and population dynamics of organisms, structure and function of biological communities, and energy flow and nutrient cycling in ecosystems; contrasts among the major biomes; and principles governing ecological responses to global climatic and other environmental changes.

Prerequisite: C- or better in BIO 181
Typically offered in Fall only

PB 400 Plant Diversity and Evolution (4 credit hours)
Diversity, morphology, taxonomy, and evolutionary history of living and fossil plants including fungi, algae, bryophytes, pteridophytes, gymnosperms, and angiosperms. Two one-day weekend field trips required.

Prerequisite: BIO 181 or PB 200 or PB 250
Typically offered in Spring only

PB 403/PB 503 Systematic Botany (4 credit hours)
The course introduces basic and contemporary systematic principles and methods as applied to vascular plants, with emphasis on flowering plants. It covers classification, identification, phylogenetics, and molecular approaches, and surveys important and common plant families representing major groups of vascular plants.

Prerequisite: PB 200, PB 250, BIO 183, Junior standing
Typically offered in Spring only

PB 407/PB 507 Medical Ethnobotany (3 credit hours)
This course covers traditional medical systems from a diversity of ancient and modern cultures, with an emphasis on the medicinal plants utilized within these healing traditions. Humans, as well as a number of other species, have utilized plants and other products from nature to treat their physical and spiritual ailments since prehistoric times. In addition to covering medicinal plant species and their known bioactivity, other topics will include traditional diagnostic techniques, complementary healing modalities, beliefs regarding health and illness, treatment and causes of spiritual diseases, food and spices as medicine, and ethical considerations in ethnobotanical research.

Prerequisite: (BIO 181 or PB 200 or PB 250) and (Junior or Senior)
Typically offered in Spring only

PB 413/PB 513 Plant Anatomy (2 credit hours)
Organelles, cells, tissues and organs of flowering plants and selected gymnosperms. Emphasis placed on developmental patterns and structural adaptations for survival. Laboratory focuses on dissection, histochemistry, and imaging of plant cells and tissues. Students cannot reserve credit for both PB 413 and PB 513.

Prerequisite: PB 200 or PB 250 or PB 321 or PB 421
Typically offered in Spring only

PB 421 Plant Physiology (3 credit hours)
Physiology of higher plants with emphasis on biochemical, cell biological and molecular aspects of how plants function. Unique aspects of regulation of plant metabolism including photosynthesis, respiration, nitrogen fixation, cell wall biosynthesis, growth and stress responses will be emphasized. The course is intended for students interested in postgraduate studies in plant biology. Students cannot receive credit for both PB 321 and PB 421.

Prerequisite: BIO 183 or ZO 160, or PB 200 and CH 220 or CH 221 or CH 225
Typically offered in Fall only

PB 445/PB 545 Paleobotany (4 credit hours)
Morphologic, taxonomic, geologic and evolutionary relationships of fossil plants; emphasis on vascular plants; discussions of taphonomy, biogeography and palynology. Requires weekend field trips at student expense. Credit will not be allowed for both BO 445 and BO 545.

Prerequisite: BIO 181 or MEA 102

PB 450/PB 550 Plant Ecology (3 credit hours)
This course introduces students to the principles and methods of plant ecology. Topics include how individual plants extract resources from their environments; population dynamics and plant life histories; species interactions in communities; and global change ecology. The course emphasizes distinctive ways that plant natural history affects their ecology while also illustrating how plants can be ideal systems for studying general ecological problems. Undergraduate students gain hands-on ecological experience by gathering real data through field activities, and all students design independent research proposals.

Prerequisite: AEC/PB 360 or FOR 260
Typically offered in Spring only

PB 464/PB 564 Rare Plants of North Carolina (3 credit hours)
This course provides a taxonomic survey of the rare plants of North Carolina, focusing primarily on federally- and secondarily on state-listed species. Particular attention will be placed on: (1) the identification of rare species, their congeners, and morphologically similar species, (2) the biogeography of rare species, (3) optimum survey windows, and (4) the conservation biology of select taxa. Two Saturday field trips required. Junior level or higher. Students cannot receive credit for both PB 464 and PB 564.

Prerequisite: One of the following: (PB 200, PB220, PB 403, or PB 405)
Typically offered in Fall only

PB 480/PB 580 Introduction to Plant Biotechnology (3 credit hours)
Introduction to gene cloning, plant tissue culture and transformation, and the development of agriculturally important transgenic traits. Critical thinking, case studies, and discussions are used to examine global approaches to the regulation and risks of genetically-modified organisms, plant and gene patents, and the consequences of these factors on food soverienty and trade. Students cannot receive credit for both PB 480 and PB 580.

Prerequisite: BCH 454 or BIT 410 or CS 211 or GN 311 or PB/BIO 414 or PB 421.
Typically offered in Fall only

PB 481/BIT 481 Plant Tissue Culture and Transformation (2 credit hours)
Basic techniques in plant tissue culture and transformation. Empirical approaches to techniques in plant tissue culture, designing transgenes for expression in specific plant cell organelles and tissues, use of reporter genes to optimize transformation, and troubleshooting transformation. Laboratory sessions provide hands-on experience with plant tissue culture and transformation. Use of reporter genes, fluorescence microscopy and digital imaging. Half semester course, first part.

Typically offered in Spring only

PB 488/ECE 488/PB 588/ECE 588 Systems Biology Modeling of Plant Regulation (3 credit hours)
This course provides an introduction to the field of systems biology with a focus on mathematical modeling, gene regulatory network and metabolic pathway reconstruction in plants. Students will learn how to integrate biological data with mathematical, statistical, and computational approaches to gain new insights into structure and behavior of complex cellular systems. Students are expected to have a minimal background in calculus and basic biology. The course will build on these basic concepts and provide all students, regardless of background or home department, with the fundamental biology, mathematics, and computing knowledge needed to address systems biology problems.

Prerequisite: MA 131 or MA 141
Typically offered in Fall only

PB 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

PB 493 Plant Biology Supervised Undergraduate Research Experience (1-3 credit hours)
This course provides students with a faculty-supervised research experience in Plant Biology that utilizes campus facilities and resources. A minimum of 45 hours of research activity must be completed for each credit hour earned. A maximum number of three credit hours, equivalent to 135 hours of research activity, may be earned per semester. Students must initiate contact and arrangements for research experience with prospective faculty mentors. To enroll, students are required to submit a completed PB 493 course contract that is approved by the faculty mentor and the Director of Plant Biology Undergraduate Programs. Students must submit a written midterm report and give an oral presentation on their research in addition to completing the tasks specified in the approved contract.

Typically offered in Fall, Spring, and Summer

PB 495 Special Topics in Plant Biology (1-4 credit hours)
Offered as needed to present material not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

PB 501/MB 501/PP 501 Biology of Plant Pathogens (3 credit hours)
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

Prerequisite: PP 315, or PP 318, or an introductory course in microbiology
Typically offered in Fall only

PB 503/PB 403 Systematic Botany (4 credit hours)
The course introduces basic and contemporary systematic principles and methods as applied to vascular plants, with emphasis on flowering plants. It covers classification, identification, phylogenetics, and molecular approaches, and surveys important and common plant families representing major groups of vascular plants.

Prerequisite: PB 200, PB 250, BIO 183, Junior standing
Typically offered in Spring only

PB 507/PB 407 Medical Ethnobotany (3 credit hours)
This course covers traditional medical systems from a diversity of ancient and modern cultures, with an emphasis on the medicinal plants utilized within these healing traditions. Humans, as well as a number of other species, have utilized plants and other products from nature to treat their physical and spiritual ailments since prehistoric times. In addition to covering medicinal plant species and their known bioactivity, other topics will include traditional diagnostic techniques, complementary healing modalities, beliefs regarding health and illness, treatment and causes of spiritual diseases, food and spices as medicine, and ethical considerations in ethnobotanical research.

Prerequisite: (BIO 181 or PB 200 or PB 250) and (Junior or Senior)
Typically offered in Spring only

PB 513/PB 413 Plant Anatomy (2 credit hours)
Organelles, cells, tissues and organs of flowering plants and selected gymnosperms. Emphasis placed on developmental patterns and structural adaptations for survival. Laboratory focuses on dissection, histochemistry, and imaging of plant cells and tissues. Students cannot reserve credit for both PB 413 and PB 513.

Prerequisite: PB 200 or PB 250 or PB 321 or PB 421
Typically offered in Spring only

PB 545/PB 445 Paleobotany (4 credit hours)
Morphologic, taxonomic, geologic and evolutionary relationships of fossil plants; emphasis on vascular plants; discussions of taphonomy, biogeography and palynology. Requires weekend field trips at student expense. Credit will not be allowed for both BO 445 and BO 545.

Prerequisite: BIO 181 or MEA 102
Typically offered in Spring only

PB 550/PB 450 Plant Ecology (3 credit hours)
This course introduces students to the principles and methods of plant ecology. Topics include how individual plants extract resources from their environments; population dynamics and plant life histories; species interactions in communities; and global change ecology. The course emphasizes distinctive ways that plant natural history affects their ecology while also illustrating how plants can be ideal systems for studying general ecological problems. Undergraduate students gain hands-on ecological experience by gathering real data through field activities, and all students design independent research proposals.

Prerequisite: AEC/PB 360 or FOR 260
Typically offered in Spring only

PB 559 Plant Water Relations (2 credit hours)
Physical and biological mechanisms that govern water uptake, water transport, transpiration, and plant responses to drought; constraints and tradeoffs that limit evolution and artificial selection of drought tolerance; methods for studying water relations. Weekly lecture and paper discussions will draw upon examples from both crop and wild plants.

Typically offered in Spring only

PB 564/PB 464 Rare Plants of North Carolina (3 credit hours)
This course provides a taxonomic survey of the rare plants of North Carolina, focusing primarily on federally- and secondarily on state-listed species. Particular attention will be placed on: (1) the identification of rare species, their congeners, and morphologically similar species, (2) the biogeography of rare species, (3) optimum survey windows, and (4) the conservation biology of select taxa. Two Saturday field trips required. Junior level or higher. Students cannot receive credit for both PB 464 and PB 564.

Prerequisite: One of the following: (PB 200, PB220, PB 403, or PB 405)
Typically offered in Fall only

PB 570 Plant Functional Ecology (3 credit hours)
Mechanisms by which plants interact with their environment, with an emphasis on the role of physiological, morphological, and life history traits, and the evolution of these traits.

Prerequisite: PB/BIO 360
Typically offered in Fall only

PB 575/MB 575/PP 575 Introduction to Mycology (4 credit hours)
A survey of the fungal kingdom in context of phyla and classes. Systematics, ecology, biology and utilization. Illustrative material, cultural techniques in laboratories. Collection and paper required.

Prerequisite: BS 125 or BS 181 and 183 or BO 200 or PP 315 or PP 318
Typically offered in Fall only

PB 580/PB 480 Introduction to Plant Biotechnology (3 credit hours)
Introduction to gene cloning, plant tissue culture and transformation, and the development of agriculturally important transgenic traits. Critical thinking, case studies, and discussions are used to examine global approaches to the regulation and risks of genetically-modified organisms, plant and gene patents, and the consequences of these factors on food soverienty and trade. Students cannot receive credit for both PB 480 and PB 580.

Prerequisite: BCH 454 or BIT 410 or CS 211 or GN 311 or PB/BIO 414 or PB 421.
Typically offered in Fall only

PB 588/ECE 588/PB 488/ECE 488 Systems Biology Modeling of Plant Regulation (3 credit hours)
This course provides an introduction to the field of systems biology with a focus on mathematical modeling, gene regulatory network and metabolic pathway reconstruction in plants. Students will learn how to integrate biological data with mathematical, statistical, and computational approaches to gain new insights into structure and behavior of complex cellular systems. Students are expected to have a minimal background in calculus and basic biology. The course will build on these basic concepts and provide all students, regardless of background or home department, with the fundamental biology, mathematics, and computing knowledge needed to address systems biology problems.

Prerequisite: MA 131 or MA 141
Typically offered in Fall only

PB 595 Special Topics in Plant Biology (1-4 credit hours)
The study of special problems and selected topics of current interest in plant biology and related fields.

Typically offered in Fall, Spring, and Summer

PB 601 Botany Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

PB 620 Special Problems In Botany (1-6 credit hours)
Directed research in some phase of botany other than a thesis problem, but designed to provide experience and training in research. Credits Arranged.

Typically offered in Fall, Spring, and Summer

PB 624 Topical Problems (1-4 credit hours)
Discussions and readings on problems of current interest in fields of ecology, anatomy and morphology, taxonomy, plant physiology and cell biology. May be repeated with a change in topic for a maximum of six credits.

Typically offered in Fall and Spring

PB 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PB 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 690 Master's Examination (1-9 credit hours)
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 695 Master's Thesis Research (1-9 credit hours)
Thesis Research.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's Student
Typically offered in Summer only

PB 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's Student
Typically offered in Fall, Spring, and Summer

PB 704 Plant Nomenclature (1 credit hours)
A practical foundation in plant nomenclature and nomenclatural references. Emphasis on the evolution of international rules for naming plant taxa and their application in both wild and cultivated plants. Nomenclature applications used in patents, cultivar releases and journal articles. Taught mid-semester. Taught five weeks of semester.

Typically offered in Spring only

PB 733 Plant Growth and Development (3 credit hours)
Advanced course in plant physiology covering plant growth, development, differentiation, senescence and biological control mechanisms.

Prerequisite: PB(ZO) 414 or PB 421, organic chemistry
Typically offered in Spring only

PB 751 Advanced Plant Physiology I (3 credit hours)
Cellular mechanisms and regulatory features related to plant respiration, photosynthesis, sulfur metabolism, nitrogen fixation and metabolism, and signal transduction. One of two courses covering field of plant physiology.

Prerequisite: PB 421
Typically offered in Fall only

PB 761/BCH 761/GN 761 Advanced Molecular Biology Of the Cell (3 credit hours)
An advanced graduate class involving integrated approaches to complex biological questions at the molecular level, encompassing biochemistry, cell biology and molecular genetics. The course will focus on an important, current area of research in eukaryotic biology using the primary scientific literature, and will involve class discussions, oral presentations, and a written research proposal.

Typically offered in Spring only

PB 774/MB 774 Phycology (3 credit hours)
Introduction to taxonomy, morphology, reproduction and ecological importance of organisms which may be included in the algae. Attention to local freshwater flow and physiology of selected species in relation to algal blooms, water quality and nutrient loading in aquatic habitats.

Typically offered in Spring only

PB 780 Plant Molecular Biology (3 credit hours)
Molecular analysis of plant growth and development. Molecular techniques and their application to understanding control of gene expression in plants.

Prerequisite: BCH 451, GN 411
Typically offered in Fall only

PB 795 Special Topics Botany (1-6 credit hours)
The study of special problems and selected topics of current interest in botany and related fields.

Typically offered in Fall and Spring

PB 801 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

PB 820 Special Problems (1-6 credit hours)
Directed research in some phase of botany other than a thesis problem, but designed to provide experience and training in research. Credits Arranged.

Typically offered in Fall, Spring, and Summer

PB 824 Topical Problems (1-4 credit hours)
Discussions and readings on problems of current interest in fields of ecology, anatomy and morphology, taxonomy, plant physiology and cell biology. May be repeated with a change in topic for a maximum of six credits.

Typically offered in Fall and Spring

PB 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral Student
Typically offered in Fall, Spring, and Summer

PB 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral Student
Typically offered in Fall, Spring, and Summer

PB 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PB 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PB 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral Student
Typically offered in Summer only

PB 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral Student
Typically offered in Fall, Spring, and Summer

Plant Pathology (PP)

PP 144/HS 144 Weeds & Diseases of Ornamentals (3 credit hours)
The objective of this course is to give students a fundamental and practical understanding of weed, disease, and pesticide management in the ornamental industries in North Carolina. Agricultural Institute students only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

PP 150 Introduction to Plant Molecular Biology (3 credit hours)
Hands-on introduction to modern molecular biology techniques. Isolation of SNA from tobacco leaves, isolating a plant gene through polymerase chain reaction (PCR), cloning DNA fragments in plasmid vectors, bacterial transformation and plasmid DNA purification, restriction digestion and gel electrophoresis, gene transfer and expression of reporter genes in plant cell lines through a biolistic gene gun. Field trips, poster assignment and poster presentation are mandatory. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS) and other pre-college, transitional and early-college programs. Students must have no more than 30 credit hours. Deparment approval required.

Typically offered in Summer only

PP 154/CS 154 Turf Weed and Disease Management (3 credit hours)
General principles in turfgrass weed and disease development and management programs. Different weeds, their life cycles, management techniques, and factors affecting herbicide application performance will be covered. Students will learn the causes, development, identification and management of turfgrass diseases. Laboratory includes weed identification and herbicide application methods. Certain laboratory exercises will require personal transportation to Lake Wheeler Road Turf Field Lab unless otherwise specified by the lab instructors. The course is restricted to AGI students only.

Requisite: Agricultural Institute Only
Typically offered in Fall only

PP 155 Diseases of Ornamentals and Turfgrasses (3 credit hours)
Causes, development, identification and management of diseases of greenhouses and landscape ornamentals and turfgrasses. WARFIELD

Requisite: Agricultural Institute Only
Typically offered in Fall only

PP 222 Kingdom of Fungi (3 credit hours)
Influence and impact of fungi in our world. The role of fungi in history, ecology, medicine, human and plant diseases, industry, food, and politics. Mushrooms, molds, mildews, and symbiosis.

Prerequisite: BIO 105 or 106 or 140 or 181 or 183 or PB 200 or 215 or 219 or 220 or 250 or MB 200
GEP Natural Sciences
Typically offered in Fall and Spring

PP 232 Big Data in Your Pocket: Call it a Smartphone (3 credit hours)
Data have been, are, and will be collected in every scientific discipline. Data provide a foundation to evaluate hypotheses and advance knowledge. For centuries scientists have collected data and built models separately with methods and principles defined in their disciplines. Modern technological advances have resulted in a data revolution. Data now come fast in all forms and in high volumes, presenting both new challenges and opportunities in many disciplines. In this course we will discuss how data is collected and visually summarized and how modern technology has allowed for the collection of big data, resulting in a revolution in the way we live, work, and think.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

PP 241 The Worm's Tale: Parasites In Our Midst (3 credit hours)
This is a 3 credit hour survey course on the impact of parasites on society, including development and exploration, wars and expansion, agriculture, health and medicine, economic impacts, political impacts, and attempts at control/management. From the fiery serpent to the scourge of malaria, parasitic organisms have played a significant, and sometimes pivotal role in the development and progress of human society. This course presents an overview that provides students the necessary information and resources to understand this ubiquitous and critically important group of organisms. Parasites represent a significant hurdle to overcome as global society continue to move forward.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

PP 315 Principles of Plant Pathology (4 credit hours)
Fundamental principles of plant pathology with emphasis on disease etiology, nature of pathogenesis, ecology of host/parasite interaction, epidemiology of plant diseases, current strategies and practices for integrated disease control.

Typically offered in Fall and Spring

PP 318/FOR 318 Forest Pathology (3 credit hours)
Major diseases of forest trees and deterioration of wood products emphasizing principles of plant pathology; diagnosis; nature, physiology, ecology, and dissemination of disease-causing agents; mechanisms of pathogenesis; epidemiology and environmental influences; principles and practices of control.

Prerequisite: PB 200
Typically offered in Fall and Spring

PP 470/CS 470/ENT 470 Advanced Turfgrass Pest Management (2 credit hours)
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pestmanagement programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

Prerequisite: C- or better in CS 200
Typically offered in Spring only

PP 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

PP 493 Special Problems in Plant Pathology (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall and Spring

PP 495 Special Topics in Plant Pathology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

PP 501/PB 501/MB 501 Biology of Plant Pathogens (3 credit hours)
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

Prerequisite: PP 315, or PP 318, or an introductory course in microbiology
Typically offered in Fall only

PP 502/CS 502/HS 502 Plant Disease: Methods & Diagnosis (2 credit hours)
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips arerequired.

Prerequisite: PP 315
Typically offered in Fall only

PP 506 Epidemiology and Plant Disease Control (3 credit hours)
Consideration of fundamental concepts and principles of epidemiology as applied to modern strategies of plant disease control. Special consideration given to evaluation of current techniques for control of fungal, bacterial, viral and nematode pathogens in an integrated crop protection system.

Prerequisite: PP 315 or PP 318
Typically offered in Spring only

PP 575/PB 575/MB 575 Introduction to Mycology (4 credit hours)
A survey of the fungal kingdom in context of phyla and classes. Systematics, ecology, biology and utilization. Illustrative material, cultural techniques in laboratories. Collection and paper required.

Prerequisite: BS 125 or BS 181 and 183 or BO 200 or PP 315 or PP 318
Typically offered in Fall only

PP 590 Special Topics (1-3 credit hours)
The study of special problems and selected topics of current interest in plant pathology and related fields.

Typically offered in Fall, Spring, and Summer

PP 601 Seminar (1 credit hours)
Discussion of assigned phytopathological topics.

Typically offered in Fall and Spring

PP 610 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in plant pathology and related fields.

Typically offered in Fall, Spring, and Summer

PP 615 Advanced Special Topics in Plant Pathology (1-6 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Prerequisite: PP 501, 502, Corequisite: ST 511
Typically offered in Fall only

PP 620 Special Problems (1-6 credit hours)
Investigation of special problems in plant pathology not related to thesis problem. Investigations may consist of original research and/or literature survey.

Typically offered in Fall and Spring

PP 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

PP 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring only

PP 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

PP 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall and Spring

PP 696 Summer Thesis Res (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Typically offered in Summer only

PP 699 Master's Thesis Preparation (1-9 credit hours)
Original research in plant pathology.

Prerequisite: Graduate standing
Typically offered in Spring only

PP 707 Plant Microbe Interactions (3 credit hours)
Fundamental concepts and current status of research on the physiology, biochemistry and molecular biology of host-pathogen interactions during plant disease. Topics include recognition, penetration and colonization, pathogenicity and virulence determinants, resistance mechanisms, sign transduction, programmed cell death, and other current topics. Information presented in context of virual-, bacterial-, fungal-and nematode-plan interactions.Credit cannot be received for both PP 507 and PP 707

Prerequisite: PP 501
Typically offered in Spring only

PP 715/MB 715 Applied Evolutionary Analysis of Population Genetic Data (3 credit hours)
This course will introduce nonparametric and model-based methods for making inferences on population processes (mutation, migration, drift, recombination, and selection). The goal is to provide a conceptual overview of these methods and hands-on training on how to implement and interpret the results. Sample data sets in computer laboratories will integrate summary statistic, cladistic, coalescent, and bayesian approaches to examine population processes in different pathosystems with specific emphasis on eukaryotic microbes, viruses and bacteria.

PP 727/ENT 727 Ecology of Soil Ecosystems (3 credit hours)
This course will focus on the interactions between soil organisms and their environment, and the ecological consequences of these diverse complex interactions. In particular, it will explore the scientific evidence that illustrates links between soil organisms, ecosystem functioning and the quality of air and water systems, and examine why and how the related research was conducted. This course will bring together theory and research trends from distinct subject areas: soil microbiology, entomology and ecosystem ecology.

Prerequisite: One course in: (SSC 332, SSC 511, SSC 521, or SSC 532), or ecology (BO 360 or CS 430), or microbiology (MB 351), or consent of instructor.
Typically offered in Spring only

PP 755 Plant Disease Resistance: Mechanisms and Applications (3 credit hours)
This class deals with the major concepts in plant disease resistance: Its molecular and biochemical bases, its effectiveness and methods of deployment and conventional and transgenic breeding methods used to incorporate improved disease resistance into crop species.

P: Basic Undergraduate Level Genetics Class
Typically offered in Spring only

PP 790 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in plant pathology and related fields.

PP 795 Advanced Special Topics (1 credit hours)
Critical study of special problems and selected topics of current interest in plant pathology and related fields.

PP 801 Seminar In Plant Pathology (1 credit hours)
Discussion of assigned phytopathological topics.

Typically offered in Fall and Spring

PP 810 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in plant pathology and related fields.

Typically offered in Fall, Spring, and Summer

PP 815 Advanced Special Topics (1-6 credit hours)
Critical study of special problems and selected topics of current interest in plant pathology and related fields.

Typically offered in Fall and Spring

PP 820 Special Problems In Plant Pathology (1-6 credit hours)
Investigation of special problems in plant pathology not related to thesis problem. Investigations may consist of original research and/or literature survey.

Typically offered in Fall and Spring

PP 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

PP 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Spring only

PP 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

PP 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall and Spring

PP 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PP 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Spring only

Political Science (PS)

PS 101 Internet Research (1 credit hours)
Tools and techniques for conducting Internet research and electronic literature reviews. Documentation and ethics of using and citing information sources. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PS 102 Data Analysis (1 credit hours)
Statistical analysis of governmental and survey data. Introduction to data sets and collecting, computerizing and analyzing political and social data.

Typically offered in Fall, Spring, and Summer

PS 103 Designing Political Web Pages (1 credit hours)
Principles of effective internet communication in political professions, for constituency contact and grassroots mobilization, and use of web documents by politicians and political organizations. Design of web page documents and creation of internet directories.

Typically offered in Fall, Spring, and Summer

PS 201 American Politics and Government (3 credit hours)
Analysis of American political institutions and processes, including the constitution, political culture, campaigns and elections, political parties, interest groups, the media, the president, congress, the federal courts, and public policy. Discussion of contemporary and controversial issues in American politics. Emphasis on placing current issues in comparative and historical perspective where relevant.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 202 State and Local Government (3 credit hours)
State and local governments within the context of the American federal system. Special emphasis on federalism, the constitutional/legal relationships between state and local governments, and the institutions, organizational forms, and political processes in American state and local government.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 203/PA 203 Introduction to Nonprofits (3 credit hours)
Development of nonprofit organizations and the contributions of nonprofits in the U.S., other countries, and the international community; political, social, and economic roles of nonprofits; nonprofit governance; partnerships with government and other nonprofits; types of organizations in the nonprofit sector; contemporary policy issues. Service project with minor transportation costs.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 204 Problems of American Democracy (3 credit hours)
Political problems in America from the perspective of political theory. Democracy, economics and politics, racial and sexual equality, civil disobedience, and individual freedom.

Typically offered in Spring only

PS 231 Introduction to International Relations (3 credit hours)
Evolution of relations among nations and of the roles of the United Nations and other international institutions, including changes in the world political system since the end of the cold war.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 236 Issues in Global Politics (3 credit hours)
Selected problems facing the world community, related political issues, and international responses to them, including international trade, economic development, wars, arms control, terrorism, ethnic conflict, human rights, status of women, population growth, food security, and environmental degradation.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 241 Introduction to Comparative Politics (3 credit hours)
Introductory comparative analysis of a selected variety of political systems always including some developed democracies, some communist states and some developing countries. A minimum familiarity with the American political system is assumed.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall and Spring

PS 298 Special Topics in Political Science (1-6 credit hours)
Experimental course at the freshman and sophomore levels.

PS 301 The Presidency and Congress (3 credit hours)
Historical development, selection, and internal organization of the presidency and congress. Discussion of the relations between the branches and the influence of public opinion, interest groups and parties on the federal government. Analysis of the legislative process.

Prerequisite: PS 201
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 302 Campaigns and Elections in the US Political System (3 credit hours)
Campaigns and elections in the United States with emphasis on presidential and congressional primary and general elections. Development of theoretical propositions concerning how and why people vote, how and why candidates campaign, and behavioral reasons underlying candidates' successes and failures. Special emphasis on the role of the mass media in the electoral process.

Prerequisite: PS 201
GEP Social Sciences
Typically offered in Fall only

PS 303 Race in U.S. Politics (3 credit hours)
Race in American politics with emphasis on the African-American political experience: civil rights legislation, voting rights, political representation, campaigns and party politics, survey attitudes, and public policies including affirmative action.

Requisite: Sophomore Standing or Above
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Summer

PS 305 The Justice System in the American Political Process (3 credit hours)
Criminal justice process and civil justice system in the American judiciary, including court organization and legal professionals such as police, attorneys and judges; formulation and implementation of policies by law enforcement and the courts; impact of political system upon police, attorneys and judges; interaction between public and legal professionals in judicial decision making. Students who have successfully completed PS 306 or PS 311 may not receive credit for PS 305.

GEP Social Sciences
Typically offered in Fall only

PS 306/WGS 306 Gender and Politics in the United States (3 credit hours)
This course explores the role of gender in contemporary American politics. The course examines the historical course of gender politics to see how we have arrived at the present state. It investigates the activities that women and men play in modern politics-voting, running for office, serving in office, etc., and how women and men perform these activities in different ways. The course also focuses on major areas of public policy that affect women and men in different ways.

Prerequisite: PS 201
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall only

PS 307 Introduction to Criminal Law in the United States (3 credit hours)
Principles underlying the criminal law in the United States and classification of crimes, criminal act, factors affecting criminal responsibility and various types of offenses. Observation of state and federal court sessions.

Typically offered in Fall and Spring

PS 308 Supreme Court and Public Policy (3 credit hours)
The role of the Supreme Court in American politics, with emphasis on the use of litigation as a form of political activity. Readings include relevant court cases as well as descriptions of the Supreme Court in action.

Typically offered in Fall and Spring

PS 309 Equality and Justice in United States Law (3 credit hours)
Equality and justice in American law; federal and state court interpretation of constitutional and statutory law. Topics include racial justice; prisoners' rights and just punishments; nontraditional families and reproductive technologies; gay rights; immigration law; criminal justice practices.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall only

PS 310 Public Policy (3 credit hours)
Introduction to public policy formulation and analysis, including agenda-setting strategies, problems of legitimation, the appropriations process, implementation, evaluation, resolution, and termination.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 312/PA 312 Introduction to Public Administration (3 credit hours)
Administration in city, state and national governments: effectiveness and responsiveness, involvement in policy areas, and issues of ethics and responsibilities.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PS 313 Criminal Justice Policy (3 credit hours)
This course covers the basic policies and controversies in criminal justice in the United States. The course will explore how criminal justice policies get made, why they get made, how well or poorly they work, and what we can do better. The course will examine primarily longstanding areas of policy debate, e.g., illegal drugs, prisons, capital punishments, etc., but we will also pay attention to policy debates in the news. The course will also pay special attention to the intersection of race and social class with our modern criminal justice policies.

Prerequisite: PS 201
GEP U.S. Diversity
Typically offered in Fall only

PS 314 Science, Technology and Public Policy (3 credit hours)
Technological innovation and scientific discovery since World War II have led to profound social, political, and economic change. This course explores some of the opportunities and challenges these advances have created and the ways in which society and government seek to limit their negative effects while maximizing gains and promoting further innovation.

GEP Social Sciences
Typically offered in Fall only

PS 320 U.S. Environmental Law and Politics (3 credit hours)
Emergence of the environment as an issue in United States politics. Law and policy pertaining to air and water pollution, land-use, water, energy, toxic substances, and wilderness. Roles of national and state governments, scientists, corporations, and citizens groups in addressing environmental problems

GEP Social Sciences
Typically offered in Fall and Spring

PS 331 U.S. Foreign Policy (3 credit hours)
The content, formulation, and execution of U.S. foreign policy during the postwar period, with concentration on major issues and trends, the instruments for implementing foreign policy, and analysis of the policy-making process.

GEP Social Sciences
Typically offered in Fall and Summer

PS 335 International Law (3 credit hours)
Usefulness and limitations of international law, including obligations and immunities of sovereign states, non-state actors, peaceful settlement of disputes, human rights, laws of war, and recent international war crimes tribunals. Emphasis on individual case decisions in U.S. and international courts.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall and Spring

PS 336 Global Environmental Politics (3 credit hours)
International politics, laws, and policies pertaining to global environmental problems in the realms of population, pollution, climate change, biological diversity, forests oceans, and fisheries.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall and Spring

PS 339 Politics of the World Economy (3 credit hours)
Politics of international trade and payments, including barriers to trade, dispute settlement, multinational corporations, financial crises, international economic institutions and the problems of economic underdevelopment.

GEP Global Knowledge
Typically offered in Fall only

PS 341 European Politics (3 credit hours)
Comparative analysis of the interests, institutions and processes that determine political stability and economic security in Europe, including the political and economic development of Europe, the role of parties and party politics, the institutions and politics of the European Union.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

PS 342 Politics of China and Japan (3 credit hours)
Politics, public policy, and foreign affairs of China and Japan.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall and Spring

PS 343 Government and Politics in South Asia (3 credit hours)
Survey of government structures, politics, foreign policies and economic policies of India, Pakistan, Bangladesh and Sri Lanka. Democratization; religious, ethnic and sectarian conflicts; nuclear proliferation; Kashmir conflict; and economic development.

Typically offered in Fall only

PS 345 Governments and Politics in the Middle East (3 credit hours)
Historical, geographic, religious, and political-economic factors of the Middle East. Particular attention is given to the internal politics of selected countries, as well as issues of international concern.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Spring only

PS 353 Issues in Latin American and Caribbean Politics (3 credit hours)
Introduction to the major issues affecting political and economic development and stability in Latin America and the Caribbean.

GEP Social Sciences
Typically offered in Spring and Summer

PS 361 Introduction to Political Theory (3 credit hours)
Nature and purpose of politics, as treated by such writers as Plato, Aristotle, St. Augustine, Machiavelli, Locke, Rousseau, Mill, Marx, and Nietzsche.

GEP Humanities
Typically offered in Fall and Spring

PS 362 American Political Thought (3 credit hours)
American ideas and institutions as viewed from the perspective of great American political thinkers, such as Frederick Douglass, Thomas Jefferson, James Madison, Alexander Hamilton, Henry David Thoreau, Abraham Lincoln, Franklin Roosevelt, and Malcolm X.

GEP Humanities
Typically offered in Fall, Spring, and Summer

PS 371 Research Methodology of Political Science (3 credit hours)
Research methods in social science and quantitative analysis in political science and public policy including research design, data collection, statistical analysis and computer applications.

Prerequisite: ST 311 or (ST301 and ST302)
Typically offered in Fall, Spring, and Summer

PS 391 Internship in Political Science (1-6 credit hours)
Internship in a governmental agency, interest group, or like organization involves seminar or formal report. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

PS 398 Special Topics in Political Science (3 credit hours)
For topics not part of regular course offerings, or offering of new courses on a trial basis. May be taken up to three times provided the topics are different.

Typically offered in Fall, Spring, and Summer

PS 401 American Political Parties (3 credit hours)
Political Parties are the central linkage mechanism of American Government. They serve to connect the desires and viewpoints of ordinary Americans to actual governing in Washington and statehouses. The course will explore the structure of the party system in America, how it compares to other countries, and the struggle of third parties in America. The course will also explore political parties as organizations working towards electoral victory. The course will examine parties as changing coalitions of voters and place our current partisan polarization in context. The course will conclude by examining how all these aspects of contemporary political parties come together to shape modern American politics and policy.

Prerequisite: PS 201
Typically offered in Spring only

PS 409/AFS 409 Black Political Participation in America (3 credit hours)
African American political participation in the United States; political culture, socialization, and mobilization, with a focus on the interaction between African Americans and actors, institutions, processes, and policies of the American political system.

Typically offered in Fall only

PS 411 Public Opinion and the Media in American Politics (3 credit hours)
Nature, content, origins, and effects of public opinion in the American political system; role of the mass media in articulating and shaping public opinion; issues concerning measurement of public opinion.

Prerequisite: PS 201
Typically offered in Spring only

PS 415 Administration of Justice (3 credit hours)
Politics and administration in the American system of justice. Credit will not be given for both PS 415 and PA 515

Junior standing or above
Typically offered in Fall and Spring

PS 418/WGS 418 Gender Law and Policies (3 credit hours)
Law and policy pertaining to contemporary gender issues. Examination of agenda setting, policy formation, implementation, judicial interpretation and evaluation of selected issues, such as reproductive policies, equal employment and sexual abuse.

Prerequisite: 3 hours of Political Science
GEP U.S. Diversity
Typically offered in Spring only

PS 431 The United Nations and Global Order (3 credit hours)
United Nations in contemporary world politics. Functions and operation of central organs, commissions, and specialized agencies. Role in addressing global issues including peacekeeping, arms control, human rights, economic and social development, and environment.

Prerequisite: PS 231 or PS 236 or PS 335
GEP Global Knowledge

PS 432/SOC 432 Violence, Terrorism, and Public Policy (3 credit hours)
The course examines interpersonal and group violence in contemporary societies and the causes for its occurrences. Specific forms of violence that will be examined include domestic violence, gangs, homicide, and terrorism, domestically and internationally. Throughout the course students will use data to critically evaluate policies and practices to prevent and control violence and will examine potential solutions to the problems of violence.

Prerequisite: SOC 300 or PS 371
Typically offered in Fall and Spring

PS 433 Global Problems and Policies (3 credit hours)
Critical analysis of issues and events in world politics, including terrorism, drug trafficking and money laundering, transmission of infectious diseases, democratization, globalization and economic development.

Prerequisite: PS 231 or PS 236 or PS 241
GEP Global Knowledge
Typically offered in Fall only

PS 437 U.S. National Security Policy (3 credit hours)
Formulation and implementation of United States national security policy, including its military, political and economic dimensions. Historical evolution of US policy primarily from the end of World War II through the end of the Cold War and to itscontemporary context.

Prerequisite: PS 331

PS 443/PS 543 Seminar in Latin American & Caribbean Politics (3 credit hours)
Comparative political development in Latin America and the Caribbean. Emphasis on democratization and implications for US foreign policy. Credit cannot be given for both PS 443 and PS 543

Prerequisite: Six hours of Political Science including PS 231
Typically offered in Spring only

PS 445/PS 545 Comparative Systems of Law and Justice (3 credit hours)
Legal culture and administration of justice in various countries and in the U.S. Emphasis on the impact of legal ideology on crime, political justice, police administration, corrections and judicial process. Credit will not be given for both PS 445 and PS 545

Junior standing or above
Typically offered in Spring only

PS 462 Seminar in Political Theory (3 credit hours)
A special area in political theory through selected texts, independent research, and seminar reports. Topics vary from year to year, such as ancient and modern political thought, democratic theory, and political theory in literature.

Prerequisite: PS 361 or Consent of Instructor
Typically offered in Spring only

PS 463 Public Choice and Political Institutions (3 credit hours)
Examination of public choice approach to political science. Analysis of political institutions and how they modify human behavior and influence political and policy outcomes. Fulfills department's undergraduate senior seminar requirement.

Prerequisite: Junior standing or Senior standing, Political Science Majors, 12 hours of Political Science Courses
Typically offered in Spring only

PS 464 The Classical Liberal Tradition (3 credit hours)
Analysis of the genesis and development in Europe and North America of liberal ideas such as natural rights, individual liberty, democracy, economic liberalism, religious pluralism, and the rule of law with a particular emphasis on important documents, thinkers, events, and leaders.

Prerequisites: PS 201 or PS 361 or PS 362
Typically offered in Fall only

PS 471 Public Opinion Research Methodology (3 credit hours)
Survey research methodology in public opinion polling, campaign management, media and market research, needs assessment and program evaluation. Topics include questionnaire design, survey sampling, computer applications, and data analysis. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

PS 490 Readings and Research in Political Science (1-6 credit hours)
Extensive readings or research in political science under direct faculty supervision. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

PS 492 Honors Readings and Thesis in Political Science (1-6 credit hours)
Independent reading and preparation of an honors thesis in political science. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Admission to Honors Program
Typically offered in Fall, Spring, and Summer

PS 498 Special Topics in Political Science (1-6 credit hours)
Detailed investigation of a topic. Topic and mode of study determined by the student and a faculty member.

Prerequisite: Six hours of Political Science
Typically offered in Fall and Spring

PS 502 The Legislative Process (3 credit hours)
The formulation of public policy from institutional and behavioral viewpoints. Important current legislative problems at congressional and state legislative levels selected and serve as basis for analyzing legislative process.

Prerequisite: Advanced Undergraduate standing including 12 hrs. of PS, Graduate standing or PBS status
Typically offered in Spring only

PS 506 United States Constitutional Law (3 credit hours)
Basic constitutional doctrines, including fundamental law, judicial review, individual rights and political privileges and national and state power. Special attention given to application of these doctrines to regulation of business, agriculture andlabor and to rights safeguarded by First, Fifth and Fourteenth Amendments to the Constitution.

Prerequisite: 12 hours of PS or Graduate standing or PBS status
Typically offered in Fall only

PS 507 Civil Liberties In the United States (3 credit hours)
Leading constitutional cases in civil liberties and individual rights along with writings of leading commentators.

Prerequisite: 12 hours of PS or Graduate standing or PBS status
Typically offered in Fall and Spring

PS 530 Seminar In International Relations (3 credit hours)
May be taken for up to six hours credit. In-depth examination of a topic within larger field of international politics to be selected by instructor for each semester from subjects pertaining to interstate relations, international law and organization, regional politics, foreign and security policy or global issues. Students undertake substantial independent research project.

Typically offered in Fall only

PS 531 International Law (3 credit hours)
Sources and subjects of international law, domestic and international jurisdictions, judicial settlement, legal and illegal uses of force and substance of law in selected policy areas.

Prerequisite: Graduate standing or Advanced Undergraduate standing
Typically offered in Fall and Spring

PS 532 Seminar in Global Governance (3 credit hours)
The politics of global governance, with emphasis on the role of intergovernmental organizations, non-governmental organizations, international regimes, and supranational institutions, and the comparative analysis of different governance structures. Includes study of the mechanisms of international cooperation between states and their citizens in a variety of issue areas, such as trade, money, development, humanitarianism, the environment, human rights, and security. Graduate standing.

Typically offered in Fall only

PS 533 Global Problems and Policy (3 credit hours)
International policy processes and policy responses to problems of global scope including role of international law. Consideration given to economic development, human rights and other policy problems selected for specific semesters. Independent research on a global policy problem of student's choice.

Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status
Typically offered in Spring only

PS 534 The Politics of Human Rights Policies (3 credit hours)
Human rights policies and politics within the modern global society; the interplay of international organizations, governments and non-governmental actors in promoting and undermining international human rights; examines how domestic politics, sovereignty, cultural norms, religion, geo-political competition, past colonialism, and economic considerations affect efforts to address human rights violations in different countries; human rights issues such as genocide, humanitarian intervention, women and gender issues, refugees, transitional justice or reconciliation, ethnic/racial divisions, human trafficking, etc. Graduate standing.

Typically offered in Fall only

PS 536 Global Environmental Law and Policy (3 credit hours)
International organizations, laws and policies addressing global environmental problems including: population growth, atmospheric pollution, climate change, use of oceans, forests and biodiversity. Relationship between environment and Third World economic development.

Prerequisite: Graduate standing or PBS status
Typically offered in Summer only

PS 539 International Political Economy (3 credit hours)
Politics of international trade and payments, with special emphasis on international and domestic determinants of protectionism, international and national political institutions, multinational corporations, debt crises, and dilemmas of economic underdevelopment.

Prerequisite: Advanced Undergraduate standing, Graduate standing or PBS status
Typically offered in Fall only

PS 540 Seminar In Comparative Politics (3 credit hours)
This seminar opens with a survey of the problems and methods of comparative political analysis, after which students assigned a specific, limited subject to be examined within framework of a systematic, analytical scheme appropriate to topic. Specific topics drawn from subjects of political ideologies, political groups, political elites and decision-making institutions and processes.

Prerequisite: One course in comparative politics and one course in PS methodology
Typically offered in Fall and Spring

PS 541 Political Islam (3 credit hours)
Explores the diversity of movements, organizations, and political parties that fall within political Islam, from the extremist, violent fringe to democratically functioning groups. Begins with an overview of the interaction of religion and politics before defining political Islam and exploring major groups practicing it. The course provides a comparative perspective on Islam's interactions with the political realm, as well as a study of the role it plays in promoting or hindering democratic development.

Prerequisite: Graduate standing
Typically offered in Spring only

PS 542 European Politics (3 credit hours)
Analysis of political institutions and processes in selected European states and the European community and major social, economic and political issues confronting European societies.

Prerequisite: Nine hours of PS program, Graduate standing or PBS status
Typically offered in Spring only

PS 543/PS 443 Seminar in Latin American & Caribbean Politics (3 credit hours)
Comparative political development in Latin America and the Caribbean. Emphasis on democratization and implications for US foreign policy. Credit cannot be given for both PS 443 and PS 543

Prerequisite: Six hours of Political Science including PS 231
Typically offered in Spring only

PS 544 Contemporary African Politics (3 credit hours)
A survey of key themes, trajectories, and trends in contemporary African politics. It analyzes political and economic development on the continent since the dawn of independence in the late 1950s. Although largely focused on Sub-Saharan Africa, the course will nevertheless touch upon linkages and connections with North Africa as well as diasporic influences and inspirations especially in the pan-African struggles for independence and the forging of new sovereign nation-states.

Prerequisite: Graduate standing
Typically offered in Fall only

PS 545/PS 445 Comparative Systems of Law and Justice (3 credit hours)
Legal culture and administration of justice in various countries and in the U.S. Emphasis on the impact of legal ideology on crime, political justice, police administration, corrections and judicial process. Credit will not be given for both PS 445 and PS 545

Junior standing or above
Typically offered in Fall and Spring

PS 546 The Politics of East Asia (3 credit hours)
This course examines the history and key theoretical and policy debates on the politics of East Asia, which in this course includes China, Japan, two Koreas, and Taiwan. Yet, other countries in and beyond the region (the United States, Russia, Southeast Asian nations) and their relations with the five states are an integral part of the course. The class comprises three parts. Part I introduces the modern history of East Asia. Part II examines the contemporary governments of East Asia, including their political systems and the main debates surrounding their politics. Part III focuses on interstate relations of East Asia and Pacific, comprising a series of topics that are both timely and heatedly debated among intellectuals and policymakers. While these topics are mostly country/countries-specific, they together are important in understanding the regional dynamics of East Asia.

Typically offered in Fall only

PS 547 Russian Politics (3 credit hours)
The course investigates the principal political and societal actors in today's Russia, as well as the key trends in Russia's domestic and foreign policy.

Typically offered in Spring only

PS 560 Nuclear Nonproliferation Policy & Process (3 credit hours)
Policy and processes associated with global nuclear nonproliferation efforts. Special emphasis on the history of the development of the global nonproliferation regime, current challenges, and future threats.

Typically offered in Fall and Spring

PS 561 Nuclear Strategy and Nonproliferation (3 credit hours)
No understanding of world politics is complete without an accounting of the role of nuclear weapons. Observers have credited the nuclear revolution with everything from responsibility for the longest period without a great-power war in modern history to bringing humanity to the precipice of annihilation. This course gives students an understanding of the role that nuclear weapons have played in world politics over the past seven decades. The course explores the ways these weapons have been incorporated into military force structures; the roles they have played in military strategy; and the effort to control their spread, limit deployments and stockpiles, avoid nuclear war, and prevent nuclear terrorism. This course will be of use to graduate students with an interest in international relations, foreign policy, and national security. No prior background in international security or nuclear policy is required.

Typically offered in Fall only

PS 571 Research Methods and Analysis (3 credit hours)
A survey of methods used in behavioral research as applied to field of political science: elements of empirical theory, research design, measurement of variables, sampling procedures, data courses, techniques of data collection, statistical analysis, qualitative methodologies and presentation of research findings.

Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status
Typically offered in Fall only

PS 585 Constitutional and Legal Principles for Police Supervisors (3 credit hours)
Intensive look at the constitutional underpinnings and restrictions on laws and government agency policies impacting police agencies. Specific constitutional protections relating to interrogation and search of employees, freedom of speech, freedom of religion and drug testing. Legal risks and liabilities facing police managers and how to reduce these risks.

Typically offered in Fall, Spring, and Summer

PS 590 Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

PS 598 Special Topics In Political Science (1-6 credit hours)
Detailed investigation of a topic. Topic and mode of study determined by student and a faculty member.

Prerequisite: Six hours of PS program
Typically offered in Fall and Spring

PS 610 Special Topics (1-6 credit hours)
Detailed investigation of a topic. Topic and mode of study determined by student and a faculty member.

Prerequisite: Six hours of PS program
Typically offered in Fall and Spring

Polymer and Color Chemistry (PCC)

PCC 101 Introduction to Polymer and Color Chemistry (2 credit hours)
Introduction of topics related to Polymer and Color Chemistry, e.g. fiber and fiber forming polymers, polymerization methods, into to color assessment methods, various chemistry disciplines, molecular interactions, periodic table, acids, bases, solutions, into to and examples of textile coloration and textile finishing techniques.

Corequisite: PCC 104
Typically offered in Fall only

PCC 104 Introduction to Polymer and Color Chemistry Lab (1 credit hours)
An introduction to hands-on laboratory work for the study of basic polymer principles, dye synthesis, forensic analysis and coloration of fibers.

Corequisite: PCC 101
Typically offered in Fall only

PCC 106 Polymer Chemistry and Environmental Sustainability (3 credit hours)
Polymers are prevalent in almost every part of our lives. Many polymers are petroleum based and their raw material supply is limited. Using a theme of environmental impact, this course will review the origin and preparation of key industrial raw materials and how they are used in polymer synthesis. Properties of synthetic polymers will be introduces and concepts for establishing sustainable polymers will be discussed.

Prerequisite: CH 101 or CH 103; Corequisite: CH 221 or CH 225
Typically offered in Spring only

PCC 201 Impact of Industry on the Environment and Society (3 credit hours)
Relationship of society to safety and environmental aspects of manufactured products. Quantifying manufacturing risks. Protective methods, e.g. administrative, engineering, personal, treatment, pollution prevention. Social factors, e.g. political, regulatory, legal, consumer attitudes, public policy, perceptions. Understanding complex social issues, especially situations with conflicting goals. Critical comparison of options for risk reduction, and selecting reasonable (hopefully optimal) courses of action in complex and uncertain situations. Unsolved problems of industry and society (e.g. greenhouse effect). Relationships of ethics, laws and regulations to manufacturing.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PCC 274 Introduction to Forensic Science (3 credit hours)
The field of forensic science is the application of science to the law. The primary purpose of this course is to introduce students to the 'real world' of forensics. It will serve as a basis for more advanced forensic courses. Solving crimes are often complex and costly affairs, involving myriad science and engineering disciplines, ethics, legal issues, and strong communication skills. These key areas will be introduced via regular course lectures, guest lectures from faculty members within NC State and other institutions, and guest lectures from current or former field agents and professional forensic scientists.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

PCC 301 Technology of Dyeing and Finishing (3 credit hours)
Basic principles and procedures for the preparation, dyeing, printing, and finishing of natural and man-made fibers. The chemical nature of dyes and fastness properties and the chemical nature of finishes used to impart specific end-use properties.

Prerequisite: PCC 106 or PCC 203 or TE 200 and Corequisite: PCC 304
Typically offered in Fall and Spring

PCC 302 Technology of Textile Wet Processing (4 credit hours)
Introduction to the science and technology used in textile wet processing. Topics include preparation, dyeing, printing and finishing of textiles, basics of color generation and measurement. Emphasis mainly on cotton, wool, nylon and polyester. Laboratory includes experiments in wet processing and a project on statistical analysis of fabric defects.

Prerequisite: (TT 105 or MT 105 or PCC 101) and (TMS 211 or TE 201) and CH 101 and (PY 211 or (PY 205 and PY 206).
Typically offered in Fall, Spring, and Summer

PCC 304 Technology of Dyeing & Finishing Laboratory (1 credit hours)
Laboratory experience involving the preparation, dyeing, printing, and finishing of natural and man-made fibers.

Prerequisite: PCC 106 or PCC 203 or TE 200 and Corequisite: PCC 301
Typically offered in Fall and Spring

PCC 350 Introduction to Color Science and Its Applications (2 credit hours)
Basic principles and applications of color science. Physical, physiological and psychophysical aspects of color, color perception, color specification, color measurement and color control.

Prerequisite: PCC 301 and either PY 208 or PY 212; Corequisite: PCC 354
Typically offered in Spring only

PCC 354 Intro to Color Science Laboratory (1 credit hours)
An introdiction to hands-on laboratory work for the color measurement and perceotion of colored materials.

Prerequisite: PCC 301 and either PY 208 or PY 212; Corequisite: PCC 350
Typically offered in Spring only

PCC 404 Introduction to the Theory and Practice of Fiber Formation (3 credit hours)
Flow behavior of polymeric materials as related to the formation of fibers by melt, dry and wet extrusion. Elementary theories of drawing and heat setting. Application of fiber-forming theories to synthetic and cellulosic fibers. Offered in Fall only.

Prerequisite: TE 200 and (CH 201 or CH 203) and ((PY 208 and PY 209) or PY 212) and (MA 231 or MA 241)
Typically offered in Fall and Spring

PCC 410 Textile Preparation and Finishing Chemistry (3 credit hours)
Topics in textile wet processing. Chemical mechanisms and unit operations in fabric preparation and finishing.

Prerequisite: PCC 301
Typically offered in Fall only

PCC 412 Textile Chemical Analysis (2 credit hours)
Application of analytical techniques for analysis to fibers, textile chemicals and textile processes; atomic absorption, ultraviolet, visible, near-infrared and infrared spectrophotometer; chromatography; interfacial tension; calorimetric, gravimetric and complexometric analyses. Emphasis on interpretation of data and solving problems of analysis for quantitate and characterization purposes.

Prerequisite: PCC 301 and (CH 331 or CH 433 or TE 303); Corequisite: PCC 414
Typically offered in Spring only

PCC 414 Textile Chemistry Analysis Lab (1 credit hours)
Laboratory course in the application of analytical techniques for analysis of fibers, textile chemicals and textile processes; atomic absorption, ultraviolet, visible, near-infrared and infrared spectrophotometery; chromatography; interfacial tension; calorimetric, gravimetric and complexometric analyses. Emphasis on interpretation of data solving problems of analysis for quantitavive and characterization purposes.

Prerequisite: PCC 301 and (CH 331 or CH 433 or TE 303); Corequisite: PCC 412
Typically offered in Spring only

PCC 420 Textile Dyeing and Printing (3 credit hours)
Topics in coloration of textile fibers; chemical and physical mechanisms in textile dyeing and printing.

Prerequisite: PCC 301
Typically offered in Spring only

PCC 442 Theory of Physico-Chemical Processes in Textiles II (3 credit hours)
Second semester of a two-semester sequence. Ideal and non-ideal solutions, colligative properties. Electro chemistry, dyeing isotherms, chemical kinetics, surface chemistry, theory of repellency and other special topics.

Prerequisite: TE 303 or CH 331 or CH 433
Typically offered in Fall only

PCC 461 Chemistry of Polymeric Materials (3 credit hours)
Polymers are a critical component of most products used by society today. Knowledge of their formation and properties is key to development of the materials of the future. The formation and properties of the major polymers are the primary focus areas of this course, including Step-growth and Chain-growth polymerization, formation techniques for preparation of synthetic fibers and the fundamental relationships between chemical structure and physical properties of natural and synthetic polymers.

Prerequisite: (CH 220 and TE 200) or CH 223 or CH 227; Corequisite: PCC 464
Typically offered in Fall only

PCC 462 Characterization and Physical Properties of Polymers (3 credit hours)
Properties unique to polymers are related to their high molecular weight, long and flexible chains, or polymers physics. The detailed molecular structures of polymer, pr polymer chemistry, are characterized and utilized to establish structure-property relations. An inside/outside approach connects their microstructures to their local conformational flexibilities, which impact their global responses, such as sizes and shapes and conformational entropies, to both their environments and the stresses placed upon them.

Prerequisite: PCC 461
Typically offered in Spring only

PCC 464 Chemistry of Polymeric Materials Laboratory (1 credit hours)
Polymers are a critical component of most products used by society today. Understanding their formation and properties is key to development of the materials of tomorrow. This laboratory course is focused on preparation of the major synthetic polymers using step-growth and chain-growth polymerization techniques. The properties of the resultant polymers are studied.

Prerequisite: (CH 220 and TE 200) or CH 223 or CH 227; Corequisite: PCC 461
Typically offered in Fall only

PCC 466 Polymer Chemistry Laboratory (3 credit hours)
Synthesis and characterization of polymers; thermodynamics of rubber elasticity and gelation; spectroscopic, thermal and scattering techniques for polymer analysis. The processing of polymers into fibers and films.

Prerequisite: (CH 331 or TE 303 or CH 433) and Senior Standing
Typically offered in Spring only

PCC 471/MT 471 The Chemistry of Synthetic and Natural Bipolymers (3 credit hours)
Introduction to natural and synthetic biopolymers used for biomedical applications. Goals and challenges of biomaterials selection for biomedical engineering. Polymer concepts of polymerization and characterization. Sources/synthesis, chemical and physical properties and degradation mechanisms are described. Polymer classes include: polysaccharides, proteins, polyesters, polyurethanes, polyanhydrides and polyethers.

Prerequisite: CH 220 or 221 or 225
Typically offered in Spring only

PCC 474 Forensic Chemistry Laboratory (3 credit hours)
Forensic chemistry is the application of chemistry to the law. It is a key part of crime scene investigations. In this course, students work in teams and discover standard methods of crime scene processing, latent evidence processing and analysis of materials and chemicals germane to forensic trace evidence. Advanced analytical chemistry techniques will be learned and applied to solve a 'crime' with suspects. Students will attempt to solve the crime and will present their analytical evidence in a courtroom setting with cross-examination.

Prerequisite: (CH 220 or CH 223 or CH 227) and TMS 211
Typically offered in Fall only

PCC 490 Undergraduate Research in Polymer and Color Chemistry (1-6 credit hours)
Faculty-supervised individual research for undergraduates in PCC. Students must find an advisor from within the department with whom to work on a regular basis. Intended for PCC majors. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PCC 301 and PCC 461/CH 461 and (TE 303 or CH 331 or CH 433).
Typically offered in Fall and Spring

PCC 491 Seminar in Polymer and Color Chemistry (1 credit hours)
Familiarizes student with the principal sources of polymer and color chemistry literature and emphasizes importance of keeping abreat of developments in the field. Emphasizes fundamentals of technical writing. Arranged. Intended for PCC majors3

Prerequisite: Senior standing
Typically offered in Fall, Spring, and Summer

PCC 492 Special Topics in Polymer and Color Chemistry (3 credit hours)
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

Typically offered in Fall, Spring, and Summer

Poultry Science (PO)

PO 150 Poultry Management (3 credit hours)
Principles and practices of commercial market turkey, broiler, and roaster managment. Includes breeding, nutrition, housing, related production parameters, and an examination of contracts and grower-company relationships.

Requisite: Agricultural Institute Only
Typically offered in Spring only

PO 162/VMP 162 Livestock and Poultry Disease Management (3 credit hours)
Basic principles of disease and disease management in livestock and poultry. Disease prevention through sanitation and vaccination. Diseases of horses, pigs, ruminants, poultry, and disease prevention programs for each species

Requisite: Agricultural Institute Only
Typically offered in Spring only

PO 201/PO 201A Poultry Science and Production (3 credit hours)
Fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing.

Co-requisite: PO 202
GEP Natural Sciences
Typically offered in Fall and Spring

PO 201A/PO 201 Poultry Science and Production (3 credit hours)
Fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing.

Co-requisite: PO 202
GEP Natural Sciences
Typically offered in Fall and Spring

PO 202/PO 202A Poultry Science and Production Laboratory (1 credit hours)
This laboratory course will cover the fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing. This course includes field trips for which transportation will be provided.

Corequisite: PO 201
GEP Natural Sciences
Typically offered in Fall and Spring

PO 202A/PO 202 Poultry Science and Production Laboratory (1 credit hours)
This laboratory course will cover the fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing. This course includes field trips for which transportation will be provided.

Corequisite: PO 201
GEP Natural Sciences
Typically offered in Fall and Spring

PO 212 Poultry and People: Why did the chicken cross the world? (3 credit hours)
Poultry species play a vital role in modern society. This course engages students to develop research skills including information literacy, data collection, and developing arguments based on evidence. Specific course topics are developed by students during each course offering. General course content will include, but is not limited by the following topics: History of Domestication, Religious Symbolism, Social and Culinary Practice, and Modern Poultry Production (post-1950) commercial and hobby. Delivery of this course will be inquiry based and focus on utilizing research techniques to gather information, develop a hypothesis, collect information, interpret the results, and report findings in multiple formats.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

PO 215 Applied Avian and Aquaculture Nutrition (3 credit hours)
Comparison of poultry and aquaculture digestive systems, nutrient requirements, formulation and nutritional management, influence of growth and production curves, consumption patterns, and feeding management in commercial poultry and aquaculture industries. Feed manufacturing and government regulations.

Prerequisite: CH 101 and CH 102
Typically offered in Spring only

PO 290 Poultry Seminar (1 credit hours)
Exploration of topics related with current and future potential to influence the poultry industry. Guest lectures from industry representatives will include: vertically integrated poultry production, primary breeders, marketing, animal health, veterinary medicine as it relates to poultry, allied equipment manufacturers, and management of poultry companies. Special emphasis on summer internships and career services.

Prerequisite: Sophomore standing
Typically offered in Fall only

PO 322/ANS 322/FS 322 Muscle Foods and Eggs (3 credit hours)
Processing and preserving fresh poultry, red meats, seafood, and eggs. Ante- and post-mortem events as they affect quality, yield, and compositional characteristics of muscle foods. Principles and procedures involved in the production of processedmeat items.

Prerequisite: ZO 160, BIO 181 or BIO 183
Typically offered in Fall only

PO 340 Live Poultry and Poultry Product Evaluation, Grading, and Inspection (3 credit hours)
To provide students with experience handling live poultry as well as working with an learning about USDA grades and evaluation of poultry meat, meat products, and eggs. Develop an understanding of product specifications.

Prerequisite: PO 201
Typically offered in Fall only

PO 404/PO 504 Avian Anatomy and Physiology (4 credit hours)
Principles of avian physiology integrating physiological functions and anatomical structures of organs and organ systems. Practical problems associated with poultry production. The importance of maximizing growth and productivity via exploitation of environmental influences on physiological systems. Credit not given for PO 404 and 504.

Prerequisite: PO 201
Typically offered in Fall only

PO 406/PO 506 Physiological Aspects of Poultry Management (3 credit hours)
Application of physiological principles to modern poultry management and research. Poultry physiology will be related to practical and research management topics including nutrition, housing, ventilation, disease, heat stress, and lighting programs. Students cannot receive credit for both PO 406 and PO 506.

Prerequisite: PO 201, Corequisite: PO 407
Typically offered in Fall only

PO 407 Physiological Aspects of Poultry Management Laboratory (1 credit hours)
Practical experience with poultry husbandry, animal environment management, and feeding in a research environment Laboratory exercises include feeding and nutrition programs, weighing birds, lighting management and infrastructure, biosecurity and sanitation, vaccinations, hatching egg management, brooding, ventilation programs and infrastructure, housing design and infrastructure, SOP development, human safety and health training, and animal care training. Laboratory exercises will prepare students for both commercial poultry industry and animal research management careers. Co-requisite with PO 406. Personal transportation to Chicken Educational Unit required.

Prerequisite: PO 201, Corequisite: PO 406
Typically offered in Fall only

PO 410 Production and Management of Game Birds in Confinement (3 credit hours)
Management principles associated with the successful propagation and rearing of game birds, ornamental birds and waterfowl in confinement. Housing and pen requirements, nutrition, disease control and regulatory issues included.

PO 411 Agrosecurity (3 credit hours)
This course is designed to increase the awareness of the issues and vulnerabilities of the IS agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is organized to integrate and assimilate knowledge across multiple disciplines including agriculture, animal health, human health, infectious diseases, business, economics, and public policy. Students will identify and analyze the interactions between these disciplines in light of increasing population and concentrated agriculture's increased vulnerability to major disruptions in food production. Students will also analyze where potential links in the food chain are susceptible to disruptions by individuals (or natural disasters), the consequences of these disruptions, and how to minimize the associated risks by developing case studies and strategies for defending against specific threats. Students must have junior standing.

Junior standing or above
GEP Interdisciplinary Perspectives
Typically offered in Spring only

PO 412 Emerging Topics in Poultry Science (3 credit hours)
This course is designed to allow students to merge science taught in previous Poultry Science courses with topics considered of interest or emerging in the poultry industry. Students will utilize science and critical thinking skills to solve real world scenarios. This course is designed for students that have completed PO 201 and PO 202. Junior or Senior standing.

Typically offered in Spring only

PO 415/PO 515/NTR 515/ANS 515/ANS 415/NTR 415 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

PO 421 Commercial Egg Production (3 credit hours)
Principles and current practices of commercial egg production. The Commercial Egg Industry as it is currently evolving and operating in the US. We will examine the development of the industry as it has progressed through integration, consolidation, and expansion. We will also look at the outside influences on the industry such as federal government, European Economic Community (EEC) perspective, animal welfare and consumer desire for naturally raised poultry and poultry products.

Prerequisite: PO 201
Typically offered in Spring only

PO 424 Poultry Meat Production (3 credit hours)
Principles and current practices of vertically integrated broiler and turkey production; encompassing management, nutrition, poultry health, environmental, and related areas.

Prerequisite: PO 201
Typically offered in Spring only

PO 425/NTR 525/FM 525/ANS 525/PO 525/NTR 425/ANS 425/FM 425 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall and Spring

PO 426/FM 426 Feed Manufacturing Technology Laboratory (1 credit hours)
Laboratory associated with feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture. PO/ANS/FM 425 is a required course for the Poultry Science Technology Concentration (TPS); the Feed Milling Minor (FEM); and the Feed Mill Certificate.

Corequisite: PO 425 or ANS 425 or FM 425 and FEM minor or 11PLTRYBS
Typically offered in Spring only

PO 433/PO 533 Poultry Processing and Products (3 credit hours)
Poultry processing, further processing, and resulting products as affected by basic muscle composition and function during the conversation of muscle to meat. Microbiology of spoilage and pathogenic organisms, and the regulatory and HACCP programs designed to minimize problems. Overall business functions of poultry processing to understand profit/loss factors, and skills necessary for communication and management. Various sections on sanitary design/construction, pest control, wastewater treatment, and further processed egg products. Credit for both PO 533 and PO 433 is not allowed. Transportation to field trips will be provided. Non-scheduled class time for field trips or out-of-class activities may be required for this class. Transportation to scheduled labs at Lake Wheeler CEU/Poultry Processing Lab will be provided by students.

Prerequisite: PO 201
Typically offered in Fall only

PO 435 Poultry Incubation & Breeding (4 credit hours)
Principles and current practices of modern poultry incubation and breeding production systems. Students will be able to describe basic elements of breeding management and production practices, to apply those elements to specific scenarios, and to strengthen their ability to interpret and make critical judgements relative to the breeding of poultry, production of hatching eggs, and the subsequent incubation and hatching process.

Prerequisite: PO 201
Typically offered in Spring only

PO 492 External Learning Experience (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

PO 493 Special Problems in Poultry Science (1-6 credit hours)
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

PO 495 Special Topics in Poultry Science (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

PO 504/PO 404 Avian Anatomy and Physiology (4 credit hours)
Principles of avian physiology integrating physiological functions and anatomical structures of organs and organ systems. Practical problems associated with poultry production. The importance of maximizing growth and productivity via exploitation of environmental influences on physiological systems. Credit not given for PO 404 and 504.

Prerequisite: PO 201
Typically offered in Fall only

PO 506/PO 406 Physiological Aspects of Poultry Management (3 credit hours)
Application of physiological principles to modern poultry management and research. Poultry physiology will be related to practical and research management topics including nutrition, housing, ventilation, disease, heat stress, and lighting programs. Students cannot receive credit for both PO 406 and PO 506.

Prerequisite: PO 201, Corequisite: PO 407
Typically offered in Fall only

PO 510 Poultry Product Safety: An On-Farm Model (3 credit hours)
Typically offered in Spring only

PO 515/NTR 515/ANS 515/ANS 415/NTR 415/PO 415 Comparative Nutrition (3 credit hours)
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227
Typically offered in Fall, Spring, and Summer

PO 524/ZO 524/PHY 524 Comparative Endocrinology (3 credit hours)
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

Prerequisite: BIO 421 or PO 405
Typically offered in Spring only

PO 525/NTR 425/ANS 425/FM 425/PO 425/NTR 525/FM 525/ANS 525 Feed Manufacturing Technology (3 credit hours)
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225
Typically offered in Fall, Spring, and Summer

PO 533/PO 433 Poultry Processing and Products (3 credit hours)
Poultry processing, further processing, and resulting products as affected by basic muscle composition and function during the conversation of muscle to meat. Microbiology of spoilage and pathogenic organisms, and the regulatory and HACCP programs designed to minimize problems. Overall business functions of poultry processing to understand profit/loss factors, and skills necessary for communication and management. Various sections on sanitary design/construction, pest control, wastewater treatment, and further processed egg products. Credit for both PO 533 and PO 433 is not allowed. Transportation to field trips will be provided. Non-scheduled class time for field trips or out-of-class activities may be required for this class. Transportation to scheduled labs at Lake Wheeler CEU/Poultry Processing Lab will be provided by students.

Prerequisite: PO 201
Typically offered in Fall only

PO 580/FM 580 Feed and Ingrdient Quality Assurance (3 credit hours)
The course will teach students the principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

Prerequisite: NTR(FM) 525
Typically offered in Fall only

PO 590 Special Problems in Poultry Science (1-6 credit hours)
.

Typically offered in Fall, Spring, and Summer

PO 601 Seminar (1 credit hours)
Preparation for research, research perspectives, rising concerns in poultry production, orientation for graduate studies in poultry science. Required of all graduate students in the Department of Poultry Science.

Typically offered in Spring only

PO 620 Special Problems (1-6 credit hours)
Specific problems of study assigned in various phases of poultry science.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PO 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PO 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

PO 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

PO 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring and Summer

PO 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

PO 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PO 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

PO 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PO 757/IMM 757 Comparative Immunology (3 credit hours)
Compare and contrast the immune system structure and function of animal species of agricultural and veterinary significance with that of humans and traditional biomedical model organisms. Discuss key evolutionary differences, how different species use different mechanisms to achieve the same outcomes, and the clinical implications for these differences.

Prerequisite: MB 751 or MB 441 or BIO 414
Typically offered in Spring only

PO 775/NTR 775 Mineral Metabolism (3 credit hours)
Requirements, function, distribution, absorption, excretion and toxicity of minerals in humans and domestic animals. Interactions between minerals and other factors affecting mineral metabolism or availability. Emphasis on mechanisms associated withmineral functions and the metabolic bases for the development of signs of deficiency.

Prerequisite: ANS(NTR,PO) 415, BCH 451 and ZO 421
Typically offered in Fall only

PO 801 Graduate Seminar In Poultry Science (1 credit hours)
Preparation for research, research perspectives, rising concerns in poultry production, orientation for graduate studies in poultry science. Required of all graduate students in the Department of Poultry Science.

Typically offered in Spring only

PO 820 Special Problems In Poultry Science (1-6 credit hours)
Specific problems of study assigned in various phases of poultry science.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PO 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planing for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

PO 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Spring only

PO 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Spring only

PO 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PO 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PO 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Professional Writing (WRT)

WRT 111 Expository Writing (3 credit hours)
Emphasis on writing process including audience analysis, topic selection, thesis support and development, editing and revision. Upon completion, students should be able to prepare unified, coherent, well-developed essays using standard written English. AGI majors only. C-Wall course; prerequisite for WRT 114, professional Writing, Research and Reporting.

Requisite: Agricultural Institute Only
Typically offered in Fall and Spring

WRT 114 Professional Writing, Research and Reporting (3 credit hours)
Emphasis placed on research, listening, critical thinking, analysis, interpretation and design used in oral and written presentations. Upon completion, students should be able to work individually and collaboratively to produce well-designed and professionally written and oral presentations. Restricted to AGI majors; C-Wall course.

Prerequisite: WRT 111
Typically offered in Fall and Spring

Psychology (PSY)

PSY 200 Introduction to Psychology (3 credit hours)
Survey of basic principles for the understanding of behavior and experience including development, learning, cognition, biological foundations, perception, motivation, personality, behavior abnormalities, measurement of individual differences, and social processes. The value of scientific observation and experimentation to the development of psychological understanding is emphasized.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PSY 208 Psychobiology of Success (3 credit hours)
Exploration of what happens within your body when you experience stress, techniques to alter your body's response, ways to manage your thoughts and emotions to enhance your performance. Development of an understanding of why your physiology and your background do not have to determine your future. Across all topics, students will critically examine biological, psychological, and medical evidence regarding stress responses, stress management and optimizing functioning.

GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Summer only

PSY 230 Introduction to Psychological Research (3 credit hours)
This course is an introduction to the principles of scientific research. Students will develop and test research hypotheses in accordance with methods approved by the American Psychological Association. Methods of analyzing data and the interpretation of research findings will be stressed. Students will work in teams to collect, analyze, report, and provide a professional presentation of a group research project. Psychology majors and minors must take the course under the graded option.

Prerequisite: PSY 200
Typically offered in Fall, Spring, and Summer

PSY 240 Introduction to Behavioral Research I (3 credit hours)
Introduction to quantitative methods in psychology, including measurement, experimental control, validity, and fundamentals of research design. Discussion of distributions and statistical inference. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PSY or HRD Majors, PSY 200, Corequisite: PSY (ST) 241
Typically offered in Fall and Spring

PSY 241 Introduction to Behavioral Research I Lab (1 credit hours)
Students design, analyze and report a variety of simple experiments. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PSY or HRD Majors, PSY 200, Corequisite: PSY (ST) 240
Typically offered in Fall and Spring

PSY 242 Introduction to Behavioral Research II (3 credit hours)
Continuation of PSY (ST) 240. Ethics of Research in Psychology. Techniques for the development of research proposals. Statistical techniques for data analysis including non-parametrics, one-way and two-way ANOVA and introduction to correlation and regression. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PSY or HRD Majors, PSY (ST) 240, Corequisite: PSY (ST) 243
Typically offered in Fall and Spring

PSY 243 Introduction to Behavioral Research II Lab (2 credit hours)
Design and analysis of a major research project. Individualized/ Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PSY or HRD Majors, PSY (ST) 240, Corequisite: PSY (ST) 242
Typically offered in Fall and Spring

PSY 307 Industrial and Organizational Psychology (3 credit hours)
Surveys the application of psychological theories and methods to problems involving people in working settings. Topics include: organizational and management theory; work motivation and job satisfaction; job and organizational analysis; performance evaluation; personnel recruitment, selection, and placement; and personnel training and development.

Prerequisite: PSY 200 or PSY 201
Typically offered in Fall, Spring, and Summer

PSY 311 Social Psychology (3 credit hours)
Theory and research on how individuals respond and are responded to in social situations. Topics include attitude formation and change, affiliation, attraction, self and interpersonal perception, interpersonal relationships, aggression, helping behavior, intergroup behavior, and group dynamics.

Prerequisite: PSY 200 or PSY 201
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PSY 312 Applied Psychology (3 credit hours)
Covers diverse areas of psychological practice, related methods and ethical issues. Includes illustrative cases of psychological practice in health, education, work settings, law, sports, consumer markets, and cross-cultural settings. Explores professional roles and contributions in the contexts of social, organizational and technological change.

Prerequisite: PSY 200 or PSY 201
Typically offered in Fall and Spring

PSY 313 Positive Psychology (3 credit hours)
Positive psychology is the scientific study of positive experience, positive individual traits, and the institutions and practices that facilitate their development. This course reviews the history of positive psychology and the contributions this new field has made to several traditional research areas in psychology. Among other issues, the course will address the questions such as: What is happiness and how should we measure it? What determines subjective well-being? Can (and should) we deliberately increase happiness? (Restricted to psychology majors)

Prerequisite: PSY 200
Typically offered in Fall and Spring

PSY 340 Human Factors Psychology (3 credit hours)
This course covers the fundamental principles of Human Factors Psychology - the science and practice of understanding the fit between people and the systems with which they interact - by focusing on improving efficiency, creativity, productivity, and safety. The course provides an overview of fundamental topics, such as perception, attention, memory, decision making, and motor control, as well as specific domains within the field, such as information technology, healthcare, aging, and transportation with an emphasize on the methods used for research and design in Human Factors.

P: PSY 200
Typically offered in Fall and Spring

PSY 345/AFS 345 Psychology and the African American Experience (3 credit hours)
Historical and cultural examination of the psychological experiences of African American experience from pre-American times to the present. Focus on mental health, personality, identity development, racism, oppression, psychological empowerment andan African-centered world view. Discussion of contemporary issues within the African American community.

Prerequisite: PSY 200 or PSY 201
GEP U.S. Diversity
Typically offered in Fall and Spring

PSY 360 Community Psychology Principles and Practice (3 credit hours)
This course provides an introduction to the field of community psychology. The aim of this course is to help empower students to contribute to effective social change in their communities. Community psychology focuses upon person-environment interactions and the ways individuals navigate between different social contexts (e.g. schools, neighborhood, community, and society). Community psychologists employ a variety of methodological approaches to understand the social issues facing communities today such as juvenile violence, homelessness, HIV-AIDS, and domestic violence.

Prerequisite: PSY 200
Typically offered in Fall and Spring

PSY 370 Personality (3 credit hours)
Major personality theories. Definition of personality associated with each theory as well as the assumptions and principles used in accounting for human behavior. Theories evaluated considering recent research.

Prerequisite: PSY 200
Typically offered in Fall, Spring, and Summer

PSY 376 Developmental Psychology (3 credit hours)
Behavioral development during the life span, including study of current theories and project work with persons at various stages of the life cycle.

Prerequisite: PSY 200 or EDP 304
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PSY 400 Perception (3 credit hours)
Anatomy and physiology of the major sensory systems, their relationship to central structures of the brain, important and/or common pathological conditions. Basic issues and techniques of psychophysics. Perceptual phenomena and theory, with an emphasis on topics in two-and three-dimensional spatial perception, including the perceptions of size, depth and motion. Consideration of perceptual phenomena in practical settings.

Prerequisite: PSY 200 or PSY 201, Junior/Senior
Typically offered in Fall and Spring

PSY 406/WGS 406 Psychology of Gender (3 credit hours)
This course is designed to introduce students to the origins and significance of the study of gender differences and gender relations from a psychological perspective. The course focuses on current theory and research on perceived and actual biological, social, cognitive, personality and emotional similarities and differences of men and women throughout the lifespan as well as the construction and meaning of gender in our society.

Prerequisite: PSY 200 or WGS 200
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

PSY 410 Learning and Motivation (3 credit hours)
Introduction to the primary laboratory research areas in learning and motivation: classical conditioning, operant conditioning, verbal learning, drive theory, and the role of motives. Emphasis upon research on conditioning and its motivational processes as the foundations for techniques in behavior modification. Examination of both the uses and limitations of current information on learning and motivation.

Prerequisite: PSY 200, Junior standing
Typically offered in Fall and Spring

PSY 411 The Psychology of Interdependence and Race (3 credit hours)
The Psychology of Interdependence and Race is designed to explore how interpersonal relationships are structured and how two-person interactions within those structures are influenced by race. Drawing on the major social psychological theory of interpersonal relationships - Interdependence Theory - this course will provide students with an understanding of the various structures of interpersonal relationships in order to explore how and why the presence of race (and other diversity categories) influence the ways in which people try to interact with each other within those interpersonal structures.

Prerequisite:PSY 311
Typically offered in Fall and Spring

PSY 416 Psychology of Emotion (3 credit hours)
Introduction to the classic and contemporary theories of emotion, with strong emphasis on how data provide evidence to test theory. Biological, cognitive, social, and cultural foundations are explored.

Prerequisite: PSY 200
Typically offered in Fall and Spring

PSY 420 Cognitive Processes (3 credit hours)
Introduction to research and theory in cognition, including such topics as memory, acquisition and use of language, reading, problem-solving, reasoning, and concepts.

Prerequisite: PSY 200, Junior standing
Typically offered in Fall, Spring, and Summer

PSY 425/PHI 425 Introduction to Cognitive Science (3 credit hours)
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

Prerequisite: One upper-level PHI, PSY, CSC or Linguistics course. Credit is not allowed for PHI 425 and PHI/PSY 525.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

PSY 430 Biological Psychology (3 credit hours)
Biological mechanisms of behavior, including elementary neuroanatomy and neurophysiology, sensory and motor processes, and their application to motivation, learning, and psychological processes.

Prerequisite: PSY 200 and (BIO 105/106 or BIO 181)
Typically offered in Fall, Spring, and Summer

PSY 431 Health Psychology (3 credit hours)
Introduction to health psychology. This course provides an overview of the field of health psychology, which is concerned with how behavior and psychological states influence physical health (i.e., how people stay healthy, why people become ill, and how people respond to illness). Application of psychological theory and research methods to such topics as: pain, stress and coping, helplessness and control, reactivity to stress, the effectiveness of behavioral interventions in health, illness prevention, health maintenance, recovery from injury and chronic pain, adjustment to chronic illness, treatment compliance.

Prerequisite: PSY 200 and (PSY 230 or PSY 240/242 OR equivalent research methods course).
Typically offered in Fall and Spring

PSY 432 Human Sexuality and Intimate Relationships (3 credit hours)
The course will focus on sexuality and intimate relationships from a biopsychosocial approach. We will explore concepts such as the development of gender identity and gender roles, sexual identity, intimacy, and sexuality across the lifespan by applying different psychological, cultural, and biological approaches, as well as discussing different research methods in the area of sexual and relationship science.

Prerequisite: PSY 200
GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Fall only

PSY 436 Introduction to Psychological Measurement (3 credit hours)
The basic principles of psychological measurement, including elementary statistical concepts, reliability, and validity. Emphasizes measurement in the science of psychology. Application of measurement principles to a wide variety of measurement problems.

Prerequisite: PSY 240-241
Typically offered in Spring only

PSY 465 Advanced Methods in Psychology (3 credit hours)
Provides students with practical experience in psychological research. Emphasis will be on hands-on training in analyzing data to develop practical problem-solving skills important in psychology research as well as in other related careers working with data.

Prerequisite: PSY 230 and ST 311
Typically offered in Fall and Spring

PSY 470 Abnormal Psychology (3 credit hours)
Common psychological disorders of children and adults. Historical and theoretical perspectives on abnormal behavior; issues of assessment and classification, etiology, symptoms, and treatment of disorders.

Prerequisite: PSY 200 or 304 or EDP 304
Typically offered in Fall, Spring, and Summer

PSY 475 Child Psychology (3 credit hours)
Theories, methods, and phenomena of child psychology and application of this information to the enhancement of child development. Multiple aspects of development, including physical, cognitive/intellectual, and social/emotional development, from conception to adolescence. Emphasis on recent research findings in developmental psychology.

Prerequisite: PSY 200 or 304 or EDP 304; PSY 376
Typically offered in Fall and Spring

PSY 476/EDP 476 Psychology of Adolescent Development (3 credit hours)
Theories, principles, and issues of human psychological development emphasizing adolescence. Cognitive, social, and physical changes; their interaction. Implications for teaching and parenting adolescents.

Prerequisite: PSY 200 or EDP 304
Typically offered in Fall, Spring, and Summer

PSY 491/PSY 590 Special Topics in Psychology (3 credit hours)
Exploration in depth of advanced areas and topics of current interest in psychology.

Prerequisite: PSY 200
Typically offered in Fall and Spring

PSY 495 Community-Based Applied Psychology (4 credit hours)
Service learning course that covers one or more areas of psychological practice, including relevant research methods, community engagement principles and practices, and ethical issues. Includes learning about psychological practice in at least one of the following settings: health, education, work settings, law, sports, community-based setting, consumer markets, and/or cross-cultural settings. Explores professional roles and contributions in the contexts of social, education, organizational and/or technological change. An internship liability insurance fee is required.

Prerequisite: PSY 200 and PSY 230
Typically offered in Fall and Spring

PSY 498 Psychology Honors Seminar (3 credit hours)
Seminar and independent study under faculty direction. Provides the undergraduate psychology honors students with an opportunity to practice skills in designing, conducting, and evaluating research. The student, working closely with a faculty advisor, designs a research approach to a particular body of literature, accumulates appropriate data, and analyzes and evaluates the data. Must take two semesters

Prerequisite: HRD and PSY honors students
Typically offered in Fall and Spring

PSY 499 Individual Study in Psychology (1-6 credit hours)
Individual research project (literature review, experiment, survey, field study) open to any undergraduate, under the direction of a Psychology Department faculty member.

Corequisite: PSY 495 for HRD majors during their work semester
Typically offered in Fall, Spring, and Summer

PSY 500 Visual Perception (3 credit hours)
Detailed consideration of anatomy and physiology of visual system (both peripheral and central components). Modern quantitative approaches to psychophysical problems of detection, discrimination, scaling. Examination of chief determinants of visual perception, including both stimulus variables and such organismic variables as learning, motivation and attention. Discussion of perceptual theory and processes emphasizes several topics in two- and three-dimensional spatial perception.

Prerequisite: Graduate standing
Typically offered in Fall only

PSY 502 Physiological Psychology (3 credit hours)
Physiological foundations of behavior, basic vertebrate neuroanatomy and neurophysiology.

Prerequisite: Twelve hours of PSY including PSY 200, 400,410
Typically offered in Spring only

PSY 504 Evolutionary Psychology (3 credit hours)
Emphasis upon use of evolutionary theory to understand the interaction of genetic and environmental influences on human behavior and thought. Topics include human mating, kinship, parenting, cooperation, aggression, cognition, and morality.

Typically offered in Fall and Spring

PSY 508 Cognitive Processes (3 credit hours)
Emphasis upon the results from research on a number of complex processes (e.g., remembering, concept learning, problem solving, acquisition and use of language) and the theories that have been proposed to explain these results.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

PSY 510 Advanced Problems In Psychology (1-3 credit hours)
Offers opportunities to explore various areas of psychology. Sections: Section D, developmental psychology; Section X, experimental psychology; Section I, industrial-organizational and vocational psychology; Section S, social psychology.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PSY 511 Advanced Social Psychology (3 credit hours)
A survey of theory and research in social psychology through reading and discussion of primary source materials. In addition, the course deals with issues of methodology, ethical questions in social psychological research and application of researchfindings to the world at large.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

PSY 525/PHI 525 Introduction To Cognitive Science (3 credit hours)
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

Prerequisite: Graduate standing. Credit is not allowed for PHI 525 and PHI/PSY 425.
Typically offered in Spring only

PSY 535 Tests and Measurements (3 credit hours)
A study of the principles of psychological testing including norms and units of measurement, elementary statistical concepts, reliability and validity. In addition, some attention devoted to the major types of available tests such as general intellectual development, tests of separate abilities, achievement tests, measures of personality and interest inventories.

Prerequisite: Six hours of PSY program
Typically offered in Fall and Spring

PSY 540/ISE 540 Human Factors In Systems Design (3 credit hours)
Introduction to problems of the systems development cycle, including human-machine function allocation, military specifications, display-control compatibility, the personnel sub-system concept and maintainability design. Detailed treatment given to people as information processing mechanisms.

Prerequisite: IE 452 or PSY 340, Corequisite: ST 507 or 515
Typically offered in Spring only

PSY 541 Overview of Human Factors Psychology (3 credit hours)
An overview of Human Factors Psychology covering a large number of tools, topics, and exercises important for the field of human factors. Includes topics fundamental to human factors research, such as attention, decision making, and motor control, as well as specific domains within human factors, such as information technology, healthcare, aging, and transportation, with particular emphasis on the methods used for study of these areas. A group project will give students experience with the usability evaluation process.

Typically offered in Fall only

PSY 558 Psychology and the African Experience (3 credit hours)
An ethnographic approach to the psychology of peoples of African descent through examination of the influence of historical and cultural phenomena. Specific attention to understanding the Africentric world view and issues of mental health, personality and identity development, racism, oppression and empowerment.

Prerequisite: Six hours PSY program
Typically offered in Spring only

PSY 582/EDP 582 Adolescent Development (3 credit hours)
Current theories and research on development during adolescence. Topics include: physical growth, cognitive changes, relationships with peers, parents and teachers, quest for identity and independence, morality and sexuality.

Prerequisite: 6 hours in PSY
Typically offered in Spring and Summer

PSY 584 Advanced Developmental Psychology (3 credit hours)
A survey of the role of growth and development in human behavior, particularly during the child and adolescent periods. This course pays particular attention to basic principles and theories in the area of developmental psychology.

Prerequisite: Nine hrs. of PSY, including PSY 376, PSY 475 or PSY 476
Typically offered in Fall only

PSY 590/PSY 491 Special Topics in Psychology (3 credit hours)
Exploration in depth of advanced areas and topics of current interest in psychology.

Prerequisite: PSY 200
Typically offered in Fall and Spring

PSY 591 History and Systems Of Psychology (1-3 credit hours)
Aim of this course is to acquaint students with the history of psychology and psychological systems and to give students some practice in taking different approaches to a particular problem area.

Prerequisite: PSY 200,400,410,420, Consent of Instructor or Graduate standing
Typically offered in Spring only

PSY 641 Psychological Clinic Practicum (1-12 credit hours)
Clinical participation in interviewing, counseling, psycho-therapy and administration of psychological tests. Practicum to be concerned with adults and children.

Prerequisite: Twelve hrs. in grad. PSY, which must include clinical skill courses PSY 722 and PSY 723.
Typically offered in Fall and Spring

PSY 651 Internship In Psychology (1-6 credit hours)
Supervised work experience in an appropriate setting with professional supervision in the field from a doctoral level psychologist with credentials and/or experience in the appropriate specialty in psychology. Experience consists of full time for one semester or half time for an academic year or equivalent time.

Prerequisite: Approval of advisory committee
Typically offered in Fall and Spring

PSY 680 Directed Study Psychology (1-6 credit hours)
Research project for graduate students supervised by members of the graduate faculty. Research to be elected on basis of interest of student and not to be part of thesis or dissertation research. Credits Arranged

Typically offered in Fall, Spring, and Summer

PSY 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PSY 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PSY 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PSY 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

PSY 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall and Spring

PSY 704 Learning and Motivation (3 credit hours)
A systematic analysis of some of the major classes of variables determining behavioral change. Learning variables analyzed within their primary experimental setting, and emphasis upon the diversity of the functions governing behavior change rather than upon the development of some comprehensive theory. Examination of both learning and motivational variables as they contribute to changes in performance within the experimental setting.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

PSY 705 Affect and Cognition (3 credit hours)
Critical examination of research and theory dealing with the intersection of affect and cognition. Topics will include the impact of emotion, mood and other aspects of affective experience on memory, decision making, judgment, and reasoning. Developmental and individual difference will be explored, as will the neuropsychological underpinnings of observed relationships.

Prerequisite: SIx Hours of Graduate Level PSY
Typically offered in Spring only

PSY 706/WGS 706 Psychology of Gender (3 credit hours)
Current theory and research on perceived and actual biological, social, cognitive, personality, and emotional similarities and differences of men and women throughout lifespan. Construction and consequences of gender in our society and others.

Typically offered in Fall and Spring

PSY 710 Special Topics In Psychology (1-3 credit hours)
Course provides opportunity for exploration in depth of advanced topical areas which, because of their degree of specialization, are not generally involved in other courses; for example, multivariate methodology in psychology, computer simulation, mathematical model building. Some new 700-level courses will first be offered under this title during developmental phase and as such may involve lectures and/or laboratories.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

PSY 714 Social Psychology: Small Groups Research (3 credit hours)
Surveys the literature and research pertaining to social psychological processes in and between groups. Course content includes basic principles of group formation, role differentiation, communication, influence, norms, social exchange, equity, cooperation/conflict, decision making and pro-social behavior. Environmental factors affecting group behavior also considered. In conjunction with each substantive topic, suitable methodologies for research considered.

Prerequisite: PSY 511
Typically offered in Spring only

PSY 721 Area Seminar In School Psychology (1-6 credit hours)
The following topics dealt with: (1) the development of school psychology as a professional area, (2) methods of inquiry, (3) scientific and theoretical bases, (4) contemporary issues, (5) ethical questions, (6) relationship to other areas within psychology.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

PSY 722 Individual Intelligence Measurement (4 credit hours)
Theoretical approaches to and individual assessment of intellectual functioning, child development, adaptive behavior, and visual motor functioning. Administration, scoring, and interpretation of current standardized instruments and nonstandardizedassessment. Written communication of findings.

Prerequisite: PSY 535 and consent of school psychology coordinator
Typically offered in Fall only

PSY 723 Personality Measurement (3 credit hours)
Theory and practicum in individual personality testing of children and adults with emphasis on projective techniques, other personality measures, report writing and case studies.

Prerequisite: PSY 722
Typically offered in Spring only

PSY 724 Psychological Intervention I (3 credit hours)
Designed to examine theories, research, techniques, ethics and professional responsibilities related to approaches to psychological intervention. Types of psychological intervention include behavior modification, milieu approaches, crisis intervention techniques and group process methods, in addition to more intensive relationship approaches. A close integration of experiences, content and supervision emphasized in a variety of professional settings with a wide range of personal problems and age groups.

Prerequisite: PSY 723
Typically offered in Fall only

PSY 725 Psychological Intervention II (3 credit hours)
The primary purpose of this course is to provide students opportunities to acquire information, conceptual frameworks, interpersonal skills and a sense of ethical responsibility, all basic to their further development as practicing psychologists. A major effort in the course made to help the student increase his/her interpersonal skills as a means of promoting the psychological growth and effective-ness of others.

Prerequisite: PSY 724
Typically offered in Fall only

PSY 727 Psychological Consultation (3 credit hours)
Introduction to psychological consultation with emphasis on school setting. Presentation of various consultation models and theoretical bases. Development of skills in practice of consultation.

Prerequisite: Nine hrs. grad. PSY or ED
Typically offered in Spring only

PSY 740/ISE 740 Engineering Psychology of Human-computer Interaction (3 credit hours)
Exploration of usability of computer technology. Theory and practice of user-centered design for HCI applications. Course focuses on current usability paradigms and principles, psychology of users, iterative and participatory design processes, system requirements specification, prototyping, user support systems, usability evaluation and engineering, interface design guidelines and standards. Application domains include, universal design, virtual reality, and scientific data visualization.

Prerequisite: IE(PSY) 540 or CSC 554

PSY 743/ISE 743 Ergonomic Performance Assessment (3 credit hours)
Fundamentals of ergonomic performance measurement used to assess the effects of environment and system design on human performance. Treatment of topics such as workload measurement, measurement of complex performance, simulator studies, measurement of change, task taxonomies, criterion task sets and statistical methods of task analysis. Problems of laboratory and field research, measurement of change and generalizability of findings.

Prerequisite: PSY 200, ST 507 and 508
Typically offered in Fall only

PSY 745/ISE 745 Human Performance Modeling (3 credit hours)
Advanced aspects of human performance research. Qualitative models of human information processing. Characteristics and role of memory in decision making and response execution. Sensory channel parameters, attention allocation, time-sharing of tasks. Situation awareness and workload responses in complext tasks. Limitations of human factors experimentation. Factors in human multiple task performance. Cognitive task analysis and computational cognitave modeling/simulation of user behavior in specific applications.

Prerequisite: ST 507 or 515 or equivalent; IE (PSY) 540, CSC 554 or IE (PSY) 744

PSY 750 The Psychology of Inequality (3 credit hours)
The following topics dealt with: (1) inequality and social justice as key areas of inquiry for Applied Social and Community Psychology, (2) methods of inquiry for social change, (3) contemporary issues, (4) ethical questions, (5) relationship to other areas within psychology.

Typically offered in Fall only

PSY 751 Intervention Planning & Evaluation (3 credit hours)
Review of the literature, methods and research issues in the field of program intervention, planning and evaluation. Goal-setting, needs assessment, information systems, subjective probability, human resource accounting, decision processes, incentive programs, human productivity and related subjects. Focus on planning and evaluation methods for communities and organizations.

Prerequisite: Graduate standing or PBS status, Corequisite: ST 507
Typically offered in Spring only

PSY 752 Action Research In Psychology (3 credit hours)
Action research models in psychology and their relationships to research methods. Research in field settings and implications for ethics and social responsibility, internal and external validity, experimenter and volunteer effects and problems of measurement.

Prerequisite: ST 511, Corequisite: ST 508
Typically offered in Spring only

PSY 753 Principles and Practice Of Ecological/Community Psychology (3 credit hours)
Introduction to community psychology and its attempt to redefine social problems according to an ecological frame-of-reference with emphasis on humanitarian values, cultural diversity, the promotion of a psychological sense of community among individuals and groups, and the need for psychologists to engage in systematic community research and action.

Typically offered in Fall only

PSY 757 Innovation and Technology (3 credit hours)
Social science theory and research on innovation process and consequences of deploying and implementing technologies. Interactions between social and technical systems: R&D management; social/ administrative technology; adoption and dissemination; public policy; computer-mediated communications; implementation; and intended and unintended outcomes for individuals, organizations and society.

Prerequisite: 3 hrs. grad. ST or research methods
Typically offered in Fall only

PSY 758 Special Topics in Applied Social and Community Psychology (3 credit hours)
Exploration of advanced specialized topics in Applied Social and Community Psychology to enhance in-depth graduate training in specific applied theories and methods. Seminar content will rotate, with attention to the development and evaluation of interventions to address important problems in individuals' well-being in society, particularly those faced by underrepresented groups. Graduate standing is required.

Prerequisite: 6 credit hours in GRAD PSY
Typically offered in Fall and Spring

PSY 760 Psychometrics (3 credit hours)
Theoretical and statistical approaches to understanding psychological measurement. Topics include detailed coverage of reliability, validity, and factor analysis.

Prerequisite: Six hours of graduate statistics, including linear regression
Typically offered in Fall only

PSY 761 Advanced Psychometrics: Item Response Theory (3 credit hours)
Item Response Theory approaches to advanced test construction and scoring; the investigation of test bias via item response theory methods.

Prerequisite: PSY 760

PSY 762 Quasi-Experimental Evaluation Design (3 credit hours)
An introduction to quasi-experimental design as applied to HRD program evaluation: (1) Methods of assessing informational needs, (2) recognition of internal and external validity threats, (3) design of quasi-experiments to minimize threats and (4) use of results by program decision makers.

Prerequisite: ST 507
Typically offered in Spring only

PSY 764 Industrial Psychology (3 credit hours)
Issues in psychology literature surrounding the person, organization, and job. Work analysis and design, recruitment, selection, training, and performance appraisal of employees. Emphasis on scientist-practitioner model throughout the course. Graduate standing or PBS status.

Typically offered in Fall only

PSY 766 Personnel Selection Research (3 credit hours)
A survey of theoretical, methodological and research literature on personnel selection. Topics include organization, task and person analyses, validation strategies, utility and equal opportunity issues and selection strategies. Emphasis on research.

Prerequisite: Six hrs. of grad. ST, PSY 760
Typically offered in Fall only

PSY 767 Training Research (3 credit hours)
A survey of conceptual and research literature on training. Topics include needs assessments, learning, transfer, maintenance, criterial and evaluation issues, as well as a review of research on specific training techniques. Emphasis on research methods and findings, not skill development in specific training techniques.

Prerequisite: Six hrs. of grad. PSY and six hrs. of grad. ST
Typically offered in Fall only

PSY 768 Organizational Psychology I (3 credit hours)
A survey of the application of behavioral science, particularly psychology and social psychology literature and research to organizational and management problems. Topics include work motivation and attitudes, job design, employee organizational commitment and work engagement.

P: ST 511 and 512
Typically offered in Spring only

PSY 769 Work Motivation (3 credit hours)
Theory and research in work motivation. An in-depth examination of motivation theory as it pertains to the study of individual behavior in work settings.

Prerequisite: PSY 768
Typically offered in Spring only

PSY 770 Organization Development and Change (3 credit hours)
A survey of theory and research in organization development. Attention directed to: (1) methods of diagnosing need for organizational change, (2) techniques currently used to implement and evaluate organizational change, (3) professional ethics and other issues dealing with client-consultant relationship. Emphasis on developmental approaches originating from psychology and allied fields.

Prerequisite: PSY 768
Typically offered in Spring only

PSY 778 Organizational Psychology II (3 credit hours)
A survey of the applications of behavioral science, particularly psychology and social psychology literature and research to organizational and management problems. Topics will pertain to the role of leadership in individual, team, and organizational performance.

Typically offered in Fall only

PSY 785 Methodological Issues In Developmental Psychology (3 credit hours)
Methodological issues, research designs and statistical techniques in developmental psychology. Role and meaning of age as a research variable. Interpretation of research reports. Ethical issues.

Prerequisite: PSY 584 and 3 hrs. of grad. statistics
Typically offered in Spring only

PSY 786 Cognitive Development (3 credit hours)
Examination of research and theory in cognitive development. Primary focus on childhood, but implications for the entire life span addressed. Application of cognitive developmental principles in creating interventions and educational programs also discussed.

Prerequisite: PSY 584
Typically offered in Spring only

PSY 787 Social Development (3 credit hours)
Survey of current theory and research on the development of social behavior systems, including attachment, aggression, gender-role behavior, prosocial behavior. Attention to the role of social class, race and culture, and to contemporary phenomena such as day care, single-parent and dual-career families, child abuse.

R: Psychology Graduate Status or Permission of Instructor
Typically offered in Spring only

PSY 788 Adulthood and Aging: Cognitive and Intellectual Change (3 credit hours)
Critical examination of theory and research associated with the study of cognitive and intellectual change in adulthood and aging. Memory and learning, information processing, language, intelligence, social cognition and expertise.

Prerequisite:PSY 584 or PSY 508
Typically offered in Fall only

PSY 789 Socio-Emotional Processes In Adulthood and Aging (3 credit hours)
Current theory and research on social, emotional and personality development during adulthood and aging. Generally including self-concept and identity, interpersonal relations (friendship, marriage, parenting, work), control, coping and life satisfaction. Attention to gender, culture and contemporary issues in adult development and aging.

Prerequisite: PSY 584
Typically offered in Fall only

PSY 792 Psychology Of Families and Parenting (3 credit hours)
Special topics in the area, including family influences on cognitive development, effects of parental divorce on children, single-parenting, step-families, child abuse and ethnic/cultural differences in family functioning. A critical examination of traditional and contemporary parenting approaches and an introduction to family therapy.

Prerequisite: Nine hrs. grad. PSY or ED
Typically offered in Fall only

PSY 795 Stress and Coping (3 credit hours)
Discussion of current research findings and theories in area of psycho-social stress. Topics include: biology of the stress response, methodology, physical, behavioral and psychological reactions to stress, and relationships between personality and social support to the development of stress-related disorders.

Prerequisite: Two grad. PSY courses
Typically offered in Fall only

PSY 809 Psychology Colloquium (1 credit hours)
Typically offered in Fall only

PSY 820 Special Topics In Psychology (1-6 credit hours)
Course provides opportunity for exploration in depth of advanced areas and topics of current interest.

Prerequisite: 6 hrs. of PSY, Corequisite: 3 hrs. of ST
Typically offered in Fall and Spring

PSY 841 School Psychology Practicum (1-6 credit hours)
Clinical participation in interviewing, counseling, psycho-therapy and administration of psychological tests. Practicum to be concerned with adults and children.

Prerequisite: Twelve hrs. in grad. PSY, which must include clinical skill courses PSY 722 and PSY 723
Typically offered in Fall and Spring

PSY 846 Practicum in Industrial/Organizational Psychology (3 credit hours)
Procedures and techniques used by Industrial and Organizational Psychologists in the field. Students write work proposals, conduct interventions in field, and codument results. Review one or more I/O procedure step-by-step.

Prerequisite: PSY 764
Typically offered in Fall and Spring

PSY 851 Internship In Psychology (1-6 credit hours)
Supervised work experience in an appropriate setting with professional supervision in the field from a doctoral level psychologist with credentials and/or experience in the appropriate specialty in psychology. Experience consists of full time for one semester or half time for an academic year or equivalent time.

Prerequisite: Master's degree in PSY and approval of advisory committee
Typically offered in Fall and Spring

PSY 880 Directed Study In Psychology (1-6 credit hours)
Research project for graduate students supervised by members of the graduate faculty. Research to be elected on basis of interest of student and not to be part of thesis or dissertation research. Credits Arranged

Typically offered in Fall and Spring

PSY 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planing for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PSY 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PSY 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PSY 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PSY 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PSY 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Public Administration (PA)

PA 203/PS 203 Introduction to Nonprofits (3 credit hours)
Development of nonprofit organizations and the contributions of nonprofits in the U.S., other countries, and the international community; political, social, and economic roles of nonprofits; nonprofit governance; partnerships with government and other nonprofits; types of organizations in the nonprofit sector; contemporary policy issues. Service project with minor transportation costs.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PA 311 Public Policy Analysis and Evaluation (3 credit hours)
This course will be an introductory course for the study of policy analysis, i.e. the systematic study of political-issue problems and alternative policy choices. An individual semester-long project will be completed by each student that identifies a policy issue of interest to the student and various alternatives to implement or improve the policy. Students will measure outcomes of their alternative choices and choose a course of action based on anticipated outcomes.

Typically offered in Fall only

PA 312/PS 312 Introduction to Public Administration (3 credit hours)
Administration in city, state and national governments: effectiveness and responsiveness, involvement in policy areas, and issues of ethics and responsibilities.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

PA 332 Human Resource Management in Public Sector (3 credit hours)
PA 332 is a fundamental, comprehensive course designed to provide a view of the major influence human resources management has in a productive public sector organization. Specifically, it examines the challenges of managing complex work systems in the political and institutional environments. Emphasis is given to the challenges facing the public sector in attracting and developing human assets in an environment of conflicting goals, stakeholder obligations and a highly aware electorate. With theoretical concepts established, the focus will shift to practical implementation tools to include recruitment, retention, compensation, and evaluation techniques.

Typically offered in Spring only

PA 410 Public Administration for Police Supervisors (3 credit hours)
Introduces law enforcement supervisors to the subject of Public Administration as a field of intellectual inquiry and as a field of professional activity. Students will learn how important founding principles such as federalism, separation of powers, equity, and democratic accountability impact police organizations today. The more practical concerns of police administrators including budgeting and financial management, labor-management relations, and personnel law are also considered. Available only to distance education students enrolled in the AOMP.

Typically offered in Fall, Spring, and Summer

PA 411 Managing Police Organizational Behavior (3 credit hours)
This course is designed to prepare police managers to develop more efficient and effective organizations. Particular attention is given to improving leadership and interpersonal communication skills through self assessment. Students will also study group dynamics, team building, and the importance of employee empowerment within a law enforcement context. Problem-solving g tools and assessments utilized by police agencies to facilitate organizational change are also considered. Available only to distance education students enrolled in the AOMP.

Typically offered in Fall, Spring, and Summer

PA 412 Management Skills & Practices for Police Supervision (3 credit hours)
The purpose of this course is to introduce law enforcement supervisors to management skills that can enhance their individual and organizational effectiveness. Students will learn collaborative leadership, conflict resolution, staff development, group problem solving, delegation and coaching. The skills taught in this class are considered theoretically (through reading assignments and lectures), experientially (through role plays, assessment center exercises, and management inventories), and analytically (through written analyses and class discussions). Available only to distance education students enrolled in the AOMP.

Typically offered in Fall, Spring, and Summer

PA 420 State and Local Economic Development Policy (3 credit hours)
In many communities, both rural and urban, the most immediate policy problem confronting public leaders is how to improve the local economy. The purpose of this course is to introduce public leaders to the tasks and challenges in policy development for improving the economies of communities. This course introduces students to the strategies fir attracting and retaining public and private investments in a local economy. An individual semester long project will be completed by each student that presents an original economic development strategy, program or project for a specific community (city/town or county).

Typically offered in Spring only

PA 498 Special Topics in Public Administration (3 credit hours)
Offered as needed to engage professional literature not normally available in regular course offerings or for new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

PA 507 The Public Policy Process (3 credit hours)
Application of current theories of the public policy process to current issues in public policy and management. Emphasis on the dominant theories of the process, including policy streams, advocacy coalitions, punctuated equilibrium, institutional and rational choice models. Graduate standing or seniors with instructor's permission.

Typically offered in Fall only

PA 509 Applied Political Economy (3 credit hours)
Principles governing the interaction of politics and markets, and their application to public policy and public administration. Economic and political market failure, dilemmas of public choice and effects of political institutions. Case studies ofpublic policy-making.

Prerequisite: EC/ARE 401
Typically offered in Fall only

PA 510 Public Administration Institutions and Values (3 credit hours)
Exploration of the critical roles public administration plays in the American constitutional system of government with emphasis on public institutions, policy making and implementation, intergovernmental and intersectoral relations, public service values, administrative discretion, and ethical responsibilities and decision-making.

Typically offered in Fall and Spring

PA 511 Public Policy Analysis (3 credit hours)
Methods and techniques of analyzing, developing and evaluating public policies and programs. Emphasis given to benefit-cost and cost-effectiveness analysis and concepts of economic efficiency, equity and distribution. Methods include problem solving, decision making and case studies. Examples used in human resource, environmental and regulatory policy.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

PA 512 The Budgetary Process (3 credit hours)
Examination of generalized budgetary process used at all levels of government in the U. S. Understanding of the process based upon comprehension of institutions involved, roles of politicians and professionals and the objectives of budgetary systems. Focus also upon budgetary reforms and on Planning-Programming-Budgetary and Zero-Based Budgeting as management tools.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Summer

PA 513 Public Organization Behavior (3 credit hours)
Major conceptual frameworks developed to understand organization behavior. Motivation, leadership, group dynamics, communication, socio-technical systems, work design and organizational learning. Application of theories and concepts to public sectororganizations.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

PA 514 Management Systems (3 credit hours)
Use of management systems by public and nonprofit organizations to monitor and manage their programs. Results-based management approaches, including strategic planning, goal setting, and output/outcome measurement. Ways of increasing managerial effectiveness through the use of structural changes, process improvements, project planning tools, performance-based budget systems, and individual and group rewards.

Prerequisite: Six hours of graduate PA course work
Typically offered in Fall and Spring

PA 515 Research Methods and Analysis (3 credit hours)
A focus on behavioral approach to study of political and administrative behavior. Topics including philosophy of social science; experimental, quasi and non-experimental research design; data collection techniques; basic statistical analysis with computer applications.

Prerequisite: ST 311
Typically offered in Fall and Spring

PA 516 Effective Communications for Public Administrators (3 credit hours)
Focus on professional written and oral skills and the applications needed by public and nonprofit administrators. This includes drafting, editing, and presenting factual and persuasive materials. Use of visual aids, handling question and answer sessions, dealing with media, and holding effective meetings. Composing memos, position papers, and press releases. The course develops competency to communicate and interact productively with a diverse and changing workforce and citizenry.

Typically offered in Fall and Spring

PA 517 MPA Capstone (3 credit hours)
Students will demonstrate their achievement of core competencies developed through their MPA course of study. The course will include three key components: (1) Academic Portfolio; (2) Capstone Project; and (3) Reflection Essay. Students will develop a professional academic portfolio in which they identify activities and assignments from their course of study that demonstrate their attainment of the program's expected learning outcomes. Students will complete a hands-on, supervised course project focusing on a major public service problem or issue and that demonstrates practical application of core competencies. Students will prepare a reflection essay of what they learned in the MPA program during their preparation for a public service career.

P: PA 510, PA 511, PA 512, PA 513, PA 514, PA 515 and PA 516.
Typically offered in Fall and Spring

PA 520 Seminar in Urban Management (3 credit hours)
A seminar focusing on analytical techniques and managerial principles required for policy formation and implementation in a complex urban governmental environment. Specific topics including urban planning and community development, housing, intergovernmental relations, organizational roles and decision making, budgeting and selected urban services (for example: police, transportation).

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

PA 521 Government and Planning (3 credit hours)
The planning function at all levels of government in the U. S., with particular attention to problems posed for planning by rapid growth of metropolitan areas. Overview of community development, urban spatial structure, housing economics and land use planning.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

PA 522 Intergovernmental Relations in the United States (3 credit hours)
Examination of distinctive features of intergovernmental relations in the U. S. Topics stressed including historical adaptations of federalism, emerging role of the administrator, contemporary trends in intergovernmental relations and assessment of contemporary trends from federal, state and local perspectives.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

PA 523 Municipal Law (3 credit hours)
A focus on the legal nature of cities as municipal corporations and the legal context in which local governments operate. Specific topics covered including incorporation, ethics, public access to meetings and records, annexation, land use, development, planning, liability, financing, contracting, and personnel actions.

Prerequisite: Graduate standing
Typically offered in Fall only

PA 525 Organizational Development and Change Management (3 credit hours)
This course provides an introduction to the applied skills and knowledge necessary for helping public and nonprofit organizations and agencies effectively manage change. Students will gain knowledge and skills in organizational assessment, action research, systems change, and the stages of change management. Graduate standing only.

Typically offered in Spring only

PA 530 Financial Management in the Public Sector (3 credit hours)
Survey of financial practices and concepts in the public sector. Topics including public sector accounting, financial information systems, revenue projections, cash management and debt management. Emphasis upon case-based applications.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

PA 531 Human Resource Management in Public and Nonprofit Organizations (3 credit hours)
Analysis of major Human Resource practices used by public and nonprofit organizations. Techniques examined include organization (strategy, job analysis, job evaluation, and compensation), staffing (recruitment, retention, testing, and hiring), performance management (appraisal and training & development), and employee relations (grievance & discipline mediation & negotiation, and labor relations).

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

PA 532 Contract Negotiation and Mediation in the Public and Nonprofit Sectors (3 credit hours)
Three inter-related leadership skills - negotiation, contracting, and mediation-essential for acheiving organizational success. Skills for negotiating with partners, for facilitation among colleagues, for crafting and monitoring contracts for equipment, services, or performance, and for using alternate dispute resolution techniques, primarily mediation.

Prerequisite: Graduate standing or Management Development Certificate Program and 6 hours of 500-level course work
Typically offered in Spring only

PA 535 Problem Solving for Public and Nonprofit Managers (3 credit hours)
The course introduces a problem solving model specific to public and nonprofit organizations. The model is based on meeting three criteria: effectiveness, efficiency, and equity. Students learn to apply the model in interpersonal and group interactions. The course relies heavily on self-assessment to enable the students to recognize their problem solving propensities and the strengths and limitations of those tendencies.

Prerequisite: PA 513
Typically offered in Fall only

PA 536 Management of Nonprofit Organizations (3 credit hours)
Strategies for developing board leadership, staffing, and managing volunteers, working in multi-cultural environments, developing partnerships with other organizations, conducting government relations. Legal requirements and contraint on nonprofits: incorporation, lobbying, and tax policies.

Restriction: PBS status for Graduate Standing
Typically offered in Fall and Spring

PA 538 Nonprofit Budgeting and Financial Management (3 credit hours)
Nonprofit budgeting and financial management practices, including budgeting, financial analysis, cash flow forecasting, internally controlling financial transcations, borrowing, external auditing, investing, managing risk, purchasing and inventory control.

Typically offered in Spring only

PA 539/COM 539 Fund Development (3 credit hours)
Identifies and assesses techniques and best practices of fund development, annual giving, capital campaigns, endowments. Topics include setting achievable goals, organizing and staffing a fund development campaing, and identifying donors. Discusses links between fund development and organization mission and governance, ethical issues, and government regulations. PBS status or Graduate standing.

Typically offered in Fall only

PA 540 Grant Writing for Public Administrators (3 credit hours)
Survey of funding environment; how to identify foundations, corporation and government funding sources, write proposals, and evaluate proposals.

Typically offered in Fall only

PA 541 Geographic Information Systems for Public Administration (3 credit hours)
Introduction to management of spatial data in relation to public administration databases, including preparation of maps, tables, and data graphics related to geographic information systems in the public sector. Use of ArcView and a variety of other GIS computer applications.

Prerequisite: Graduate standing, PBS status, Advanced Undergraduate standing with 12 hours in PS program
Typically offered in Spring only

PA 545 Administrative Law (3 credit hours)
Case law of exercise of administrative power, judicial and legislative control of administrative action, legal rights of public employers and legal procedures of administrative tribunals.

Prerequisite: Graduate standing or PBS status

PA 546 Seminar in Program Evaluation (3 credit hours)
Combination of seminar and field research techniques to study evaluation of public programs. Focus on political and administrative problems associated with program evaluation. Examination of availiability and appropriateness of various quantitative methodologies. Seminar concepts applied through evaluative projects conducted for public agencies.

Prerequisite: Graduate standing and 6 hours of 500-level courses
Typically offered in Spring only

PA 550 Environmental Policy (3 credit hours)
Focus on formation and impact of environmental policy in the U. S. Examination on decision-making processes at all levels of government. Comparisons between political, economic, social and technological policy alternatives. Emphasis upon applicationof policy analysis in environmental assessment and consideration on theoretical perspectives on nature of the environmental crisis.

Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status
Typically offered in Fall only

PA 551 Energy Policy (3 credit hours)
This course provides an introduction to U.S. energy policy, using a contemporary electric utility Integrated Resource Plan (IRP) as both a conceptual and weekly roadmap. By way of the IRP, the course reviews the critical technical, economic, and public policy considerations that go into development and operation of an electric utility's generation portfolio. The first part of the course emphasizes the policy context of energy supply and consumption, including utility choice of generation technology, projected load growth, the economics of electricity generation and distribution, power purchase and contracting, and compliance with environmental regulations and requirements. The second half of the course takes the form of an extended group exercise, in which students will develop alternatives to the utility IRP, defending their scenarios and findings at a hypothetical Utilities Commission hearing. In between, guest lectures will add real-world context to the material discussed in class.

Typically offered in Spring only

PA 552 Science and Technology Policy (3 credit hours)
This course explores multiple methodologies and disciplinary perspectives to examine the public policies involving or affected by science and technology (S&T). Course themes include the history and evolution of S&T policy, current national and international S&T policy systems and the interactions and conflicts within and surrounding them, and responsible governance of S&T.

Prerequisite: Graduate Standing or PBS Status
Typically offered in Spring only

PA 553 Disaster, Crisis and Emergency Management and Policy (3 credit hours)
Study of the policies designed to prepare for, respond to, mitigate, and recover from natural and technological hazards, disasters, accidents, or terrorist attacks. Surveys government, nonprofit, and private sector activities in hazards, disasters,emergency and crisis management and policy.

PA 555 Administration of Criminal Justice (3 credit hours)
Politics and administration in American criminal justice system. Emphasis upon interrelationships between ideology, organization and policy outputs in analysis of major problems confronting the system today. Topics including intergovernmental relations, discretionary justice, impact of judicial decisions on criminal justice administration and management trends in criminal justice bureaucracies.Credit for both PS 555 and PA 555 is not allowed.3

Prerequisite: PS 311 or Graduate standing
Typically offered in Fall and Spring

PA 580 Independent Study (1-3 credit hours)
Independent research or readings by graduate students under direct supervision of individual faculty members. Students' work evaluated, based on reports, papers and exams.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

PA 598 Special Topics in Public Administration (1-6 credit hours)
Detailed investigation of contemporary topics in fields of public administration. Topic and mode of study determined by program faculty.

Prerequisite: Advanced Undergraduate standing including 12 hours in PS program, Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

PA 635 Readings and Research (1-3 credit hours)
To enable graduate students to pursue a subject of particular interest to them by doing extensive readings or research in that subject under direct, individual faculty supervision.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PA 650 Internship in Public Affairs (1-6 credit hours)
Exposure of the student to environment and value systems of the public organization through a supervised work experience. Involving application of substantive knowledge and analytical skills to organizational problems. Credit will vary with nature of the work experience.

Prerequisite: Minimum 9 hours graduate work
Typically offered in Fall, Spring, and Summer

PA 651 Advanced Practical Training (1-3 credit hours)
Substantive knowledge and analytical skills applied to projects under agency supervision. Participation in monthly on-campus meetings. Credit will not be given for placements in current or previous work unit. Credit will not be given for both PA 650 and PA 651. Credit will vary with number of work hours. Must have MPA, current or previous professional work experience.

Prerequisite: 12 graduate credit hours
Typically offered in Fall, Spring, and Summer

PA 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

PA 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring and Summer

PA 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring and Summer

PA 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

PA 714 Public Administration Research Methods and Traditions (3 credit hours)
This course explores a variety of topics, ranging from the philosophy of social science to tailoring a literature review. The goal of this course is to approach the public administration research craft from a variety of perspectives, though their underlying epistemic assumptions are often not made explicit. The course also incorporates material on the responsible conduct of research.

Typically offered in Fall only

PA 715 Quantitative Policy Analysis (3 credit hours)
Application of quantitative tools to conduct public policy and administrative research. Course identifies and uses secondary data, including U.S. Census Data, to empirically assess social and economic policies. Emphasis is on the correct selection, use and interpretation of data to answer public policy questions and to understand the strengths and limitations of quantitative analysis.

Prerequisite: ST 407, ST 511, ST 513
Typically offered in Fall only

PA 761 Foundation of Public Administration (3 credit hours)
Intellectual foundation of public administration and its development as a discipline. Boundaries between public administration and large political process, external political control, factors producing administrative influence and the bases of administrative ethics.

Prerequisite: Graduate standing
Typically offered in Fall only

PA 762 Public Organization Theory (3 credit hours)
Examination of fundamental questions guiding organization research in public administration with emphasis on reconciling democracy and organization. Analysis of classical bureaucratic systems, rational choice, cognitive and organizational economic,and nonlinear and chaos theories.

Prerequisite: Graduate standing
Typically offered in Spring only

PA 763 Public Policy Process (3 credit hours)
Examination of public policy process at federal level in the United States. Analysis of constitutional foundations of this process and the role of governmental institutions, political culture, parties, interest groups, and public opinion in policy making. Case studies of policy making and implementation in selected policy areas.

Prerequisite: Graduate standing
Typically offered in Fall only

PA 764 Budgeting and Financial Management (3 credit hours)
Examination of budgetary and financial management processes in governmental and nonprofit agencies. Budgetary and financial management theory, practice, and unanswered research questions.

Prerequisite: PA 512
Typically offered in Spring only

PA 765 Quantitative Research in Public Administration (3 credit hours)
Review of quantitative procedures commonly applied in public administration with emphasis on applications found in leading journals in the discipline. Exploration of data acquisition, appropriate research design, selection of procedures, data assumptions of procedures, and common errors in the research process and in statistical analysis.

Prerequisite: PA 515 ; ST 507
Typically offered in Spring only

PA 766 Advanced Quantitative Research in Public Administration (3 credit hours)
Review of advanced quantitative procedures commonly applied in public administration research with emphasis on multivariate models found in leading journals in the discipline. Illustrative topics include the application of specialized regression models, generalized linear models, event history models, mixed and multilevel models, and structural equation models to topics in public administration.

Prerequisite: PA 765
Typically offered in Fall only

PA 770 Contemporary Public Management (3 credit hours)
Current public management practices, including evaluation of their underlying theoretical assumptions and of empirical evidence about their effectiveness. Causes of recent shifts in public management theory; political implications of management choices; privatization in theory and practice; managerial use of performance measurement systems; customer feedback systems; worker incentive structures.

Prerequisite: PA 514
Typically offered in Spring only

PA 771 Seminar on Nonprofit Organizations (3 credit hours)
Course provides the necessary theoretical foundation to design scholarly research on nonprofit organizations, voluntary action, and the nonprofit sector. Topics focus on the historical and philosophical roots of the nonprofit sector, the theories used to frame scholarly research and answer contemporary research questions. Students assume a leadership role in shaping the course content. Doctoral students only.

PA 780 Independent Study (1-3 credit hours)
Independent research or readings by graduate students under direct supervision of individual faculty members. Students' work evaluated, based on reports, papers and exams.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

PA 798 Special Topics in Public Administration and Policy (1-6 credit hours)
In depth exploration of specialized or emerging topics in public administration or public policy. Student presentations on readings and research projects. Also used to test and develop new courses.

Typically offered in Fall and Spring

PA 803 Advanced Research Design (3 credit hours)
Philsosphy and objectives of social scientific research with focus on basic and applied research, need for hypothesis development and testing as a basis of scientific research, inductive and deductive reasoning. Emphasis on preparation of research design of dissertation, published articles, and technical presentations. Students will present a research prospectus that will serve as the basis for their dissertation.

Prerequisite: Doctoral student in Public Administration; PA 765, Corequisite: At least two graduate methodology or statistics courses
Typically offered in Fall only

PA 810 Special Topics in Public Administration (1-6 credit hours)
Detailed investigation of contemporary topics in fields of public administration. Topic and mode of study determined by program faculty.

Prerequisite: Advanced Undergraduate standing including 12 hours in PS program, Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

PA 835 Readings and Research (1-3 credit hours)
To enable graduate students to pursue a subject of particular interest to them by doing extensive readings or research in that subject under direct, individual faculty supervision.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

PA 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall only

PA 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Summer only

PA 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PA 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

PA 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

PA 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Religious Studies (REL)

REL 200 Introduction to the Study of Religion (3 credit hours)
Historical, theoretical, and methodological introduction to the study of religion. Critical analysis of development of the discipline of Religious Studies. Preparation for all advanced study in Religious Studies theory and method, as well as training to study religious traditions of the world.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 210 Religious Traditions of the World (3 credit hours)
Major Eastern and Western religious traditions with attention to their basic teachings and practices as well as to the historical, geographical, social, and political settings in which they have arisen and developed.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 220 Religion in the Contemporary World (3 credit hours)
Engagement of diverse religious traditions with the contemporary world. Examination of topics such as religion and the environment, science, women and gender, the state, justice and conflict.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 230 Asian Religions (3 credit hours)
Asian religious traditions in comparative perspective. Religious and cultural history through literature, film, and art o India, Pakistan, Bangladesh, Sri Lanka, Nepal, Afghanistan, China, Japan, Korea, and other countries in the region. Doctrine, practice, teaching tales, and issues of change and conflict.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 298 Special Topics in Religious Studies (3 credit hours)
Selected studies in religion that do not appear regularly in the curriculum. Topics will be announced for each semester in which the course is offered.

REL 309/SOC 309 Religion and Society (3 credit hours)
Religious beliefs, practices and organizations addressed as social phenomena. Structural functionalism, conflict and subjectivism as theoretical orientations for understanding influences between religion and society. Relationship of religions to family, government, and economy and to social divisions, conflict and change.

P: 3 credits in SOC at the 200 level
GEP Humanities, GEP Social Sciences
Typically offered in Fall and Spring

REL 311 Introduction to the Old Testament (3 credit hours)
Study of Old Testament books [=Hebrew Bible, HB], examining their content, background and development. Comparisons of the biblical material with other Ancient Near Eastern literature. Assessment of contributions from archaeology and literary studies for clarifying the text. No prior knowledge of the subject matter is required.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

REL 312 Introduction to the New Testament (3 credit hours)
Literary and historical study of the New Testament in its Jewish and Greco-Roman contexts. Special attention to distinctive characteristics of the Gospels and their relationships, early controversies with Judaism and the emergence of church structure and teaching.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall, Spring, and Summer

REL 314 Introduction to Intertestamental Literature (3 credit hours)
Intertestamental literature in the context of Jewish history, institutions and beliefs of the Intertestamental Period (ca. 300 B.C.-ca. 100 A.D.)

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 317 Christianity (3 credit hours)
Development of Christianity from its origins to the present; events, persons, ideas, beliefs and practices which were most significant in this development.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 320/HI 320 Religion in American History (3 credit hours)
Representative people, movements and thought in the major religions within the context of American society and culture.

GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

REL 323 Religious Cults, Sects, and Minority Faiths in America (3 credit hours)
Religious cults, sects and minority faiths in America, including Mormonism, Christian Science and Jehovah's Witnesses. Also covers such alternate groups as the holiness-charismatic movement and the Unification Church. Origins, development and teachings of these groups within the context of American culture and religion.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

REL 327 Issues in Contemporary Religion (3 credit hours)
Responses of contemporary Western religious thinkers to critics of religion and to challenges posed by the 20th century including the Nazi Holocaust, social injustice (liberation theologies - black, feminist, Third World), ecological crisis, threat of nuclear warfare, and conflicts between religions.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 331 The Hindu Tradition (3 credit hours)
Basic religio-philosophical concepts, social institutions, and individual practices of Hindu civilization from earliest Vedic times to the present. Focus on major traditions: Action (karma), Knowledge (jnana), and Devotion (bhakti), with emphasis on disciplines (yoga), myth, symbol, art.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 332 The Buddhist Traditions (3 credit hours)
History and structure of the Buddhist tradition analyzed through the "three jewels": the Buddha, the Monastic Community (sangha), and the Teachings (dharma). Emphasis on fundamental religio-philosophical concepts, social history and ritual practices of Southern Buddhism, early Mahayana development, and Tantric ideals. Growth of the traditions in China and Japan.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

REL 333 Chinese Religions (3 credit hours)
Survey of Chinese religions from prehistoric times to present. Confucianism, Daoism, primary Buddhist schools in China, spirit possession, divination and popular religious worship.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 334 Japanese Religions (3 credit hours)
Survey of various strands of Japanese religious life from prehistoric times until present. Kami worship; primary Buddhist schools in Japan; Japanese Christianity; Confucianism; and New Religions.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 340 Islam (3 credit hours)
Introductory survey of the Islamic religious tradition. Examination of the primary historical, literary, and theological sources for Islamic religious thought in global contexts. Topics include the Prophet Muhammad, the development of the early Muslim community, Islamic religious practice, Sunni and Shi'i Islam, Sufism, theology, law and Islamic art and architecture.

GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 343/AFS 343 African American Religions (3 credit hours)
History of religions among Americans of African descent from the period of the development of the transatlantic slave trade to the present. Exploration of the complex ways religion has shaped the lifeworld of African Americans.

GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

REL 350 Introduction to Judaism (3 credit hours)
A survey of Jewish religious traditions from the bible through the present day. Evolution of major religious ideas through classical texts including torah, Talmud, philosophical and mystical literature, and contemporary fiction.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 380 Emotion and Religion (3 credit hours)
The application of theories of emotion and specific emotions (such as wonder, grief, anger and fear) to the study and practice of religion and to the relationship of religion to race, gender, class and politics.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

REL 383 Religion, Globalism, and Justice (3 credit hours)
Issues and problems in religion and societies since 1945. Historical, theoretical, sociological, and cultural approaches to globalism and religion. Inquiry into the role of ethical reasoning in religious debates on the problem of globalization.

GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 402/HI 402 Early Christianity to the Time of Eusebius (3 credit hours)
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority. Students may not receive credit for both REL /HI 402 and REL/HI 502.

Prerequisite, one of: REL 312, REL 317, or HI 207.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

REL 407/HI 407 Islamic History to 1798 (3 credit hours)
The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe. Credit will not be given for both REL/HI 407 and REL/HI 507.

Prerequisite: 3 hrs HI or REL 300 or above
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

REL 408/HI 408 Islam in the Modern World (3 credit hours)
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

Prerequisite: 3 hours of history or religious studies
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

REL 412 Advanced Readings in the Christian Gospels (3 credit hours)
Close study of the varieties of gospel writings, both canonical and non-canonical, in early Christianity. Analysis of the constituent features of the gospels (parables, healing narratives, sermons), and their "pre-history"; the use of the gospels in the reconstruction of the life and ministry of Jesus; and critical methods in gospel research. Students may not receive credit for both REL 412 and REL 512.

P: REL 312 or REL 317
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 413 The Life and Letters of the Apostle Paul (3 credit hours)
Intensive study of the apostle Paul and his writings in their historical, literary and religious contexts. Sources for the life and ministry of Paul; the structure and theology of the Pauline and deutero-Pauline epistles; the influence and image of Paul in early Christianity; and contemporary controversies and issues in the study of Paul. Students may not receive credit for both REL 413 and REL 513.

P: REL 312 or REL 317
GEP Global Knowledge, GEP Humanities
Typically offered in Fall only

REL 423 Religion and Politics in America (3 credit hours)
Issues and problems in religion and politics in the United States since 1900. Historical, theoretical, sociological, and cultural approaches to religion and politics. Inquiry into the relations between religion and the state. Responses of religious traditions to American social and political issues. Students cannot receive credit for both REL 423 and REL 523.

Prerequisite for REL 423: one 300-level course in religion, philosophy, or history
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

REL 424 Religion and Politics in Global Perspective (3 credit hours)
An interdisciplinary investigation of interfaces between religion and politics in select global hotspots. Possible topics include governmental systems, constitutional law, war, disaster, and development.
Prerequisites: For REL 424, 3 credits in one or more of the following: ANT, COM, HI, IS, PS, REL, SOC; for REL 524, graduate standing.

Prerequisite: 3 credits in one or more of the following: ANT, COM, HI, IS, PS, REL, SOC
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 471/STS 471 Darwinism and Christianity (3 credit hours)
Evolutionary biology and Christianity. Darwin's evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in anevolutionary world.

Prerequisite: One course in religious studies, biological sciences, philosophy of science, or history of science. Credit is not allowed for both REL 471 and REL 571.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

REL 472/WGS 472 Women and Religion (3 credit hours)
Historical, literary, and theological sources dealing with portrayals of women and women's religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women's religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.

Prerequisite: one course in religious studies or women's and gender studies
GEP Humanities
Typically offered in Spring only

REL 473/WGS 473/REL 573/WGS 573 Religion, Gender, and Reproductive Technologies (3 credit hours)
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for more than one of: REL 473, REL 573, WGS 473, WGS 573.

Prerequisite: One 3 cr course in Philosophy (PHI) or Religious Studies (REL) or Women's and Gender Studies (WGS). Credit is not allowed for more than one of REL 473, WGS 473.
Typically offered in Fall only

REL 482 Religion and Conflict (3 credit hours)
Critical and theoretical inquiry into religious violence and nonviolence. Source materials on violence and nonviolence from histories and texts. Case studies of inter- and intra-religious conflict and violence, including both US and non-US religious traditions. Conflict resolution and role of religion in peacebuilding. Politics and public policy of religion, violence, and conflict. Credit cannot be earned for both REL 482 and REL 582.

Prerequisite: A 300 or above level Religion course
GEP Global Knowledge, GEP Humanities
Typically offered in Spring only

REL 489 Interpretations of Religion (3 credit hours)
Theory and method in the study of religion. Historical survey of the discipline of religious studies. Investigation of the major schools of interpretation and themes of study. Application of methodologies to historical and sociological case studies, involving both US and non-US religious traditions. Students cannot receive credit for both REL 489 and REL 589.

P: One course in religion, philosophy, anthropology, history, or sociology.
GEP Global Knowledge, GEP Humanities
Typically offered in Fall and Spring

REL 496 Seminar in Religious Studies (3 credit hours)
Advanced research and writing in selected topics; application of contemporary and historical methods for the study of religion; hermeneutic theory. Open primarily to Religious Studies majors and minors

Prerequisite: 300-level course in Religion

REL 498 Special Topics in Religious Studies (1-6 credit hours)
Detailed investigation of selected topics in religion. Topics determined by faculty members in consultation with head of the department. Course may be used for individualized study programs.

Prerequisite: 6 hours REL

REL 502/HI 502 Early Christianity to the Time of Eusebius (3 credit hours)
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority. Students may not receive credit for both REL /HI 402 and REL/HI 502.

Prerequisite: Graduate standing
Typically offered in Fall only

REL 507/HI 507 Islamic History to 1798 (3 credit hours)
The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe. Credit will not be given for both REL/HI 407 and REL/HI 507.

Prerequisite: Graduate Standing
Typically offered in Fall only

REL 508/HI 508 Islam in the Modern World (3 credit hours)
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

Prerequisite: Graduate Standing
Typically offered in Fall only

REL 512 Advanced Readings in the Christian Gospels (3 credit hours)
Close study of the varieties of gospel writings, both canonical and non-canonical, in early Christianity. Analysis of the constituent features of the gospels (parables, healing narratives, sermons), and their "pre-history"; the use of the gospels in the reconstruction of the life and ministry of Jesus; and critical methods in gospel research. Students may not receive credit for both REL 412 and REL 512.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

REL 513 The Life and Letters of the Apostle Paul (3 credit hours)
Intensive study of the apostle Paul and his writings in their historical, literary and religious contexts. Sources for the life and ministry of Paul; the structure and theology of the Pauline and deutero-Pauline epistles; the influence and image of Paul in early Christianity; and contemporary controversies and issues in the study of Paul. Students may not receive credit for both REL 413 and REL 513.

Prerequisite: Graduate standing
Typically offered in Spring only

REL 523 Religion and Politics in America (3 credit hours)
Issues and problems in religion and politics in the United States since 1900. Historical, theoretical, sociological, and cultural approaches to religion and politics. Inquiry into the relations between religion and the state. Responses of religious traditions to American social and political issues. Students cannot receive credit for both REL 423 and REL 523.

Prerequisite for REL 523: graduate standing
Typically offered in Spring only

REL 524 Religion and Politics in Global Perspective (3 credit hours)
An interdisciplinary investigation of interfaces between religion and politics in select global hotspots. Possible topics include governmental systems, constitutional law, war, disaster, and development.
Prerequisites: For REL 424, 3 credits in one or more of the following: ANT, COM, HI, IS, PS, REL, SOC; for REL 524, graduate standing.

R: Graduate Standing
Typically offered in Spring only

REL 571/STS 571 Darwinism and Christianity (3 credit hours)
Evolutionary biology and Christianity. Darwin's evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world. Credit is not allowed for both REL 571 and REL 471.

Prerequisite: Graduate standing. Credit is not allowed for both REL 571 and REL 471.
Typically offered in Fall only

REL 572/WGS 572 Women and Religion (3 credit hours)
Historical, literary, and theological sources dealing with portrayals of women and women's religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women's religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.

Prerequisite: Graduate Standing
Typically offered in Spring only

REL 573/WGS 573/REL 473/WGS 473 Religion, Gender, and Reproductive Technologies (3 credit hours)
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for more than one of: REL 473, REL 573, WGS 473, WGS 573.

Prerequisite: One 3 cr course in Philosophy (PHI) or Religious Studies (REL) or Women's and Gender Studies (WGS). Credit is not allowed for more than one of REL 473, WGS 473.
Typically offered in Fall only

REL 582 Religion and Conflict (3 credit hours)
Critical and theoretical inquiry into religious violence and nonviolence. Source materials on violence and nonviolence from histories and texts. Case studies of inter- and intra-religious conflict and violence, including both US and non-US religious traditions. Conflict resolution and role of religion in peacebuilding. Politics and public policy of religion, violence, and conflict. Credit cannot be earned for both REL 482 and REL 582.

Restriction: Graduate Standing
Typically offered in Spring only

REL 589 Interpretations of Religion (3 credit hours)
Theory and method in the study of religion. Historical survey of the discipline of religious studies. Investigation of the major schools of interpretation and themes of study. Application of methodologies to historical and sociological case studies, involving both US and non-US religious traditions. Students cannot receive credit for both REL 489 and REL 589.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

REL 598 Special Topics in Religious Studies (1-6 credit hours)
Detailed investigation of selected topics in religion. Topics determined by faculty members in consultation with head of the department. Course may be used for individualized study programs. Students cannot receive credit for both REL 498 and REL 598 unless the topic is different.

Typically offered in Fall, Spring, and Summer

Science, Technology and Society (STS)

STS 210/WGS 210 Women and Gender in Science and Technology (3 credit hours)
Interdisciplinary introduction to the reciprocal relationships between scientific/technological research and contemporary understanding of gender. Special emphasis on social factors influencing scientists and engineers in their professions.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

STS 214 Introduction to Science, Technology, and Society (3 credit hours)
Introduction to the field of Science, Technology, and Society (STS), including most important STS scholars, major schools of thought, and important theoretical and empirical issues in STS.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

STS 257/ARS 257 Technology in the Arts (3 credit hours)
The interaction between technology and the arts with an emphasis on developments in Western art of the twentieth century. Historical and emerging issues include: sound and film recordings, the addition of sound to films, the impact of films and television on theater, the impact of radio, computer applications to music, the visual arts, and literature.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

STS 301 Science and Civilization (3 credit hours)
An inquiry into the scientific achievement and cultural impact of three different, but interrelated, models (or paradigms) of understanding the world and man's place in it; the Ancient-Medieval model of Aristotle, Ptolemy and Aquinas; the 17th century model of Newtonian physics; and the emerging, but fragmentary, 20th century model based upon the new physics of Einstein, Planck and Heisenberg.

Requisite: Sophomore Standing or Above
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

STS 302 Contemporary Science, Technology and Human Values (3 credit hours)
Interdisciplinary evaluation of recent and potential influences of current scientific and technological developments on US and non-US societies. Emerging social, ethical, and intellectual issues include: The adequacy of contemporary scientific frameworks; the relations among science, technology, and society; the social consequences of scientific and technological applications, and human prospects and possibilities.

Prerequisite: Sophomore standing
GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

STS 304 Ethical Dimensions of Progress (3 credit hours)
Multidisciplinary examination of traditional western notion of progress, focusing on ethical issues raised by concept of progress, and connections between science, technology and society. Places relationships such as engineering and social responsibility within the context of present day redefinitions of the notion of progress.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

STS 322 Technological Catastrophes (3 credit hours)
Interdisciplinary examination of the human, organizational and technical factors contributing to the causes and impacts of recent technological accidents such as the Bhopal chemical leak, the space shuttle Challenger explosion, the Chernobyl nuclear accident, and the Exxon Valdez oil spill. Evaluation of risk assessment, risk perception and risk communication strategies. Consideration of options for living with complex technological systems.

Prerequisite: Sophomore standing
GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

STS 323 World Population and Food Prospects (3 credit hours)
Examination of the dynamics of population size and food needs, production, distribution and utilization. Consequences of inadequate nutrition and food choices, efforts to increase the compatibility of effective food production systems and alternate crops and cropping systems examined.

GEP Global Knowledge, GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

STS 325/PHI 325 Bio-Medical Ethics (3 credit hours)
Interdisciplinary examination and appraisal of emerging ethical and social issues resulting from recent advances in the biological and medical sciences. Abortion, euthanasia, physician-assisted suicide, compromised infants, aids, reproductive technologies, and health care. Focus on factual details and value questions, fact-value questions, fact-value interplay, and questions of impact assessment and policy formulation.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

STS 402 Peace and War in the Nuclear Age (3 credit hours)
An interdisciplinary examination of contemporary wars and international conflict, arms, races, nuclear strategy and defense policy, arms control, theories and strategies of peace.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

STS 403 Seminar in Science, Technology, and Society (3 credit hours)
Capstone course for the Science, Technology, and Society (STS) major. Review of the principal theoretical and empirical issues of the field. Research project focused on each student's STS specialty.

Prerequisite: STS 214, STS or STB Majors
Typically offered in Fall and Spring

STS 405 Technology and American Culture (3 credit hours)
Interdisciplinary study of the role of technology in American culture that examines the social, ideological, economic, and institutional contexts of technological change in nineteenth and/or twentieth-century America. Explores cultural impacts of transformative technological innovations, such as electricity, trains, telephones, radios, cars, airplanes, and computers, as reflected in popular cultural products like magazine/newspaper articles, advertising, literature, music, museum exhibits, and/or film.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

STS 471/REL 471 Darwinism and Christianity (3 credit hours)
Evolutionary biology and Christianity. Darwin's evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in anevolutionary world.

Prerequisite: One course in religious studies, biological sciences, philosophy of science, or history of science. Credit is not allowed for both REL 471 and REL 571.
GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Fall only

STS 490 Issues in Science, Technology, and Society (3 credit hours)
Examination of a significant issue, method, or historical episode in the area of science, technology, and society.

Prerequisite: Junior standing.
Typically offered in Fall and Spring

STS 491 Independent Study in Science, Technology, and Society (3 credit hours)
Independent investigation and discussion of a selected topic in science, technology, and society. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

STS 571/REL 571 Darwinism and Christianity (3 credit hours)
Evolutionary biology and Christianity. Darwin's evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world. Credit is not allowed for both REL 571 and REL 471.

Prerequisite: Graduate standing. Credit is not allowed for both REL 571 and REL 471.
Typically offered in Fall only

Social Sciences (SSGE)

SSGE 295 Social Sciences Special Topics (3 credit hours)
Special topics course offering for the general education Social Sciences category.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

Social Sciences and Global Knowledge (SSGK)

SSGK 295 Social Sciences and Global Knowledge Special Topics (3 credit hours)
Special topics course offering for the general education Social Sciences and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Social Sciences (SS) requirement.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

Social Sciences and U.S. Diversity (SSUS)

SSUS 295 Social Sciences and U.S. Diversity Special Topics (3 credit hours)
Special topics course offering for the general education Social Sciences and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Social Sciences (SS) requirement.

GEP Social Sciences, GEP U.S. Diversity

Social Work (SW)

SW 201 Introduction to Social Work (4 credit hours)
This course, the basis for all other social work courses, provides an introduction to generalist practice and an overview of social work practice in a variety of settings. Successful completion of this course is a prerequisite for all advanced SW courses. This course is designed to acquaint students with social services typical of most American communities: what they are, who uses them, their impact, who pays for them, and who works in them. 40-hour pre-professional placement required, intern liability insurance required. Transportation to and from agency and/or community settings is the responsibility of the student.

GEP U.S. Diversity
Typically offered in Fall and Spring

SW 260 Introduction to Gerontology: An Interdisciplinary Field of Practice (3 credit hours)
An integrative seminar in introducing students to gerontology as an interdisciplinary field of practice. The course provides an overview of topics such as the demography of older adults and the physical, cognitive, and psychosocial aspects of aging. The course also covers health care and social policies that impact older persons and caregivers along with the aging network of services. Students will discuss forms of oppression such as ageism, sexism, racism, able-body(ism), and homophobia that impacts work with older people as well as strategies to promote social and economic justice.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Summer only

SW 290 The Development of Social Welfare and Social Work in the U.S. (3 credit hours)
This course reviews the major policy and program developments in American social welfare and the emergence and development of professional social work. Emphasis will be on the socio-cultural context of policy and programs, and the ideas and ideals that shape social welfare. In addition, the basic elements of social policy development will be considered. This course provides the history, mission, philosophy, and evolution of social welfare policies and services that form the foundation of social welfare, particularly as they relate to poverty, racism, and efforts to address the needs of oppressed and marginalized populations.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SW 300 Research Methods in Social Work (3 credit hours)
This course provides an overview of the principles and methods of basic social work research. Substantive research knowledge, including quantitative and qualitative research methodologies, are highlighted. Research ethics within the context of social work ethics and values are emphasized. The course introduces students to how high-quality research in social work is designed and conducted, as well as how research can assist in making important decisions about the design and implementation of projects, programs, and policies that address the social needs of diverse groups.

Prerequisite: ST 311
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SW 307 Social Welfare Policy: Analysis and Advocacy (3 credit hours)
This course introduces students to the processes by which social welfare policies are developed and implemented as well as the ways in which people can intervene to affect these processes. Students have the opportunity to review recent developments in national and state social welfare policies and programs in major areas such as poverty, welfare, social security, housing, health and mental health care, and child welfare. The course focuses on the development of students' policy analysis and advocacy skills.

Requirement: Junior Standing
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SW 310 Human Behavior Theory for Social Work Practice (3 credit hours)
This course is designed to introduce theory regarding human life/development for students intending to practice social work. Students learn to recognize ways in which diversity characterizes and shapes the human experience and is critical to the formation of identity, the extent to which a culture's structures and values may oppress, marginalize, alienate, create or enhance privilege and power. Course surveys major theoretical frameworks and normative developmental variations. Students learn to apply these theories and knowledge from the liberal arts to understand biological, psychological, social, cultural, and spiritual development. Transportation to and from agency and/or community setting is the responsibility of the student.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SW 312 Multicultural Social Work (3 credit hours)
Course prepares students to work with diverse groups of people locally and globally defined by gender, ethnicity, race, national origin, sexual orientation, income, physical and mental ability, age and religion. Emphasis is placed on defining and developing skills for culturally competent social work generalist practice with these populations through students' self-examination, experiential learning, and critical reading of class material. This course helps students develop competencies in critical self-reflection, multicultural values and ethics, knowledge, awareness and skills in a variety of ways so that they can work against manifestations of social injustice. Students are expected to provide their own transportation as needed.

GEP U.S. Diversity
Typically offered in Fall and Spring

SW 320 Social Work Practice I (4 credit hours)
First of a three-course sequence. Practice I presents the generalist social work practice method and focuses on interviewing skills, engaging clients in the helping process, and integrating theory and social work practice. It addresses ethical and professional standards and emphasizes understanding and applying systems and ecological frameworks to practice situations. It examines strengths-based assessment, the phases of the helping relationship, and the dynamics of change in interpersonal helping relationships, within a framework of human rights, social justice, and diversity. 40-hour preprofessional placement required; intern liability insurance required. Transportation to and from agency and/or community settings is the student's responsibility.

Corequisite: Social Work Majors, and a prerequisite or corequisite of SW 310
Typically offered in Fall, Spring, and Summer

SW 405 Social Work Practice II (4 credit hours)
Second of a three-course sequence (Practice I, II, and III). Practice II examines generalist social work roles and techniques with families and groups. Building on the foundation interviewing and engagement skills presented in Practice I, it focuses on assessment, planning, and intervention with individuals, families and small groups within a framework of human rights, social justice, and diversity. 40-hour preprofessional placement is required, intern liability insurance is required. Transportation to and from agency and/or community settings is the student's responsibility.

Prerequisite: Social Work Majors, SW 320, Corequisite: SW 480/SW 408
Typically offered in Fall and Spring

SW 408 Social Work Practice III (3 credit hours)
Course prepares students for practice will organizations, communities, policy structures, and institutions that are viewed as both tools and targets for change efforts. Course emphasizes multiculturalism, diversity, and social justice in relation to social systems. It is designed to provide social work practitioners with the means to help organizations and communities empower themselves to make change through networking, political participation, leadership development, mobilization, utilization of resources, and other strategies and techniques. Transportation to and/or from community settings is the responsibility of the student.

Prerequisite: Social Work Majors, SW 320, Corequisite: SW 405, SW 480
Typically offered in Fall and Spring

SW 412/SW 512 Social Work in Schools (3 credit hours)
Models and roles relevant to school social work practice. Cooperative work with school personnel in the identification, prevention and treatment of social, emotional and behavioral problems of children and interventive techniques with parents and community groups. For individuals preparing for social work practice in the public schools and for school social workers seeking licensure. Credit not given for both SW 412 and SW 512. Instructor Permission Required.

Typically offered in Fall, Spring, and Summer

SW 413 African American Families: History, Tradition, and Community (3 credit hours)
Characteristics, traditions, history and strengths of African American families and their relationship to other social institutions, social advocacy and social policy development. African-centered worldview and relevant theory pertaining to best practice with African American families.

Prerequisite: Sophomore standing
Typically offered in Summer only

SW 415/SW 515 Child Welfare (3 credit hours)
Generalist perspective on the practice of public child welfare. History of child welfare, practices in child welfare, and current trends in child welfare programs. Skills needed to practice in child protective services, adoption, and foster care with specific attention to the North Carolina child welfare system. Application of cultural diversity and cultural competency integrated throughout as it relates to child welfare issues.

Prerequisite: SW 201
Typically offered in Fall, Spring, and Summer

SW 416/SW 516 Addiction Recovery and Social Work Practice (3 credit hours)
Knowledge and skills in identifying Alcohol and Other Drugs (AOD) problems, screening, assessment, intervention, referral, and prevention: history of AOD problems and treatment, AOD classification, effects and signs/symptoms of AOD, models of addiction, diversity, assessment, diagnosis, intervention, treatment modalities, mutual-help groups, family dynamics, prevention, and ethical considerations. Students cannot receive credit for both SW 416 and SW 516

Prerequisite: SW 310
Typically offered in Fall, Spring, and Summer

SW 417/SW 517 Direct Practice with Older Adults (3 credit hours)
Physical, psychological, social, and cultural theories of the aging process as it relates to social work practice, social policy, and services for working with older adults and their families. Emphasis on mental and physical well-being, diversity, social and economic justice, intergenerational issues, policy and programs. Credit is not allowed for both SW 417 and SW 517.

Typically offered in Fall and Spring

SW 418 Child Welfare Seminar (1 credit hours)
Best practice seminar for participants in the NC Child Welfare Education Collaborative Program. Seminars focus on current issues in child welfare practice and policy. Topics vary from semester to semester. Students arrange own transportation for occasional field trips to community agencies.

Prerequisite: Students are Participants in the NC Child Welfare Education Collaborative Program
Typically offered in Fall and Spring

SW 420 The Legal Aspects of Social Work (3 credit hours)
Legal environment of the social work profession. Relationships among legal processes, the delivery of social work services and client problems.

Prerequisite: Social Work Majors and Social Work Minors
Typically offered in Fall and Spring

SW 423/SW 523 Social Work with Soldiers, Veterans, and Their Families (3 credit hours)
A basic overview of military life and the issues and challenges faced by military personnel, their families, friends, and community. The course provides a foundational guide to help professionals working with military families and to understand and address these issues and challenges.

R: Junior or Senior standing. Sophomores and Non-Degree may enroll with instructor approval.
Typically offered in Fall and Spring

SW 425/SW 525 Hunger and Homelessness (3 credit hours)
This course will familiarize students with the history and experience of hunger and homelessness in contemporary American society. The course includes discussion, narrative readings, experiential exercises, movie reviews, field trips, and other media to expose students to issues of food insecurity and housing instability. Students will critique ideas of what it means to be "poor" and be exposed to the lives of individuals who do not have access to adequate food, housing, healthcare, and other basic needs. American social welfare policy, including governmental and local programs that address these issues, will be discussed. Students are responsible for transportation.

Restricted: Junior or Senior Standing. Sophomores and Non-Degree Students may enroll with instructor approval.
GEP U.S. Diversity
Typically offered in Fall and Spring

SW 440/SW 540 International Learning Experience in Social Work (6 credit hours)
A seven week learning experience in Guatemala. Through this course, the student will develop a global perspective of social welfare and social work practice, will learn about the people and culture of the Lake Atitlan area of Guatemala, will learn the variety of resources available in response to social need, and will enhance or develop Spanish language competence. All costs associated with learning opportunities and activities for this course are included in the cost of the program.

GEP Global Knowledge
Typically offered in Summer only

SW 480 Preparation for Field Work (1 credit hours)
Introduction to aspects of field placement process and necessary skills for a successful internship. Application, interview, ethical practice, documentation, supervision and learning contract.

Prerequisite: Social Work Majors, SW 320, Corequisite: SW 405, SW 408
Typically offered in Fall and Spring

SW 490 Field Seminar (3 credit hours)
Weekly integrative seminar taken in conjunction with SW 491, Community-Based Field Internship. Field seminar provides students the opportunity to discuss and reflect upon their practice of social work skills through dialogue and discourse facilitated by a faculty member who develops a professional environment for students to discuss and reflect upon their agency-based field placement experience. Through organized group discussion and assignments, students use critical reflection pedagogy to discuss their application of professional social work.

Prerequisites: Social Work Majors, SW 405, SW 408, and SW 480; Corequisite: SW 491
Typically offered in Fall, Spring, and Summer

SW 491 Community-Based Field Practicum (9 credit hours)
This nine-credit course is a co-requisite for, and is taken in conjunction with, SW 491 during the BSW student's final semester. Students must complete a range of 450 to 480 hours of supervised field agency practicum in an approved community-based agency. It serves as a direct practice component of the culmination of knowledge gained in the BSW courses. Field placement provides students the opportunity to practice social work skills under the supervision of a professional social worker and apply evidence-informed practices, with emphasis on social and economic justice, in their work with individuals, families, groups, organizations, and communities.

Prerequisites: SW 405 and SW 408 and SW 480; Corequisite: SW 490
Typically offered in Fall, Spring, and Summer

SW 495 Special Topics in Social Work (3 credit hours)
Detailed investigation of a topic in social work. Topic and mode of study determined by faculty member.

Typically offered in Fall, Spring, and Summer

SW 498 Independent Studies in Social Work (1-6 credit hours)
Independent or small group study of a social work practice or social welfare area. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing or Senior standing, Social Work Majors or Social Work Minor, Nine credits in social work courses
Typically offered in Fall, Spring, and Summer

SW 500 Advanced Standing Seminar (4 credit hours)
Orients advanced standing students to the Department and the MSW Program; provides connection between the BSW curriculum and advanced MSW curriculum; assures attainment of CSWE Foundation Curriculum Competencies; provides opportunities to demonstrate/ evaluate practice skills of engagement, assessment, intervention, and evaluation; assists students with successful entry into advanced MSW program of study and advanced field placement. For graduate students in the advanced standing program.

Corequisite: SW 505
Typically offered in Summer only

SW 501 Social Work Policy, Services and Programs (3 credit hours)
Provides students with an understanding of and critical perspective on the development of social systems, social policy and the profession of Social Work in the United States. Examination of the history, mission, philosophy, and evolution of social welfare polices and services that form the foundation of social welfare, particularly as they relate to poverty, racism, and efforts to address the needs of oppresses and marginalized populations.

Typically offered in Spring only

SW 505 Human Behavior and the Social Environment: Social Justice (3 credit hours)
Theoretical and experiential knowledge related to oppression, privilege, and social and economic justice. Particular attention is given to persons and groups most affected by oppression and mechanisms that advance the achievement of a more just society.

Typically offered in Fall and Summer

SW 506 Human Behavior and the Social Environment: Individuals, Families, and Groups (3 credit hours)
An overview of normative individual and family development trajectories through the life cycle and survey of major theoretical frameworks and normative development variations: Theories of individual, familial, and group interaction and ways that informal groupings and support networks function to maintain individual and family well-being and stability. Admission to the MSW program or permission of the instructor.

Typically offered in Fall only

SW 510 Research Methods for Social Work (3 credit hours)
This course prepares students to carry out evidence-based practice in social work by interpreting empirical research findings in the context of social work practice and using social work research methods. The major activities of the course include: (1) identification of human diversity and ethical issues in research design and implementation, (2) identification of the steps of the research process, (3) assessment of the strengths and weaknesses of empirical research studies, and (4) utilization of mixed methods in designing social work research and evaluation.

P: ST 311; R: Departmental approval required
Typically offered in Spring only

SW 512/SW 412 Social Work in Schools (3 credit hours)
Models and roles relevant to school social work practice. Cooperative work with school personnel in the identification, prevention and treatment of social, emotional and behavioral problems of children and interventive techniques with parents and community groups. For individuals preparing for social work practice in the public schools and for school social workers seeking licensure. Credit not given for both SW 412 and SW 512. Instructor Permission Required.

Typically offered in Fall, Spring, and Summer

SW 515/SW 415 Child Welfare (3 credit hours)
Generalist perspective on the practice of public child welfare. History of child welfare, practices in child welfare, and current trends in child welfare programs. Skills needed to practice in child protective services, adoption, and foster care with specific attention to the North Carolina child welfare system. Application of cultural diversity and cultural competency integrated throughout as it relates to child welfare issues.

Prerequisite: SW 201
Typically offered in Fall, Spring, and Summer

SW 516/SW 416 Addiction Recovery and Social Work Practice (3 credit hours)
Knowledge and skills in identifying Alcohol and Other Drugs (AOD) problems, screening, assessment, intervention, referral, and prevention: history of AOD problems and treatment, AOD classification, effects and signs/symptoms of AOD, models of addiction, diversity, assessment, diagnosis, intervention, treatment modalities, mutual-help groups, family dynamics, prevention, and ethical considerations. Students cannot receive credit for both SW 416 and SW 516

Prerequisite: SW 310
Typically offered in Fall, Spring, and Summer

SW 517/SW 417 Direct Practice with Older Adults (3 credit hours)
Physical, psychological, social, and cultural theories of the aging process as it relates to social work practice, social policy, and services for working with older adults and their families. Emphasis on mental and physical well-being, diversity, social and economic justice, intergenerational issues, policy and programs. Credit is not allowed for both SW 417 and SW 517.

Typically offered in Fall and Spring

SW 518 Child Welfare Seminar (1 credit hours)
Best practice seminar for participants in the NC Child Welfare Education Collaborative Program. Seminars focus on current issues in child welfare practice and policy. Topics vary from semester to semester. Students arrange own transportation for occasional field trips to community agencies. Required for members of the NC Child Welfare Education Collaborative Program.

Typically offered in Fall and Spring

SW 519 Evaluation of a Social Work Intervention (2 credit hours)
Second of three courses in social work research. Evaluating social work practice and health and human services programs within different research paradigms. Prepares students for collecting, analyzing, and reporting qualitative and quantitative data; includes laboratory experience. Restricted to students who have completed all foundation courses in the MSW program.

P: SW 505 & SW 510
Typically offered in Fall only

SW 520 SW Generalist Practice I (3 credit hours)
Provides the foundation knowledge and skills needed to engage and assess individuals, families and groups. Examines underlying theories and models of research-informed practice and evidence-based social work interventions with particular emphasis on the ecological systems model from a strengths perspective. Presents the phases and dynamics of change in interpersonal helping relationships within a framework of human rights, social justice, and diversity. Restricted to students admitted to the MSW program.

C: SW 505 and SW 651
Typically offered in Fall only

SW 521 SW General Practice II (3 credit hours)
Prepares students for Social Work practice within organizations, communities and policy structures. Emphasizes multiculturalism, diversity, and social justice in relation to social systems. Restricted to students admitted to the MSW program.

P: SW 505 & SW 520; C: SW 652
Typically offered in Spring only

SW 523/SW 423 Social Work with Soldiers, Veterans, and Their Families (3 credit hours)
A basic overview of military life and the issues and challenges faced by military personnel, their families, friends, and community. The course provides a foundational guide to help professionals working with military families and to understand and address these issues and challenges.

R: Junior or Senior standing. Sophomores and Non-Degree may enroll with instructor approval.
Typically offered in Fall and Spring

SW 524 Portrayals of Social Welfare in Urban Life (3 credit hours)
This course provides an in-depth analysis of social policy development in the urban context and the multi-dimensional nature of environments, communities, and individuals. Popular media (newspaper and journal articles, film, television, and textbooks) will proxy as a microcosm of contemporary social welfare problems and purported solutions. Following an ethical and social justice paradigm, this course will examine the portrayals of the urban experience and the attendant social problems of life (crime, drugs, economic bifurcation, educational system, and the media) in an economically depressed or struggling major metropolitan area.

Typically offered in Fall, Spring, and Summer

SW 525/SW 425 Hunger and Homelessness (3 credit hours)
This course will familiarize students with the history and experience of hunger and homelessness in contemporary American society. The course includes discussion, narrative readings, experiential exercises, movie reviews, field trips, and other media to expose students to issues of food insecurity and housing instability. Students will critique ideas of what it means to be "poor" and be exposed to the lives of individuals who do not have access to adequate food, housing, healthcare, and other basic needs. American social welfare policy, including governmental and local programs that address these issues, will be discussed. Students are responsible for transportation.

Restricted: Junior or Senior Standing. Sophomores and Non-Degree Students may enroll with instructor approval.
GEP U.S. Diversity
Typically offered in Fall and Spring

SW 526 DSM and Clinical Conditions (3 credit hours)
This course examines evidence-based treatments across the lifespan from a social work perspective, with a specific focus on the most common mental disorders and evidence-based treatments. Students will demonstrate application of the most current version of the Diagnostic and Statistical Manual of Mental Disorders and become critical consumers of evidence-based treatment research with diverse populations. The course emphasizes strengths and ecological systems perspectives, risk and resiliency factors, and the impact of biological, psychological, cultural, spiritual and other social factors.

Prerequisite: SW 501 and SW 505 and SW 506 and SW 510 and SW 520 and SW 521 and SW 651 and SW 652; Corequisite: SW 653
Typically offered in Fall, Spring, and Summer

SW 540/SW 440 International Learning Experience in Social Work (6 credit hours)
A seven week learning experience in Guatemala. Through this course, the student will develop a global perspective of social welfare and social work practice, will learn about the people and culture of the Lake Atitlan area of Guatemala, will learn the variety of resources available in response to social need, and will enhance or develop Spanish language competence. All costs associated with learning opportunities and activities for this course are included in the cost of the program.

GEP Global Knowledge
Typically offered in Summer only

SW 550 Advanced Social Work Practice with Families (3 credit hours)
Theories, concepts, and skills needed for practice with diverse, at-risk family populations. Includes overview of historical and current social work approaches to family intervention as well as skill development in contemporary intervention methods. Focuses on understanding families within their cultural and community contexts, and presents several family intervention models useful for helping families build on their strengths to cope with a variety of family constellations, changes, and challenges.

Prerequisite: SW 652, Corequisite: SW 654
Typically offered in Spring only

SW 551 Social Work Practice with Children and Adolescents (3 credit hours)
Focuses on assessment and intervention strategies for clinical practice with children and adolescents. Explores issues common to these client groups.

Prerequisite: SW 521 and SW 652
Typically offered in Fall only

SW 557 SW Program Development and Grant Writing (3 credit hours)
This course provides a comprehensive introduction to program development and grant writing in social work. The course examines the major steps in the process including problem identification, needs assessment, program planning, and resource identification and development. It is designed to provide a hands-on approach to developing grant writing and other resource development skills. Restricted to students who have completed all foundation courses in a related graduate program.

Typically offered in Spring only

SW 560 Advanced Policy Practice with Organizations and Communities (3 credit hours)
This is the first course on social policy and examines how social workers collaborate with organizations and communities to intervene in social policy. Strategies for policy practice include values clarification, legislative advocacy, analytic advocacy, and implementation advocacy, and these strategies build upon concepts and skills from community development, social planning, and community organizing. Emphasis is given to working with economically disadvantaged and historically disempowered communities. This course is restricted to students admitted to the MSW Program.

Prerequisite: SW 501 & SW 521
Typically offered in Spring and Summer

SW 561 Social Work Administration and Supervision (3 credit hours)
This course addresses the theoretical frameworks and functions for managing human service organizations. The course will also explore personal and professional values and ethical dilemmas in exercising leadership in the management of culturally diverse community groups, boards, and committee meetings. Issues of staff development, team building, group decision-making, problem solving strategies, legal structure and governance, funding, accountability systems, and human resources will be discussed. The course provides students with a conceptual framework for understanding the management function, and promotes the development of specific skills necessary to critically evaluate and purposefully select among different management strategies.

Prerequisite: SW 521 & SW 652
Typically offered in Fall and Summer

SW 571 Community Mental Health (3 credit hours)
Focuses on social work practice in the field of Mental Health. Reviews policy and practice as it pertains to the promotion of mental health, the prevention of mental illnesses, and the delivery of psychosocial treatment. Strategies and practice for use at the individual, family, group, organizational, community, and societel levels are explored. Master of social work required.

Prerequisite: SW 691

SW 580 Social Work Professional Seminar (4 credit hours)
Capstone course taken in the final semester of the MSW program intended to help students integrate all coursework in preparation for graduation and professional practice. Directs students to apply promising practices to their professional work andencourages students to interact and blend perspectives from both direct practice and community partnership concentration options.

Prerequisite: SW 653

SW 581 Advanced Social Work Practice with Individuals (3 credit hours)
Prepares the student for advanced generalist practice with individuals who are experiencing a range of complex life challenges. Focus on traditional and emerging social work practice theories used by social workers to assist individuals in experiencing external and/or internal stressors. Interventions with diverse populations risk. Restricted to students who have completed all foundation courses in the MSW program.

Prerequisite: SW 521 and SW 652
Typically offered in Fall only

SW 582 Advanced Social Work Practices with Groups (3 credit hours)
Focuses on advanced social work practice with groups. Uses ecological systems and empowerment perspectives to explore major theories of social work practice with groups. Critical examination of contemporary issues in designing and evaluation group interventions in assessing their impact on individual and social change. Restricted to students who have completed all foundation courses in the MSW program.

Prerequisite: SW 521 and SW 652; Corequisite: SW 653
Typically offered in Fall only

SW 583 Advanced Social Work Practice with Family Systems (3 credit hours)
Theories, concepts, and skills needed for practice with diverse, at-risk families. Overview of historical and current social work approaches to family intervention as well as skill development in contemporary methods. Focuses on understanding families within their cultural and community contexts and presents several family intervention models useful for helping families build on their strengths to cope with a variety of family constellations, changes, and challenges experienced throughout their lifespan. Restricted to students who have completed all foundation courses in the MSW program.

Prerequisite: SW 521 and SW 652; Corequisite: SW 654
Typically offered in Spring only

SW 590 Social Work Capstone (2 credit hours)
This course involves implementation of a capstone project reflecting mastery of curricular content and demonstrating readiness to practice as an MSW-level professional social worker. Through the capstone project, students apply social work skills and integrate multiple social work concepts, such as the ecological systems and empowerment perspectives, intersectionality, and covert and overt oppression.

P: SW 519
Typically offered in Spring only

SW 595 Special Topics in Social Work (3-6 credit hours)
In-depth exploration of specialized or emerging topics in social work or social welfare. Topic of current interest and mode of study determined by faculty member. Also used to test and develop new courses.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

SW 630 Independent Study in Social Work (1-3 credit hours)
An independent study addressing an area of social work practice or social welfare.

Prerequisite: Master of Social Work, SW 510
Typically offered in Fall, Spring, and Summer

SW 651 Social Work Field Internship I (5 credit hours)
First course in a two-course foundation sequence that provides students the opportunity to use generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

C: SW 505 & SW 520
Typically offered in Fall only

SW 652 Social Work Field Internship II (5 credit hours)
Second course in a two-course foundation field internship sequence that provides students the opportunity to use generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

Prerequisite: SW 520 and SW 651, Corequisite: SW 521
Typically offered in Spring only

SW 653 Advanced Social Work Field Internship I (5 credit hours)
First course in the advanced field internship sequence that provides students with the opportunity to use advanced generalist practice social work in a field agency under the supervision of an MSW social work practitioner.

C: SW 512 or 557 or 561 or 581 or 582
Typically offered in Fall only

SW 654 Advanced Social Work Field Internship II (5 credit hours)
Second course in the advanced field internship sequence that provides students the opportunity to use advanced generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

Prerequisite: SW 653; Corequisite: SW 560 or SW 561 or SW 583 or SW 590
Typically offered in Spring only

Sociology (SOC)

SOC 202 Principles of Sociology (3 credit hours)
Introduction to sociology. Analyses of key processes and institutions including interaction, inequality, organization, socialization, and social change. Addresses experiences and outcomes of diverse groups in U.S. society. Includes core sociological concepts, methods, theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 203/SOC 203A Current Social Problems (3 credit hours)
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 203A/SOC 203 Current Social Problems (3 credit hours)
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 204/WGS 204 Sociology of Family (3 credit hours)
Contemporary American family structures and processes and their development. Focus on socialization, mate selection, marital adjustment and dissolution. Includes core sociological concepts, methods, theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 205 Jobs and Work (3 credit hours)
Work experience in terms of intrinsic and extrinsic rewards for worker. Work experience as intersection of occupation, industry, organization, region, and time period. Research skills for comparing job options to individual goals. Includes core sociological theories, concepts and methods.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 206 Social Deviance (3 credit hours)
Social processes in the creation and maintenance of deviant populations: classification, objectification of social meanings, functions of deviant groups and social outcomes of the deviance-ascription process. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 207 Language and Society (3 credit hours)
Introduction to the intersections of language, society and the individual, and the role of language in social interaction, socialization, ideologies, inequality and social change.Â Focus on language variation related to race, class, gender, and other social identities. Includes core sociological and sociolinguistics concepts, methods, theories.

GEP Interdisciplinary Perspectives, GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 211 Community and Health (3 credit hours)
Course introduces students to the fields of community sociology and population health. It focuses on how structural characteristics of communities influence health disparities, as well as the sociocultural, economic, political, and environmental determinants of physical and mental health and well-being.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 212 Race in America (3 credit hours)
Introduction to race and racism in the United States. Analysis of the key role that racism has played in US history and how racism has shaped opportunities and outcomes for people living in the US.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 220/GEO 220 Cultural Geography (3 credit hours)
Investigates the world's past and present cultural diversity by studying spatial patterns of population, language, religion, material and non-material culture, technology and livelihoods, communities and settlements and political organization and interaction.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 241/SOC 241A Sociology of Agriculture and Rural Society (3 credit hours)
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 241A/SOC 241 Sociology of Agriculture and Rural Society (3 credit hours)
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 261/ANT 261 Technology in Society and Culture (3 credit hours)
Processes of social and cultural change with a focus on role of technological innovation. Cross-cultural emphasis. Workplace changes and societal risks in U.S. and non-U.S. societies associated with technological innovations. Special attention to the role of scientists and engineers in socio-cultural change. Topical case studies apply course concepts and principles. Core sociological and anthropological concepts, methods, theories.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 295 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present 200-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

SOC 300 Social Research Methods (4 credit hours)
Basic methods of social research, research design, sampling, data collection, measurement, and analysis; the relationship between theory and research. Laboratory exercises on computer applications.

P: SOC 202 ; C: ST 311
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 301 Human Behavior (3 credit hours)
The development of personality as a consequence of social interactions and behavior of individuals in social contexts. Processes of learning, socialization, social perception, organization, stability and change of attitudes, norms, norm-formation and conformity, social roles and role strain, interpersonal attraction, and intergroup and intragroup relations.

P: 3 credits in 200-level SOC
GEP Social Sciences
Typically offered in Fall and Spring

SOC 304/WGS 304 Gender and Society (3 credit hours)
A sociological analysis of women and men in contemporary American society. Perpetuation of and change in gender stratification using sociological concepts, theories, and research. How gender expectations developed and transmitted. Historical data and research on diversity in American society used for analysis of causes and consequences of gender inequality.

P: 3 credits in SOC at the 200-level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 305/AFS 305 Racial and Ethnic Relations (3 credit hours)
Study of the nature of the relationships among racial and ethnic groups in societies around the world but with emphasis on the United States. Explores topics such as inequalities of wealth, power, and status, racism, conflict, and social boundaries among groups. Current trends in intergroup relations are discussed.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 306 Criminology (3 credit hours)
Study of processes whereby behavior is defined as crime and persons are identified as criminals. Includes a sociological investigation of agencies of law enforcement, adjudication, corrections and prevention; patterns of criminal behavior; explanations of variations in criminality with emphasis on sociocultural and sociopsychological theories.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences
Typically offered in Fall and Spring

SOC 307 Sociology of Immigration (3 credit hours)
Examination of the links between institutional discrimination of immigrants, racialization of immigrants, criminalization of immigration, identity formation of immigrant groups, and responses of individuals, communities, and institutions to these processes.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall only

SOC 309/REL 309 Religion and Society (3 credit hours)
Religious beliefs, practices and organizations addressed as social phenomena. Structural functionalism, conflict and subjectivism as theoretical orientations for understanding influences between religion and society. Relationship of religions to family, government, and economy and to social divisions, conflict and change.

P: 3 credits in SOC at the 200 level
GEP Humanities, GEP Social Sciences
Typically offered in Fall and Spring

SOC 311 Community Relationships (3 credit hours)
Institutions, organizations and agencies found in modern communities; social problems and conditions with which they deal; their interrelationships and trends toward comprehensive planning.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences
Typically offered in Fall and Spring

SOC 320 Survey Design (3 credit hours)
Focus on principles of designing surveys and developing survey questions common in sociological research. Topics include the survey-response process, the total survey error paradigm, how to conceptualize and measure attitudes and opinions, sensitive topics, nonresponse and satisficing, survey experiments, randomized-response techniques, pretesting, survey layout, and ethical and compliance issues.

Prerequisite: SOC 300 or PSY 230 or PS 371 or SW 300
GEP Social Sciences
Typically offered in Fall only

SOC 342 International Development (3 credit hours)
Sociological explanations of global patterns of development, with an emphasis on how the global political economy has evolved over time and how this contributes to social, economic, and environmental changes. Focus on the Global South in particular. Contemporary issues (such as migration and global food insecurity) will be included.

P: 3 credits in 200-level SOC
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

SOC 350 Food and Society (3 credit hours)
Relationships among individuals, groups, and organizations in the production, consumption, and distribution of food. Influences of gender, class, race, and ethnicity. Impacts of laws and regulations, markets, and social movements.

Prerequisite: 3 credits of a 200-level Sociology
GEP Social Sciences
Typically offered in Spring only

SOC 351 Population and Planning (3 credit hours)
Effects of births, deaths, and migration on population size, composition and distribution. Comparisons across U.S. and non-U.S. societies. Socioeconomic and political implications of demographic change. Impact of alternative policies on demographic processes.

Prerequisite: 3 credits in SOC at the 200 level
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

SOC 381 Sociology of Medicine (3 credit hours)
Use of theory and empirical studies to understand the social etiology of disease health practices, practitioners, and institutions, and the special area of mental health. Historical as well as contemporary examples of social influences on, and effects of, health throughout the world, but especially in the United States. Core sociological concepts, methods, theories.

Prerequisite: 200 level Sociology
GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

SOC 395 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present 300-level subject materials not normally available in regular course offerings or for new courses on a trial basis. This course is repeatable innumerable times as long as a different topic is addressed each time.

Prerequisite: 3 credits of a 200-level Sociology
Typically offered in Fall, Spring, and Summer

SOC 400 Theories of Social Structure (3 credit hours)
Contributions of Durkheim, Marx, Weber and others to contemporary macro-level sociological theories. Origins and development of functionalist and conflict approaches. Theories of social solidarity, class structure, the state, bureaucratization, ideology. Uses of original works.

Prerequisite: 3 cr. in SOC, 200 level
Typically offered in Fall and Spring

SOC 401 Theories of Social Interaction (3 credit hours)
Contributions of Weber, Simmel, Mead, Homans, Goffman and others to contemporary micro-level sociological theories. Origins and development of symbolic interaction, ethnomethodology, exchange theory and dramaturgy. Theories of the self, social construction of reality, emotions, interpersonal relationships. Interrelationship of theory and research; use of original works.

Prerequisite: 3 cr. in SOC, 200 level
Typically offered in Fall, Spring, and Summer

SOC 402 Urban Sociology (3 credit hours)
Urban social structures emphasizing determinants and consequences of changes in urban places and life styles. Current urban problems and various approaches to urban social planning.

Prerequisite: SOC 300

SOC 404 Families and Work (3 credit hours)
Sociological analysis of the interplay between economy and family. How men and women make decisions regarding work and family. Theory and research techniques appropriate to the student of work/family conflicts.

Prerequisite: SOC 200 level, SOC 300
Typically offered in Spring only

SOC 405 Racism in the U.S. (3 credit hours)
The course will examine the nature of racism in American society and its correlates: prejudice, discrimination, racial conflict, and racial oppression. Emphasis on the history and development of racism in the U.S. as well as its impact on minority groups. Sociological explanations for the emergence and continuation of racism.

Prerequisite: SOC 300

SOC 407/WGS 407 Sociology of Sexualities (3 credit hours)
Exploration of sexuality in a social context. Relationship between sexuality, gender and power in the U.S. Historical trends in behaviors and identities: social movements and sexual issues; current behavioral trends. Some issues covered; identity, social construction, sexual meanings.

Prerequisite: 3 hours SOC 200 level, 300 level
Typically offered in Fall only

SOC 410 Sociology of Organizations (3 credit hours)
Application of sociological theories to study of organizational structures and processes. Special attention to control and coordination, relations with other organizations, and decision making.

Prerequisite: 3 cr. in SOC, 200 level, SOC 300

SOC 413 Criminal Justice Field Work (4 credit hours)
Supervised observation and experience in a criminal justice agency. Study of relationships between ongoing programs and relevant political and sociological theory and research. Weekly seminars, small groups and individual conferences. Presentation of an integrative report.

Prerequisite: SOC 306 and PS 305, Senior standing in Criminal Justice option
Typically offered in Fall, Spring, and Summer

SOC 414 Social Class (3 credit hours)
The universality of social inequality, its bases and consequences. Relationship of social inequality to social class, life chances, life styles and social mobility. Theories and research methods pertinent to the study of social class.

Prerequisite: SOC 300

SOC 418 Sociology of Education (3 credit hours)
Application of sociological theories to education, relating processes of stratification, socialization and organization. Sociological analysis of classrooms and learning. Connections of schooling with family, community and work. Cross-cultural and U.S. research.

Prerequisite: SOC 300
Typically offered in Fall only

SOC 425 Juvenile Delinquency (3 credit hours)
Nature and extent of juvenile delinquency; measurement problems; and biogenic, psychogenic and sociogenic theories of delinquency causation. Policy implications of delinquency theories for treatment and prevention. Evaluation of treatment and prevention programs.

Prerequisite: 3 cr. in SOC 200-level; SOC 300
Typically offered in Fall and Spring

SOC 427 Sociology of Law (3 credit hours)
Sociological concepts, theories and research of law as social control. Social forces behind the creation, maintenance and application of law in American Society.

Prerequisite: 3 cr. in SOC 200-level; SOC 300
Typically offered in Fall only

SOC 428 Formal Institutions of Social Control (3 credit hours)
Development, structure and behavior of formal institutions of social control in the United States (police, courts, corrections); divergent philosophies of punishment that guide the juvenile and adult criminal justice system, dimensions of inequalitythat influence processing decisions and effectiveness of formal institutions in controlling violations of legal norms.

Prerequisite: 3 hours SOC 200 level; SOC 300
Typically offered in Spring only

SOC 429 Quantitative Data Analysis in Sociology (3 credit hours)
Analysis of quantitative data in sociology, including relationship between theory and research, operationalization and measurement of concepts, descriptive and inferential statistics using computer statistical software, interpreting statistical findings and writing research papers. Sociology and Criminology majors or consent of the instructor.

Prerequisite: SOC 300 or ST 311 or equivalent
Typically offered in Spring only

SOC 430 Community and Crime (3 credit hours)
Neighborhood development, structure and processes as related to delinquency, crime and criminality. Divergent theories of the effect of neighborhood context on crime and crime on neighborhood processes. The interaction of person and neighborhood context. Implications of community processes for social control.

Prerequisite: 3 credits in SOC 200 level; SOC 300
Typically offered in Spring only

SOC 432/PS 432 Violence, Terrorism, and Public Policy (3 credit hours)
The course examines interpersonal and group violence in contemporary societies and the causes for its occurrences. Specific forms of violence that will be examined include domestic violence, gangs, homicide, and terrorism, domestically and internationally. Throughout the course students will use data to critically evaluate policies and practices to prevent and control violence and will examine potential solutions to the problems of violence.

Prerequisite: SOC 300 or PS 371
Typically offered in Fall and Spring

SOC 440 Social Change (3 credit hours)
Sources, processes and consequences of social change on macro and micro levels. Applications of classical and contemporary theories to historical and modern examples of social change in international, national, regional, community, and institutionalsettings. Examples of empirical studies and appropriate methodologies for each level of analysis.

Prerequisite: 3 cr. in SOC, 200 level; SOC 300
Typically offered in Spring only

SOC 445 Inequality, Ideology, and Social Justice (3 credit hours)
Systematically addresses the question of why people believe what they do about the legitimacy of inequality; explores the role of self-interest, secular and religious values, considers specific types of ideology such as meritocracy, racism, sexism, colonialism; applies various theories to explain patterns of belief; looks at the role of media and propaganda in shaping beliefs.

Prerequisite: 3 hours of 200-level SOC and SOC 300
Typically offered in Fall only

SOC 450 Environmental Sociology (3 credit hours)
Systematic relations between natural environment and human societies. Dependency on the natural world. Population technology, cultural and economic influences on ecosystems. Development of environmentalism and alternative models for understanding threats and potentials. current environmental issues and considerations of their global contexts.

Prerequisite: 3 hours SOC 200 level, SOC 300
Typically offered in Fall only

SOC 457 Corporate Power in America (3 credit hours)
Examines the nature, distribution, and exercise of power in U.S. society. Emphasizes corporate power and its relationship to government. Topics include membership in the upper class and the power elite, media and shaping of public opinion, the culture of politics, formation of political consciousness, and the emergence of oppositional and reactionary social movements.

Prerequisite: (SOC 202 or SOC 203) and SOC 300
Typically offered in Spring only

SOC 465 Social Aspects of Mental Health (3 credit hours)
A survey of the role of social environment and life experiences in mental health and mental disorder, focusing on the link between social inequality and emotional inequality. Topics include the social construction of mental illness and the classification process, social distribution of mental health, explanations of mental health differences. Special emphasis on adolescent and adult traumas that shape the life course.

Prerequisite: SOC 300
Typically offered in Spring only

SOC 492 External Learning Experience (1-6 credit hours)
A learning experience in sociological research that utilizes facilities and resources which are external to the campus. Students are placed with organizations to apply sociological concepts in planning or conducting a research project. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

SOC 493 Special Problems in Sociology (1-6 credit hours)
A learning experience in sociological research that utilizes campus facilities and resources. Arrangements must be initiated by the student and approved by the instructor prior to the experience. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

SOC 495 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for new courses on a trial basis.

SOC 498 Independent Study in Sociology (1-6 credit hours)
A detailed investigation of a topic in sociology. Topic and mode of study determined by the faculty member(s) in consultation with the department head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Six hours SOC above the 200 level
Typically offered in Fall, Spring, and Summer

SOC 508 Social Organization (3 credit hours)
Introduction to study of social structure. Focus on inequality, work, organizations, the economy, the state. Classic writings and their impacts.

Prerequisite: SOC 400 or SOC 701

SOC 509 Population Problems (3 credit hours)
Examination of population growth, rates of change and distribution. Emphasis on functional roles of population, i.e., age, sex, race, residence, occupation, marital status and education. Stress on population dynamics fertility, mortality and migration. Analysis on population policy in relation to national and international goals stressing a world view.

Prerequisite: SOC 202

SOC 514 Developing Societies (3 credit hours)
Definition of major problems posed for development sociology and exploration of social barriers and theoretical solutions for development set forth with regard to newly developing countries. Review of significant past strategies and presentation of main themes in current development schemes. Proposal and discussion of untested strategies for the future. Examination of these problems in their national and international contexts.

Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status

SOC 533 The Community (3 credit hours)
The community viewed in sociological perspective as a functioning entity. Presentation and application of a method of analysis to eight "dimensions," with emphasis on the unique types of understanding to be derived from measuring each dimension. Finally, analysis of effect of change on community integration and development.

Prerequisite: Six hrs. SOC

SOC 591 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Spring only

SOC 601 Seminar (1-3 credit hours)
Appraisal of current literature; presentation of research papers by students; progress reports on departmental research; review of developing research methods and plans; reports from scientific meetings and conferences; other professional matters. Credits Arranged

Typically offered in Fall only

SOC 610 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 642 Practicum In Sociology (1-6 credit hours)
Opportunity for student under supervision of graduate advisory committee chair and organization/agency supervisor to develop and demonstrate competency in the area of graduate specialization through application of sociological knowledge to practicalproblems facing the organization/ agency.

Prerequisite: Graduate standing in the Master of Sociology program and nine hrs. of SOC at the 500-600 level
Typically offered in Fall, Spring, and Summer

SOC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

SOC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 701 Classical Sociological Theory (3 credit hours)
The interdependence of theory and research in sociology; major theoretical classics in the discipline and how they provide foundations for subsequent developments and for analysis in substantive areas.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 702 Contemporary Sociological Theory (3 credit hours)
Works by major figures representing leading schools of sociological theory in the post-World War II period studied as primary sources. Underlying assumptions made explicit, the structure of the theory, including propositions, examined critically anddiscussion of relationships with other theoretical perspectives.

Prerequisite: SOC 701

SOC 705 Historical Materialism Approaches to Social Theory (3 credit hours)
This sociological theory course will cover the development of Marxist social thought from the 19th century to the present. We will explore themes, arguments, and debates during this era, concentrating on theoretical developments and syntheses in the historical materialist traditions, and explore their relevance and application for sociological research. Issues and topics will be broadly organized around theories of class, gender, race, power, ideology, culture, capitalist development, science, social crises, social change, and social justice.

Typically offered in Spring only

SOC 707 Quantitative Sociological Analysis (3 credit hours)
Introduction to application of common quantitative methodologies in sociology including multiple regression and path analysis. Emphasis on selecting appropriate analytical techniques, model estimation and sociological interpretation of findings.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 708 Advanced Sociological Analysis (3 credit hours)
Examination of advanced analysis techniques adaptable to needs of sociological research. Special attention given to causal analysis, analysis of change and aggregate versus individual level data analyses. Consideration of sociological examples. Attention to emerging issues and techniques.

Prerequisite: SOC 711, ST 507 or ST 711
Typically offered in Fall only

SOC 710 Teaching Sociology (3 credit hours)
The objective of this course is for students to further their skills in teaching sociology. Students will plan an undergraduate course, construct a teaching philosophy, evaluate a variety of teaching techniques, and demonstrate an understanding of teaching as a sociological phenomenon.

Prerequisite: Admission to sociology graduate program
Typically offered in Spring only

SOC 711 Research Methods In Sociology I (3 credit hours)
Issues in philosophy of science, causation, relationship of theory and research. Qualitative, experimental and survey design methodologies.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 712 Advanced Survey Research Methods (3 credit hours)
Advanced survey methodology including research design, sampling, questionnaire development and surveys using the World Wide Web. Designing and executing substantive and methodological studies using surveys to perationalize behavioral and social constructs and to test hypotheses.

Prerequisite: SOC 711 and SOC 707
Typically offered in Spring only

SOC 713 Applied Research (3 credit hours)
Studies research process with emphasis upon its application to action problems. Stress upon development of research design to meet action research needs.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 715 Qualitative Sociological Methods and Analysis (3 credit hours)
Survey of qualitative sociological research methods. Practice in research design and evaluation, multiple forms of data gathering and data analysis. Theoretical and epistemological issues as related to qualitative sociology, with special attentionto ritical and feminist epistemological debates.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 721 Deviant Behavior (3 credit hours)
Topics include: the inevitability of deviance and its social utility; cross-cultural variations in appearance and behavioral cues for labeling the deviant; descriptive and explanatory approaches to kinds and amounts of deviance in contemporary American society; social change, anomie and social disorganization theories; the process of stigmatization; formal and informal societal responses to deviance and the deviant; social action implications.

Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status

SOC 722 Social Control (3 credit hours)
Examination of need, functions, utilization and effects of both informal and formal social control mechanisms. Emphasis and critical evaluation of theoretical perspectives on social control and the empirical support for these positions.

Prerequisite: Six hrs. SOC above 200 level or Graduate standing or PBS status

SOC 723 Research On Crime and Deviance (3 credit hours)
Major topics including an examination of conceptual problems and research issues and methods in study of crime and deviance; an assessment of current research on crime causation and deviance processes; an examination of research on social control processes and agencies; and an assessment of social action and evaluative research. A variety of substantive topics dealt with in the context of above topical areas including: delinquency, drug usage, mental illness, obesity, stuttering, suicide, prostitution, homicide and rape.

Prerequisite: SOC 721

SOC 725 Gender and Crime (3 credit hours)
This seminar will provide an overview of the literatures on gender, crime and violence. The course framework and readings emphasize the social structures of gender, social constructions of gender, symbolic meaning systems, and intersections of race, class and gender. We will examine theoretical approaches and empirical research that informs our understanding of the gendered commission of offending.

Typically offered in Fall and Spring

SOC 727 Comparative Societies (3 credit hours)
Sociological analysis of societies around the world with particular reference to North and South America. Special emphasis given to cultural and physical setting, population composition, levels of living, relationship of the people to the land, structure and function of major institutions and forces making for change.

Prerequisite: Six hrs. SOC

SOC 731 Survey of Family Sociology (3 credit hours)
Examination of structural and demographic continuities and changes for American families in general and within major subgroups (e.g., race, ethnicity, social class). Consideration of historical and cross-cultural comparisons. Assessment of the impact of families upon their members and the dynamics of marital and family relationships.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 732 Contemporary Family Theory and Research (3 credit hours)
Emphasis on contemporary research, theory and methodological techniques used by sociologists studying families. Critical examination of where field is now and where it appears to be heading. Primarily for graduate students designing or doing research about families.

Prerequisite: SOC 731

SOC 736 Social Stratification (3 credit hours)
The theoretical background, methodological approaches and analysis of the consequences of systems of stratification. Emphasis on static and dynamic qualities of stratification systems on relations within and between societies. Attention to the integrative and divisive quality of stratification as expressed in life styles, world views, etc.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 737/WGS 737 Sociology Of Gender (3 credit hours)
Theories about the development and maintenance of gender. Historical development of gender stratification. How individuals "do gender" in their daily lives. Contemporary research and substantive readings about gender in public and intimate relationships.

Prerequisite: Graduate student, SOC 736 or 731
Typically offered in Fall only

SOC 738 Race and Ethnic Inequality (3 credit hours)
Theoretical and methodological approaches and critical debates on race. Impact of racial discrimination on inequality. Effects of inequality on community institutions. Formation of attitudes and identities.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 739/WGS 739 Social Psychology Of Inequality (3 credit hours)
The effects of race, class and gender inequality on the formation of group consciousness, self-evaluations, emotions, values, attitudes and beliefs. Attention to interpersonal processes through to reproduction of inequality in everyday life.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 746 Sociological Social Psychology (3 credit hours)
Central issues in sociological social psychology, including formation of the self, effects of social structure on individual development, emergence of ritualized interaction and tension between individual agency and societal constraint. Emphasis on symbolic interactionist and dramaturgical perspectives.

Prerequisite: SOC 401t

SOC 752 Work and Industry (3 credit hours)
Control of economy and workplace. Special attention to economic restructuring, the labor process and recent workplace innovations. Theories include managerialism, bank hegemony and deskilling. Historical studies complement analyses of contemporary settings and issues.

Prerequisite: SOC 400 or SOC 508 or SOC 701

SOC 753 Inequality in Work and the Economy (3 credit hours)
Sociological study of structural inequality in labor markets and workplaces with implications for class, race, gender, and spatial disparities in employment-related outcomes. Special attention is paid to job quality, spatial disparities in employment opportunity, and processes contributing to race and gender disparities in job attainment and rewards.

Prerequisite: SOC 701
Typically offered in Spring only

SOC 754 Economic Sociology (3 credit hours)
Embeddedness of economic action by individuals, firms, and states within a social context. Topics include globalization, restructuring, the informal economy, social capital, spatial organization, labor markets and role of the state.

Prerequisite: SOC 701
Typically offered in Spring only

SOC 755 Global Institutions and Markets (3 credit hours)
This course introduces students to sociological and related perspectives on the dynamics of global production and consumption processes, focusing in particular on how they shape and are shaped by their organizational, political, cultural, and natural environments.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 761 Contemporary Debates in Food & Environment (3 credit hours)
This course will be organized around contemporary debates related to the intersections between food and race, class, and gender inequalities. We will focus largely on recent books on these topics, with attention to both their substantive findings as well as the methods and theory employed.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 762 Sociology of Food Systems (3 credit hours)
This course examines the social relations surrounding the production, distribution, and consumption of food. Sociologists of food display considerable diversity in their theoretical approaches, research methods, and empirical foci. This course will traverse social science research and theorizing to offer an analytic taste on what we eat, how we produce and procure it, who benefits, what we think about it, and how it fits with contemporary social life and institutions.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 763 Environmental Sociology (3 credit hours)
This is a survey course in environmental sociology. We begin with a discussion of the emergence and development of environmental sociology, followed by an overview of theoretical perspectives in the field. We then conduct a survey of topics that have typically been addressed in the area. These topics include: environmental concern and values, environmental health, environmental inequality, environmental movements, technological disasters, and global environmental issues. Throughout the course we survey theoretical concerns as they relate to various topics within the field.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 791 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 810 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

SOC 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Sociology (SOC)

SOC 202 Principles of Sociology (3 credit hours)
Introduction to sociology. Analyses of key processes and institutions including interaction, inequality, organization, socialization, and social change. Addresses experiences and outcomes of diverse groups in U.S. society. Includes core sociological concepts, methods, theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 203/SOC 203A Current Social Problems (3 credit hours)
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 203A/SOC 203 Current Social Problems (3 credit hours)
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 204/WGS 204 Sociology of Family (3 credit hours)
Contemporary American family structures and processes and their development. Focus on socialization, mate selection, marital adjustment and dissolution. Includes core sociological concepts, methods, theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 205 Jobs and Work (3 credit hours)
Work experience in terms of intrinsic and extrinsic rewards for worker. Work experience as intersection of occupation, industry, organization, region, and time period. Research skills for comparing job options to individual goals. Includes core sociological theories, concepts and methods.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 206 Social Deviance (3 credit hours)
Social processes in the creation and maintenance of deviant populations: classification, objectification of social meanings, functions of deviant groups and social outcomes of the deviance-ascription process. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 207 Language and Society (3 credit hours)
Introduction to the intersections of language, society and the individual, and the role of language in social interaction, socialization, ideologies, inequality and social change.Â Focus on language variation related to race, class, gender, and other social identities. Includes core sociological and sociolinguistics concepts, methods, theories.

GEP Interdisciplinary Perspectives, GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 211 Community and Health (3 credit hours)
Course introduces students to the fields of community sociology and population health. It focuses on how structural characteristics of communities influence health disparities, as well as the sociocultural, economic, political, and environmental determinants of physical and mental health and well-being.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

SOC 212 Race in America (3 credit hours)
Introduction to race and racism in the United States. Analysis of the key role that racism has played in US history and how racism has shaped opportunities and outcomes for people living in the US.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 220/GEO 220 Cultural Geography (3 credit hours)
Investigates the world's past and present cultural diversity by studying spatial patterns of population, language, religion, material and non-material culture, technology and livelihoods, communities and settlements and political organization and interaction.

GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 241/SOC 241A Sociology of Agriculture and Rural Society (3 credit hours)
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 241A/SOC 241 Sociology of Agriculture and Rural Society (3 credit hours)
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

GEP Social Sciences
Typically offered in Fall and Spring

SOC 261/ANT 261 Technology in Society and Culture (3 credit hours)
Processes of social and cultural change with a focus on role of technological innovation. Cross-cultural emphasis. Workplace changes and societal risks in U.S. and non-U.S. societies associated with technological innovations. Special attention to the role of scientists and engineers in socio-cultural change. Topical case studies apply course concepts and principles. Core sociological and anthropological concepts, methods, theories.

GEP Global Knowledge, GEP Interdisciplinary Perspectives, GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 295 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present 200-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

SOC 300 Social Research Methods (4 credit hours)
Basic methods of social research, research design, sampling, data collection, measurement, and analysis; the relationship between theory and research. Laboratory exercises on computer applications.

P: SOC 202 ; C: ST 311
GEP Social Sciences
Typically offered in Fall, Spring, and Summer

SOC 301 Human Behavior (3 credit hours)
The development of personality as a consequence of social interactions and behavior of individuals in social contexts. Processes of learning, socialization, social perception, organization, stability and change of attitudes, norms, norm-formation and conformity, social roles and role strain, interpersonal attraction, and intergroup and intragroup relations.

P: 3 credits in 200-level SOC
GEP Social Sciences
Typically offered in Fall and Spring

SOC 304/WGS 304 Gender and Society (3 credit hours)
A sociological analysis of women and men in contemporary American society. Perpetuation of and change in gender stratification using sociological concepts, theories, and research. How gender expectations developed and transmitted. Historical data and research on diversity in American society used for analysis of causes and consequences of gender inequality.

P: 3 credits in SOC at the 200-level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 305/AFS 305 Racial and Ethnic Relations (3 credit hours)
Study of the nature of the relationships among racial and ethnic groups in societies around the world but with emphasis on the United States. Explores topics such as inequalities of wealth, power, and status, racism, conflict, and social boundaries among groups. Current trends in intergroup relations are discussed.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

SOC 306 Criminology (3 credit hours)
Study of processes whereby behavior is defined as crime and persons are identified as criminals. Includes a sociological investigation of agencies of law enforcement, adjudication, corrections and prevention; patterns of criminal behavior; explanations of variations in criminality with emphasis on sociocultural and sociopsychological theories.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences
Typically offered in Fall and Spring

SOC 307 Sociology of Immigration (3 credit hours)
Examination of the links between institutional discrimination of immigrants, racialization of immigrants, criminalization of immigration, identity formation of immigrant groups, and responses of individuals, communities, and institutions to these processes.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall only

SOC 309/REL 309 Religion and Society (3 credit hours)
Religious beliefs, practices and organizations addressed as social phenomena. Structural functionalism, conflict and subjectivism as theoretical orientations for understanding influences between religion and society. Relationship of religions to family, government, and economy and to social divisions, conflict and change.

P: 3 credits in SOC at the 200 level
GEP Humanities, GEP Social Sciences
Typically offered in Fall and Spring

SOC 311 Community Relationships (3 credit hours)
Institutions, organizations and agencies found in modern communities; social problems and conditions with which they deal; their interrelationships and trends toward comprehensive planning.

Prerequisite: 3 cr. in SOC, 200 level
GEP Social Sciences
Typically offered in Fall and Spring

SOC 320 Survey Design (3 credit hours)
Focus on principles of designing surveys and developing survey questions common in sociological research. Topics include the survey-response process, the total survey error paradigm, how to conceptualize and measure attitudes and opinions, sensitive topics, nonresponse and satisficing, survey experiments, randomized-response techniques, pretesting, survey layout, and ethical and compliance issues.

Prerequisite: SOC 300 or PSY 230 or PS 371 or SW 300
GEP Social Sciences
Typically offered in Fall only

SOC 342 International Development (3 credit hours)
Sociological explanations of global patterns of development, with an emphasis on how the global political economy has evolved over time and how this contributes to social, economic, and environmental changes. Focus on the Global South in particular. Contemporary issues (such as migration and global food insecurity) will be included.

P: 3 credits in 200-level SOC
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

SOC 350 Food and Society (3 credit hours)
Relationships among individuals, groups, and organizations in the production, consumption, and distribution of food. Influences of gender, class, race, and ethnicity. Impacts of laws and regulations, markets, and social movements.

Prerequisite: 3 credits of a 200-level Sociology
GEP Social Sciences
Typically offered in Spring only

SOC 351 Population and Planning (3 credit hours)
Effects of births, deaths, and migration on population size, composition and distribution. Comparisons across U.S. and non-U.S. societies. Socioeconomic and political implications of demographic change. Impact of alternative policies on demographic processes.

Prerequisite: 3 credits in SOC at the 200 level
GEP Global Knowledge, GEP Social Sciences
Typically offered in Fall only

SOC 381 Sociology of Medicine (3 credit hours)
Use of theory and empirical studies to understand the social etiology of disease health practices, practitioners, and institutions, and the special area of mental health. Historical as well as contemporary examples of social influences on, and effects of, health throughout the world, but especially in the United States. Core sociological concepts, methods, theories.

Prerequisite: 200 level Sociology
GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

SOC 395 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present 300-level subject materials not normally available in regular course offerings or for new courses on a trial basis. This course is repeatable innumerable times as long as a different topic is addressed each time.

Prerequisite: 3 credits of a 200-level Sociology
Typically offered in Fall, Spring, and Summer

SOC 400 Theories of Social Structure (3 credit hours)
Contributions of Durkheim, Marx, Weber and others to contemporary macro-level sociological theories. Origins and development of functionalist and conflict approaches. Theories of social solidarity, class structure, the state, bureaucratization, ideology. Uses of original works.

Prerequisite: 3 cr. in SOC, 200 level
Typically offered in Fall and Spring

SOC 401 Theories of Social Interaction (3 credit hours)
Contributions of Weber, Simmel, Mead, Homans, Goffman and others to contemporary micro-level sociological theories. Origins and development of symbolic interaction, ethnomethodology, exchange theory and dramaturgy. Theories of the self, social construction of reality, emotions, interpersonal relationships. Interrelationship of theory and research; use of original works.

Prerequisite: 3 cr. in SOC, 200 level
Typically offered in Fall, Spring, and Summer

SOC 402 Urban Sociology (3 credit hours)
Urban social structures emphasizing determinants and consequences of changes in urban places and life styles. Current urban problems and various approaches to urban social planning.

Prerequisite: SOC 300

SOC 404 Families and Work (3 credit hours)
Sociological analysis of the interplay between economy and family. How men and women make decisions regarding work and family. Theory and research techniques appropriate to the student of work/family conflicts.

Prerequisite: SOC 200 level, SOC 300
Typically offered in Spring only

SOC 405 Racism in the U.S. (3 credit hours)
The course will examine the nature of racism in American society and its correlates: prejudice, discrimination, racial conflict, and racial oppression. Emphasis on the history and development of racism in the U.S. as well as its impact on minority groups. Sociological explanations for the emergence and continuation of racism.

Prerequisite: SOC 300

SOC 407/WGS 407 Sociology of Sexualities (3 credit hours)
Exploration of sexuality in a social context. Relationship between sexuality, gender and power in the U.S. Historical trends in behaviors and identities: social movements and sexual issues; current behavioral trends. Some issues covered; identity, social construction, sexual meanings.

Prerequisite: 3 hours SOC 200 level, 300 level
Typically offered in Fall only

SOC 410 Sociology of Organizations (3 credit hours)
Application of sociological theories to study of organizational structures and processes. Special attention to control and coordination, relations with other organizations, and decision making.

Prerequisite: 3 cr. in SOC, 200 level, SOC 300

SOC 413 Criminal Justice Field Work (4 credit hours)
Supervised observation and experience in a criminal justice agency. Study of relationships between ongoing programs and relevant political and sociological theory and research. Weekly seminars, small groups and individual conferences. Presentation of an integrative report.

Prerequisite: SOC 306 and PS 305, Senior standing in Criminal Justice option
Typically offered in Fall, Spring, and Summer

SOC 414 Social Class (3 credit hours)
The universality of social inequality, its bases and consequences. Relationship of social inequality to social class, life chances, life styles and social mobility. Theories and research methods pertinent to the study of social class.

Prerequisite: SOC 300

SOC 418 Sociology of Education (3 credit hours)
Application of sociological theories to education, relating processes of stratification, socialization and organization. Sociological analysis of classrooms and learning. Connections of schooling with family, community and work. Cross-cultural and U.S. research.

Prerequisite: SOC 300
Typically offered in Fall only

SOC 425 Juvenile Delinquency (3 credit hours)
Nature and extent of juvenile delinquency; measurement problems; and biogenic, psychogenic and sociogenic theories of delinquency causation. Policy implications of delinquency theories for treatment and prevention. Evaluation of treatment and prevention programs.

Prerequisite: 3 cr. in SOC 200-level; SOC 300
Typically offered in Fall and Spring

SOC 427 Sociology of Law (3 credit hours)
Sociological concepts, theories and research of law as social control. Social forces behind the creation, maintenance and application of law in American Society.

Prerequisite: 3 cr. in SOC 200-level; SOC 300
Typically offered in Fall only

SOC 428 Formal Institutions of Social Control (3 credit hours)
Development, structure and behavior of formal institutions of social control in the United States (police, courts, corrections); divergent philosophies of punishment that guide the juvenile and adult criminal justice system, dimensions of inequalitythat influence processing decisions and effectiveness of formal institutions in controlling violations of legal norms.

Prerequisite: 3 hours SOC 200 level; SOC 300
Typically offered in Spring only

SOC 429 Quantitative Data Analysis in Sociology (3 credit hours)
Analysis of quantitative data in sociology, including relationship between theory and research, operationalization and measurement of concepts, descriptive and inferential statistics using computer statistical software, interpreting statistical findings and writing research papers. Sociology and Criminology majors or consent of the instructor.

Prerequisite: SOC 300 or ST 311 or equivalent
Typically offered in Spring only

SOC 430 Community and Crime (3 credit hours)
Neighborhood development, structure and processes as related to delinquency, crime and criminality. Divergent theories of the effect of neighborhood context on crime and crime on neighborhood processes. The interaction of person and neighborhood context. Implications of community processes for social control.

Prerequisite: 3 credits in SOC 200 level; SOC 300
Typically offered in Spring only

SOC 432/PS 432 Violence, Terrorism, and Public Policy (3 credit hours)
The course examines interpersonal and group violence in contemporary societies and the causes for its occurrences. Specific forms of violence that will be examined include domestic violence, gangs, homicide, and terrorism, domestically and internationally. Throughout the course students will use data to critically evaluate policies and practices to prevent and control violence and will examine potential solutions to the problems of violence.

Prerequisite: SOC 300 or PS 371
Typically offered in Fall and Spring

SOC 440 Social Change (3 credit hours)
Sources, processes and consequences of social change on macro and micro levels. Applications of classical and contemporary theories to historical and modern examples of social change in international, national, regional, community, and institutionalsettings. Examples of empirical studies and appropriate methodologies for each level of analysis.

Prerequisite: 3 cr. in SOC, 200 level; SOC 300
Typically offered in Spring only

SOC 445 Inequality, Ideology, and Social Justice (3 credit hours)
Systematically addresses the question of why people believe what they do about the legitimacy of inequality; explores the role of self-interest, secular and religious values, considers specific types of ideology such as meritocracy, racism, sexism, colonialism; applies various theories to explain patterns of belief; looks at the role of media and propaganda in shaping beliefs.

Prerequisite: 3 hours of 200-level SOC and SOC 300
Typically offered in Fall only

SOC 450 Environmental Sociology (3 credit hours)
Systematic relations between natural environment and human societies. Dependency on the natural world. Population technology, cultural and economic influences on ecosystems. Development of environmentalism and alternative models for understanding threats and potentials. current environmental issues and considerations of their global contexts.

Prerequisite: 3 hours SOC 200 level, SOC 300
Typically offered in Fall only

SOC 457 Corporate Power in America (3 credit hours)
Examines the nature, distribution, and exercise of power in U.S. society. Emphasizes corporate power and its relationship to government. Topics include membership in the upper class and the power elite, media and shaping of public opinion, the culture of politics, formation of political consciousness, and the emergence of oppositional and reactionary social movements.

Prerequisite: (SOC 202 or SOC 203) and SOC 300
Typically offered in Spring only

SOC 465 Social Aspects of Mental Health (3 credit hours)
A survey of the role of social environment and life experiences in mental health and mental disorder, focusing on the link between social inequality and emotional inequality. Topics include the social construction of mental illness and the classification process, social distribution of mental health, explanations of mental health differences. Special emphasis on adolescent and adult traumas that shape the life course.

Prerequisite: SOC 300
Typically offered in Spring only

SOC 492 External Learning Experience (1-6 credit hours)
A learning experience in sociological research that utilizes facilities and resources which are external to the campus. Students are placed with organizations to apply sociological concepts in planning or conducting a research project. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

SOC 493 Special Problems in Sociology (1-6 credit hours)
A learning experience in sociological research that utilizes campus facilities and resources. Arrangements must be initiated by the student and approved by the instructor prior to the experience. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

Prerequisite: Sophomore standing
Typically offered in Fall, Spring, and Summer

SOC 495 Special Topics in Sociology (1-3 credit hours)
Offered as needed to present materials not normally available in regular course offerings or for new courses on a trial basis.

SOC 498 Independent Study in Sociology (1-6 credit hours)
A detailed investigation of a topic in sociology. Topic and mode of study determined by the faculty member(s) in consultation with the department head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Six hours SOC above the 200 level
Typically offered in Fall, Spring, and Summer

SOC 508 Social Organization (3 credit hours)
Introduction to study of social structure. Focus on inequality, work, organizations, the economy, the state. Classic writings and their impacts.

Prerequisite: SOC 400 or SOC 701

SOC 509 Population Problems (3 credit hours)
Examination of population growth, rates of change and distribution. Emphasis on functional roles of population, i.e., age, sex, race, residence, occupation, marital status and education. Stress on population dynamics fertility, mortality and migration. Analysis on population policy in relation to national and international goals stressing a world view.

Prerequisite: SOC 202

SOC 514 Developing Societies (3 credit hours)
Definition of major problems posed for development sociology and exploration of social barriers and theoretical solutions for development set forth with regard to newly developing countries. Review of significant past strategies and presentation of main themes in current development schemes. Proposal and discussion of untested strategies for the future. Examination of these problems in their national and international contexts.

Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status

SOC 533 The Community (3 credit hours)
The community viewed in sociological perspective as a functioning entity. Presentation and application of a method of analysis to eight "dimensions," with emphasis on the unique types of understanding to be derived from measuring each dimension. Finally, analysis of effect of change on community integration and development.

Prerequisite: Six hrs. SOC

SOC 591 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Spring only

SOC 601 Seminar (1-3 credit hours)
Appraisal of current literature; presentation of research papers by students; progress reports on departmental research; review of developing research methods and plans; reports from scientific meetings and conferences; other professional matters. Credits Arranged

Typically offered in Fall only

SOC 610 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 642 Practicum In Sociology (1-6 credit hours)
Opportunity for student under supervision of graduate advisory committee chair and organization/agency supervisor to develop and demonstrate competency in the area of graduate specialization through application of sociological knowledge to practicalproblems facing the organization/ agency.

Prerequisite: Graduate standing in the Master of Sociology program and nine hrs. of SOC at the 500-600 level
Typically offered in Fall, Spring, and Summer

SOC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

SOC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SOC 701 Classical Sociological Theory (3 credit hours)
The interdependence of theory and research in sociology; major theoretical classics in the discipline and how they provide foundations for subsequent developments and for analysis in substantive areas.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 702 Contemporary Sociological Theory (3 credit hours)
Works by major figures representing leading schools of sociological theory in the post-World War II period studied as primary sources. Underlying assumptions made explicit, the structure of the theory, including propositions, examined critically anddiscussion of relationships with other theoretical perspectives.

Prerequisite: SOC 701

SOC 705 Historical Materialism Approaches to Social Theory (3 credit hours)
This sociological theory course will cover the development of Marxist social thought from the 19th century to the present. We will explore themes, arguments, and debates during this era, concentrating on theoretical developments and syntheses in the historical materialist traditions, and explore their relevance and application for sociological research. Issues and topics will be broadly organized around theories of class, gender, race, power, ideology, culture, capitalist development, science, social crises, social change, and social justice.

Typically offered in Spring only

SOC 707 Quantitative Sociological Analysis (3 credit hours)
Introduction to application of common quantitative methodologies in sociology including multiple regression and path analysis. Emphasis on selecting appropriate analytical techniques, model estimation and sociological interpretation of findings.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 708 Advanced Sociological Analysis (3 credit hours)
Examination of advanced analysis techniques adaptable to needs of sociological research. Special attention given to causal analysis, analysis of change and aggregate versus individual level data analyses. Consideration of sociological examples. Attention to emerging issues and techniques.

Prerequisite: SOC 711, ST 507 or ST 711
Typically offered in Fall only

SOC 710 Teaching Sociology (3 credit hours)
The objective of this course is for students to further their skills in teaching sociology. Students will plan an undergraduate course, construct a teaching philosophy, evaluate a variety of teaching techniques, and demonstrate an understanding of teaching as a sociological phenomenon.

Prerequisite: Admission to sociology graduate program
Typically offered in Spring only

SOC 711 Research Methods In Sociology I (3 credit hours)
Issues in philosophy of science, causation, relationship of theory and research. Qualitative, experimental and survey design methodologies.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 712 Advanced Survey Research Methods (3 credit hours)
Advanced survey methodology including research design, sampling, questionnaire development and surveys using the World Wide Web. Designing and executing substantive and methodological studies using surveys to perationalize behavioral and social constructs and to test hypotheses.

Prerequisite: SOC 711 and SOC 707
Typically offered in Spring only

SOC 713 Applied Research (3 credit hours)
Studies research process with emphasis upon its application to action problems. Stress upon development of research design to meet action research needs.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 715 Qualitative Sociological Methods and Analysis (3 credit hours)
Survey of qualitative sociological research methods. Practice in research design and evaluation, multiple forms of data gathering and data analysis. Theoretical and epistemological issues as related to qualitative sociology, with special attentionto ritical and feminist epistemological debates.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 721 Deviant Behavior (3 credit hours)
Topics include: the inevitability of deviance and its social utility; cross-cultural variations in appearance and behavioral cues for labeling the deviant; descriptive and explanatory approaches to kinds and amounts of deviance in contemporary American society; social change, anomie and social disorganization theories; the process of stigmatization; formal and informal societal responses to deviance and the deviant; social action implications.

Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status

SOC 722 Social Control (3 credit hours)
Examination of need, functions, utilization and effects of both informal and formal social control mechanisms. Emphasis and critical evaluation of theoretical perspectives on social control and the empirical support for these positions.

Prerequisite: Six hrs. SOC above 200 level or Graduate standing or PBS status

SOC 723 Research On Crime and Deviance (3 credit hours)
Major topics including an examination of conceptual problems and research issues and methods in study of crime and deviance; an assessment of current research on crime causation and deviance processes; an examination of research on social control processes and agencies; and an assessment of social action and evaluative research. A variety of substantive topics dealt with in the context of above topical areas including: delinquency, drug usage, mental illness, obesity, stuttering, suicide, prostitution, homicide and rape.

Prerequisite: SOC 721

SOC 725 Gender and Crime (3 credit hours)
This seminar will provide an overview of the literatures on gender, crime and violence. The course framework and readings emphasize the social structures of gender, social constructions of gender, symbolic meaning systems, and intersections of race, class and gender. We will examine theoretical approaches and empirical research that informs our understanding of the gendered commission of offending.

Typically offered in Fall and Spring

SOC 727 Comparative Societies (3 credit hours)
Sociological analysis of societies around the world with particular reference to North and South America. Special emphasis given to cultural and physical setting, population composition, levels of living, relationship of the people to the land, structure and function of major institutions and forces making for change.

Prerequisite: Six hrs. SOC

SOC 731 Survey of Family Sociology (3 credit hours)
Examination of structural and demographic continuities and changes for American families in general and within major subgroups (e.g., race, ethnicity, social class). Consideration of historical and cross-cultural comparisons. Assessment of the impact of families upon their members and the dynamics of marital and family relationships.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 732 Contemporary Family Theory and Research (3 credit hours)
Emphasis on contemporary research, theory and methodological techniques used by sociologists studying families. Critical examination of where field is now and where it appears to be heading. Primarily for graduate students designing or doing research about families.

Prerequisite: SOC 731

SOC 736 Social Stratification (3 credit hours)
The theoretical background, methodological approaches and analysis of the consequences of systems of stratification. Emphasis on static and dynamic qualities of stratification systems on relations within and between societies. Attention to the integrative and divisive quality of stratification as expressed in life styles, world views, etc.

Requisite: Admission to SOC Graduate Program
Typically offered in Fall only

SOC 737/WGS 737 Sociology Of Gender (3 credit hours)
Theories about the development and maintenance of gender. Historical development of gender stratification. How individuals "do gender" in their daily lives. Contemporary research and substantive readings about gender in public and intimate relationships.

Prerequisite: Graduate student, SOC 736 or 731
Typically offered in Fall only

SOC 738 Race and Ethnic Inequality (3 credit hours)
Theoretical and methodological approaches and critical debates on race. Impact of racial discrimination on inequality. Effects of inequality on community institutions. Formation of attitudes and identities.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 739/WGS 739 Social Psychology Of Inequality (3 credit hours)
The effects of race, class and gender inequality on the formation of group consciousness, self-evaluations, emotions, values, attitudes and beliefs. Attention to interpersonal processes through to reproduction of inequality in everyday life.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

SOC 746 Sociological Social Psychology (3 credit hours)
Central issues in sociological social psychology, including formation of the self, effects of social structure on individual development, emergence of ritualized interaction and tension between individual agency and societal constraint. Emphasis on symbolic interactionist and dramaturgical perspectives.

Prerequisite: SOC 401t

SOC 752 Work and Industry (3 credit hours)
Control of economy and workplace. Special attention to economic restructuring, the labor process and recent workplace innovations. Theories include managerialism, bank hegemony and deskilling. Historical studies complement analyses of contemporary settings and issues.

Prerequisite: SOC 400 or SOC 508 or SOC 701

SOC 753 Inequality in Work and the Economy (3 credit hours)
Sociological study of structural inequality in labor markets and workplaces with implications for class, race, gender, and spatial disparities in employment-related outcomes. Special attention is paid to job quality, spatial disparities in employment opportunity, and processes contributing to race and gender disparities in job attainment and rewards.

Prerequisite: SOC 701
Typically offered in Spring only

SOC 754 Economic Sociology (3 credit hours)
Embeddedness of economic action by individuals, firms, and states within a social context. Topics include globalization, restructuring, the informal economy, social capital, spatial organization, labor markets and role of the state.

Prerequisite: SOC 701
Typically offered in Spring only

SOC 755 Global Institutions and Markets (3 credit hours)
This course introduces students to sociological and related perspectives on the dynamics of global production and consumption processes, focusing in particular on how they shape and are shaped by their organizational, political, cultural, and natural environments.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 761 Contemporary Debates in Food & Environment (3 credit hours)
This course will be organized around contemporary debates related to the intersections between food and race, class, and gender inequalities. We will focus largely on recent books on these topics, with attention to both their substantive findings as well as the methods and theory employed.

Prerequisite: Graduate standing
Typically offered in Spring only

SOC 762 Sociology of Food Systems (3 credit hours)
This course examines the social relations surrounding the production, distribution, and consumption of food. Sociologists of food display considerable diversity in their theoretical approaches, research methods, and empirical foci. This course will traverse social science research and theorizing to offer an analytic taste on what we eat, how we produce and procure it, who benefits, what we think about it, and how it fits with contemporary social life and institutions.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 763 Environmental Sociology (3 credit hours)
This is a survey course in environmental sociology. We begin with a discussion of the emergence and development of environmental sociology, followed by an overview of theoretical perspectives in the field. We then conduct a survey of topics that have typically been addressed in the area. These topics include: environmental concern and values, environmental health, environmental inequality, environmental movements, technological disasters, and global environmental issues. Throughout the course we survey theoretical concerns as they relate to various topics within the field.

Prerequisite: Graduate standing
Typically offered in Fall only

SOC 791 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 810 Special Topics In Sociology (1-6 credit hours)
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

Typically offered in Fall, Spring, and Summer

SOC 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 890 Doctoral Preliminary Exam (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SOC 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

SOC 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Soil Science (SSC)

SSC 112 Principles of Soil Science (4 credit hours)
Fundamental soil physical and chemical properties and principles. Major lecture topics: soil description, formation, soil water and the hydrologic cycle, and soil fertility and fertilizers. Laboratory exercises in identifying soil horizons, determining soil texture, identifying nutrient deficiency symptoms in plants and interpreting soil fertility test reports. BROOME

Requisite: Agricultural Institute Only
Typically offered in Fall and Spring

SSC 151 Fertilizers and Soil Fertility (3 credit hours)
Principles of managing plant nutrients in soils for crop, turfgrass and other plant production; nutrient requirements; deficiency symptons, nutrient availability in soils; soil acidity and liming; fertilizer materials; organic fertilizers; and environmental effects of fertilizers.

Requisite: Agricultural Institute Only; Prerequisite: SSC 112
Typically offered in Spring only

SSC 185 Land and Life (3 credit hours)
Soil is a fundamental natural resource that sustains life on earth. Detailed information is provided about soils at local, community, regional, national, and global scales; and their importance to world food security and human health, agricultural production, environmental quality, and sustainable ecosystems. Students will gain practical knowledge about soils, their use and management, and their critical role in supporting life. Understanding basic soil properties, their interactions, and how they are influenced or impacted by human activity is essential to everyday life and to being a well-informed citizen.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

SSC 200 Soil Science (3 credit hours)
Fundamentals of soils including origin, composition and classification; their physical, chemical, and biological properties; significance of these properties to soil-plant relationships and soil management.

Prerequisite: CH 101 or CH 100
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

SSC 201 Soil Science Laboratory (1 credit hours)
Hands-on laboratory experience in fundamentals of soils including origin, composition and classification; their physical, chemical, and biological properties; significance of these properties to soil-plant relationships, soil management and the environment.

Corequisite: SSC 200
GEP Natural Sciences
Typically offered in Fall and Spring

SSC 332 Environmental Soil Microbiology (3 credit hours)
Analysis of the effects of soil environments on microbial growth. Relationships and significance of microbes to mineral transformations, plant development, and environmental quality. Management of soil microorganisms in different ecosystems.

Prerequisite: BIO 181 and SSC 200
Typically offered in Spring only

SSC 341 Soil Fertility and Nutrient Management (3 credit hours)
The course provides detailed information on plant nutrition, soil fertility, and management of essential plant nutrients and other amendments affecting plant growth and nutrition. The influence of numerous biological, physical, and chemical soil properties on plant nutrient availability will be emphasized. Students will be familiar with contemporary diagnostic tools to assess nutrient availability, and the soil and nutrient management technologies essential for enhancing soil and plant productivity while minimizing the impact of nutrient use on the environment.

Prerequisite: SSC 200
Typically offered in Fall, Spring, and Summer

SSC 342 Soil and Plant Nutrient Analysis (1 credit hours)
The course provides detailed information on (1) the chemical methods utilized in routine soil testing and plant analysis, (2) field soil sampling techniques, (3) nutrient recommendations, (4) nutrient response functions, and (5) nutrient management planning. Students gain essential experience in interpreting soil, plant, waste, and water analysis reports, and how these data are used in soil and crop management decisions. Course material will be presented in lecture and laboratory format.

Prerequisite: SSC 341
Typically offered in Fall and Spring

SSC 410 Soil Judging for Land Evaluation (1 credit hours)
Lecture and field-based course on describing, classifying, and interpreting soils in their natural setting. Topics will focus on a particular land region that will change each term. The course is in preparation for the regional soil judging contest in the Fall and the national soil judging contest in the Spring. Lectures explain land evaluation techniques and include soil morphology, genesis, and classification. Urban and agricultural applications will be considered. The course meets once per week for 8 weeks. Three field trips will be required and count as field work. The weekly meeting time is TBA. Students who complete the class have the option of participating in a regional, intercollegiate, Soil Judging Contest during each fall semester. Participation in the national contest during the spring semester depends on qualifying at the regional level the previous fall.

Prerequisite: SSC 200
Typically offered in Fall only

SSC 421 Role of Soils in Environmental Management (3 credit hours)
Importance of soils in land application of municipal, industrial and agricultural wastes; onsite disposal of domestic wastewater; bioremediation of contaminated sites; erosion and sedimentation control; farm nutrient management; and nonpoint source water pollution.

Prerequisite: SSC 200
Typically offered in Spring only

SSC 427 Biological Approaches to Sustainable Soil Systems (3 credit hours)
Ecological and biochemical concepts will be applied to managing soils in agro-ecological settings such as organic and conventionally managed farms and gardens, emphasizing microbial transformations of nutrients and matter. Topics covered include soil organic matter formation and fractionation, decomposition, microbial assimilation of nutrients, fertilizer management, tillage, crop rotations, cover crop management. Companion course SSC 428 and SSC 341 recommended.

Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101
Typically offered in Fall only

SSC 428/HS 428 Service-Learning in Urban Agriculture Systems (1 credit hours)
Course provides students a hands-on experience in urban agriculture with under-served youth in the Raleigh area. Students partner with a community gardening organization to provide knowledge and experience in soil science and agriculture to youth with the goals of increasing urban food security and developing student leadership skills. Particular emphasis is places on reflecting on course activities and deepening of skills related to extension, outreach, and working with diverse populations. Course designed to be taken as a companion course to SSC 427, however can be taken as a stand-alone course.

Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101
GEP U.S. Diversity
Typically offered in Spring only

SSC 440/SSC 540 Geographic Information Systems (GIS) in Soil Science and Agriculture (3 credit hours)
Geographic information systems (GIS), global positioning system (GPS), and remote sensing to manage spatially variable soils, vegetation, other natural resources. Develop: function understanding of GIS principles, working knowledge of ArcGIS, problem-solving/critical-thinking necessary to use GIS to characterize and manage soils, agriculture, natural resources. Introduction to GIS; Maps/Cartography; Vectore/Raster Data Models; Georeferencing/Coordinate Systems; Spatial Data Sources; GPS/GPS skillls/ Remote Sensing; Statistics/Interpolation; Precision Agriculture; Computer Aided Design and GIS; Creating Analyzing 3-D Surfaces. Credit not given for both SSC 440 and SSC 540.

Prerequisite: SSC 200
Typically offered in Fall and Spring

SSC 442 Soil and Environmental Biogeochemistry (3 credit hours)
Quantitative approaches to the cycling of elements and chemical species in soils and the environment, including carbon and organic contaminants, non-metallic macronutrients, metals and metalloids.

Prerequisite: SSC 200 and (CH 101, or CH 201, or CH 220, or CH 221)
Typically offered in Spring only

SSC 452 Soil Classification (4 credit hours)
Genesis, morphology, and classification of soils; characterization of soils according to their diagnostic properties; interpreting soil use potential; emphasis on North Carolina soils and their taxonomy; field exercise in soil mapping and site evaluation; several field trips, one overnight.

Prerequisite: SSC 200
Typically offered in Spring only

SSC 455 Soils, Environmental Quality and Global Challenges (3 credit hours)
As the world population grows to 9 billion people by 2050, we will be pressed to increase food security, respond to the consequences of a changing climate, and improve human health -- all while protecting the environment and maintaining natural resources. Soils play a critical role in many of these challenges. The goal of this course is to teach students how soils regulate environmental quality through a host of chemical, physical a,d biological processes. We will examine a series of global challenges, assess their related environmental issues and policies, and analyse the roles of soils in each issue.

P: SSC 200 or ES 100 or Instructor permission
Typically offered in Fall only

SSC 461 Soil Physical Properties and Plant Growth (3 credit hours)
Soil physical properties and their influence on plant growth and environmentally sound land use; soil solid-porosity-density relationships, soil water, heat and air relations and transport. Principles and applications of these topics using current literature in agronomy, turf, horticulture, water quality, waste management and urban land use.

Prerequisite: SSC 200
Typically offered in Fall only

SSC 462 Soil-Crop Management Systems (3 credit hours)
Unites principles of soil science and crop science with those of allied areas into realistic agronomic applications; practical studies in planning and evaluation of soil and crop management systems.

Prerequisite: CS 213 and CS 414 and SSC 342 and Senior standing
Typically offered in Spring only

SSC 470/SSC 570 Wetland Soils (3 credit hours)
Wetland definitions, concepts, functions and regulations; chemical, physical and morphological characteristics of wetland soils. Wetland soil identification using field indicators and monitoring equipment; principles of wetland creation, restoration and mitigation. Special project required for SSC 570. Two mandatory field trips. Field trips for distance education students are not required but optional. Credit will not be given for both SSC 470 and SSC 570.

Prerequisite: SSC 200, SSC 452 recommended
Typically offered in Fall, Spring, and Summer

SSC 473/BAE 473/BAE 573/SSC 573 Introduction to Hydrologic and Water Quality Modeling (3 credit hours)
Concepts in basic hydrologic, erosion and chemical transport used in modeling. Evaluation of typical hydrologic and water quality models on watershed systems. Project examples using state-of-the-art models. Credit will not be given for both BAE 473 and BAE 573.

Prerequisite: BAE 371
Typically offered in Fall only

SSC 511 Soil Physics (4 credit hours)
Soil physical properties and theory of selected instrumentation to measure them. Topics including soil solids, soil water, air and heat. Emphasis on transport processes and the energy concept of soil and water.

Prerequisite: SSC 200, PY 212
Typically offered in Fall only

SSC 521 Soil Chemistry (3 credit hours)
A consideration of the chemical and colloidal properties of clay and soil systems, including ion exchange and retention, soil solution reactions, solvation of clays and electrokinetic properties of clay-water systems.

Prerequisite: SSC 200, one yr. of general inorganic chemistry
Typically offered in Spring only

SSC 532/MB 532 Soil Microbiology (4 credit hours)
Soil as a medium for microbial growth, the relation of microbes to important mineral transformations in soil, the importance of biological equilibrium and significance of soil microbes to environmental quality.

Prerequisite: MB 351, CH 220

SSC 535/CS 535 Root and Rhizosphere Processes for Plant Nutrition (3 credit hours)
The focus of this course is on the understanding of concepts and principles of plant hydro-mineral acquisition, plant adaptation to nutrient deficiencies, water and nutrient cycles in the soil, and the impact that microbial communities have on these processes. Understanding below ground biological networks and their complexity is crucial for understanding soil fertility and improving the acquisition of nutrients in natural and agroecosystems.

Prerequisite: SSC 200 or PB 321, or consent of instructor
Typically offered in Fall only

SSC 540/SSC 440 Geographic Information Systems (GIS) in Soil Science and Agriculture (3 credit hours)
Geographic information systems (GIS), global positioning system (GPS), and remote sensing to manage spatially variable soils, vegetation, other natural resources. Develop: function understanding of GIS principles, working knowledge of ArcGIS, problem-solving/critical-thinking necessary to use GIS to characterize and manage soils, agriculture, natural resources. Introduction to GIS; Maps/Cartography; Vectore/Raster Data Models; Georeferencing/Coordinate Systems; Spatial Data Sources; GPS/GPS skillls/ Remote Sensing; Statistics/Interpolation; Precision Agriculture; Computer Aided Design and GIS; Creating Analyzing 3-D Surfaces. Credit not given for both SSC 440 and SSC 540.

Prerequisite: SSC 200
Typically offered in Spring only

SSC 541 Soil Fertility (3 credit hours)
Soil conditions affecting plant growth and the chemistry of soil and fertilizer interrelationships. Factors affecting the availability of nutrients. Methods of measuring nutrient availability.

Prerequisite: SSC 341

SSC 545 Remote Sensing Applications in Soil Science and Agriculture (3 credit hours)
Overview of remote sensing including history, evolution, vocabulary, and physical principles, i.e., electromagnetic radiation and its interaction with matter. Distant and proximate remote sensing techniques (aerial photography, satellite imaging, radar, lidar, etc.), hardware, and platforms and their application in the characterization and management of soils and crops. Development of strategies for incorporating remote sensing into soil and agronomic research, and of practical skills for processing, analysis, display, and discussion of remote sensing data with applications in soil science and agriculture.

Prerequisite: SSC 200, PY 212

SSC 551 Soil Morphology, Genesis and Classification (3 credit hours)
Morphology: Chemical, physical and mineralogical parameters useful in characterizing soil. Genesis: soil-forming factors and processes. Classification: historical development and present concepts of soil taxonomy with particular reference to worldwide distribution of great soil groups as well as discussions of logical bases of soil classification.

Prerequisite: SSC 200

SSC 562 Environmental Applications Of Soil Science (3 credit hours)
Identification and evaluation of basic factors influencing movement of potential pollutants through soil and their underlying strata. Development of understanding of processes of soil and site evaluation for waste disposal and transport of pollutants through soils.

Prerequisite: SSC 200
Typically offered in Spring only

SSC 570/SSC 470 Wetland Soils (3 credit hours)
Wetland definitions, concepts, functions and regulations; chemical, physical and morphological characteristics of wetland soils. Wetland soil identification using field indicators and monitoring equipment; principles of wetland creation, restoration and mitigation. Special project required for SSC 570. Two mandatory field trips. Field trips for distance education students are not required but optional. Credit will not be given for both SSC 470 and SSC 570.

Prerequisite: SSC 200, SSC 452 recommended
Typically offered in Fall, Spring, and Summer

SSC 573/SSC 473/BAE 473/BAE 573 Introduction to Hydrologic and Water Quality Modeling (3 credit hours)
Concepts in basic hydrologic, erosion and chemical transport used in modeling. Evaluation of typical hydrologic and water quality models on watershed systems. Project examples using state-of-the-art models. Credit will not be given for both BAE 473 and BAE 573.

Prerequisite: BAE 371
Typically offered in Fall only

SSC 590 Special Problems in Soil Science (1-6 credit hours)
Special problems in various phases of soils. Emphasis placed on review of recent and current research. Credits arranged in consultation with sponsoring faculty member.

Prerequisite: SSC 200 or consent of instructor.
Typically offered in Fall, Spring, and Summer

SSC 592 Special Topics in Soil Science (1-6 credit hours)
Special Topics in Soil Science. Topics of contemporary interest in soil science presented in an experimental or pilot course format.

P: Graduate Standing
Typically offered in Fall, Spring, and Summer

SSC 601 Seminar (1 credit hours)
A maximum of two semester hours allowed toward the master's degree, but any number toward the doctorate. Scientific articles, progress reports in research and special problems of interest to soil scientists reviewed and discussed.

Prerequisite: Graduate standing in SSC
Typically offered in Fall and Spring

SSC 609 Colloquium In Soil Science (1-3 credit hours)
Seminar-type discussions and lectures on specialized and advanced topics in soil science. Credits Arranged

Prerequisite: Graduate standing in SSC
Typically offered in Fall and Spring

SSC 620 Special Problems (1-6 credit hours)
Special problems in various phases of soils. Emphasis placed on review of recent and current research. Credits Arranged

Prerequisite: SSC 200
Typically offered in Fall and Spring

SSC 675 Project in Soil Science (1-6 credit hours)
Credit for required, independent project in soil science for the Master of Soil Science degree program. Project topic and learning contract will be developed with, and approved by, the student's faculty advisor and the Director of Graduate Programs. May be repeated for a maximum of 6 credit hours towards the Master of Soil Science degree. May not be taken by Master of Science or PhD students.

R: Master of Soil Science (MR) students only
Typically offered in Fall, Spring, and Summer

SSC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

SSC 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 690 Master's Exam (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam. Credits Arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

SSC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

SSC 720 Soil and Plant Analysis (3 credit hours)
Theory and advanced principles of utilization of chemical instruments to aid research on the heterogeneous systems of soils and plants.

Prerequisite: PY 212; CH 315; at least three soils courses including SSC 341
Typically offered in Spring only

SSC 725/TOX 725/CS 725/HS 725 Pesticide Chemistry (1 credit hours)
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taughtduring the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225)
Typically offered in Spring only

SSC 727/TOX 727/CS 727/HS 727 Pesticide Behavior and Fate In the Environment (2 credit hours)
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: CS(HS,SSC,TOX) 725,SSC 200
Typically offered in Spring only

SSC 771/BAE 771 Theory Of Drainage--Saturated Flow (3 credit hours)
Discussion of physical concepts and properties of fluids and porous media in relation to soil-water movement. Derivation and discussion of the fundamental laws and equations governing saturated flow in porous media. Analysis of mathematical solutions of steady-state and transient flow equations to determine their applicability to drainage problems. Consideration of analogs and models of particular drainage problems.

Prerequisite: MA 301
Typically offered in Fall only

SSC 790 Special Topics (1-6 credit hours)
The study of special problems and selected topics of current interest in soil science and related fields.

Typically offered in Fall only

SSC 801 Seminar (1 credit hours)
Weekly seminars on topics of current interest given by resident faculty members, graduate students and visiting lecturers.

Typically offered in Fall and Spring

SSC 809 Colloquium In Soil Science (1-3 credit hours)
Seminar-type discussions and lectures on specialized and advanced topics in soil science. Credits Arranged

Prerequisite: Graduate standing in SSC
Typically offered in Fall, Spring, and Summer

SSC 820 Special Problems (1-6 credit hours)
Special problems in various phases of soils. Emphasis placed on review of recent and current research. Credits Arranged

Prerequisite: SSC 200
Typically offered in Fall and Spring

SSC 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

SSC 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SSC 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graudate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SSC 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

SSC 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

SSC 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination and residency requirements for the doctoral degree and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Statistics (ST)

ST 101 Statistics by Example (3 credit hours)
Sampling, experimental design, tables and graphs, relationships among variables, probability, estimation, hypothesis testing. Real life examples from the social, physical and life sciences, the humanities and sports. Credit not allowed if student has prior credit for another ST course

GEP Mathematical Sciences
Typically offered in Fall and Spring

ST 114 Statistical Programming (3 credit hours)
This is an introductory course in computer programming for statisticians using Python. Emphasis is on designing algorithms, problem solving, and forming good coding practices: methodical development of programs from specifications; documentation and style; appropriate use of control structures such as loops, of data types such as arrays; modular program organization; version control. Students will become acquainted with core statistical computational problems through examples and coding assignments, including computation of histograms, boxplots, quantiles, and least squares regression.

Restriction: Statistics majors only
Typically offered in Fall only

ST 305 Statistical Methods (4 credit hours)
Basic concepts of data collection, sampling, and experimental design. Descriptive analysis and graphical displays of data. Probability concepts, and expectations. Normal and binomial distributions. Sampling distributions and the Central Limit Theorem. Confidence intervals and hypothesis testing. Tests for means/proportions of two independent groups. One factor analysis of variance. Understanding relationships among variables; correlation and simple linear regression. Computer use is emphasized.

Prerequisite: MA 141; Corequisite: ST 307
Typically offered in Fall and Spring

ST 307 Introduction to Statistical Programming- SAS (1 credit hours)
An introduction to using the SAS statistical programming environment. The course will combine lecture and a virtual computing laboratory to teach students how to use the SAS sytem for: basic data input and manipulation; graphical displays of univariate and bivariate data; one- and two-sample analyses of means; simple linear regression; one-way ANOVA. Documentation of code and writing of statistical reports will be included.

Corequisite: ST 305 or ST 312 or ST 372 or Prerequisite: ST 350 or BUS 350
Typically offered in Fall and Spring

ST 308 Introduction to Statistical Programming - R (1 credit hours)
Introduction to the statistical programming language R. The course will cover: reading and manipulating data; use of common data structures (vectors, matrices, arrays, lists); basic graphical representations.

Typically offered in Spring only

ST 311 Introduction to Statistics (3 credit hours)
Examining relationships between two variables using graphical techniques, simple linear regression and correlation methods. Producing data using experiment design and sampling. Elementary probability and the basic notions of statistical inference including confidence interval estimation and tests of hypothesis. One and two sample t-tests, one-way analysis of variance, inference for count data and regression. Credit not allowed if student has prior credit for another ST course or BUS 350

GEP Mathematical Sciences
Typically offered in Fall, Spring, and Summer

ST 312 Introduction to Statistics II (3 credit hours)
A further examination of statistics and data analysis. Inference for comparing multiple samples, experimental design, analysis of variance and post-hoc tests. Inference for correlation, simple regression, multiple regression, and curvilinear regression. Analysis of contingency tables and categorical data. No credit for students who have credit for ST 305.

Prerequisite: ST 311
GEP Mathematical Sciences
Typically offered in Fall and Spring

ST 350/BUS 350 Economics and Business Statistics (3 credit hours)
Introduction to statistics applied to management, accounting, and economic problems. Emphasis on statistical estimation, inference, simple and multiple regression, and analysis of variance. Use of computers to apply statistical methods to problems encountered in management and economics.

Prerequisite: MA 114
Typically offered in Fall, Spring, and Summer

ST 370 Probability and Statistics for Engineers (3 credit hours)
The class is a calculus-based introduction to probability and statistics, with a focus on collection and summary of data, along with making formal inferences and practical conclusions on the basis of data. Topics may include sampling, descriptive statistics, designed experiments, simple and multiple regression, basic probability, discrete and continuous distributions, sampling distributions, hypothesis testing, confidence intervals, one and two-way ANOVA.

Prerequisite: MA 241
Typically offered in Fall, Spring, and Summer

ST 371 Introduction to Probability and Distribution Theory (3 credit hours)
Basic concepts of probability and distribution theory for students in the physical sciences, computer science and engineering. Provides the background necessary to begin study of statistical estimation, inference, regression analysis, and analysis of variance.

Prerequisite: MA 241, Corequisite: MA 242
Typically offered in Fall and Spring

ST 372 Introduction to Statistical Inference and Regression (3 credit hours)
Statistical inference and regression analysis including theory and applications. Point and interval estimation of population parameters. Hypothesis testing including use of t, chi-square and F. Simple linear regression and correlation. Introduction to multiple regression and one-way analysis of variance.

Prerequisite: ST 371
Typically offered in Fall and Spring

ST 380 Probability and Statistics for the Physical Sciences (3 credit hours)
Introduction to probability models and statistics with emphasis on Monte Carlo simulation and graphical display of data on computer laboratory workstations. Statistical methods include point and interval estimation of population parameters and curveand surface fitting (regression analysis). Credit not allowed for both ST 380 and ST 361 or ST 370

Prerequisite: MA 241
Typically offered in Fall only

ST 401 Experiences in Data Analysis (4 credit hours)
This course will allow students to see many practical aspects of data analysis. Each section of this course will expose students to the process of data analysis in a themed area such as biostatistics or environmental statistics. Students will see problems of data collection and analysis through a combination of classroom demonstrations, hands on computer activities and visits to local industries.

Prerequisite: Permission of Instructor and either ST 311 or ST 305
Typically offered in Summer only

ST 404/GPH 404 Epidemiology and Statistics in Global Public Health (3 credit hours)
This course will provide a general introduction to the quantitative methods used in global health, combining elements of epidemiology and biostatistics. The course will focus on linear and logistic regression, survival analysis, traditional study designs, and modern study designs. Students will learn fundamental principles in epidemiology, including statistical approaches, and apply them to topics in global public health. The course prerequisite is a B- or better in one of these courses: ST 305, ST 311, ST 350, ST 370, or ST 371. In addition, a B- or better in GPH 201 is strongly recommended.

Pre-requisite: B- or better in one of these courses: ST 305, ST 311, ST 350, ST 370, or 371
Typically offered in Fall only

ST 405/ST 505 Applied Nonparametric Statistics (3 credit hours)
Statistical methods requiring relatively mild assumptions about the form of the population distribution. Classical nonparametric hypothesis testing methods, Spearman and Kendall correlation coefficients, permutation tests, bootstrap methods, and nonparametric regressions will be covered.

Prerequisite: ST 508 or ST 512 or ST 514 or ST 516
Typically offered in Fall only

ST 412/MA 412 Long-Term Actuarial Models (3 credit hours)
Long-term probability models for risk management systems. Theory and applications of compound interest, probability distributions of failure time random variables, present value models of future contingent cash flows, applications to insurance, health care, credit risk, environmental risk, consumer behavior and warranties.

Prerequisite: MA 241 or MA 231, Corequisite: MA 421, BUS(ST) 350, ST 301, ST 305, ST 311, ST 361, ST 370, ST 371, ST 380 or equivalent
Typically offered in Fall only

ST 413/MA 413 Short-Term Actuarial Models (3 credit hours)
Short-term probability models for risk management systems. Frequency distributions, loss distributions, the individual risk model, the collective risk model, stochastic process models of solvency requirements, applications to insurance and businessdecisions.

Prerequisite: MA 241 or MA 231, and one of MA 421, ST 301, ST 305, ST 370, ST 371, ST 380, ST 421.
Typically offered in Summer only

ST 421 Introduction to Mathematical Statistics I (3 credit hours)
First of a two-semester sequence of mathematical statistics, primarily for undergraduate majors in Statistics. Introduction to probability, univariate and multivariate probability distributions and their properties, distributions of functions of random variables, random samples and sampling distributions. Credit is not allowed for both ST 421 and MA 421.

Prerequisite: MA 242
Typically offered in Fall and Spring

ST 422 Introduction to Mathematical Statistics II (3 credit hours)
Second of a two-semester sequence of mathematical statistics, primarily for undergraduate majors in Statistics. Random samples, point and interval estimators and their properties, methods of moments, maximum likelihood, tests of hypotheses, elements of nonparametric statistics and elements of general linear model theory.

Prerequisite: ST 421 or MA 421
Typically offered in Fall and Spring

ST 430 Introduction to Regression Analysis (3 credit hours)
Regression analysis as a flexible statistical problem solving methodology. Matrix review; variable selection; prediction; multicolinearity; model diagnostics; dummy variables; logistic and non-linear regression. Emphasizes use of computer.

Prerequisites: (ST 305 or ST 312 or ST 372) and ST 307 and (MA 303 or MA 305 or MA 405)
Typically offered in Fall and Spring

ST 431 Introduction to Experimental Design (3 credit hours)
Experimental design as a method for organizing analysis procedures. Completely randomized, randomized block, factorial, nested, latin squares, split-plot and incomplete block designs. Response surface and covariance adjustment procedures. Stresses use of computer.

Prerequisite: (ST 305 or ST 312 or ST 372) and ST 307
Typically offered in Fall, Spring, and Summer

ST 432 Introduction to Survey Sampling (3 credit hours)
Design principles pertaining to planning and execution of a sample survey. Simple random, stratified random, systematic and one- and two-stage cluster sampling designs. Emphasis on statistical considerations in analysis of sample survey data. Class project on design and execution of an actual sample survey.

Prerequisite: (ST 305 or ST 312 or ST 372) and ST 307
Typically offered in Fall and Spring

ST 433/ST 533 Applied Spatial Statistics (3 credit hours)
Introduction to statistical models and methods for analyzing various types of spatially referenced data. The focus is on applications with real data and their analysis with statistical programs such as R and SAS. Students are required to write, modify, and run computer code in order to complete homework assignments and final projects.

P: ST 422 and ST 430
Typically offered in Spring only

ST 434/ST 534 Applied Time Series (3 credit hours)
Statistical models and methods for the analysis of time series data using both time domain and frequency domain approaches. A brief review of necessary statistical concepts and R will be given at the beginning. Analyses of real data sets using the statistical software packages will be emphasized.

Prerequisite: ST 422 and ST 430
Typically offered in Fall only

ST 435/ST 535 Statistical Methods for Quality and Productivity Improvement (3 credit hours)
Use of statistics for quality control and productivity improvement. Control chart calculations and graphing, process control and specification; sampling plans; and reliability. Computer use will be stressed for performing calculations and graphing.

Prerequisite: (ST 305 or ST 312 or ST 372) and ST 307
Typically offered in Fall only

ST 437/ST 537 Applied Multivariate and Longitudinal Data Analysis (3 credit hours)
An introduction to use of statistical methods for analyzing multivariate and longitudinal data collected in experiments and surveys. Topics covered include multivariate analysis of variance, discriminant analysis, principal components analysis, factor analysis, covariance modeling, and mixed effects models such as growth curves and random coefficient models. Emphasis is on use of a computer to perform statistical analysis of multivariate and longitudinal data.

Prerequisite: ST 422 and ST 430
Typically offered in Fall and Spring

ST 440/ST 540 Applied Bayesian Analysis (3 credit hours)
Introduction to Bayesian concepts of statistical inference; Bayesian learning; Markov chain Monte Carlo methods using existing software (SAS and OpenBUGS); linear and hierarchical models; model selection and diagnostics.

Prerequisite: ST 422 and ST 430
Typically offered in Spring only

ST 442/CSC 442 Introduction to Data Science (3 credit hours)
Overview of data structures, data lifecycle, statistical inference. Data management, queries, data cleaning, data wrangling. Classification and prediction methods to include linear regression, logistic regression, k-nearest neighbors, classification and regression trees. Association analysis. Clustering methods. Emphasis on analyzing data, use and development of software tools, and comparing methods.

Prerequisite: (MA 305 or MA 405) and (ST 305 or ST 312 or ST 370 or ST 372 or ST 380) and (CSC 111 or CSC 112 or CSC 113 or CSC 114 or CSC 116 or ST 114 or ST 445)
Typically offered in Fall only

ST 445 Introduction to Statistical Computing and Data Management (3 credit hours)
Detailed discussion of the program data vector and data handling techniques that are required to apply statistical methods. Topics are based on the current content of the Base SAS Certification Exam and typically include: importing, validating, and exporting of data files; manipulating, subsetting, and grouping data; merging and appending data sets; basic detail and summary reporting; and code debugging. Additional topics with practical applications, such as graphics and advanced reporting, may also be introduced. Statistical methods for analyzing data are not covered in this course. Regular access to a computer for homework and class exercises is required. Previous exposure to SAS is expected.

Prerequisite: (ST 305 or ST 312 or ST 372) and ST 307
Typically offered in Fall and Spring

ST 446 Intermediate SAS Programming with Applications (3 credit hours)
This course covers a wide range of SAS skills that build on the topics introduced in ST 445: Introduction to Statistical Computing and Data Management. In particular, many topics related to the Advanced SAS Certifi cation Exam are covered in order to help students prepare for that exam. However, an additional goal of equal importance is to synthesize statistical content such as regression, distributional assumptions for inference, and power from multiple courses through simulation- and graphics-based investigations.

Prerequisite: ST 430 and ST 445
Typically offered in Spring only

ST 491 Statistics in Practice (3 credit hours)
Mentored experience in applied statistical analysis. Students will work in small groups in collaboration with local scientists to answer real questions about real data. The experience involves mentoring by both the project scientist and the instructor.

P: ST 430
Typically offered in Spring only

ST 495 Special Topics in Statistics (1-6 credit hours)
Offered as needed to present material not normally available in regular departmental course offerings, or for offering new courses on a trial basis.

Typically offered in Fall, Spring, and Summer

ST 497 Professional Experience in Statistics (1-3 credit hours)
Mentored professional experience in statistics. A minimum of 45 hours must be completed for each credit hour earned. The experience must be arranged in advance by the student and approved by the Department of Statistics prior to enrollment. Approval requires completion of the Statistics Department's Experiential Learning Contract, which must be signed by the student, their professional mentor, and their academic advisor. Professional mentors are encouraged to require a research paper or poster presentation as part of the work expectations when appropriate. Students should refer to their curriculum requirements for possible restrictions on the total number of ST 497 credit hours that may be applied to their degree.

Prerequisite: Sophomore Standing. Students are responsible for identifying their own internship mentor and experience.
Typically offered in Fall, Spring, and Summer

ST 498 Independent Study In Statistics (1-6 credit hours)
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Six hours of ST
Typically offered in Fall, Spring, and Summer

ST 499 Research Experience in Statistics (1-3 credit hours)
Mentored research experience in statistics. A minimum of 45 hours must be completed for each credit hour earned. The experience must be arranged in advance by the student and approved by the Department of Statistics prior to enrollment. Approval requires completion of the Statistics Department's Experiential Learning Contract, which must be signed by the student, their research mentor, and their academic advisor. Research mentors are encouraged to require a research paper or poster presentation as part of the work expectations when appropriate. Students should refer to their curriculum requirements for possible restrictions on the total number of ST 499 credit hours that may be applied to their degree.

Prerequisite: Sophomore Standing. Students are responsible for identifying their own research mentor and experience.
Typically offered in Fall, Spring, and Summer

ST 501 Fundamentals of Statistical Inference I (3 credit hours)
First of a two-semester sequence in probability and statistics taught at a calculus-based level. Probability: discrete and continuous distributions, expected values, transformations of random variables, sampling distributions. Credit not given for both ST 701 and ST 501. Note: this course will be offered in person (Fall) and online (Summer).

Prerequisite: MA 242 or equivalent
Typically offered in Fall and Summer

ST 502 Fundamentals of Statistical Inference II (3 credit hours)
Second of a two-semester sequence in probability and statistics taught at a calculus-based level. Statistical inference: methods of construction and evaluation of estimators, hypothesis tests, and interval estimators, including maximum likelihood. Credit not given for both ST 702 and ST 502. Note: this course will be offered in person (Spring) and online (Fall).

Prerequisite: ST 501
Typically offered in Fall and Spring

ST 503 Fundamentals of Linear Models and Regression (3 credit hours)
Estimation and testing in full and non-full rank linear models. Normal theory distributional properties. Least squares principle and the Gauss-Markov theorem. Estimability, analysis of variance and co variance in a unified manner. Practical model-building in linear regression including residual analysis, regression diagnostics, and variable selection. Emphasis on use of the computer to apply methods with data sets. Credit not given for both ST 705 and ST 503. Note: this course will be offered in person (Spring) and online (Summer).

P: ST 501 and MA 405 or equivalent (Linear Algebra); C: ST 502
Typically offered in Spring and Summer

ST 505/ST 405 Applied Nonparametric Statistics (3 credit hours)
Statistical methods requiring relatively mild assumptions about the form of the population distribution. Classical nonparametric hypothesis testing methods, Spearman and Kendall correlation coefficients, permutation tests, bootstrap methods, and nonparametric regressions will be covered.

Prerequisite: ST 508 or ST 512 or ST 514 or ST 516
Typically offered in Fall only

ST 507 Statistics For the Behavioral Sciences I (3 credit hours)
A general introduction to the use of descriptive and inferential statistics in behavioral science research. Methods for describing and summarizing data presented, followed by procedures for estimating population parameters and testing hypotheses concerning summarized data.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ST 511 Statistical Methods For Researchers I (3 credit hours)
Basic concepts of statistical models and use of samples; variation, statistical measures, distributions, tests of significance, analysis of variance and elementary experimental design, regression and correlation, chi-square.

Prerequisite: Graduate Standing
Typically offered in Fall, Spring, and Summer

ST 512 Statistical Methods For Researchers II (3 credit hours)
Covariance, multiple regression, curvilinear regression, concepts of experimental design, factorial experiments, confounded factorials, individual degrees of freedom and split-plot experiments. Computing laboratory addressing computational issues and use of statistical software.

Prerequisite: ST 511 or ST 513 or ST 517
Typically offered in Fall, Spring, and Summer

ST 513 Statistics for Management and Social Sciences I (3 credit hours)
This course introduces important ideas about collecting high quality data and summarizing that data appropriately both numerically and graphically. We explore the use of probability distributions to model data and find probabilities. Estimation of parameters and properties of estimators are discussed. Construction and interpretation of commonly used confidence intervals and hypothesis tests are investigated. Students will gain considerable experience working with data. Software is used throughout the course with the expectation of students being able to produce their own analyses.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ST 514 Statistics For Management and Social Sciences II (3 credit hours)
Linear regression, multiple regression and concepts of designed experiments in an integrated approach, principles of the design and analysis of sample surveys, use of computer for analysis of data.

Prerequisite: ST 513
Typically offered in Spring and Summer

ST 515 Experimental Statistics for Engineers I (3 credit hours)
General statistical concepts and techniques useful to research workers in engineering, textiles, wood technology, etc. Probability distributions, measurement of precision, simple and multiple regression, tests of significance, analysis of variance,enumeration data and experimental design.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

ST 516 Experimental Statistics For Engineers II (3 credit hours)
General statistical concepts and techniques useful to research workers in engineering, textiles, wood technology, etc. Probability distributions, measurement of precision, simple and multiple regression, tests of significance, analysis of variance, enumeration data and experimental designs.

Prerequisite: ST 515
Typically offered in Fall and Spring

ST 517 Applied Statistical Methods I (3 credit hours)
Course covers basic methods for summarizing and describing data, accounting for variability in data, and techniques for inference. Topics include basic exploratory data analysis, probability distributions, confidence intervals, hypothesis testing, and regression analysis. This is a calculus-based course. Statistical software is used; however, there is no lab associated with the course. Credit not given for this course and ST 511 or ST 513 or ST 515. This course does NOT count as an elective towards a degree or a minor in Statistics. Note: the course will be offered in person (Fall) and online (Fall and Summer).

Prerequisites: MA 241 or equivalent (Calculus II) and MA 405 or equivalent (Linear Algebra)
Typically offered in Fall and Summer

ST 518 Applied Statistical Methods II (3 credit hours)
This second course in statistics for graduate students is intended to further expand students' background in the statistical methods that will assist them in the analysis of data. Course covers many fundamental analysis methods currently used to analyze a wide array of data, mostly arising from designed experiments. Topics include multiple regression models, factorial effects models, general linear models, mixed effect models, logistic regression analysis, and basic repeated measures analysis. This is a calculus-based course. Statistical software is used, however, there is no lab associated with the course. Credit not given for this course and ST 512 or ST 514 or ST 516. Note: this course will be offered in person (Spring) and online (Fall and Spring).

Prerequisite: ST 517
Typically offered in Fall and Spring

ST 519/EMS 519 Teaching and Learning of Statistical Thinking (3 credit hours)
This course is designed to bridge theory and practice on how students develop understandings of key concepts in data analysis, statistics, and probability. Discussion of students' understandings, teaching strategies and the use of manipulatives and technology tools. Topics include distribution, measures of center and spread, sampling, sampling distribution, randomness, and law of large numbers. Must complete a first level graduate statistics course (ST 507, ST 511, or equivalent) before enrolling.

Prerequisite: ST 507 or ST 511
Typically offered in Spring only

ST 520 Statistical Principles of Clinical Trials (3 credit hours)
Statistical methods for design and analysis of clinical trials and epidemiological studies. Phase I, II, and III clinical trials. Principle of Intention-to-Treat, effects of non-compliance, drop-outs. Interim monitoring of clinical trials and data safety monitoring boards. Introduction to meta-analysis. There is also discussion of Epidemiological methods time permitting.

Corequisite: ST 501 or ST 521 or ST 701
Typically offered in Fall only

ST 525 Statistics and Computing for Agricultural Data Science (3 credit hours)
The fundamentals of designed experiments, analysis of variance, and regression modeling. Categorical data analysis including logistic regression will be covered. Regular access to a computer for homework, class exercises, and statistical computing is required. The emphasis in this class is on the practical aspects of statistical modeling. Assignments will concentrate on problem solving rather than formal proofs and derivations.

P: ST 511 or equivalent
Typically offered in Fall and Spring

ST 531 Experimental Design (3 credit hours)
Overview and comparison of observational studies and designed experiments followed by a thorough discussion of design principles. Review of estimation and inference for regression and ANOVA models from an experimental design perspective. Review of design and analysis for completely randomized, randomized complete block, and Latin square designs. Designs and analysis methods for factorial experiments, general blocking structures, incomplete block designs, confounded factorials, split-plot experiments, and fractional factorial designs. Examples used to illustrate application and analysis of these designs.

Prerequisite: ST 512, or ST 515, or ST 516, or ST 517, or ST 703
Typically offered in Fall only

ST 533/ST 433 Applied Spatial Statistics (3 credit hours)
Introduction to statistical models and methods for analyzing various types of spatially referenced data. The focus is on applications with real data and their analysis with statistical programs such as R and SAS. Students are required to write, modify, and run computer code in order to complete homework assignments and final projects.

P: ST 422 and ST 430
Typically offered in Spring only

ST 534/ST 434 Applied Time Series (3 credit hours)
Statistical models and methods for the analysis of time series data using both time domain and frequency domain approaches. A brief review of necessary statistical concepts and R will be given at the beginning. Analyses of real data sets using the statistical software packages will be emphasized.

Prerequisite: ST 422 and ST 430
Typically offered in Fall only

ST 535/ST 435 Statistical Methods for Quality and Productivity Improvement (3 credit hours)
Use of statistics for quality control and productivity improvement. Control chart calculations and graphing, process control and specification; sampling plans; and reliability. Computer use will be stressed for performing calculations and graphing.

Prerequisite: (ST 305 or ST 312 or ST 372) and ST 307
Typically offered in Fall only

ST 537/ST 437 Applied Multivariate and Longitudinal Data Analysis (3 credit hours)
An introduction to use of statistical methods for analyzing multivariate and longitudinal data collected in experiments and surveys. Topics covered include multivariate analysis of variance, discriminant analysis, principal components analysis, factor analysis, covariance modeling, and mixed effects models such as growth curves and random coefficient models. Emphasis is on use of a computer to perform statistical analysis of multivariate and longitudinal data.

Prerequisite: ST 422 and ST 430
Typically offered in Fall and Spring

ST 540/ST 440 Applied Bayesian Analysis (3 credit hours)
Introduction to Bayesian concepts of statistical inference; Bayesian learning; Markov chain Monte Carlo methods using existing software (SAS and OpenBUGS); linear and hierarchical models; model selection and diagnostics.

Prerequisite: ST 422 and ST 430
Typically offered in Spring only

ST 542 Statistical Practice (3 credit hours)
This course will provide a discussion-based introduction to statistical practice geared towards students in the final semester of their Master of Statistics degree. Note: the course will be offered in person (Fall) and online (Spring and Summer).

Prerequisite: (ST 512 or ST 514 or ST 516 or ST 518) and (ST 502 or ST 522 or ST 702)
Typically offered in Fall, Spring, and Summer

ST 544 Applied Categorical Data Analysis (3 credit hours)
This course focuses on the concepts, methods, and models used to analyze categorical data, particularly contingency tables, count data and binary/binomial type of data. The topics covered include Pearson Chi-squared independence test for contingency tables, measures of marginal and conditional associations, small-sample inference, logistic regression models for independent binary/binomial data and many extended models for correlated binary/binomial data including matched data and longitudinal data. The course emphasizes the implementation of methods/models using SAS and the interpretation of the results from the output.

Prerequisite: ST 512 or ST 514 or ST 515 or ST 516
Typically offered in Fall only

ST 546/MA 546 Probability and Stochastic Processes I (3 credit hours)
Modern introduction to Probability Theory and Stochastic Processes. The choice of material is motivated by applications to problems such as queueing networks, filtering and financial mathematics. Topics include: review of discrete probability and continuous random variables, random walks, markov chains, martingales, stopping times, erodicity, conditional expectations, continuous-time Markov chains, laws of large numbers, central limit theorem and large deviations.

Prerequisite: MA 421 and MA 425 or MA 511
Typically offered in Fall only

ST 555 Statistical Programming I (3 credit hours)
An introduction to programming and data management using SAS, the industry standard for statistical practice. Detailed discussion of the program data vector and data handling techniques that are required to apply statistical methods. Topics are based on the current content of the Base SAS Certification Exam and typically include: importing, validating, and exporting of data files; manipulating, subsetting, and grouping data; merging and appending data sets; basic detail and summary reporting; and code debugging. Additional topics with practical applications are also introduced, such as graphics and advanced reporting. Statistical methods for analyzing data are not covered in this course. Regular access to a computer for homework and class exercises is required. Previous exposure to SAS is not expected.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

ST 556 Statistical Programming II (3 credit hours)
Statistical procedures for importing/managing complex data structures using SQL, automated analysis using macro programming, basic simulation methods and text parsing/analysis procedures. Students learn SAS, the industry standard for statistical practice. Regular access to a computer for homework and class exercises is required.

P: ST 555 or Base SAS Certification
Typically offered in Spring and Summer

ST 558 Data Science for Statisticians (3 credit hours)
Methods for reading, manipulating, and combining data sources including databases. Custom functions, visualizations, and summaries. Common analyses done by data scientists. Methods for communicating results including dashboards. Regular access to a computer for homework and class exercises is required.

Prerequisites: (ST 511 or ST 517 or equivalent) and (ST 555 or equivalent)
Typically offered in Fall and Summer

ST 561/ECG 561 Applied Econometrics I (3 credit hours)
Introduction and application of econometrics methods for analyzing cross-sectional data in economics, and other social science disciplines, such as OLS, IV regressions, and simultaneous equations models. Students should have had a statistical methods course at the 300 level or above as well as Calculus I and II.

Typically offered in Fall only

ST 562 Data Mining with SAS Enterprise Miner (3 credit hours)
This is a hands-on course using modeling techniques designed mostly for large observational studies. Estimation topics include recursive splitting, ordinary and logistic regression, neural networks, and discriminant analysis. Clustering and association analysis are covered under the topic "unsupervised learning," and the use of training and validation data sets is emphasized. Model evaluation alternatives to statistical significance include lift charts and receiver operating characteristic curves. SAS Enterprise Miner is used in the demonstrations, and some knowledge of basic SAS programming is helpful.

Prerequisite: ST 512 or ST 514 or ST 515 or ST 516 or ST 517
Typically offered in Spring only

ST 563 Introduction to Statistical Learning (3 credit hours)
This course will introduce common statistical learning methods for supervised and unsupervised predictive learning in both the regression and classification settings. Topics covered will include linear and polynomial regression, logistic regression and discriminant analysis, cross-validation and the bootstrap, model selection and regularization methods, splines and generalized additive models, principal components, hierarchical clustering, nearest neighbor, kernel, and tree-based methods, ensemble methods, boosting, and support-vector machines.

Prerequisite: ST 512 or ST 514 or ST 515 or ST 517
Typically offered in Summer only

ST 590 Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

ST 630 Independent Study (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

ST 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ST 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

ST 701 Statistical Theory I (3 credit hours)
Probability tools for statistics: description of discrete and absolutely continuous distributions, expected values, moments, moment generating functions, transformation of random variables, marginal and conditional distributions, independence, orderstatistics, multivariate distributions, concept of random sample, derivation of many sampling distributions.

Typically offered in Fall only

ST 702 Statistical Theory II (3 credit hours)
General framework for statistical inference. Point estimators: biased and unbiased, minimum variance unbiased, least mean square error, maximum likelihood and least squares, asymptotic properties. Interval estimators and tests of hypotheses: confidence intervals, power functions, Neyman-Pearson lemma, likelihood ratio tests, unbiasedness, efficiency and sufficiency.

Prerequisite: ST 701
Typically offered in Spring only

ST 703 Statistical Methods I (3 credit hours)
Introduction of statistical methods. Examples include multiple linear regression, concepts of experimental design, factorial experiments, and random-effects modeling. A computing laboratory addresses computational issues and use of statistical software. This course is a prerequisite for most advanced courses in statistics. This section is restricted to statistics and closely related majors.

R: 17STPHD Students Only
Typically offered in Fall only

ST 704 Statistical Methods II (3 credit hours)
This course will introduce many methods that are commonly used in applications. Examples include: model generation, selection, assessment, and diagnostics in the context of multiple linear regression (including penalized regression); linear mixed models; generalized linear models; generalized linear mixed models; nonparametric regression and smoothing; and finite-population sampling basics. Coverage will include some theory, plus implementation using SAS and/or R.

Prerequisite:ST 703; Corequisites: ST 702 and ST 705
Typically offered in Spring only

ST 705 Linear Models and Variance Components (3 credit hours)
Theory of estimation and testing in full and non-full rank linear models. Normal theory distributional properties. Least squares principle and the Gauss-Markoff theorem. Estimability and properties of best linear unbiased estimators. General linear hypothesis. Application of dummy variable methods to elementary classification models for balanced and unbalanced data. Analysis of covariance. Variance components estimation for balanced data.

Corequisite: ST 702
Typically offered in Spring only

ST 706/MA 706/OR 706 Nonlinear Programming (3 credit hours)
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.

Prerequisite: OR(IE,MA) 505 and MA 425
Typically offered in Spring only

ST 715 Theory Of Sampling Applied To Survey Design (3 credit hours)
Principles for interpretation and design of sample surveys. Estimator biases, variances and comparative costs. Simple random sample, cluster sample, ratio estimation, stratification, varying probabilities of selection. Multi-stage, systematic and double sampling. Response errors.

Prerequisite: ST 422, ST 512
Typically offered in Fall only

ST 721/GN 721 Genetic Data Analysis (3 credit hours)
Analysis of discrete data, illustrated with genetic data on morphological characters allozymes, restriction fragment length polymorphisms and DNA sequences. Maximum likelihood estimation, including iterative procedures. Numerical resampling. Development of statistical techniques for characterizing genetic disequilibrium and diversity. Measures of population structure and genetic distance. Construction of phylogenetic trees. Finding alignments and similarities between DNA sequences. Locating genes with markers.

Prerequisite: ST 430 and GN 311
Typically offered in Spring only

ST 732 Longitudinal Data Analysis (3 credit hours)
Introduction to modeling longitudinal data; Population-averaged vs. subject-specific modeling; Classical repeated measures analysis of variance methods and drawbacks; Review of estimating equations; Population-averaged linear models; Linear mixed effects models; Maximum likelihood, restricted maximum likelihood, and large sample theory; Review of nonlinear and generalized linear regression models; Population-averaged models and generalized estimating equations; Nonlinear and generalized linear mixed effects models; Implications of missing data; Advanced topics (including Bayesian framework, complex nonlinear models, multi-level hierarchical models, relaxing assumptions on random effects in mixed effects models, among others). Implementation in SAS and R.

Prerequisites: ST 702 and ST 705
Typically offered in Spring only

ST 733 Spatial Statistics (3 credit hours)
Introduction to the theory and methods of spatial data analysis including: visualization; Gaussian processes; spectral representation; variograms; kriging; computationally-efficient methods; nonstationary processes; spatiotemporal and multivariate models.

Prerequisite: ST 705
Typically offered in Spring only

ST 740 Bayesian Inference and Analysis (3 credit hours)
Introduction to Bayesian inference; specifying prior distributions; conjugate priors, summarizing posterior information, predictive distributions, hierachical models, asymptotic consistency and asymptotic normality. Markov Chain Monte Carlo (MCMC) methods and the use of exising software(e.g., WinBUGS).

Prerequisite: ST 702
Typically offered in Fall only

ST 745 Analysis of Survival Data (3 credit hours)
Statistical methods for analysis of time-to-event data, with application to situations with data subject to right-censoring and staggered entry, including clinical trials. Survival distribution and hazard rate; Kaplan-Meier estimator for survival distribution and Greenwood's formula; log-rank and weighted long-rank tests; design issues in clinical trials. Regression models, including accelerated failure time and proportional hazards; partial likelihood; diagnostics.

Prerequisite: ST 502 or ST 702
Typically offered in Spring only

ST 746/MA 746 Introduction To Stochastic Processes (3 credit hours)
Markov chains and Markov processes, Poisson process, birth and death processes, queuing theory, renewal theory, stationary processes, Brownian motion.

Prerequisite: MA 405 and MA(ST) 546 or ST 521
Typically offered in Spring only

ST 747/MA 747 Probability and Stochastic Processes II (3 credit hours)
Fundamental mathematical results of probabilistic measure theory needed for advanced applications in stochastic processes. Probability measures, sigma-algebras, random variables, Lebesgue integration, expectation and conditional expectations w.r.t.sigma algebras, characteristic functions, notions of convergence of sequences of random variables, weak convergence of measures, Gaussian systems, Poisson processes, mixing properties, discrete-time martingales, continuous-time markov chains.

Prerequisite: MA(ST) 546
Typically offered in Spring only

ST 748/MA 748 Stochastic Differential Equations (3 credit hours)
Theory of stochastic differential equations driven by Brownian motions. Current techniques in filtering and financial mathematics. Construction and properties of Brownian motion, wiener measure, Ito's integrals, martingale representation theorem, stochastic differential equations and diffusion processes, Girsanov's theorem, relation to partial differential equations, the Feynman-Kac formula.

Prerequisite: MA(ST) 747
Typically offered in Fall only

ST 750/ECG 750 Introduction to Econometric Methods (3 credit hours)
Introduction to principles of estimation of linear regression models, such as ordinary least squares and generalized least squares. Extensions to time series and panel data. Consideration of endogeneity and instrumental variables estimation. Limited dependent variable and sample selection models. Attention to implementation of econometric methods using a statistical package and microeconomic and macroeconomic data sets.

Prerequisite: ST 421; Corequisite: ST 422
Typically offered in Spring only

ST 751/ECG 751 Econometric Methods (3 credit hours)
Introduction to important econometric methods of estimation such as Least Squares, instrumentatl Variables, Maximum Likelihood, and Generalized Method of Moments and their application to the estimation of linear models for cross-sectional ecomomic data. Discussion of important concepts in the asymptotic statistical analysis of vector process with application to the inference procedures based on the aforementioned estimation methods.

Prerequisite: ST 421, ST 422
Typically offered in Fall only

ST 752/ECG 752 Time Series Econometrics (3 credit hours)
The characteristics of macroeconomic and financial time series data. Discussion of stationarity and non-stationarity as they relate to economic time series. Linear models for stationary economic time series: autoregressive moving average (ARMA) models; vector autoregressive (VAR) models. Linear models for nonstationary data: deterministic and stochastic trends; cointegration. Methods for capturing volatility of financial time series such as autoregressive conditional heteroscedasticity (ARCH) models. Generalized Method of Moments estimation of nonlinear dynamic models.

Prerequisite: ECG(ST) 751
Typically offered in Spring only

ST 753/ECG 753 Microeconometrics (3 credit hours)
The characteristics of microeconomic data. Limited dependent variable models for cross-sectional microeconomic data: logit/probit models; tobit models; methods for accounting for sample selection; count data models; duration analysis; non-parametricmethods. Panel data models: balanced and unbalanced panels; fixed and random effects; dynamic panel data models; limited dependent variables and panel data analysis.

Prerequisite: ECG 751
Typically offered in Spring only

ST 756/GN 756 Computational Molecular Evolution (3 credit hours)
Phylogenetic analyses of nucleotide and protein sequence data. Sequence alignment, phylogeny reconstruction and relevant computer software. Prediction of protein secondary structure, database searching, bioinformatics and related topics. Project required.

Prerequisite: GN 311 and ST 511
Typically offered in Fall only

ST 757/HS 757/GN 757 Quantitative Genetics Theory and Methods (3 credit hours)
The essence of quantitative genetics is to study multiple genes and their relationship to phenotypes. How to study and interpret the relationship between phenotypes and whole genome genotypes in a cohesive framework is the focus of this course. We discuss how to use genomic tools to map quantitative trait loci, how to study epistasis, how to study genetic correlations and genotype-by-environment interactions. We put special emphasis in using genomic data to study and interpret general biological problems, such as adaptation and heterosis. The course is targeted for advanced graduate students interested in using genomic information to study a variety of problems in quantitative genetics.

Prerequisite: ST 511
Typically offered in Fall only

ST 758 Computation for Statistical Research (3 credit hours)
Computational tools for research in statistics, including applications of numerical linear algebra, optimization and random number generation, using the statistical language R. A project encompassing a simulation experiment will be required.

Prerequisite: ST 702 and ST 705
Typically offered in Fall only

ST 771/BMA 771/MA 771 Biomathematics I (3 credit hours)
Role of theory construction and model building in development of experimental science. Historical development of mathematical theories and models for growth of one-species populations (logistic and off-shoots), including considerations of age distributions (matrix models, Leslie and Lopez; continuous theory, renewal equation). Some of the more elementary theories on the growth of organisms (von Bertalanffy and others; allometric theories; cultures grown in a chemostat). Mathematical theories oftwo and more species systems (predator-prey, competition, symbosis; leading up to present-day research) and discussion of some similar models for chemical kinetics. Much emphasis on scrutiny of biological concepts as well as of mathematical structureof models in order to uncover both weak and strong points of models discussed. Mathematical treatment of differential equations in models stressing qualitative and graphical aspects, as well as certain aspects of discretization. Difference equation models.

Prerequisite: Advanced calculus, reasonable background in biology
Typically offered in Fall only

ST 772/BMA 772/MA 772 Biomathematics II (3 credit hours)
Continuation of topics of BMA 771. Some more advanced mathematical techniques concerning nonlinear differential equations of types encountered in BMA 771: several concepts of stability, asymptotic directions, Liapunov functions; different time-scales. Comparison of deterministic and stochastic models for several biological problems including birth and death processes. Discussion of various other applications of mathematics to biology, some recent research.

Prerequisite: BMA 771, elementary probability theory
Typically offered in Spring only

ST 773/BMA 773/MA 773/OR 773 Stochastic Modeling (3 credit hours)
Survey of modeling approaches and analysis methods for data from continuous state random processes. Emphasis on differential and difference equations with noisy input. Doob-Meyer decomposition of process into its signal and noise components. Examples from biological and physical sciences, and engineering. Student project.

Prerequisite: BMA 772 or ST (MA) 746
Typically offered in Spring only

ST 779 Advanced Probability for Statistical Inference (3 credit hours)
Sets and classes, sigma-fields and related structures, probability measures and extensions, random variables, expectation and integration, uniform integrability, inequalities, L_p-spaces, product spaces, independence, zero-one laws, convergence notions, characteristic functions, simplest limit theorems, absolute continuity, conditional expectation and conditional probabilities, martingales.

Prerequisite: ST 702
Typically offered in Spring only

ST 790 Advanced Special Topics (1-6 credit hours)
Typically offered in Fall, Spring, and Summer

ST 793 Advanced Statistical Inference (3 credit hours)
Statistical inference with emphasis on the use of statistical models, construction and use of likelihoods, general estimating equations, and large sample methods. Includes introduction to Bayesian statistics and the jackknife and bootstrap.

Prerequisite: ST 702
Typically offered in Fall only

ST 801 Seminar (1 credit hours)
Typically offered in Fall and Spring

ST 810 Advanced Topics in Statistics (1-3 credit hours)
Typically offered in Fall and Spring

ST 835 Readings (1-3 credit hours)
Typically offered in Spring only

ST 841 Statistical Consulting (1 credit hours)
Participation in regularly scheduled supervised statistical consulting sessions with faculty member and client. Consultant's report written for each session. Regularly scheduled meetings with course instructor and other student consultants to present and discuss consulting experiences.

Prerequisite: ST 512 and ST 702
Typically offered in Fall only

ST 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planing for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

ST 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ST 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation Research

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

ST 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

ST 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Sustanaible Materials and Technology (SMT)

SMT 200 Introduction to Sustainable Materials and Technology (3 credit hours)
The overall goal of the class is to introduce the students to the properties and production, and environmental implications, of common materials, including biobased, metals, plastics and mineral based. The class will connect the structure and mechanical properties of these common materials with the technology used for producing the materials from raw ingredients, and also the processing of these materials into useful items. In addition to the material properties, the environmental impacts, e.g., emissions of carbon, water, and pollutants, will be discussed. The concepts of embodied energy, mass and energy balances, water and land use will all be considered. The concept of Life Cycle Analysis will be introduced and used to evaluate the production of different building materials.

Restriction: SMT majors or with the permission of the instructor
Typically offered in Fall only

SMT 201 Sustainable Materials for Green Housing (2 credit hours)
Sustainable Materials for Green Housing

GEP Interdisciplinary Perspectives
Typically offered in Spring only

SMT 202 Anatomy and Properties of Renewable Materials (3 credit hours)
Formation, cell morphology, cell wall, structure of softwoods, hardwoods, and other renewable materials; variability, naturally occurring defects, biological deterioration, and basic physical and mechanical properties of renewable materials in relation to products utilization. Techniques on hand lens and microscopic identification of renewable materials.

GEP Natural Sciences
Typically offered in Fall only

SMT 203 Physical Properties of Sustainable Materials (4 credit hours)
Basic concepts involving the interaction of sustainable materials with moisture, heat, and electricity. Concepts needed to perform calculations related to material balance, energy balance, mass transfer by diffusion, and heat transfer by conduction. Principles and application of basic techniques for characterizing the physical properties of materials and for drying of lumber.

Typically offered in Spring only

SMT 206 Wood Manufacturing Site Visits (1 credit hours)
Examples of the practical implementation of the value added processes within the wood products industry. Visits to wood products industries will be representative of the primary breakdown and secondary value added product operations that will expand and reinforce classroom instruction. Five days are spent visiting industries to provide an appreciation for the range of products and processes. The student is responsible for room and board; transportation and personal protective equipment are provided.

P: SMT 240
Typically offered in Summer only

SMT 207 Principles of Sustainable Product Development Lecture (2 credit hours)
This course is a Human-Centered Design (HCD) approach that involves the interdisciplinary integration of user, ergonomics, and aesthetic needs with technological and production methods to create manufacturable products. Product Development Principles cover user/object interaction, product form, innovation, redesign, and sustainable product development involving materials from natural resources. Students will conduct a research product analysis and translate preexisting products and analyze creative development methods. Minimal ideation to emphasize the product development comprehension.

C: SMT 217 for 15SMTBS students
Typically offered in Fall only

SMT 210 Sustainable Materials Internship (1 credit hours)
Experience in the forest products or related industries with a departmentally selected employer. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Completion of summer practicum
Typically offered in Fall, Spring, and Summer

SMT 217 Principles of Sustainable Product Development Laboratory (1 credit hours)
This lab course is a Human-Centered Design (HCD) approach that involves the interdisciplinary integration of user, ergonomics, and aesthetic needs with technological and production methods to create manufacturable products. Product Development Principles cover user/object interaction, product form, innovation, redesign, and sustainable product development involving materials from natural resources. Students will justify research from SMT 207 with product analysis and ideation with reflective recordings--sketching and hands-on projects that emphasize product development.

C: SMT 207
Typically offered in Fall only

SMT 232 Recycling to Create a Sustainable Environment (2 credit hours)
The goal of this class is to link the impetus for recycling and recycled materials to the building of a sustainable world. Recycling efficiencies for various materials will be examined as well as recycling practices and attitudes in other parts of the world. This course will explore the technology, economics, markets, trade and social impacts due to the recycling of materials. Case studies will provide an in-depth examination of the problems and potentials for the recycling of selected recycled materials. The use of Life Cycle Analysis (LCA) to evaluate recycling alternatives will be introduced. The economic, policy, social and resource availability drivers for recycling will be examined as well as the technological, economic, market and social barriers to recycling.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

SMT 240 Introduction to Wood Products Industries (2 credit hours)
An introduction to wood products including the products and their characteristics produced by the primary and secondary wood products industries, pulp and paper industry, energy and chemical products produced from wood.

P: SMT 202 or permission of the instructor
Typically offered in Spring only

SMT 293 Independent Study in Sustainable Materials & Technology (1-6 credit hours)
Independent Study for Sustainable Materials & Technology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Summer

SMT 294 Independent Study in Sustainable Materials & Technology (1-6 credit hours)
Independent Study for Sustainable Materials & Technology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Summer

SMT 295 Special Topics in Sustainable Materials and Technology (1-3 credit hours)
Special Topics in Wood Products at the 200 level for offering of courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

SMT 301 Chemistry of Sustainable Materials (3 credit hours)
Introduction of polymer science concepts (thermal transitions, molecular weight, viscoelasticity) to sustainable materials such as wood, cork, starch, silk, etc. Detailed instruction on the chemistry of sustainable materials including reactivity, decay, the chemical aspects of thermal treatments, the separation of sustainable materials into their individual components, the reactivity and modification of the individual components, and the conversion of sustainable materials into energy products.

Prerequisite: CH 101 and CH 102 and CH 220
Typically offered in Spring only

SMT 302 Processing of Biomaterials (4 credit hours)
Principles of the manufacturing processes used in the sustainable and renewable materials industries. Content includes primary and secondary manufacturing, theory of machining basics, and biomaterials-based composite fabrication. Field trips might require meeting outside of class time.

Prerequisite: SMT 202 or SMT 203
Typically offered in Spring only

SMT 307 Product Visualization (3 credit hours)
This course covers the visual representation of objects intended for product development using 3D CAD software. Parametric solid modeling of parts and assemblies and creating orthographic views drawings using Solidworks, Rhinoceros and additional CAD software. This course is intended to visually enhance product development ideation. We will also study other forms of technology for ideation, for example, but not limited to 3D printing, 3D scanning, Laser Cutter/Engraver, and CNC machines. In this course, students will conduct research and produce solutions focusing on sustainability with 2D and 3D visual communication development.

P: SMT 207 and SMT 217
Typically offered in Spring only

SMT 308 Wood Processing (4 credit hours)
Principles of the manufacturing processes used in the wood products industries. Content includes primary and secondary manufacturing, theory of machining basics, and solid wood and wood-based composite fabrication. Field trips might require meeting outside of class time.

SMT 202 and SMT 240 or permission of the instructor
Typically offered in Fall only

SMT 310 Introduction to Industrial Ecology (3 credit hours)
In this course, students will explore the main concepts of industrial ecology for sustainable materials. Students will learn about environmental supply chain, manufacturing of products from sustainable materials such as wood and agricultural materials, and how we can learn from nature to close the manufacturing loop. To support the activities in these technical areas, students will also learn how to better manage time, how to work efficiently in teams, and how best to interact with their co-workers.

GEP Interdisciplinary Perspectives
Typically offered in Fall only

SMT 320 Industrial Chemical Pollutants (2 credit hours)
Introduction to the sources, fates, and analysis of common chemical pollutants from industrial sources. Content will focus predominantly on chemicals from industries related to the production and use of sustainable materials such as wood, bamboo, cork, silk, renewable plastics, etc.

P: SMT 301
Typically offered in Spring only

SMT 330 Project Management for Sustainability (3 credit hours)
Main concept and principles of Project Management (PM). Different tools utilized in project management will be covered. Relationship between project management and sustainability will be emphasized. With the concepts and tools learned in class, students will learn how to better manage their time, how to work efficiently in teams, and how best to interact with their superiors.

Restriction: Junior or Senior Standing
Typically offered in Fall only

SMT 346 Sustainable Materials Business Marketing (3 credit hours)
This course will examine the business and marketing approaches in the forest products industry from a theoretical as well as an applied perspective. Students will learn the importance of business processes and how products, price, distribution, and promotion plays a role in the purchase behavior of consumers. Students will analyze situations and cases to solve real and hypothetical business problems in the forest products industry.

Typically offered in Spring only

SMT 441 Mechanical Properties of Sustainable Materials (4 credit hours)
Overview of statics. Concepts of stress and strain. Mechanical properties of elastic and viscoelastic materials. Application of elastic theory to axial loading and bending, orthotropic elasticity of lamina and laminates, buckling of columns. Principles and application of basic techniques for characterizing the mechanical properties of sustainable materials.

Prerequisite: MA 121 and PY 211 and SMT 203
Typically offered in Spring only

SMT 444 Sustainable Composites and Biopolymers (3 credit hours)
Manufacture, properties, and processing of lignocellulosic composites and polymers such as laminates, strandboard, particleboard, fiberboard, and nanocomposites. Principles and application of basic techniques for manufacture and testing of composites according to product and quality standards.

Prerequisite: SMT 301 and Senior standing in SMT
Typically offered in Fall only

SMT 450 Sustainable Business and Innovation (2 credit hours)
Theories, practice and case studies of sustainability and innovation in corporate settings. Content will include sustainability and environmental management, innovation, new business development and R&D, change management, corporate strategy and strategic alignment.

Prerequisite: Junior or senior standing
Typically offered in Fall only

SMT 483 Capstone in Sustainable Materials and Technology (3 credit hours)
Capstone course in sustainable materials and technology; integration of sustainable material and technology concepts with economic, environmental, and societal considerations; case studies and practicum in sustainable materials and technologies.

Restricted to students with Senior Standing in SMT
Typically offered in Spring only

SMT 493 Independent Study in Sustainable Materials & Technology (1-6 credit hours)
Independent Study for Sustainable Materials & Technology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

SMT 494 Independent Study in Sustainable Materials & Technology (1-6 credit hours)
Independent Study for Sustainable Materials & Technology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

Technology Education (TED)

TED 530 Foundations for Teaching Technology (3 credit hours)
Three topics related to teaching technology at the secondary and post-secondary levels: philosophical and historical foundations; methodology and curriculum development; and current trends and issues. Emphasis is on developing critical thinking skills, research, technology skill development, and writing procedures.

Prerequisite: Graduate standing
Typically offered in Fall only

TED 532 Current Trends in Technical Graphics Education (3 credit hours)
Current trends in the technology, techniques, and theories relating to technical graphics education. Discussion will center on assigned readings and student-researched presentations on topical subjects. Readings will be drawn from journals and texts, on-line databases and articles, and current news media sources.

Prerequisite: Graduate standing
Typically offered in Fall only

TED 534 Instructional Design in Technical and Technology Education (3 credit hours)
Create instructional activities for technical and technology education. Examine learning theories appropriate for technical and technology education. Explore and apply models for instructional design. Examine issues relative to electronic applications in technical and technology education classrooms.

Prerequisite: Graduate standing
Typically offered in Spring only

TED 536 Scientific and Technical Visualization: Theory and Practice (3 credit hours)
Theory and practice of scientific and technical visualization as a means of displaying scientific data and concepts using graphical methods. Both practitioner and theory driven models of communication are considered. How computer and print graphics can be used to assist individuals in the exploration of scientific and technical concepts. Particular focus on how to integrate scientific/technical graphics into the instructional settings.

TED 551 Technology Education: A Discipline (3 credit hours)
Defines essential attributes of technology and examines the relationship between technology education and related disciplines. Analyzes the theory, models, and literature that constitute the foundation of technology education. Synthesizes relevantresearch and identifies areas of needed research.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TED 552 Curricula for Emerging Technologies (3 credit hours)
Analyze advanced technologies and develop instructional programs for technology education curricula in secondary schools. Topics include technologies in production, transportation and communication.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TED 555 Developing and Implementing Technology Education (3 credit hours)
Technology Education curriculum trends, standards, design, implementation and management. Students will analyze current curricular trens and develop strategies for implementing and managing technology education programs.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TED 556 Laboratory Management and Safety in TED (3 credit hours)
Laboratory management, planning, and safety considerations for technology education. Analysis of recent research, environmental factors, development of a safety system, safety education, and legal implications. Use of student leaders in managementof a safe learning environment. Offfered by Distance Education Only

Prerequisite: Graduate standing
Typically offered in Spring only

TED 558 Teaching Creative Problem Solving (3 credit hours)
Provides teachers with the opportunity to study the research associated with creativity and apply these theories to implement a creative problem solving program.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TED 601 Practicum in Technology Education (1-6 credit hours)
Faculty supervised experience in educational, industrial or governmental setting where a student analyzes activities associated with planning, implementing and evaluating instructional and/or services in technology education. This plan is developedby students and approved by supervisor.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

TED 602 Practicum in TED (1-3 credit hours)
Typically offered in Summer only

TED 610 Special Topics in Technology Education (1-6 credit hours)
Individual or group of special topics in professional education. The faculty member determines the topic and mode of study after discussion with students.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 621 Special Problems in Technology Education (1-6 credit hours)
Guided independent or group or current problems in technology education.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 641 Internship in Technology Education (3 credit hours)
Classroom teachers will document products of learning to include: content pedagogy, student development, multiple instructional strategies, motivation and management, professional growth and community involvement.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 646 Field-based Research in Technology Education (3 credit hours)
Employ methods of field-based research to examine and improve instructional effectiveness and student achievement.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 655 Internship in Graphic Communications Education (3 credit hours)
Mentoring during a higher education level teaching experience in the field of technical graphics with emphasis on providing help in teaching visualization, graphical sciences, and technical graphics standards. *Course is offered as needed to 2-3 students at a time (independent Study).

Prerequisite: TED 530 or EOE 751 with Consent of Instructor
Typically offered in Fall and Spring

TED 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

TED 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Spring and Summer

TED 692 Research Project in Technology Education (1-6 credit hours)
A project or problem in research in education for graduate students, supervised by members of graduate faculty. The research chosen on the basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: ELP 732
Typically offered in Spring only

TED 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TED 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Typically offered in Fall, Spring, and Summer

TED 696 Summer Thesis Res (1 credit hours)

TED 709 Seminar in Technology Education (1-3 credit hours)
Seminar type course with toics selected for each class with attention given to broad concepts of and issues facing technology education at each leels of delivery and implementation.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

TED 751 Technology Education: A Discipline (3 credit hours)
Defines essential attributes of technology and examines the relationship between technology education and related disciplines. Analyzes the theory, models, and literature that constitute the foundation of technology education. Synthesizes relevantresearch and identifies areas of needed research.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TED 752 Curricula for Emerging Technologies (3 credit hours)
Analyze advanced technologies and develop instructional programs for technology education curricula in secondary schools. Topics include technologies in production, transportation and communication.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TED 755 Developing and Implementing Technology Education (3 credit hours)
Technology Education curriculum trends, standards, design, implementation and management. Students will analyze current curricular trens and develop strategies for implementing and managing technology education programs.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TED 756 Planning of Change in TED (3 credit hours)
Theories, research, strategies and practices needed to function as a technology education change agent; demonstrate a working knowledge of planned change in technology education; observe, assess, design and competently plan intervention strategies and aptly use behavioral tools to achieve success.

Typically offered in Summer only

TED 757 Leadership Development in TED (3 credit hours)
Research, development and practice of individual and organizational leadership in technology education. Content builds leadership knowledge, skill and practice with emphasis on student assesment and development.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TED 758 Teaching Creative Problem Solving (3 credit hours)
Provides teachers with the opportunity to study the research associated with creativity and apply these theories to implement a creative problem solving program.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TED 801 Practicum in Technology Education (1-6 credit hours)
Faculty supervised experience in educational, industrial or governmental setting where a student analyzes activities associated with planning, implementing and evaluating instructional and/or services in technology education. This plan is developedby student and approved by supervisor.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 810 Special Topics in Technology Education (1-6 credit hours)
Individual or group of special topics in professional education. The faculty member determines the topic and mode of study after discussion with students.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TED 821 Special Problems in Technology Education (1-6 credit hours)
Guided independent or group or current problems in technology education.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

TED 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TED 896 Summer Dissert Res (1 credit hours)

TED 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

Technology Engineering and Design Education (TDE)

TDE 101 Introduction to Technology Education (1 credit hours)
Orientation to technology teacher education curricula. Overview of the philosophy, objectives and scope of technology education programs in the public schools, multicultural and individual differences of students. A study of current technology issues will be conducted throughout the course.

Typically offered in Fall only

TDE 110 Materials & Processes Technology (3 credit hours)
Basic knowledge and skills needed to process common materials and produce functional products of woods, metals, plastics, and composite materials. Includes laboratory safety, use of hand tools, operation of materials, and teaching strategies. Laboratory experiences in materials testing and construction of multi-material projects.

Typically offered in Fall and Spring

TDE 131 Technology through Engineering and Design I (3 credit hours)
Study of engineering and design processes used to solve technological problems, innovate and invent. Students will actively design, model and test solutions to technological problems and explore methods to teach middle and high school students about engineering design and the design process.

Prerequisite: TDE 110
Typically offered in Fall and Spring

TDE 202 Introduction to Teaching Technology Engineering and Design Education (2 credit hours)
This course introduces students to teaching technology, engineering, and design in middle and secondary schools. Students will become familiar with state standards and national recommendations for teaching technology, engineering, and design. The co-requisite for this course has a required fieldwork component in local middle and secondary schools, and students are responsible for their own transportation to and from their field experience sites. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

Prerequisite: Sophomore standing; Corequisite: ED 204
Typically offered in Fall only

TDE 205 Desktop Publishing and Imaging Technology (3 credit hours)
An introduction to digital document production and techniques. Explores software packages used in producing documents for print. Structured for public school teachers and other interested persons, the course introduces basic standards and concepts of page layout, copyright and trademark laws, document usability, readability, and methods of document production.

Typically offered in Fall and Spring

TDE 220 Civil Engineering Graphics (3 credit hours)
Civil engineering graphics is an introductory course in basic graphic principles for constructed facilities. The emphasis is on sketching and CAD (computer-aided design) drawing skills and how specific construction systems and materials selected for a design affect production of civil engineering drawings for buildings, residences, and other constructed facilities through CAD. Topics include orthographic and axonometric engineering drawing of site plans, plat plans, section details, utility structure details, elevations and related topics. Restricted to Civil Engineering Majors.

Typically offered in Fall and Spring

TDE 230 Scientific and Technical Visualization (3 credit hours)
Scientific and technical visualization is an introductory course providing orientation to communication of scientific and technical information with graphics. Using current practice in science, technology, and engineering disciplines as the context, the class will use general and discipline-specific techniques to explore how to effectively communicate with graphics. Both manual and current software and computer technologies will be used to design and create graphics. Students will also learn to critically examine and discuss graphics produced by themselves and others.

Prerequisite: TDE 205
Typically offered in Spring only

TDE 261 Digital Media Education (3 credit hours)
Image creation and control, aesthetics, production processes and environments, and media transfer are explored. This course emphasizes concepts of audio and video design, various digital media technologies, and nonlinear editing concepts through laboratory experiments and projects in radio, television, original audio development, and video production. TDE Majors or instructor permission.

Typically offered in Spring only

TDE 331 Technology Through Engineering and Design II (3 credit hours)
Students will explore the contributions of systems engineering for developing and sustaining our designed world. Appropriate measurement, analysis and simulation tools will be used to make informed decisions and solve problems. Students will explore methods to teach middle and high school students about engineering design and the design process. TDE Majors or instructor approval.

Prerequisite: TDE 131
Typically offered in Fall and Spring

TDE 351 Ceramics: The Art and Craft of Clay (3 credit hours)
Contemporary and historical examples of the art and craft of ceramics will be studied. Experiences in designing ceramic forms and expressing individual ideas through the medium of clay.

GEP Visual and Performing Arts

TDE 359 Electronics Technology (3 credit hours)
Direct current, alternating current, and semiconductors. Measurement and circuit behavior. Experimentation with application circuits.

Prerequisite: Junior Standing
Typically offered in Fall only

TDE 371 Emerging Issues in Technology (3 credit hours)
Examination of current and projected technology topics which are growing in importance but are not presently reflected in the Technology Education programs of NC public schools. Laboratory experiences include development, revision, and field testing of appropriate learning activities for middle and high school students in the selected topic areas.

Prerequisite: TDE 131
Typically offered in Fall only

TDE 385 Robotics Education (3 credit hours)
This course is an introduction to design and invention system control mechanisms and robot sensors. Students will classify foundational technical developments in autonomous and computer- and radio-control robot teleoperations. Students will explore the history and evolution of robots and automation and their social, economic, industrial, and educational impacts.

Prerequisite: Junior standing.
Typically offered in Spring only

TDE 386 Robotics Education Lab (3 credit hours)
Students will apply technological problem solving skills toward 21st century design and innovation. This includes experiences multiple robotics design and invention systems and related programming and designing, prototyping, and programming an autonomous robot to resolve a real world issue.

Corequisite: TDE 385
Typically offered in Spring only

TDE 407 Field Work in Technology Education (6 credit hours)
A supervised off-campus field experience in Technology, Engineering, and Design Education that relates on-the-job experiences in the field to the technical competencies that are the content of the curriculum. This course has a required fieldwork component in a workplace, and students are responsible for their own transportation to and from their field experience sites.

Co-requisite: TDE 452, Senior Standing
Typically offered in Spring only

TDE 452 Lab Planning in Technology Education (3 credit hours)
Laboratory planning, management, and safety for technology education. Physical layout, selection, specification, and cost of equipment; the safe operation, repair and maintenance of power and hand tools; specification of expendable supplies, estimating, and ordering.

Restriction: Senior Standing; Corequisite: TDE 407 or TDE 457
Typically offered in Spring only

TDE 456 Curriculum and Methods in Technology Education (4 credit hours)
Methods of teaching Technology Education. Emphasis on curriculum development, instructional methods, laboratory instruction, meeting needs of special populations, and management of student organizations. Field experiences and course assignments two hours each week. Students are responsible for their own transportation.

Prerequisite: Technology Education Majors, Admittance to teacher education candidacy
Typically offered in Fall only

TDE 457 Student Teaching in Technology Education (8 credit hours)
Skills and techniques involved in teaching technology education through practice in a public school setting. The co-requisite for this course has a required fieldwork component in local middle and secondary schools, and students are responsible for their own transportation to and from their field experience sites. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

Prerequisite: TDE 456 and Corequisite: TDE 452
Typically offered in Spring only

TDE 481 Research & Development in Technology Education (3 credit hours)
Senior design, research, and development experience in technology education. Students research a problem, ideate potential solutions, select a final solution, construct a prototype, and complete a final report analyzing the chosen solution.

Prerequisite: TDE 331
Typically offered in Fall and Spring

TDE 490 Special Problems in Technology Education (1-6 credit hours)
Supervised, independent investigation in a defined area of interest in Technology Education.

Prerequisite: Junior standing.
Typically offered in Fall and Spring

TDE 495 Senior Seminar in Technology Education (3 credit hours)
An in-depth investigation of a topic or a set of problems and/or issues in Technology Education.

Prerequisite: Junior standing.
Typically offered in Spring only

TDE 498 Independent Study in Technology Education (1-3 credit hours)
Individual or group study of special topics in professional technology education. The topic and mode of study are determined by the faculty member after discussion with the student. May be repeated for a maximum of 6 credits. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing.
Typically offered in Fall, Spring, and Summer

Textile and Apparel Management (TAM)

TAM 589 Special Studies In Textile Management and Technology (1-4 credit hours)
New or special course on developments in textile management and technology. Specific topics and prerequisites vary.

Prerequisite: Senior standing
Typically offered in Fall and Spring

Textile Chemistry (TC)

TC 530 The Chemistry Of Textile Auxiliaries (3 credit hours)
Industrially important textile chemicals used for enhancing fiber and fabric properties such as durable press, water repellency, anti-soiling, flame retardancy, softness, stiffness, lubricity and other uses. Correlation of effect with structure, end-use influences, interaction with fabric and fibers, sources and synthetic routes, economic and environmental considerations.

Prerequisite: One yr. of organic chemistry
Typically offered in Spring only

TC 561/MSE 561 Organic Chemistry Of Polymers (3 credit hours)
Principles of step reaction and addition polymerizations; copolymerization; emulsion polymerization; ionic polymerization; characterization of polymers; molecular structure and properties.

Prerequisite: TC 461 and CH 231 or CH 431
Typically offered in Fall only

TC 565 Polymer Applications and Technology (3 credit hours)
Poly(olefins), poly(vinyl chloride), poly(vinyl acetate), poly(urethanes), epoxies, silicones, styrene copolymers used as textile finishes, nonwoven binders, fabric coatings, composites, adhesives, foams, carpet backing adhesives. Emphasis upon synthesis, industrial processes, properties and products.

Prerequisite: One yr. of organic chemistry, TC 461
Typically offered in Spring only

TC 589/TE 589/TMS 589 Special Studies In Textile Engineering and Science (1-4 credit hours)
New or special course on developments in textile engineering and science. Specific topics and prerequisites identified vary. Generally used for first offering of a new course.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall, Spring, and Summer

TC 601 Seminar (1 credit hours)
Discussion of scientific articles and presentations; review and discussion of student papers and research problems.

Typically offered in Fall and Spring

TC 630 Independent Study (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

TC 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall only

TC 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TC 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TC 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TC 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall and Spring

TC 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TC 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall only

TC 704 Fiber Formation--Theory and Practice (3 credit hours)
Practical and theoretical analysis of the chemical and physical principles underlying conventional methods of converting bulk polymer to fiber; rheology; melt, dry and wet polymer extrusion; fiber drawing; heat setting; general theory applied to unit processes.

Prerequisite: MA 341, PY 208
Typically offered in Spring only

TC 705 Theory Of Dyeing (3 credit hours)
Mechanisms of dyeing. Application of thermodynamics to dyeing systems. Kinetics of diffusion in dyeing processes.

Prerequisite: CH 433
Typically offered in Spring only

TC 706 Color Science (3 credit hours)
Basis of modern techniques for color specification, measurement, control and communication. Applications of color science to textiles, plastics, color reproduction, computer-based imaging and display systems. Basic concepts taught by computer color graphics.

Prerequisite: Senior standing or Graduate standing in TC, Corequisite: TC 707
Typically offered in Fall only

TC 707 Color Laboratory (1 credit hours)
Exercises with modern methods and equipment to aid in understanding color perception, color science and color measurement. Computer color graphics exercises for comprehension of basic concepts. Independent projects in color science. Limited enrollment.

Prerequisite: Senior standing or Graduate standing in TC, Corequisite: TC 706
Typically offered in Fall only

TC 710/FPS 710 Science of Dye Chemistry, Dyeing, Printing and Finishing (3 credit hours)
The primary course purpose is to gain a strong fundamental understanding of the chemistry and technology of preparation, dyes, dyeing and finishes. Emphasis will be on the chemistry of different bleach activators, surfactants, photophysics and photochemistry of FWAs, modulations of dyes structures to influence color, tinctorial strength, light fastness, wash fastness and aggregation. Chemistry of different dye classes will be studied with emphasis on structure-property relationships and dye-fiber interactions. Dyeing isotherms (Nernst and Langmuir), kinetics of dyeing with emphasis on derivation of Nernst and Langmuir based on thermodynamics and kinetics principles will be covered with practical examples of dyeing at different temperature and how to calculate thermodynamic parameters of dyeing (entropy, standard affinity and isotherm constants of Nernst and Langmuir). Chemistry of different finishes, including soil release, chemistry of flame retardants and mechanisms of flame retardancy, antimicrobial and water and oil repellency, will be covered with emphasis on structure-property relationships.

Prerequisite: Graduate Standing and C or better in CH221 or CH225 and CH223 or CH227
Typically offered in Fall and Spring

TC 720 Chemistry Of Dyes and Color (3 credit hours)
Correlation of color and chemical constitution, synthetic routes for popular dyes of all important types; electronic mechanisms for reactive dyes; chemistry of dye interactions with light, washing and other in-use influences; economic and environmental considerations.

Prerequisite: (CH 221 or CH 225) and (CH 223 or CH 227)
Typically offered in Spring only

TC 771 Polymer Microstructures, Conformations and Properties (3 credit hours)
Exploration of connections between microstructures and properties of polymers afforded by analysis of their conformational characteristics. Analysis of NMR spectroscopy and conformational energy estimates to establish polymer microstructures and resultant sizes and shapes of polymer chains, which then related to their unique and rich variety of physical properties.

Prerequisite: CH 220
Typically offered in Fall only

TC 791 Special Topics In Textile Science (1-6 credit hours)
Intensive treatments of selected topics in textile, polymer and fiber science.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall and Spring

TC 792 Special Topics In Fiber Science (1-6 credit hours)
Study of selected topics of particular interest in various advanced phases of fiber science.

Typically offered in Fall and Spring

TC 896 Summer Dissert Res (1 credit hours)

Textile Engineering (TE)

TE 105 Textile Engineering: Materials and Systems (2 credit hours)
Introducation to textile engineering, polymers and fibers with emphasis on applications. Discussions of what makes macromolecules unique and pairing of material properties to a given application. Other discussions by various TE faculty giving students a picture of the breadth of the program. This course will also help develop leadership/team work skills and oral/written communications.

Corequisite: CH 101
Typically offered in Spring only

TE 110 Computer-Based Modeling for Engineers (3 credit hours)
Introductory course in computer-based modeling and programming using Visual Basic for Applications. Emphasis on algorithm development and engineering problem solving. Methodical development of VBA within applications like Microsoft Excel and Access from specifications; documentation, style; control structures; classes and methods; data types and data abstraction; object-oriented programming and design; graphical user interface design. Projects: design problems from electrical, industrial, textile, and financial systems. Functional relationships will be given and programs will be designed and developed from a list of specifications.

Prerequisite: E 115, Corequisite: MA 141
Typically offered in Fall only

TE 200 Introduction to Polymer Science and Engineering (3 credit hours)
Science and engineering of large molecules. Correlation of molecular structure and properties of polymers in solution and in bulk. Introductory polymer synthesis and kinetics. Analysis of physical methods for characterization of molecular weight, morphology, rheology, and mechanical behavior. The content will be focused on polymer synthesis, structure, and properties. The course will focus on a thorough understanding of polymer concepts and definitions, equations to calculate properties, and equipment used to measure properties.

Prerequisite: Grade of C- or better CH 101
Typically offered in Fall and Spring

TE 201 Fiber Science (4 credit hours)
Structure, physical and mechanical properties of fibers; structure of fiber assemblies. Structure/property relations. Laboratory exercises in characterization of fiber properties.

Prerequisite: CH 101 and (Grade of C- or better in MA 131 or MA 141)
Typically offered in Spring only

TE 205 Analog and Digital Circuits (4 credit hours)
Fundamentals of analog and digital circuit analysis and design. The course will present the systematic analysis and design of AC and DC circuits using Ohms and Kirchhoff's laws, the node voltage method, Thevenin and Norton's theorem, Laplace Transforms, resistance, capacitance, inductance, operational amplifiers, and frequency response. Next, the design of combinatorial and synchronous sequential circuit design will be covered using Karnaugh maps, laws of Boolean algebra, flip-flops, state machines, and latches. Laboratory exercises will supplement the topics presented in class.

Prerequisite: C- or better in TE 110, PY 208, Corequisite: MA 341
Typically offered in Spring only

TE 301 Engineering Textile Structures I: Linear Assemblies (3 credit hours)
Engineering analysis of textile structures, especially yarns. Unit processes of production, handling and packaging. Production sequences, intermachine effects, machine design and their consequences on the textile product.

Prerequisite: (MAE 206 or CE 214) and MA 242
Typically offered in Fall only

TE 302 Textile Manufacturing Processes and Systems II (4 credit hours)
Mechanisms used in the production of woven, knitted and nonwoven fabrics. Design and operation of these mechanisms and their impact on the fabric. System dynamics of the different fabric forming processes.

Prerequisite: TE 301 and C- or better in TE/ISE 110
Typically offered in Spring only

TE 303 Thermodynamics for Textile Engineers (3 credit hours)
Introduction to the concept of energy and the laws governing the transfer and transformation of energy with an emphasis on thermodynamic properties and the First and Second Laws of Thermodynamics. The fundamentals of thermodynamics will be emphasized, although more applied examples and problems will be heavily utilized.

Prerequisite: MA 242, PY 208
Typically offered in Fall only

TE 401 Textile Engineering Design I (4 credit hours)
The design process including initial specification, design constraints, sources of information and design strategy. Development of fact-finding ability in areas unfamiliar to the student. Analysis of existing designs and the development of improved or new designs.

Prerequisite: TE 302
Typically offered in Fall only

TE 402 Textile Engineering Design II (4 credit hours)
Application of textile engineering principles using team approach to design, construct and analyze novel engineering solutions to textile industry problems. Evaluation of design to assess the impact on worker, industry and society.

Prerequisite: TE 401
Typically offered in Spring only

TE 404 Textile Engineering Quality Improvement (3 credit hours)
Defining and quantifying quality of textile products; quality improvement using statistical process control (SPC) and design of experiment (DOE) techniques.

Prerequisite: ST 370 and C- or better in TE/ISE 110
Typically offered in Spring only

TE 424 Textile Engineering Quality Improvement Laboratory (1 credit hours)
Application of process improvement methods to textile systems using statistical software. Laboratory supplements lecture material presented in TE 404.

Corequisite: TE 404
Typically offered in Spring only

TE 435/CHE 435 Process Systems Analysis and Control (3 credit hours)
Dynamic analysis and continuous control of chemical and material engineering processes. Process modeling; stability analysis, design and selection of control schemes. Solution of differential equations using Laplace transform techniques.

Prerequisite: (MA 341 and TE 205) or CHE 312
Typically offered in Fall and Spring

TE 440/TE 540 Textile Information Systems Design (4 credit hours)
Textile information system design, real-world constraints. Principles of hardware, software, security and ethics issues. Emphasis on solving a real world problem. Credit will not be given for both TE 440 and TE 540.

Prerequisite: C- or better in TE 110 and JR standing
Typically offered in Fall only

TE 463 Polymer Engineering (3 credit hours)
Chemical and physical properties of polymers and fibers; thermodynamics of crystallization, time dependent phenomena, fracture mechanics and rheology. Advanced topics in extrusion.

Prerequisite: MSE 201 or BME 203; and Corequisite: TE 303, MAE 301, or MSE 301
Typically offered in Fall only

TE 466/BME 466/TE 566/BME 566 Polymeric Biomaterials Engineering (3 credit hours)
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including surface modification and characterization techniques. Bioresorbable polymers.

Prerequisite: PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and (MAE 206 or CE 214)
Typically offered in Fall only

TE 467/BME 467 Mechanics of Tissues & Implants Requirements (3 credit hours)
Application of engineering and biological principles to understand the structure and performance of tendons, ligaments, skin, and bone; bone mechanics; viscoelasticity of soft biological tissues; models of soft biological tissues; mechanics of skeletal muscle; and tissue-derived devices as well as interfaces between native tissues and synthetic devices.

Prerequisite: (ZO 160 or BIO 183) and (MAE 214 or CE 225)
Typically offered in Spring only

TE 492 Special Topics in Textile Engineering (1-3 credit hours)
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

Typically offered in Fall and Spring

TE 505 Textile Systems and Control (3 credit hours)
Theory and application of instruments and control systems used in modern textile plants. Description of basic instruments and computer systems along with their use in process control, production control, research and development.

Prerequisite: TE 305, CSC 114
Typically offered in Spring only

TE 518 Textile Electronics - Materials and Systems (3 credit hours)
For electronics integration, textiles are considered an unconventional substrate and a potentially disruptive technology space within wearable electronics. The objective of this course is to survey concepts in textile electronics including devices (communication, sensors, energy storage, digital processing) and use cases (military, health, wellness, infotainment). Students will examine materials and processing methods used in textile electronic development. Finally, students will use entrepreneurial design concepts to fabricate a textile electronic system.

R: Masters level standing or Senior standing with GPA >3.25
Typically offered in Spring only

TE 533/TT 533/TTM 533 Lean Six Sigma Quality (3 credit hours)
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

Prerequisite: ST 361 and ST 371, or equivalent
Typically offered in Spring only

TE 540/TE 440 Textile Information Systems Design (4 credit hours)
Textile information system design, real-world constraints. Principles of hardware, software, security and ethics issues. Emphasis on solving a real world problem. Credit will not be given for both TE 440 and TE 540.

Prerequisite: C- or better in TE 110 and JR standing
Typically offered in Fall only

TE 550 Clothing Comfort and Personal Protection Science (3 credit hours)
The course presents scientific principles for characterization and development of comfortable and/or protective textiles and clothing. Properties associated with human tactile response, thermal comfort and heat stress are emphasized. Inherent issues of balancing comfort versus protection are illustrated by research studies on performance garments or protective clothing systems. Methods and standards for evaluating comfort and protective performance range from bench level instruments to system level tests for ensembles using instrumented manikins, human clothing wear trials, and physiological tests.

R: Graduate Standing or Permission of Instructor
Typically offered in Fall only

TE 561/TT 561 Human Physiology for Clothing and Wearables (3 credit hours)
This course will provide students with the knowledge of scientific principles on the interactions between textiles and the human body. The students will learn some basics of human physiology, specifically as it relates to the interactions of the human with clothing and other related body worn products (protective wear, e-textile products and sensors). An important part of this course will focus on the thermal strain of humans when being active and wearing (protective) clothing. As the thermal heat balance is an important part of this course, students will learn to do a basic thermal analysis and computation of the human heat balance, including the influence of clothing. Also test and evaluation methods to assess clothing performance will be addressed on thermal aspects as well as addressing other ergonomics aspects of clothing, such as restriction of movement, visual and auditory aspects.

R: Graduate Standing or Permission of Instructor
Typically offered in Fall only

TE 562/OR 562/ISE 562 Simulation Modeling (3 credit hours)
This course concentrates on design, construction, and use of discrete/continuous simulation object-based models employing the SIMIO software, with application to manufacturing, service, and healthcare. The focus is on methods for modeling and analyzing complex problems using simulation objects. Analysis includes data-based modeling, process design, input modeling, output analysis, and the use of 3D animation with other graphical displays. Object-oriented modeling is used to extend models and enhance re-usability.

Typically offered in Spring only

TE 565/TMS 565 Textile Composites (3 credit hours)
Fiber architecture of textiles used for composites. Manufacturing processes and geometric quantification. Basic analysis for predicting elastic properties. Interrelationship of elastic properties and geometric quantities. Failure criteria for these materials.

Prerequisite: MA 341, MAE 206
Typically offered in Fall only

TE 566/BME 566/TE 466/BME 466 Polymeric Biomaterials Engineering (3 credit hours)
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including surface modification and characterization techniques. Bioresorbable polymers.

Prerequisite: PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and (MAE 206 or CE 214)
Typically offered in Fall only

TE 570/PY 570 Polymer Physics (3 credit hours)
Polymer microstructures, polymer solutions, polymer physical states (including amorphous polymers, crystalline polymers, polymer melts, melting of polymers, glass-transition, and other transitions), polymer blends, polymer mechanical properties, polymer viscoelasticity and flow, multicomponent polymer systems, and modern polymer topics. The physics of polymer fibers. Graduate standing or permission of instructor.

Typically offered in Fall only

TE 589/TMS 589/TC 589 Special Studies In Textile Engineering and Science (1-4 credit hours)
New or special course on developments in textile engineering and science. Specific topics and prerequisites identified vary. Generally used for first offering of a new course.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall, Spring, and Summer

TE 601 Seminar (1 credit hours)
Typically offered in Fall and Spring

TE 630 Independent Study (1-3 credit hours)
Typically offered in Fall, Spring, and Summer

TE 676 Special Projects (1-3 credit hours)
Typically offered in Spring only

TE 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall only

TE 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TE 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TE 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Fall and Spring

TE 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TE 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged

Prerequisite: Master's student
Typically offered in Fall only

Textile Materials Science (TMS)

TMS 211 Introduction to Fiber Science (3 credit hours)
Properties of fibers are related to their classification, chemical structure, type and origin- which helps with their identification and classification. Covered in this course are principles of fiber formation and the physical behaviors of fibers (including their mechanical, thermal, optical, frictional, electrical, and moisture management properties), and methods of measuring the physical properties of fibers. Relationships between polymer structure, fiber properties and utilization are explored. Also, students are introduced to tools that will help them reflect on how problems related to fiber science are solved.

Prerequisite: MT 105 or TT 105 or PCC 101; Corequisite: MA 131 or MA 141
GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

TMS 212 Yarn and Fabric Formation and Properties (2 credit hours)
The development of products from textile and fibrous materials is a critical component of new product development in many industries, including textiles, retail, plastics, composites, transporations, and architecture. This course provides the technical information required for scientists to understand how textile and fiber-based products are manufactures, with a practical view to cmbining the new knowledge with a molucular level understanding of fibers for unique new product development.

Prerequisite: TMS 211
Typically offered in Fall only

TMS 214 Yarn and Fabric Formation and Properties Lab (1 credit hours)
The development of products from textiles and fibrous materials is a critical component of new product development in many industry. This laboratory course provides hands-on exercises and demonstrations of key textile and fiber-based products are manufactured.

Prerequisite: TMS 212
Typically offered in Fall only

TMS 492 Special Topics in Textile Materials Science (1-3 credit hours)
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

Typically offered in Fall and Spring

TMS 500 Fiber and Polymer Microscopy (3 credit hours)
Art and science of light and electron microscopy; theoretical and practical aspects of visibility, resolution and contrast. Laboratory practice in assembling, testing and using various microscopes and accessories in analyzing, describing and identifying unoriented and oriented crystalline or amorphous materials. Laboratory emphasis on study of fibers and polymers through transmission microscopy with polarized light.

Prerequisite: MA 242, PY 208, TC 203
Typically offered in Fall only

TMS 521/TT 521 Filament Yarn Production Processing and Properties (3 credit hours)
Structure, properties and processes for manufacturing and treating continuous filament yarns. Response of fibers to elevated temperatures, twist, false twist and various bulking processes. Yarn structures and properties required for stretch and molded fabrics. Independent laboratory and critical literature review in general area of filament yarn processing, properties and test methods. credit not allowed for both TT 521 and TT 425

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TMS 565/TE 565 Textile Composites (3 credit hours)
Fiber architecture of textiles used for composites. Manufacturing processes and geometric quantification. Basic analysis for predicting elastic properties. Interrelationship of elastic properties and geometric quantities. Failure criteria for these materials.

Prerequisite: MA 341, MAE 206
Typically offered in Spring only

TMS 589/TC 589/TE 589 Special Studies In Textile Engineering and Science (1-4 credit hours)
New or special course on developments in textile engineering and science. Specific topics and prerequisites identified vary. Generally used for first offering of a new course.

Prerequisite: Senior standing or Graduate standing
Typically offered in Fall, Spring, and Summer

TMS 676 Special Projects (1-3 credit hours)

TMS 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall and Spring

TMS 690 Master's Exam (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

TMS 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TMS 695 Master's Thesis Research (1-9 credit hours)
Thesis research

Prerequisite: Master's student
Typically offered in Fall and Spring

TMS 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TMS 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall and Spring

TMS 761 Mechanical and Rheological Properties Of Fibrous Material (3 credit hours)
In-depth study of the stress-strain, bending, torsional, dynamic and rheological behavior of natural and man-made fibers. Presentation and discussion of theoretical relations and advanced techniques.

Prerequisite: MA 301
Typically offered in Spring only

TMS 762 Physical Properties Of Fiber Forming Polymers, Fibers and Fibrous Structures (3 credit hours)
Experimental results and theoretical considerations of physical properties of fibers and fiber-forming polymers. Electrical, thermal, optical, frictional and moisture properties of these materials. Influence of chemical and molecular fine structure on these properties.

Prerequisite: PY 208
Typically offered in Spring only

TMS 763/MSE 763 Characterization Of Structure Of Fiber Forming Polymers (3 credit hours)
Theories, experimental evidence and characterization methods of the molecular fine structure of fiber forming polymers in the solid state. Characterization methods include X-ray diffraction, microscopy, infrared, thermal and magnetic resonance.

Prerequisite: Graduate standing
Typically offered in Fall only

Textile Technology (TT)

TT 105 Introduction to Textile Technology (3 credit hours)
Introduction to Textile and Apparel, Technology and Management. Structures and production methods for fabrics, yarn, and fibers. Introduction to the nature of polymers and the characteristics of polymers which make them useful for producing fibersthat are practically and aesthetically desirable. Design of end products as well as fundamental economic and supply chain issues.

Typically offered in Fall, Spring, and Summer

TT 221 Yarn Production and Properties I (2 credit hours)
The techniques available for manufacturing yarns from staple fibers. A review of yarn numbering and fiber properties. The principles involved in opening, cleaning, blending, drafting, twisting and winding. Short and long staple spinning systems including a review of opening and cleaning lines, carding, draw frames, roving frames and different spinning machines. Filament yarn processing.

Prerequisite: TT 105 or MT 105; Corequisite: MA 131 or MA 141
Typically offered in Fall, Spring, and Summer

TT 252 Formation and Structure of Textile Fabrics (4 credit hours)
Fundamentals of the conversion of fibers and yarns into woven, knitted, and nonwoven fabrics, and fabrics' conversion systems. Introduction to woven, knitted and nonwoven fabric design structure. Structure, property, and performance relations of textile fabrics. Testing and evaluation of textile structures.

Prerequisite: TT 221 or TTM 106
Typically offered in Fall, Spring, and Summer

TT 305 Introduction to Nonwoven Products and Processes (3 credit hours)
Fiber web/nonwoven fabrics produced directly from fibers or their precursors. Physical and chemical nature of local bonding and fiber entanglement. Viable processes for producing these fabrics. Economic justification for process and production. Product/process interaction. Plant visits whenever possible.

Prerequisite: TMS 211 and (MA 131 or MA 141) and (PY 211 or PY 205 and 206); Corequisite: ST 311 or ST 370
Typically offered in Fall, Spring, and Summer

TT 327 Yarn Production and Properties (4 credit hours)
The processing of natural and synthetic, fibers and filaments into yarns. The impact of fiber selection and processing parameters on the quality of the yarn and subsequent products. Major processing routes for staple fibers and filaments together with recent developments in applicable technologies.

Prerequisite: (TMS 211 or TE 201) and (MA 231 or MA 241) and (PY 211 or (PY 205 and PY 206))
Typically offered in Fall only

TT 331 Performance Evaluation of Textile Materials (4 credit hours)
Standards, principles and effects of test conditions in measuring basic physical and mechanical properties of textile materials. Design of test and interpretation of test results in relation to end-use performance, product development, process control, research and development and other requirements.

Prerequisite: (ST 311 or ST 370) and (TT 327 or TE 301) and (PY 211 or(PY 205 and PY 206)) and (MA 231 or MA 241)
Typically offered in Fall and Spring

TT 341 Knitted Fabric Technology (3 credit hours)
Review of knitted fabric production techniques. Technology of more advanced weft and warp knitting. Jersey and rib fabric modification techniques, yarn knitability and productivity, yarns, creels, patterning and machinery developments, manufacture and properties of warp knit fabrics such as mesh, laid-in, weft insertion and plush. Quality measures, measurement and standards, defects and problem solving. Management of knitting operations.

Prerequisite: TT 327
Typically offered in Spring only

TT 351 Woven Products and Processes (3 credit hours)
Design and development of various woven textile products including their component properties, performance, requirements, structures, and methods of production. The primary objective of the course is to introduce students to various woven textile products, including those used in automotives, agriculture, construction, ETC. and stimulate understanding of their structure, performance requirements, and relevant manufacturing principles including braiding.

Prerequisite: (TT 221 or TT 327) and (PY 211 or (PY 205 and PY 206))
Typically offered in Spring only

TT 380/FTM 380 Management and Control of Textile and Apparel Systems (3 credit hours)
Management approaches, practices and basic economic considerations in the development, production and distribution of industrial and consumer textile and apparel products.

Prerequisite: FTM 217
Typically offered in Fall only

TT 401 Textile Technology Senior Design I (4 credit hours)
This is Part 1 of 2 for the Senior Capstone Design Course. Students work in cross-functional teams to research and solve real-world problems in fibers, polymers, and textile science utilizing their foundation skills in Textile Technology. TT 401 and TT 402 must be taken in the same academic year as the class is project and team dependent. Students will be required to meet outside the normal class times as well as expected to participate in various off-campus field trips and activities for successful completion of the project. Project sponsors will cover any transportation costs that are incurred. TT majors only.

Prerequisite: TT 331, Senior standing
Typically offered in Fall only

TT 402 Textile Technology Senior Design II (4 credit hours)
This is Part 2 of 2 for the Senior Capstone Design Course. Students work in cross-functional teams to research and solve real-world problems in fibers, polymers, and textile science utilizing their foundation skills in Textile Technology. TT 401 and TT 402 must be taken in the same academic year as the class is project and team dependent. Students will be required to meet outside the normal class times as well as expected to participate in various off-campus field trips and activities for successful completion of the project. Project sponsors will cover any transportation costs that are incurred. TT majors only.

Prerequisite: TT 401
Typically offered in Spring only

TT 404/TT 504/NW 504/NW 404 Introduction to Nonwovens Products and Processes (3 credit hours)
This course introduces the fundamentals of nonwoven structures, process, and products. It provides performance criteria, raw materials, manufacturing methods, and market outlooks of major nonwoven application segments including hygiene, wipes, filters, medical, automotive, and geotextile. Emphasis is placed on building basic understandings of process/structure/property relationship in nonwoven product and the economic justification for process and production.

Prerequisite: (MA 131 or 141), PY 205; Corequisite: TT 503
Typically offered in Fall only

TT 405/TT 505/NW 505/NW 405 Advanced Nonwovens Processing (3 credit hours)
Mechanisms used in the production of nonwoven materials. Design and operation of these mechanisms. Process flow, optimization of process parameters, influence of process parameters on product properties.

Prerequisite: MA 231 or MA 241, PY 211 or (PY 205 and PY 206) , TT 305 or TT 404
Typically offered in Spring only

TT 407 Characterization Methods in Nonwovens (3 credit hours)
Fundamentals of methods used in evaluating properties and performance of nonwovens. Assessment of thermal, mechanical, moisture transport and barrier properties of nonwovens. Reliability and interpretation of test results.

Prerequisite: ST 311 or ST 370; and TT 305 or TT 404
Typically offered in Spring only

TT 408/TT 508/NW 508/NW 408 Nonwoven Product Development (3 credit hours)
Fundamentals of nonwoven product development. In-depth knowledge of the materials, processes and nonwovens products. Design of a set of experiments intended for product development. Students work in teams to design, fabricate and evaluate nonwoven products.

Prerequisites: TT 405 and TT 407
Typically offered in Spring only

TT 431 Quality Management and Control In Textile Manufacturing (3 credit hours)
Principles of quality and process management and control in textile/apparel manufacturing with emphases in quality management systems, quality costs, statistical control chart procedures, process capability, acceptance sampling, and optimal process and product design and improvement methods.

Prerequisite: TT 331
Typically offered in Spring only

TT 451/TT 551 Advanced Woven Fabric Design (3 credit hours)
Design and production requirements for highly specialized woven fabric structures. The laboratory activities will include a project on design from concept to final production and finishing.

Prerequisite: (TT 252 or TT 351) and Senior Standing
Typically offered in Fall only

TT 470 Jacquard Woven Fabric Design (3 credit hours)
This course is dedicated to the study of Jacquard woven fabric design and structural technology through the use of CAD as both an aesthetic and technical tool, and will culminate in each student producing a unique fabric collection based upon his/her developed area of interest. Jacquard design for many different end uses is addressed, from art fabrics to unique specialty products. A field trip in this course will require personal transportation.

Prerequisite: TT 252, TT 371
Typically offered in Fall only

TT 480/FTM 480 Operations Management Decisions for Textiles (3 credit hours)
Quantitative techniques for decision making and management in the textile complex. Applications include vendor selection, plant location, retail inventory management, forcasting demand, project management, and logistics planning. Techniques covered include simulation, PERT/CPM, mathematical modeling.

Prerequisite: TT/FTM 380 and ACC 210 and ST 311 or ST 370 and ((MA 131 and 132) or MA 141)
Typically offered in Fall only

TT 481 Design and Technology of Technical Textiles (3 credit hours)
Performance requirements of various technical textiles. Underlying principles of design, application, manufacture, and evaluation of fibrous structures intended to meet specific end-use requirement.

Prerequisite: TT 305, TT 341 and TT 351
Typically offered in Fall only

TT 485/FTM 485 Textile Computer Integrated Enterprise (3 credit hours)
Survey of information technology in textile and apparel industries. Topics discussed include: computer aided design (CAD); computer aided manufacturing (CAM); computer aided engineering (CAE); material handling systems; automation and robotics; logistics and warehousing systems; retail product tracking, and Internet resources.

Prerequisite: TT/FTM 380
Typically offered in Fall only

TT 486/FTM 486 Supply Chain Management in the Textile Industry (3 credit hours)
Study of the operations necessary to produce and distribute a product, starting with the procurement of the raw material used in making the goods and ending with the delivery of the finished product. Topics covered include approaches to solving problems in manufacturing, sourcing, transportation logistics, and retail operations within the Integrated Textile Complex. Credit cannot be given for both TAM486 and MT386.

Prerequisite: TT/FTM 380
Typically offered in Spring only

TT 499 Textile Senior Project (4 credit hours)
This is a project based course to be taken in the last semester of the Senior year. In this capstone course the students work in cross-functional teams to research and solve applied problems in textile related fields. The results of the projects will be presented formally at the end of the semester. Course should be taken in the last semester of the Senior year. It cannot be substituted by other project courses

Prerequisite: Senior standing
Typically offered in Fall and Spring

TT 500 Understanding the Textile Complex (3 credit hours)
This course provides an overview of product development, processing, managing, financing, etc., for the textile industry. It is designed to give new graduate students basic preparations for more advanced, required textile courses. Students will also gain insight into the research being conducted within the College of Textiles.

Prerequisite: Graduate standing
Typically offered in Fall only

TT 503/NW 503 Materials, Polymers, and Fibers used in Nonwovens (3 credit hours)
Fundamentals of raw material used in nonwoven processes. Raw material production, chemical and physical properties of nonwoven raw materials and assessment of material properties. Introduction of structure/property relationships for these materials and how these relationships influence end use applications.

Prerequisite: MA 141, PY 205, PCC 203
Typically offered in Fall and Spring

TT 504/NW 504/NW 404/TT 404 Introduction to Nonwovens Products and Processes (3 credit hours)
This course introduces the fundamentals of nonwoven structures, process, and products. It provides performance criteria, raw materials, manufacturing methods, and market outlooks of major nonwoven application segments including hygiene, wipes, filters, medical, automotive, and geotextile. Emphasis is placed on building basic understandings of process/structure/property relationship in nonwoven product and the economic justification for process and production.

Prerequisite: (MA 131 or 141), PY 205; Corequisite: TT 503
Typically offered in Fall and Spring

TT 505/NW 505/NW 405/TT 405 Advanced Nonwovens Processing (3 credit hours)
Mechanisms used in the production of nonwoven materials. Design and operation of these mechanisms. Process flow, optimization of process parameters, influence of process parameters on product properties.

Prerequisite: MA 231 or MA 241, PY 211 or (PY 205 and PY 206) , TT 305 or TT 404
Typically offered in Spring only

TT 507/NW 507 Nonwoven Characterization Methods (3 credit hours)
Fundamentals of methods used in evaluating properties and performance of nonwovens. Assessment of thermal, mechanical, moisture transport and barrier properties of nonwovens. Reliability and interpretation of test results.

Prerequisite: ST 361, Corequisite: TT/NW 505
Typically offered in Spring only

TT 508/NW 508/NW 408/TT 408 Nonwoven Product Development (3 credit hours)
Fundamentals of nonwoven product development. In-depth knowledge of the materials, processes and nonwovens products. Design of a set of experiments intended for product development. Students work in teams to design, fabricate and evaluate nonwoven products.

Prerequisites: TT 405 and TT 407
Typically offered in Fall and Spring

TT 520 Yarn Processing Dynamics (3 credit hours)
Principles and practice involved in modern yarn and manufacture; including machine-fiber interactions occurring during different processing stages. Not normally for credit for undergraduate textile majors.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Spring

TT 521/TMS 521 Filament Yarn Production Processing and Properties (3 credit hours)
Structure, properties and processes for manufacturing and treating continuous filament yarns. Response of fibers to elevated temperatures, twist, false twist and various bulking processes. Yarn structures and properties required for stretch and molded fabrics. Independent laboratory and critical literature review in general area of filament yarn processing, properties and test methods. credit not allowed for both TT 521 and TT 425

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TT 530/TTM 530 Textile Quality and Process Control (3 credit hours)
Quality control and improvement methods for textile processes and products including quality systems, statistical control chart procedures, process capabilities, acceptance sampling plans, textiles process and product designs, on-line and off-line control systems and specific quality factors governing textile products and processes and their variabilities.

Prerequisite: TT 420, Corequisite: ST 511 or ST 515
Typically offered in Spring only

TT 532 Evaluation of Biotextiles (3 credit hours)
Evaluation of the performance of biotextiles and medical polymers in biological and microbiological environments, with an emphasis on "in vitro" and "in vivo" techniques for testing the biocompatibility and biostability of implantable biomedical products. Related issues will deal with quality assurance systems, inspection and sampling plans, ISO certification, GMP's, reference materials and organisms, and the use of accelerated tests an animal trials so as to meet regulatory requirements.

Prerequisite: ZO 160, TC 203, TMS 211, CH 220
Typically offered in Fall only

TT 533/TTM 533/TE 533 Lean Six Sigma Quality (3 credit hours)
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

Prerequisite: ST 361 and ST 371, or equivalent
Typically offered in Spring only

TT 535/TTM 535 Research Methods and Management (3 credit hours)
This course provides students with an understanding and appreciation of the basic principles of research methods when using qualitative, quantitative or a mixed methods approach. This course will provide guidance to students in conducting their thesis project and cover all aspects of a thesis project, including but not limited to the first three chapters, defining the problem, conducting and writing the literature review, use of theories and a conceptual framework, data collection and analyses, ethical considerations and IRB approval, and the Electronic Thesis Dissertation requirements. Students will be assigned additional readings and learning activities that will expand the understanding of the research process. This course is geared to students who have narrowed down their research topic in collaboration with their committee chair.

Restriction: TTM Students, FPS Students, or a Master's of Science in Textiles, Textile Engineering, or Textile Chemistry. Graduate standing or permission of instructor.
Typically offered in Fall and Spring

TT 549 Warp Knit Engineering and Structural Design (3 credit hours)
Engineering analysis of tricot and raschel machinery. Design of yarn let-off and fabric take-up mechanisms. Studies of fabric production techniques and quality control systems. Theory of production optimization and the properties of fabrics. Complexgeometrical loop models and their application.

Prerequisite: TT 443
Typically offered in Spring only

TT 550 Production Mechanics and Properties of Woven Fabrics (3 credit hours)
Interrelation between mechanics of production and mechanical properties of woven fabric; unit operations required to prepare yarns for weaving and the mechanism employed in weaving; fabric structure, geometry and mechanical properties; designing forspecific fabrics properties. Not normally for credit for undergraduate textiles majors.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TT 551/TT 451 Advanced Woven Fabric Design (3 credit hours)
Design and production requirements for highly specialized woven fabric structures. The laboratory activities will include a project on design from concept to final production and finishing.

Prerequisite: (TT 252 or TT 351) and Senior Standing
Typically offered in Fall only

TT 553 Formation and Structure of Woven and Knitted Fabrics (3 credit hours)
The interrelation between the mechanics of production and mechanical properties of woven and knitted fabrics; unit operations required to prepare yams for weaving and knitting and mechanisms employed in weaving and knitting; fabric structure, geometry and mechanical properties; designing for specific fabric properties. Students will not be allowed credit for TT 553 and (TT 541, TT 549, and TT 550).

Typically offered in Spring only

TT 561/TE 561 Human Physiology for Clothing and Wearables (3 credit hours)
This course will provide students with the knowledge of scientific principles on the interactions between textiles and the human body. The students will learn some basics of human physiology, specifically as it relates to the interactions of the human with clothing and other related body worn products (protective wear, e-textile products and sensors). An important part of this course will focus on the thermal strain of humans when being active and wearing (protective) clothing. As the thermal heat balance is an important part of this course, students will learn to do a basic thermal analysis and computation of the human heat balance, including the influence of clothing. Also test and evaluation methods to assess clothing performance will be addressed on thermal aspects as well as addressing other ergonomics aspects of clothing, such as restriction of movement, visual and auditory aspects.

R: Graduate Standing or Permission of Instructor
Typically offered in Fall only

TT 570 Textile Digital Design and Technology (3 credit hours)
This course focuses on design of textile products balancing industry and creative foci. Students will study a range of industry focused technologies and techniques essential to creation of textile products in a technology intensive environment. Basics of textile product design and relevant technologies will be covered along with methods and techniques to improve commercial textile product design process. Students will research in-depth a topic related to textile product design, and present their research in an oral format.

Prerequisite: Graduate standing
Typically offered in Fall only

TT 571 Professional Practices in Textile Design and Technology (3 credit hours)
This course builds on the concepts introduced in TT 570 with increased focus on professional practice and methods. Focus on advanced textile product design topics incorporating an industry focus and utilizing commercial technologies. Students willinvestigate in depth a textile product design industry application, technique or method of interest using individual and tam based strategies. Topics include advanced study of textile product design concepts, techniques and preparation for professional competitions, displays and conferences.

Prerequisite: TT 570
Typically offered in Spring only

TT 581 Technical Textiles (3 credit hours)
Performance requirements of various technical textiles. Underlying principles of design and manufacturing of fibrous structures to meet specific needs in mechanical and other behaviors.

Prerequisite: TT 520 or TT 521, and TT 550
Typically offered in Fall only

TT 591 Special Studies in Textile Technology (1-4 credit hours)
Special Studies in Textile Technology to fulfill needs not covered by current offering. Student and faculty required to submit topics to be covered to director of graduate programs within first week of semester.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TT 601 Seminar (1 credit hours)
Discussion of scientific articles of interest to the textile industry; review and discussion of student papers and research problems.

Typically offered in Fall and Spring

TT 630 Independent Study in Textile Technology (1-3 credit hours)
Problems of specific interest in textile technology. Preparation of report, in format suitable for publication required. One-page outline signed by advisor must be submitted to director of graduate programs within first week of semester. A maximumof 3 credit hours will be allowed towards Master of Textiles Degree. No credit is allowed towards MS (Textiles).

Typically offered in Fall, Spring, and Summer

TT 676 Special Projects Textile Technology (1-3 credit hours)
Typically offered in Fall and Spring

TT 685 Master's Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

Prerequisite: Master's student
Typically offered in Fall only

TT 690 Master's Examination (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall and Spring

TT 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TT 695 Master's Thesis Research (1-9 credit hours)
Thesis Research

Prerequisite: Master's student
Typically offered in Spring only

TT 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TT 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

Prerequisite: Master's student
Typically offered in Spring only

TT 896 Summer Dissert Res (1 credit hours)

Textile Technology Management (TTM)

TTM 106 Yarn Formation, Classification and Numbering Systems (1 credit hours)
The course addresses techniques available for manufacturing staple and filament yarns, classification of yarn types, and processes involved in manufacturing staple and filament yarns. The course covers hands-on calculations and measurements of yarn numbering systems including direct and indirect systems.

Prerequisite: TT 105; Corequisite: MA 131 or MA 141 (Calculus I)
Typically offered in Fall and Spring

TTM 501 Textile Enterprise Integration (3 credit hours)
Discussion of philosophy, strategy and technology of enterprise integration for textile manufacturing. Survey of enabling technologies such as computer-aided design; computer-aided manufacturing; material handling systems; information systems for control, supervision and planning; and internet resources.

Prerequisite: Graduate standing, Background in textile manufacturing.
Typically offered in Fall only

TTM 510 Apparel Technology Management (3 credit hours)
Role of the apparel complex in manufacturing and supplying products on demand to meet the quality and performance of the global customer. The critical juxtaposition of the textile supply together with retail demand studied to understand constraintson manufacturing capacities and elasticities.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall only

TTM 515 Apparel Production (3 credit hours)
Concepts and practices for the production of apparel items, beginning with development of basic fit blocks and extending through the reation of stylized garments using pattern engineering techniques, supported by computerized pattern development.

Typically offered in Fall only

TTM 517 Advanced Computer-Aided-Design for Fashion (3 credit hours)
Exploration of industry design software for apparel and other sewn products. U4ia visual design software, 3D to 2D pattern generation software, Gerber Accumark or Lectra pattern design programs, Adobe Illustrator and Photoshop, and other programs used by the industry to create, market and/or visualize products will be taught. Peripheral equipment essential to the design and visualization process will be included.

Typically offered in Spring only

TTM 530/TT 530 Textile Quality and Process Control (3 credit hours)
Quality control and improvement methods for textile processes and products including quality systems, statistical control chart procedures, process capabilities, acceptance sampling plans, textiles process and product designs, on-line and off-line control systems and specific quality factors governing textile products and processes and their variabilities.

Prerequisite: TT 420, Corequisite: ST 511 or ST 515
Typically offered in Spring only

TTM 533/TE 533/TT 533 Lean Six Sigma Quality (3 credit hours)
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

Prerequisite: ST 361 and ST 371, or equivalent
Typically offered in Spring only

TTM 535/TT 535 Research Methods and Management (3 credit hours)
This course provides students with an understanding and appreciation of the basic principles of research methods when using qualitative, quantitative or a mixed methods approach. This course will provide guidance to students in conducting their thesis project and cover all aspects of a thesis project, including but not limited to the first three chapters, defining the problem, conducting and writing the literature review, use of theories and a conceptual framework, data collection and analyses, ethical considerations and IRB approval, and the Electronic Thesis Dissertation requirements. Students will be assigned additional readings and learning activities that will expand the understanding of the research process. This course is geared to students who have narrowed down their research topic in collaboration with their committee chair.

Restriction: TTM Students, FPS Students, or a Master's of Science in Textiles, Textile Engineering, or Textile Chemistry. Graduate standing or permission of instructor.
Typically offered in Spring only

TTM 545 Weft and Warp Knit Engineering and Structural Design (3 credit hours)
This class is for both designers, engineers, and technicians for garment applications and machine technologies, to design and create a wide range of products using non-traditional materials and techniques, with the options of knitting in both two and three dimensions. Applications can be but are not limited to sports, medicine, Industrial, electronic and entertainment, transportation, interior design, and furniture.

Typically offered in Fall only

TTM 561 Strategic Technology Management in the Textile Complex (3 credit hours)
Management approaches and strategies for forecasting, planning, creating, and implementing technology changes in textile industry complex undergoing rapid market place and global competitive changes.

Prerequisite: Graduate standing or PBS status
Typically offered in Spring only

TTM 573 Management of Textile Product Development (3 credit hours)
The course focuses on an integrated approach to new product design, development and marketing of textile products. This integrated approach includes a) innovation strategy and opportunity identification, b) the design process for textile products, c) market launch, and d) managing innovation. The course include diverse textile end-uses, including apparel, home textiles, transportation textiles, and medical textiles. Trends in textile product development are reviewed. The dynamics of business analysis and strategy, design prototypes, and product analysis and recommendation are analyzed.

Prerequisite: Graduate standing
Typically offered in Spring only

TTM 579 Textile Design Collection Studio (6 credit hours)
Execution of creative projects addressing textile design problems through synthesis of background research and investigation, and knowledge from previous courses; preparation of work for portfolio, juried exhibition and participation in industry based competitions. Professional textile design practices including advanced portfolio development concepts and presentation, development of textile collections for specified end uses with emphasis on ideation, refinement and design development, and visual communication. FTD-TD ABM and TATM graduate students only.

Prerequisite: FTD 374, FTD 475, FTD 476
Typically offered in Spring only

TTM 580 Consumer Perspectives in Fashion (3 credit hours)
Introduction of concepts and theories related to consumer behavior. Analysis of apparel and textile consumers and their decision making processes as well as internal and external influencing factors. Application of consumer behavior models to investigate consumer behaviors pertaining to textile and apparel products through individualized research projects.

Typically offered in Fall only

TTM 581 Global Textile and Apparel Business Dynamics (3 credit hours)
An overview of the economic, competitive, tchnological and market dynamics of the international textile and apparel industries. Trends in demand, output and trade are reviewed. The dynamic forces shaping and transforming the industry internationally are analyzed. Patterns of change at the global, regional, national and company level are explained and the outlook for the industries is considered.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall and Summer

TTM 582 Global Textile Brand Management and Marketing (3 credit hours)
The course provides an understanding of the global textile brand management and marketing environments, global markets, and marketing programs and organizations. Specific topics include a) the economic, social, political/legal, and cultural environments; b) global textile market opportunities and challenges; c) global textile and apparel marketing strategies, and d) creation and management of global textile and apparel marketing programs. Credit will not be allowed for both TAM 482 and TAM 582. Graduate standing.

Typically offered in Fall only

TTM 583 Strategic Planning for Textile Firms (3 credit hours)
Elements of competitive strategy and planning methods within the textile complex with emphasis on the concepts of strategy in a mature industry, defining business in a global industry, resource allocation through strategic planning methods and implementing strategy in a single business and multi-business firms.

Prerequisite: Graduate standing
Typically offered in Fall only

TTM 587 Advanced Fashion Collection Studio (6 credit hours)
Graduate level fashion product design. Design and production of a "collection" using various methods of generating patterns for garments, such as flat pattern, draping CAD design techniques. Relationship of body configuration and fabrication to garment design. Emphasis on ideation, creativity, communication, fit quality and exhibition of a fashion collection. Work culminates in a fashion show or static exhibition. Restricted to TATM majors.

P: FTM 315,317, and 318 or FTD215, 216, and 321
Typically offered in Fall and Spring

TTM 588 Global Perspectives in Textiles Supply Chain Management (3 credit hours)
Study and analysis of global textile supply chains. Field trips to textile related companies and organizations are required. Students will conduct a research project on global supply chain issues. Course taught off campus for non US global perspectives. Students may not take this course more than once for the same global perspective.

TTM 591 Special Studies in Textile Technology Management (1-4 credit hours)
Special Studies in Textile and Apparel, Technology and Management to fulfill needs not covered by current offerings. Student and faculty required to submit topics to be covered to director of graduate programs within first week of semester.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TTM 601 Seminar (1 credit hours)
Discussion of scientific articles of interest to the textile industry; review and discussion of student papers and research problems.

Typically offered in Fall and Spring

TTM 630 Independent Study in Textile Technology Management (1-3 credit hours)
Problems of specific interest in textile and apparel technology. Preparation of report, in a format suitable for publication required. One-page outline signed by advisor must be submitted within first week of semester.

Typically offered in Fall, Spring, and Summer

TTM 632 Special Studies in Textile Product Development (1-6 credit hours)
Preq: Graduate standing or PBS student. This course is an Independent Study in Textile Product Development to fulfill needs not covered by current course offerings. Student and faculty are required to submit the topic to be covered to the graduate administrator within the first week of the semester. Either a paper or a presentation of a body of work will be the outcome of this effort.

Prerequisite: Graduate standing or PBS status
Typically offered in Fall, Spring, and Summer

TTM 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall and Spring

TTM 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TTM 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TTM 710 Textile Technology Management (3 credit hours)
The course will discuss economic and technical aspects of managing technology in the textile complex. It will explain how technological change can be planned and thus managed, and it will address the required framework for forecasting, planning, creating, and implementing technological change. Cases of technological change in the textile complex will be discussed.

Requirement: 18TTMPHD
Typically offered in Fall only

TTM 731 Decision Models and Applications in Textile and Apparel Management (3 credit hours)
This course provides students with an overview of data decision models used in the textile and apparel industry, along with skills to apply them in real-world decision processes. Published academic papers and case studies will augment the teaching and learning in international trade, supply chains, manufacturing processes, quality, marketing, retail and distribution.

Restriction: TTM PhD
Typically offered in Spring only

TTM 750/FPS 750 Advances in Fabric Formation, Structure, and Properties (3 credit hours)
The course covers different aspects of the processing of yarns to products (braided, knitted, woven, and their composites) and the interrelation between the production mechanics and structure, geometry and properties of fiber assembly. Topics in the field are assigned and each student is expected to thoroughly study the topics and write critical papers based on structured assignments and specific questions. Conduct projects from concept to fabric formation, analyses, and evaluation.

Prerequisite: TT 550 or TT 551 (or TT 451) or equivalent
Typically offered in Spring only

TTM 761 Supply Chain Management and Information Technology (3 credit hours)
Working knowledge of management concepts and information technologies to design and manage supply chain operations in textile complex. Deals with markets and operations distributed geographically and institutionally.

R: Graduate Students Only
Typically offered in Spring only

TTM 785 Doctoral Research Methods (3 credit hours)
The course in research methods examines contributions to knowledge among the interdisciplinary streams of inquiry that inform global management in textiles and apparel. The course requires active discourse among students regarding: philosophy of science, dominant research paradigms, assumptions of quantitative and qualitative research methods, application of qualitative and quantitative research methods to areas including but not limited to: product development, technology management, supply chain management, textile economics & trade, marketing strategy and consumer behavior. Students are expected to develop particular understanding of the methods commonly applied in their area of interest.

Requirement: 18TTMPHD
Typically offered in Fall only

TTM 791 Advanced Special Studies in Textile Technology Management (1-4 credit hours)
Advanced Special Studies in Textile Technology Management to fulfill needs not covered by current offerings. Students and faculty are required to submit topics to be covered to the graduate administrator before the start of semester.

Prerequisite: Doctoral Student
Typically offered in Fall, Spring, and Summer

TTM 801 Seminar (1 credit hours)
Typically offered in Fall and Spring

TTM 830 Independent Study (1-3 credit hours)
Typically offered in Fall and Spring

TTM 876 Special Project TTM (1-3 credit hours)
Typically offered in Fall only

TTM 885 Doctoral Supervised Teaching (1-3 credit hours)
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student
Typically offered in Fall only

TTM 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

TTM 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

TTM 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

TTM 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

TTM 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall and Spring

Textiles (T)

T 101 Strategies for Success in the Wilson College of Textiles (1 credit hours)
Introduction to topics related to the Wilson College of Textiles, all textile curricula, advising, academic skills, high impact activities, diversity, career preparation, campus resources and key Wilson College personnel. Students will not receive credit for both USC 301 and T 101.

Typically offered in Fall and Spring

T 102 Introduction to Product Evolution (2 credit hours)
Students explore the new product development (NPD) process through analysis of case studies of how textile products are designed and developed for a variety of sectors of our economy, including automotive, medical, industrial, furniture, and clothing. Students develop critical thinking skills as they read a variety of texts and respond using several forms of writing techniques.

Typically offered in Fall and Spring

T 104 Fabric of Success and Career Readiness (1 credit hours)
This course will provide students with the knowledge and resources needed to effectively identify, plan, and achieve their career interests and goals. Participants will develop the career-readiness skills that employers seek in new hires, thus allowing them to be better prepared for and successful in their future internship and job searches.

Restriction: Wilson College of Textiles Students with 30+ hours completed at NC State or have junior status
Typically offered in Fall and Spring

T 200 Introduction to Textiles (3 credit hours)
Survey of textiles including technical and economic history of the industry; physical and chemical processes involved in producing textile products from raw materials; unique aesthetic, physical and chemical properties of textiles and how these properties are determined by raw materials and production processes; and influence of properties of textile materials on their utilization and performance. Not open to students required to take TT 105; open to transfer students

Typically offered in Fall, Spring, and Summer

T 491 Honors Seminar in Textiles (1 credit hours)
A seminar on current university and industrial research in the field of textiles.

Prerequisite: By invitation into Honors Program in Textiles
Typically offered in Spring only

T 493 Internship in Textiles (1-3 credit hours)
Students enrolled in T 493 will complete a professional internship experience in a supervised textiles-related role. Students must acquire their own internship prior to enrolling in the course.

R: Textiles Students Only, Departmental Approval Required
Typically offered in Fall, Spring, and Summer

T 495 International Collaboration in Textiles Research (1-6 credit hours)
Directed undergraduate research in Textiles and/or Apparel related areas that requires collaboration with students at an institution abroad. The research project is structured as an international team project in an applied field that allows students in different countries to work together using various communication tools. Students shall arrange international contacts and provide a written proposal of the project to the undergraduate administrator or course coordinator prior to registration. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: GPA of 2.75 or better and JR standing
Typically offered in Fall, Spring, and Summer

T 497 Independent Research in Textile Engineering, Chemistry and Materials Science I (1-3 credit hours)
Independent research in Textile Engineering, Chemistry and Materials Science topics through experimental, theoretical and literature studies. Written and oral reports required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in TECS; 2.8 GPA
Typically offered in Fall and Spring

T 498 Independent Research in Textile Engineering, Chemistry and Materials Science II (1-3 credit hours)
Independent research in Textile Engineering, Chemistry and Materials Science topics through experimental, theoretical and literature studies. Written and oral reports required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: T 497
Typically offered in Spring only

Theatre (THE)

THE 103 Introduction to the Theater (3 credit hours)
Artistic, technical, historical, and literary areas of theater, including acting, directing, design, stagecraft, lighting, costuming, makeup, and criticism.

GEP Visual and Performing Arts
Typically offered in Fall and Spring

THE 203 Theory and Practice of Acting (3 credit hours)
Basic contemporary theories on acting, with practical application through classroom exercises. Role analysis, adaptation of voice and body to performance demands, and role development through various rehearsal activities.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

THE 223 Stagecraft (3 credit hours)
Fundamentals of scenery design, set construction, and related technical activities. Practical applications with use of design media and shop facilities. Required production participation in University Theater presentations.

Typically offered in Fall only

THE 293 Theater Practicum (1-6 credit hours)
Practical experience in one or more of the various areas of artistic and technical theater through active participation in Thompson Theater's play production program.

Typically offered in Fall, Spring, and Summer

THE 303 Stage Directing (3 credit hours)
Basic theory of directing and its application to theatrical production. Play reading, evaluation, casting procedure, staff organization, and rehearsal planning and practices. Laboratory productions of short plays.

Typically offered in Spring only

THE 334 Advanced Acting (3 credit hours)
Advanced methods in role preparation through exercises in concentration, imagination, sensory and emotional recall, and other Stanislavskian techniques. Analyses and critiques of plays and in-class performances.

Prerequisite: THE 203 or demonstrated competence in acting
Typically offered in Spring only

THE 340 African American Theatre (3 credit hours)
This course examines African American dramaturgy and its impact on American theatre. We will study plays from the early period, 1847-1938, and from the recent period, 1935-present. This course will investigate the thematic structure of each section of plays including family life, social protest, and religion. The course will also help students to better understand the social milieu that shaped the content of each play. THE 103 Intro to Theatre recommended prior to course.

GEP U.S. Diversity
Typically offered in Fall and Spring

THE 353 Fundamentals of Theatre Design (3 credit hours)
Fundamentals of Theatre Design provides a framework for the designer's artistic process and practical foundation for scenic, costume, and lighting design for the theatre. Students will learn design terminology, text and performance analysis, design development and presentation, design and production communication and collaboration. Recommended completion of THE 223 Stagecraft. Students may be required to provide their own transportation to and cover the cost of on- or off-campus performance events not to exceed $20.

Typically offered in Spring only

THE 398 Special Topics in University Theatre (1-3 credit hours)
Presentation of material normally not available in regular course offerings, or offerings of a new course on a trial basis.

Typically offered in Fall, Spring, and Summer

THE 433 Period Styles in Acting (3 credit hours)
Interpreting daily lives in earlier eras through reading, discussion, research, and performance. Plays of complex heightened language, in verse and prose, studied from perspective of character's daily lives and their relevance to contemporary performance skills. Scenes, monologues, and soliloquies rehearsed and performed.

Prerequisite: THE 203
Typically offered in Fall and Spring

Toxicology (TOX)

TOX 201 Poisons, People and the Environment (3 credit hours)
TOX 201 serves as an introduction to the fascinating world of chemical poisons and covers their numerous and varied effects on human health and the environment. We will learn how and why poisons have played an important history, how to critically evaluate the chemical risk information reported in the media, in addition to the underlying principles of the basic science of poisons.

GEP Natural Sciences
Typically offered in Fall, Spring, and Summer

TOX 400 Undergraduate Seminar in Toxicology (1 credit hours)
In this seminar course students will be exposed to different presenters each week who will speak on current topics in toxicology, presenting their research on that topic in a broader context. Specific topic areas will vary from semester to semester, but will always be relevant to environmental and molecular toxicology. Students will be expected to write two 1-2 page reflection essays over the course of the semester and participate in a current events in toxicology discussion forum.

Restriction: 17ETM Only
Typically offered in Spring only

TOX 401/TOX 501 Principles of Toxicology (4 credit hours)
Introduce students to the basic principles of toxicology. Will cover the history and scope of the field; absorption, distribution, metabolism and elimination of toxicants; types and mechanisms of toxic action; carcinogenesis; environmental toxicology as well as human and ecological risk assessment.

Prerequisite: CH 220 or CH 221 or CH 225; BIO 181 or ZO 160
Typically offered in Spring only

TOX 415 Environmental Toxicology and Chemistry (4 credit hours)
Environmental toxicology and chemistry including the sources, fate, and effects of chemicals in the environment. Emphasis on contemporary problems in human health and the environment.

Prerequisite: CH 220 or CH 221 or CH 225; BIO 181 or ZO 160 recommended
Typically offered in Fall and Spring

TOX 501/TOX 401 Principles of Toxicology (4 credit hours)
Introduce students to the basic principles of toxicology. Will cover the history and scope of the field; absorption, distribution, metabolism and elimination of toxicants; types and mechanisms of toxic action; carcinogenesis; environmental toxicology as well as human and ecological risk assessment.

Prerequisite: CH 220 or CH 221 or CH 225; BIO 181 or ZO 160
Typically offered in Spring only

TOX 515 Environmental Toxicology (4 credit hours)
Evaluation of the nature, distribution and significance of microchemical contamination. Emphasis on current, relevant problems.

Prerequisite: Two years of biology

TOX 595 Special Topics (1-6 credit hours)

TOX 601 Toxicology Seminar (1 credit hours)
Prerequisite: Graduate standing
Typically offered in Fall and Spring

TOX 620 Special Problems (1-6 credit hours)
Topics include responsibility in science, environmental fate of chemicals, developmental toxicology, lab rotations, journal club and wildlife toxicology.

Prerequisite: Graduate standing
Typically offered in Fall, Spring, and Summer

TOX 660 Free Radicals In Toxicology (1 credit hours)
Introduction to the field of free radicals and their role in toxicology and health; chemical and physical properties of partially reduced oxygen intermediates and the natural biological defense mechanisms.

Prerequisite: BCH 451 and TOX 710
Typically offered in Fall only

TOX 688 Non-Thesis Masters Continuous Registration - Half Time Registration (1 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Prerequisite: Master's student
Typically offered in Spring only

TOX 689 Non-Thesis Master Continuous Registration - Full Time Registration (3 credit hours)
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

Prerequisite: Master's student
Typically offered in Spring only

TOX 690 Master's Exam (1-9 credit hours)
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TOX 693 Master's Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TOX 695 Master's Thesis Research (1-9 credit hours)
Thesis research.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TOX 696 Summer Thesis Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student
Typically offered in Summer only

TOX 699 Master's Thesis Preparation (1-9 credit hours)
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

Prerequisite: Master's student
Typically offered in Fall, Spring, and Summer

TOX 701 Fundamentals of Toxicology (3 credit hours)
The basis of toxic action at cellular and molecular levels covering the absorption, distribution, elimination and metabolism of toxicants; toxic action (acute toxicity, carcinogenesis, mutagenesis, organ toxicity, etc.); chemical classes of toxicants; and toxicity testing.

Prerequisite: BCH 451, Senior standing or Graduate standing
Typically offered in Fall only

TOX 704 Chemical Risk Assessment (1 credit hours)
Concepts and vocabulary of risk assessment. Risk assessment models and techniques used in cancer and non-cancer risk assessment and strategies for successful risk communications. Case studies of risk assessment and issues of current interest. Utilization of background in toxicology and statistics to examine a critical end-point in toxicological science, the quantitative risk assessment.

Prerequisite: TOX 701, a ST course

TOX 710 Molecular and Biochemical Toxicology (3 credit hours)
Fundamental understanding of biochemical, molecular and cellular mechanisms through which xenobiotics alter cellular homeostasis, produce toxicity and alter organ function. Current biochemical, molecular and cellular experimental approaches for study of biochemical mechanisms of toxicity.

Prerequisite: BCH 451; TOX 701
Typically offered in Spring only

TOX 715 Environmental Toxicology (3 credit hours)
Evaluation of fundamental processes relating fate and effects of chemicals in the environment. Emphasis on effects of pollutants on non-human species, environmental risk assessment and historically relevant incidents of environmental contaminants.

Prerequisite: Two years of biology
Typically offered in Fall only

TOX 725/CS 725/HS 725/SSC 725 Pesticide Chemistry (1 credit hours)
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taughtduring the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225)
Typically offered in Spring only

TOX 727/CS 727/HS 727/SSC 727 Pesticide Behavior and Fate In the Environment (2 credit hours)
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

Prerequisite: CS(HS,SSC,TOX) 725,SSC 200
Typically offered in Spring only

TOX 771/CBS 771 Cancer Biology (4 credit hours)
A comprehensive graduate course focusing on the molecular and cellular bases of cancer. Targets of oncogenic mutations will be discussed as well as their impact on cell proliferation, cell survival, and the invasion of normal tissues by tumorigeniccells. State-of-the-art technologies to detect oncogenic mutations and characterize transformed cells will be discussed as well as therapeutic strategies for the rational treatment of cancer.

Prerequisite: CBS 770
Typically offered in Fall only

TOX 795 Special Topics in Toxicology (1-6 credit hours)
Typically offered in Fall and Spring

TOX 801 Toxicology Seminar (1 credit hours)
Prerequisite: Graduate standing
Typically offered in Fall and Spring

TOX 820 Special Problems In Toxicology (1-6 credit hours)
Topics include responsibility in science, environmental fate of chemicals, developmental toxicology, lab rotations, Journal Club, and wildlife toxicology.

Prerequisite: Graduate standing
Typically offered in Fall and Spring

TOX 860 Free Radicals in Toxicology (1 credit hours)
Introduction to the field of free radicals and their role in toxicology and health; chemical and physical properties of partially reduced oxygen intermediates and the natural biological defense mechanisms.

Prerequisite: BCH 451 and TOX 710
Typically offered in Fall only

TOX 890 Doctoral Preliminary Examination (1-9 credit hours)
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

TOX 893 Doctoral Supervised Research (1-9 credit hours)
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

TOX 895 Doctoral Dissertation Research (1-9 credit hours)
Dissertation research.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

TOX 896 Summer Dissertation Research (1 credit hours)
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student
Typically offered in Summer only

TOX 899 Doctoral Dissertation Preparation (1-9 credit hours)
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Prerequisite: Doctoral student
Typically offered in Fall, Spring, and Summer

U.S. Diversity (USD)

USD 295 U.S. Diversity Special Topics (1-3 credit hours)
Special topics course offering for the general education U.S. Diversity category.

GEP U.S. Diversity
Typically offered in Fall and Spring

University Scholars Program (USP)

USP 110 Humanities and Social Sciences Scholars Forum (0 credit hours)
Interdisciplinary seminar series with presentations by distinguished faculty members and experts drawn from technical, academic, business and government communities. Discussions of major public issues and topics of contemporary concern.

Prerequisite: Enrollment limited to participants in the University Scholars Program
Typically offered in Fall only

USP 111 Humanities and Social Sciences Scholars Forum (0 credit hours)
Interdisciplinary seminar series with presentations by distinguished faculty members and experts drawn from technical, academic, business and government communities. Discussions of major public issues and topics of contemporary concern.

Prerequisite: Enrollment limited to participants in the University Scholars Program
Typically offered in Spring only

USP 201 Great Decisions (1 credit hours)
Discussion and investigation of major issues in contemporary American foreign policy selected annually by the Foreign Policy Association through its Great Decisions Program. Must be participants in the University Scholars Program. Must have completed three semesters of the Scholars Forum (USP 110/111). Must have GPA of at least 3.25.

Prerequisite:3 semesters of USP 110/111; R: RS/CS students
Typically offered in Fall and Spring

USP 204 Readings Inspired By the Scholars Forum (1 credit hours)
Seminar course for upper class University Scholars who have completed three semesters of the Scholars Forum, with readings drawn from upcoming Scholars Forum themes.

Prerequisite:3 semesters of USP 110/111; R: RS/CS students
Typically offered in Fall and Spring

University Studies Course (USC)

USC 100 Transition into a Diverse Community (1 credit hours)
USC 100 is required for all Summer Start students. It is designed to assist freshmen in making an effective transition to the rigors of a large diverse research-focused university. The course is designed to provide students with the support and knowledge needed to address the academic and personal challenges as well as other transitional issues. This course will also help students understand how culture shapes identity. Classroom discussions, small group work, completion of StrengthsQuest, and an introduction to technological and other resources are all vital components of this course. Topics include: diversity, cultural awareness, StrengthsQuest, academic adjustment, college success, social adjustment, campus resources, and health.

GEP U.S. Diversity
Typically offered in Summer only

USC 101 Introduction to University Education I (1 credit hours)
Developmental and academic topics to assist students as they make well-informed decisions about majors. Topics include: transition issues between high school and college; community and diversity; major and career decision making; assessment of interests, skills, and values; university resources; overview of university majors and minors as well as policies and procedures. Exploratory Studies students only. Student cannot get credit for both USC 101 and USC 103.

GEP U.S. Diversity
Typically offered in Fall only

USC 102 Introduction to University Education II (1 credit hours)
Continuation of USC 101. Developmental and academic topics to assist students as they make well-informed decisions about majors and careers. Topics include: career readiness, preparation, and exploration; community and diversity; major and career decision making; assessment of interests, skills, and values; university resources; exploration of university majors and minors. Exploratory Studies students only. Credit cannot be received for both USC 102 and USC 104.

Prerequisite: USC 101
Typically offered in Spring only

USC 103 Introduction to University Education for Varsity Student Athletes I (1 credit hours)
Introduction to University Education for Varsity Student Athletes I provides success strategies for first year student athletes at North Carolina State University. The course is designed to assist student-athletes with the skills and knowledge needed to meet the academic and personal challenges of university life and the increased responsibilities of adulthood, with special attention to the unique challenges and opportunities of student-athletes. Topics include: goal setting, time management, study skills, critical thinking, interaction with the faculty, NCAA and NCSU continuing eligibility, academic integrity, nutrition, and diversity.

Typically offered in Fall and Spring

USC 104 Introduction to University Education for Varsity Student-Athletes II (1 credit hours)
Introduction to University Education for Varsity Student-Athletes II will provide student-athletes with the skills necessary to promote informed decision making in choosing an appropriate major and exploring possible careers. Additional areas of career development, academic success, and personal development will also be addressed as they would relate to the day-to-day responsibilities and challenges that student-athletes face, as well as a review of NCAA and NCSU continuing eligibility.

Prerequisite: USC 103
Typically offered in Spring only

USC 107 College Success for the Pre-College Student (1 credit hours)
USC 107 is designed to assist first-generation pre-college students in making an effective transition to post-secondary education. The course is designed to provide pre-college students with the skills and knowledge needed to address the academic and personal challenges that may impact their progress to degree. Classroom discussions, small group work, guided tours, near-peer mentoring, and access to resources are all vital components of this course. Topics will include campus resources, policies, procedures; study skills; and life management concerns such as health, self-esteem, motivation, goal setting, diversity, and communication. Upon completion, students should be able to function effectively within the college environment to meet their educational goals.

Typically offered in Summer only

USC 110 Freshman Advancement Seminar (1 credit hours)
USC 110 provides an opportunity for a diverse student population to explore the question of race and cultural differences in a global society. This course requires that participants actively explore their biases and cultural prejudices for greater enlightenment. This course challenges sources of conventional information such as media outlets, empirical data and prevailing folklore. The course represents an opportunity to have a positive impact on the matriculation and graduation rate of diverse student populations through positive reinforcement, affirmation of cultural heritage and background. Freshman First Year Entering Students Only.

GEP U.S. Diversity
Typically offered in Fall only

USC 111 Strategies for College Success (1 credit hours)
This course is intended for students who need to improve their academic standing, with enrollment priority given to students readmitted on academic probation. Students will acquire policy and resource knowledge, practical skills, and strategies to improve their academic standing at NC State University. Students will address the academic and personal challenges that may have impacted progress towards their chosen degree. Department Consent Required

Typically offered in Fall, Spring, and Summer

USC 116 Introduction to Sustainability for EcoVillage (1 credit hours)
This course serves as an orientation for students participating in the EcoVillage Living-Learning Village and provides an introduction to the topic of "sustainability." Students have the opportunity to network with their fellow Village residents, campus partners, and guest faculty while performing service learning and during class group activities and discussions. Students will assess their personal definitions, connections to, and impacts on sustainability. This course is required for all first-year EcoVillage residents. This course meets the requirements for the Interdisciplinary Perspectives GEP Category.

Restricted to students participating in the EcoVillage Living-Learning Village
GEP Interdisciplinary Perspectives
Typically offered in Fall and Spring

USC 120 SERV- Seminar Education for Military Veterans/Service Members (1 credit hours)
The USC 120 class will help military veteran/service members transition into the academic environment and campus community. Topics include academic success skills, academic culture, campus resources and student services. Military Veterans (Active and Veteran)

Typically offered in Fall and Spring

USC 201 Exploring Majors, Careers, and Identities (2 credit hours)
Selecting a major and career path are critical components of academic success at NC State and beyond. Exploratory Studies focuses on supporting students as they acclimate to campus, learn about themselves, develop skills, and utilize tools to make informed decisions about their major and career paths. This class will focus on the academic transition to college, exploration of majors and careers, understanding the role of diversity in the community, and assist students as they make well-informed decisions about majors. Additional topics include: community and diversity; assessment of interests, skills, and values; available university resources; overview of university majors and minors as well as policies and procedures. Course limited to Exploratory Studies Spring Connection Students.

Students in Exploratory Studies Only
Typically offered in Spring only

USC 202 Career Exploration and Development (2 credit hours)
This course is intended for students who are considering changing their college major and/or are interested in exploring academic major opportunities. Career exploration and development provides students across campus a focused classroom setting to receive career exploration and academic major decision-making assistance. Students will learn about their personal strengths, values, skills, and personality and understand how these self-assessments will affect their major/career decisions. Students will explore the concept of career resiliency while developing professional skills that will be transferable into any college/major.

Typically offered in Fall and Spring

USC 203 Professional Development For Career Ambassadors (2 credit hours)
The course is for Career Ambassadors only. This course will offer learning opportunities that will provide class members with the knowledge, skills and attitude necessary to become effective Career Ambassadors. The top seven career readiness competencies will be explained. Guest speakers, class discussions, group activities, reflections and out of class team building experiences will be utilized to facilitate learning. Restricted to students who are chosen to be Career Ambassadors after the interview process. (Department Approval Required).

Typically offered in Fall and Spring

USC 210 Introduction to College Tutoring (1 credit hours)
All enrolled students must be employed as ASC tutors. The purpose of the course is threefold: to introduce tutors to effective tutoring techniques based on educational research, to help tutors implement a variety of tutoring methods depending on the students' specific needs, and to guide tutors in self-evaluating their individual tutoring progress and goals. Departmental Approval Required. GPA 3.25 or higher.

Prerequisite: Cumulative GPA greater than or equal to 3.25
Typically offered in Fall, Spring, and Summer

USC 220 Leadership and the Resident Mentor (3 credit hours)
Course will provide the student basic concepts of involvement theory, group development theory and community development relevant to residence hall living as a paraprofessional leader on the campus; the basic principles related to leadership with emphasis on how one develops and leads with their values, beliefs and attitudes and develop skills involving active listening, communication, conflict management and mediation techniques; basic program development and presentation skills; teaching pedagogy; and diversity issues. Some out of classroom activities are required. Departmental approval required.

Typically offered in Fall only

USC 223 NSP Student Leader Development (2 credit hours)
For New Student Programs Student Leaders only. Relevant research, student development theory, and shared professional experiences are presented. This course will offer learning opportunities that will provide class members with knowledge, attitude, and skills necessary to become effective NSP Student Leaders. Class discussion, small groups activities, simulations, and writing employed. Individual projects and out-of-class team building experiences are required, including Saturday activities. Departmental Approval Required.

Typically offered in Spring only

USC 225 Leadership Development for University Ambassadors (2 credit hours)
Course provides University Ambassadors with the knowledge, mindset, and skills necessary to effectively represent the University in a variety of settings to a variety of constituents. Course prepares students to emerge as leaders within the Ambassador program and throughout their University experience. Restricted to University Ambassadors only.

Requisite: University Ambassadors Only
Typically offered in Fall and Spring

USC 240 Leadership and Coalition Building in Diverse Communities (3 credit hours)
Exploration of US diversity and effective leadership practices using the National Coalition Building Institute (NCBI) model. NCBI is an international non-profit leadership development network dedicated to elimination of racism and other forms of oppression. Students will be introduced to the NCBI model which involves significant self-discovery, active listening and dialogue, and participate in activities that establish leadership strategies applied in various contexts. Each practical learning tool is grounded in principles that will be explored through group discussions and reflective journaling. Specific skill training will focus on conflict resolution, creating inclusive environments, strategies for effective listening/communication, personal growth and development. This course is intended for undergraduates, sophomores and above.

Prerequisite: Class Level = Sophomore, Junior, or Senior
GEP U.S. Diversity
Typically offered in Fall and Spring

USC 260 Research as a Profession (2 credit hours)
Broadly defined, research is an interconnected and global process that adds new knowledge, creativity, and innovation to any discipline, from the sciences to the arts to the humanities and in between. During the first half of this course, students will build a foundation of knowledge in the research enterprise including inquiry, research methods, and research governance in a cross-cultural, multi-disciplinary context. Through the use of site-specific case studies, students will analyze past discoveries and innovations that have shaped our current world. This analysis will then become the basis for a research project during the study abroad component of the course. Upon their return, students will learn to synthesize their findings, draw conclusions, and present their research in a cross-disciplinary manner, developing strong oral and written communication skills. To enroll, students must be accepted to the associated study abroad program. All majors are encouraged.

GEP Interdisciplinary Perspectives
Typically offered in Spring and Summer

USC 291 Service Learning Program Leader Development I (1 credit hours)
The purpose of the course is to prepare students for their role as Alternative Service Break Team Leaders. The course will incorporate the larger issues of citizenship, social justice, and positive change and will include the logistics, risk-management, and leadership skills needed when leading a service trip. This course will require students to think critically about their role as a leader. Students will participate in a weekend overnight retreat. Transportation for the retreat will be provided by University Van rental. Expenses for the weekend retreat are covered in the ASB administrative charge paid by participants.

Typically offered in Fall only

USC 292 Service Learning Program Leader Development II (2 credit hours)
The purpose of the course is to prepare students for their role as Alternative Service Break Team Leaders. Part II of the Service Learning Program Leader Development will build upon what students learned in Part I and they will be able to put into practice what has been learned with their own teams. Students will travel with their respective teams during spring break to complete the week long service-learning project. Students will be responsible for fundraising for approximately half the cost of their trip. Trip costs vary and depends on location selected.

Prerequisite: AEE 291
Typically offered in Spring only

USC 293 Independent Study (1-3 credit hours)
A course in which students participate in individualized, independent, directed, or guided studies under the supervision of the instructor of the field or discipline. Topic, mode of study, evaluation criteria, and credit hours to be determined in consultation with the supervising faculty and documented. Course may be taken a maximum of three times provided the topic is sufficiently different. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall, Spring, and Summer

USC 298 Special Topics in University Studies (1-6 credit hours)
Special Topics in University Studies at the Undergraduate level for offering of courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

USC 301 Transfer Student Success (1 credit hours)
USC 301 is designed to assist new transfer students in making an effective transition to the rigors of a large research university. The course is designed to provide students with the skills and knowledge needed to address the academic and personal challenges as well as other transitional issues that may impact their progress toward their degree. Classroom discussions, small group work, guided tours, faculty mentors and introduction to resources, services and opportunities are all vital components of this course. Topics include: academic adjustment, social adjustment, campus resources, major and career exploration, policies and procedures, financial aid, and technology. COURSE IS RESTRICTED TO FIRST OR SECOND SEMESTER TRANSFER STUDENTS. Students will not received credit for both USC 301 and ALS 303 or T 101.

Typically offered in Fall and Spring

USC 401 Transitions for the College Graduate (3 credit hours)
Focus on the unique transitions the student will face upon leaving college. Through a variety of formats, students will have the opportunity to explore several aspects of their post-baccalaureate lives and ways in coping with emerging careers, money management, extracurricular retirement, transitional issues, civic engagement, and continuing education opportunities. Explorations of these areas include specific emphasis on developing and refining interviewing skills, professional and personal networks, financial endeavors, and job application and selection.

Typically offered in Fall and Spring

Veterinary Medicine-Companion Animal & Sp Species (VMC)

VMC 900 Advanced Equine Medicine (1 credit hours)
This course will build upon topics covered in VMC 952 Equine Medicine and Surgery. Lectures will cover equine medical problems in more depth than in the previous course. Additional topics will also be included. This course is designed for students who plan to practice equine medicine after graduation.

Typically offered in Spring only

VMC 901 Advanced Small Animal Medicine (2 credit hours)
This course provides more advanced instruction on medical and surgical diseases of dogs and cats. Pathophysiology, diagnostic evaluation and medical and surgical management of diseases in nephrology, urology, oncology, respiratory medicine, infectious diseases, gastroenterology, cardiology and endocrinology are contained within this course. This advanced content of this course is designed to run alongside the content in VMC 951.

Typically offered in Fall only

VMC 902 Small Animal Rounds (1 credit hours)
Course incorporates weekly rounds on actual cases in the NCSU-CVM. Students will practice clinical reasoning, test interpretation and oral and written case presentations in a low stakes, safe environment. Real cases will provide a comprehensive application of the pre-clinical courses. Weekly repetition of these skills will prepare students for clinical practice.

Typically offered in Spring only

VMC 903 Advanced Equine Surgery and Lameness (1 credit hours)
Course will augment areas noted by the syllabus of core equine surgery and lameness presented in VMC952. In the course surgical alternatives, techniques and outcomes will be presented at a level that a student graduating with an equine or mixed focus could describe and discuss treatments with clients or comfortably function in an internship environment

Typically offered in Fall only

VMC 904 Advanced Equine Theriogenology (1 credit hours)
This course provides more advanced instruction in equine Theriogenology (mare and stallion). Diagnostic evaluation and techniques, with expansion on basic core concepts introduced in previous course content are contained within this course.

Typically offered in Fall only

VMC 905 Advanced Topics in Small Animal Dermatology (1 credit hours)
This course will provide broad understanding of small animal dermatology by building upon the basic foundation principles covered in VMC 951. Students will learn to recognize, diagnose and treat both common and uncommon skin diseases of small animals.

Typically offered in Spring only

VMC 906 Equine Field Skills Elective (2 credit hours)
This course will provide practical instruction in commonly used skills and techniques necessary for equine primary care practice. It is an intensive, team taught series of individual laboratories that provide students with experience in the varied skill set required of an equine general practitioner. This course is designed for students that are in the third year of the DVM curriculum, have good horse handling skills and a desire to practice equine veterinary medicine upon graduation. Registration for this course is by instructor permission only.

Typically offered in Spring only

VMC 907 Small Animal Comfort Crew (1 credit hours)
This course is an introduction to patient care in the Terry Center. Students will receive instruction on low stress dog and cat handling, hospital protocols in the general wards, intermediate care unit (IMC) and intensive care unit (ICU), and topics such as the transplant program, management of postoperative patients, and student elected topics based on patients they have cared for. Students will play an active role in improving in hospital patient care through hands on comfort sessions with in patients.

R: DVM Students Only
Typically offered in Fall and Spring

VMC 908 Advanced Small Animal Neurology, Ophthalmology, and Orthopedics (2 credit hours)
This course will provide a more advanced approach to the medical and surgical management of selected metabolic, neoplastic, nutritional, immune mediated, developmental and degenerative diseases and traumatic injury of the ophthalmologic, neurologic, and musculoskeletal systems of small animals. It is a companion course to material given in VMC961. Concurrent enrollment in third year of DVM curriculum.

Typically offered in Spring only

VMC 909 Feline Medicine (1 credit hours)
This course will equip students for success in feline practice or in small animal or mixed practice with a feline component. The course will address the basic behavioral and nutritional needs of cats, and students will learn how the unique physiology of this species affects feline health and feline disease management.

Typically offered in Spring only

VMC 910 Careers in Veterinary Medicine (1 credit hours)
Specialists and invited speakers from multiple areas of veterinary medicine will present information about career opportunities.

Typically offered in Fall only

VMC 914 Group Communication in Veterinary Medicine (1 credit hours)
This course explores how to effectively communicate in small groups in a professional veterinary context. Students will develop verbal and nonverbal communication skills, an understanding of task/process balance, meeting management and facilitation techniques, and communication styles and strategies for dealing with challenging group situations and conflict management. Examples and cases from veterinary medicine will guide application of group communication in context. Course limited to students enrolled in the DVM curriculum.

Typically offered in Fall only

VMC 919 Clinical Behavior and Welfare for Dogs and Cats Elective (1 credit hours)
This is a one-credit course in clinical veterinary behavioral medicine and welfare, with an emphasis on diagnosis and treatment of behavior problems of dogs and cats. The course will build upon the foundation of normal versus abnormal behavior and learning theory of VMC 927. This course will focus on the recognition of common problem behaviors in dogs and cats and how to approach a behavior problem with a systematic Problem Oriented Approach (POVMR). The presentation, proposed etiology and pathogenesis, differential diagnosis, and plan formulation-including diagnostic, treatment, and education plans, will be discussed for common problems. Behavioral medication and complementary products will be included when discussing treatment plans. Additionally, the impact on animal welfare and the human-animal bond will be discussed. Problems to be reviewed include noise aversion, separation anxiety, compulsive disorders, housesoiling, fear and anxiety related problems, problems presenting with aggression, cognitive dysfunction, and some nuisance behaviors.

Prerequisite: VMC 927 or equivalent
Typically offered in Fall only

VMC 921 Special Topics in Zoological Medicine (1-3 credit hours)
This elective course allows students to participate in customized laboratory and field experiences in zoological medicine (avian, aquatic, reptile, amphibian, invertebrate, and mammalian species). This course is designed to be adapted to the needs of students in the DVM program who desire practical experiences in the discipline. Specific details of individual projects are developed by the course coordinator and participating faculty. this elective course can provide partial fulfillment for elective credit for Zoo Focus Area

Prerequisite: 1st, 2nd, or 3rd year DVM student
Typically offered in Fall and Spring

VMC 922 Veterinary Acupuncture in China (2 credit hours)
This elective course is a two week international experience in China that will introduce DVM students to Traditional Chinese Veterinary Medicine (TCVM), including acupuncture, moxibustion, and related therapies. The course will include an overview of TCVM history, terminology, theory, and practical applications using equine (horse or donkey) and canine species. In addition, the course will include elective opportunities to meet and interact with Chinese veterinary students, and opportunities to explore the many cultural options available in China.

Prerequisite: VMB 911 and VMB 921; Corequisite: Current enrollment in the DVM program
Typically offered in Spring only

VMC 923 Research in Zoological Health (1-4 credit hours)
This course provides an opportunity to pursue mentored research projects relevant to zoological health while in the DVM curriculum. Projects may be but are not limited to those related to the zoological focus thesis option.

Restriction: DVM student status. By Instructor Permission only.
Typically offered in Fall and Spring

VMC 924 Equatorial Zoology and Medicine In GalÃ¡pagos (1 credit hours)
This unique opportunity will allow DVM students to experience a unique, equatorial archipelago and much of its natural history offerings. The GalÃ¡pagos Science Center (GSC) will serve as the base of operations. Dr. Gregory Lewbart, who has worked at the facility four separate times, will be the local program leader and guide. He will be assisted by local and visiting scientists. Lectures, laboratory sessions, and field trips will cover a wide variety of zoological and medical topics dealing with native invertebrates, fishes, reptiles, birds, and mammals. There will be an emphasis on aquatic species and a paper is required.

Typically offered in Spring only

VMC 927 Introduction to Companion Animal Behavior (2 credit hours)
This course explores the behavior of companion animals from a veterinary perspective. An emphasis is placed on behavior as an indicator of welfare and health, humane handling of animals, prevention of behavior problems, and treatment of common behavior problems. In addition the nature of human-animal bond and ethical issues relating to human-animal interactions will be discussed. Students will learn how to diagnose and treat common behavior problems on the basis of video-rich case presentations, lecture material, and class discussion. This course is restricted to students enrolled in the DVM Curriculum.

Doctor of Veterinary Medicine Majors Only
Typically offered in Spring only

VMC 928 Topics in Wild Reptile Medicine (1 credit hours)
The NCSU-CVM Turtle Rescue Team treats sick and injured wild reptiles (mostly turtles) belonging to over a dozen different species. First, second, and third year veterinary students taking this course will be responsible for case management, coordinating consultations, diagnostic testing within the hospital, and placing recuperating animals with local wildlife rehabilitators. Students are also required to attend periodic rounds and attend eight lectures about amphibians and/or reptiles, separate from the core and Selective curriculum.

Typically offered in Fall and Spring

VMC 930 Rehabilitation and Mobility Clinical Rotation (2 credit hours)
In this course, students will gain a general understanding of veterinary rehabilitation therapy, including principles and protocols of assessment and treatment, tissue healing, the theory and application of treatment modalities and the common conditions treated.

Requisite: Currently enrolled DVM student
Typically offered in Fall and Spring

VMC 932 Principles of Surgery (3 credit hours)
This course covers the science, art and craft of surgery, as a foundation for clinical applications. The principles you learn will give you a foundation for performing surgery on all species, even though the examples in this course are centered on the dog and cat.

Prerequisite: 2nd year DVM student
Typically offered in Fall only

VMC 933 Theriogenology (2 credit hours)
The physiology, endocrinology, and pathology of the reproductive system are presented. Emphasis includes genital anatomy and function, endocrine interrelationships, and methods for examination of mammary gland and reproductive tract function, including diagnosis and treatment of clinical disorders.

Typically offered in Fall only

VMC 937 Introduction to Physical Examination Skills- Small Animal (1 credit hours)
Introduction to physical examination, laboratory sample collection, and medication administration skills in dogs and cats. Students will also be taught how to understand and use the problem oriented approach for patient management. Students must be enrolled in the Doctor of Veterinary Medicine program. Enrollment in year 2 of Doctor of Veterinary Medicine Program.

Typically offered in Spring only

VMC 938 Advanced Small Animal Primary Care (2 credit hours)
Advanced exposure of clinical year veterinary students to a small animal primary care veterinary practice. There will be several areas of focus to increase efficiency and/or enhancement of pre-existing abilities: clinical skills relevant to a primary care veterinary practitioner; strong problem solving abilities; strong communication skills necessary to interact effectively with clients, colleagues and staff; incorporating and conducting behavioral evaluations of pets during wellness examinations. Enrollment in this course is limited to students in the DVM professional program that have passed VMC 939 (Small Animal Primary Care).

Prerequisite: VMC 939
Typically offered in Spring only

VMC 939 Small Animal Primary Care (2 credit hours)
This rotation is designed to immerse fourth year veterinary students in a primary care small animal veterinary practice experience. There will be several areas of focus: teaching clinical skills relevant to a small animal veterinary practitioner, developing strong communication skills necessary to interact effectively with clients, colleagues and staff, incorporating and strengthening behavioral evaluations of pets during wellness examinations and developing strong problem solving abilities. Enrollment in this course is limited to students in the DVM professional program.

Typically offered in Fall, Spring, and Summer

VMC 940 Clinical Theriogenology (2 credit hours)
This course is designed to instruct veterinary students to make clinical diagnoses and problems of the reproduction system of domestic animals. Instruction is provided on medical and surgical correction of clinical reproductive system problems, such as infertility, obstetrical procedures, assisted reproductive techniques, and traumatic injuries. Must be enrolled in fourth year clinical rotations.

Typically offered in Fall and Spring

VMC 941 Special Topics in Theriogenology (2 credit hours)
The primary objective of this course is to provide additional information and training to veterinary students that have taken the VMP 980 (VMC 940 new course #) clinical theriogenology senior clinical rotation. Emphasis will be directed to acquaint students with modern and current practices of clinical Theriogenology. It is expected that the majority of the information and activities offered in this course will involve equine species (80%) and, to a lesser extent, canine (10%) and bovine species (10%). Requires satisfactory completion of 3rd year of professional program and clinical theriogenology senior rotations.

Typically offered in Fall and Spring

VMC 942 Principles of Medicine (2 credit hours)
This cross-species course provides an introduction to the principles of disease and injury state common to all species. Content in this course is intended to prepare the students for third year DVM medicine and surgery courses.

Typically offered in Spring only

VMC 943 Laboratory Animal and Zoological Species Health and Disease I (1 credit hours)
Principles of applied biology, management, physical examination, and medical techniques, health problems and medical treatment of laboratory and companion fishes, amphibians, and reptiles will be presented. Laboratory sessions will include handling of live animals, examination of necropsy specimens, and case discussions. Students must be enrolled in the Doctor of Veterinary Medicine program.

Typically offered in Spring only

VMC 944 Introduction to Clinical and Professional Communication (1 credit hours)
The ability to communicate with clients is important to successful veterinary practice. The focus of this course is to explore how to effectively communicate with clients in a clinical context. Students will develop verbal and nonverbal communication skills, an understanding of relationship-centered care, management of client interactions, getting informed consent, and communicating complex information. Examples and cases from veterinary medicine will guide application of clinical communication in context.

Typically offered in Spring only

VMC 945 Mobile Veterinary Hospital Shelter Surgery and Medicine (2 credit hours)
This course is designed to offer students additional experience in general small animal soft tissue surgery and shelter medicine. Through partnership with Central North Carolina animal sheltering organizations and utilizing the NC State Mobile Veterinary Hospital, students will primarily gain small animal spay/neuter experience and may also perform additional surgical procedures as needed based on animal patient condition and student abilities. Secondarily, students will also provide medical care for sheltered pets including but not limited to primary wellness care, treatment of sick and injured animals and may perform heartworm testing and treatments as needed. This opportunity will consist of an evolving list of external partners that could additionally include community cat organizations and foster care sheltering networks for any given rotation.

Typically offered in Fall and Spring

VMC 946 Extramural Business Management Experience (2 credit hours)
This course is designed to offer students additional business experience in the veterinary industry. Through partnership with external organizations, students will gain business experience and explore topics such as emerging business, legal, and ethical issues, practice management, human resource management, employment contracts and negotiations, buy and selling veterinary practices, and practice financing. This opportunity will consist of an evolving list of external partners and could include organizations offering practice management consulting, human resource consulting, business consulting, insurance and financing.

Prerequisite: 4th year DVM student
Typically offered in Fall only

VMC 947 Practice Management: Evaluating the workflow, services, and financial performance of a hospital (2 credit hours)
The Practice Management rotation is designed for students interested in obtaining a deeper understanding of how to manage a successful veterinary practice. This experience will give students the opportunity to apply business principles learned in the classroom to real world practices. Students will use assessment tools provided to analyze veterinary practices and provide constructive feedback to practice owners. Students will be expected to interview practice owners and staff, observe practice flow and patient care, and perform an in depth financial analysis. Students will then prepare a written summary and present their findings and appropriate recommendations to the practice owner(s).

Prerequisite: 4th year DVM student
Typically offered in Fall and Spring

VMC 948 Clinical Rotation in Veterinary Radiation Oncology (2 credit hours)
This is an elective rotation during the 4th year of CVM professional studies providing an introduction to veterinary radiation oncology. Basic information about radiation therapy equipment, treatment planning and delivery, and outcome of patients treated for various cancers with radiation therapy will be emphasized. Students will be assigned cases being seen by the radiation oncology service as inpatients, outpatients, and new referral appointments.

Prerequisite: VMB 960
Typically offered in Fall and Spring

VMC 949 Equine Primary Care (4 credit hours)
This 4 week course will provide students with an initial one week of intensive clinical experience in equine primary care and three weeks with a NCSU CVM approved equine primary care practice. Students will be seeing a variety of primary care cases from CVM staff and faculty owned horses, state owned horses, and horses from non-profit organizations during the first week at Southern Pines; including vaccinations, dentistry, lameness, imaging, nasogastric intubation, and field surgery. This course is not an externship and students will have outcome assessments from the instructor as well as the veterinarian at the equine primary care practice. During the final three weeks, students will be exposed to a general equine primary care practice. Students will be expected to examine cases, discuss differentials, provide a treatment plan, perform treatments, and provide client communication. Instructor approval for enrollment required.

Prerequisite: 4th year DVM student
Typically offered in Fall and Spring

VMC 950 Sea Turtle Medicine and Rehabilitation (2 credit hours)
This course provides practical experience in husbandry and disease diagnosis and treatment in rehabilitating sea turtles at the Karen Beasley Sea Turtle Rescue and Rehabilitation Center (KBSRRC) in Topsail Beach, NC. Skills to be acquired in clinical and didactic setting include sea turtle husbandry and rehabilitation techniques, diagnostic sample collection and interpretation, physical examination and safe handling, medication delivery, wound treatment, and necropsy protocols.

Prerequisite: 4th year DVM student
Typically offered in Fall only

VMC 951 Companion Animal Medicine and Surgery I (4 credit hours)
Overview of medical and surgical management of selective metabolic, neoplastic, nutritional, immune-mediated, developmental and degenerative diseases of companion animals.

Typically offered in Fall only

VMC 952 Equine Medicine and Surgery (3 credit hours)
Medical conditions in large domesticated animals are presented in this course. Discussions involve the agents causing diseases and the therapeutic methods used to correct. 3 semester hours.

Typically offered in Fall only

VMC 953 Laboratory Animal and Zoological Species Health and Disease II (3 credit hours)
Principles of applied biology, management, physical examination and medical techniques, health problems and medical treatment of laboratory animals,small companion mammals and zoological species will be presented. Laboratory sessions may include handling of live animals, examination of necropsy specimens, and case discussions. Laboratory Animal and Zoological Species Health and Disease II will focus on avian and mammalian species. Students must be enrolled in the Doctor of Veterinary Medicine program.

Typically offered in Fall only

VMC 954 Companion Animal Medicine for Food Animal Students (2 credit hours)
Small animal medicine clinical rotation emphasizing the disciplined detection, prioritizing and planning for therapy of medical diseases in small companion animals. Development of medical judgment and the use of the problem oriented medical record is stressed. This course is intended for DVM students in the food animal focus area.

Prerequisite: Senior DVM student
Typically offered in Fall and Spring

VMC 955 Extramural Experiences in Lab An Med (2 credit hours)
DVM students will have the opportunity to undertake a two-week rotation in an approved labratory animal facility under the supervision of a labratory animal veterinarian. This opportunity will meet the need to increase "hands-on" experience as partof the focus area requirements or recommendations.

Corequisite: Current enrollment in DVM program.
Typically offered in Fall and Spring

VMC 956 Advanced Clinical and Professional Communication (1 credit hours)
The ability to communicate with clients is important to successful veterinary practice. This course explores how to effectively communicate with clients in a clinical context during problem appointments. Students will develop verbal and nonverbal communication skills and an understanding of how to manage difficult client interactions including 1) communicating about money, 2) communicating during adverse events, and 3) communicating during euthanasia. Examples and cases from veterinary medicine and simulated client interactions will guide application of clinical communication in context.

Prerequisite: 3rd year DVM student
Typically offered in Fall only

VMC 957 Introduction to Clinical Practice (1 credit hours)
This course has 4 components: a surgery laboratory, a clinical skills laboratory, a communication and wellness case-based facilitated session and community-based experiences. Taken together, these experiences are designed to give students practice and confidence in skills related to small animal general practice.

Typically offered in Fall only

VMC 958 Advanced Prosimian Medicine (2 credit hours)
This course is designed to provide senior veterinary students with clinical experience in prosimian medicine. Students will gain practical experience in the diagnosis, treatment, and prevention of disease in captive prosimians maintained in research facilities. Students participate in formal rounds, autodidactic exercises, and case management at the Duke Lemur Center. Limited to 4th Year DVM curriculum students.

Prerequisite: VMC 991, restricted to 4th year DVM students
Typically offered in Fall and Spring

VMC 959 Advanced Primate Medicine (2-4 credit hours)
The delivery of health care and management to captive and free-ranging primates is a component of zoological, wildlife, and laboratory animal medicine. There is a distinct body of information and techniques for the practice and an increasing demand and opportunity for veterinary graduates with this knowledge. Practical application of techniques and methods for diagnosing disease, delivering health care, and devising preventative medical programs in a research primate facility environment will enable students to evaluate their potential role in the field and equip them to evaluate and responsibly deal with medical issues involving primates.

Typically offered in Fall only

VMC 960 Small Animal Emergency Service (2 credit hours)
Assessment, triage, and management of canine and feline patients admitted to the small animal emergency service after hours.

Prerequisite: fourth year clinics student, DVM student
Typically offered in Fall and Spring

VMC 961 Companion Animal Medicine and Surgery II (3 credit hours)
This course is an overview of medical and surgical management of selected metabolic, neoplastic, nutritional, immune-mediated, developmental, and degenerative diseases of companion animals.

Typically offered in Spring only

VMC 963 Extramural Experience in Zoological Medicine (2 credit hours)
This elective senior year rotation allows students to obtain clinical, laboratory, field, and research experiences in zoological medicine that augment the basic rotations in the zoological medicine focus area. Students can customize their training through participation in a variety of opportunities including epidemiology projects, other basic or clinical research projects, and externships involving captive and free-ranging wildlife & zoo species. does not fulfill senior year requirement for elective credit in Zoo Focus Area

Requisite: Currently enrolled DVM student
Typically offered in Fall and Spring

VMC 965 Advanced Principles of Surgery (1 credit hours)
This laboratory includes induction and maintenance of anesthesia in representative companion animal, food animal, and equine species; the practice of surgery on anesthetized animals and cadaver specimens; and experience with diagnostic and therapeutic techniques. Students examine, assess, and provide preoperative, intraoperative, and postoperative management of their patients.

Prerequisite: DVM student, Completion of fall semester, VM3 students
Typically offered in Spring only

VMC 966 Equine Emergency and Critical Care (2 credit hours)
An intensive course in the assessment and management of equine emergencies. This would include evaluation of patients, surgical and medical treatment of in house and emergency critical care patients, and post-operative assessment and management. Students will gain valuable practical experience of critically ill patients and rounds will be held daily to ensure a high level of learning.

Prerequisite: 4th year DVM student, Third year veterinary curriculum
Typically offered in Fall and Spring

VMC 967 Clinical Veterinary Dentistry (2 credit hours)
Will participate in examination, admission, diagnosis treatment, discharge, and follow-up of patients in dentistry service. Take a clinical history, perform a physical examination, develop appropriate diagnostic plan, discuss the plan with the service's clinicians, and participate in formulation of treatment protocol. Service treats patients Monday-Thursday, Friday reserved for overflow, emergencies, research and teaching. Students given prepared lectures on dental procedures and diseases, and will be allowed to perform supervised procedures on cadavers. (No animals euthanized for this purpose.)

Typically offered in Fall and Spring

VMC 968 Equine Orthopedic Surgery and Lameness (2 credit hours)
Application of problem solving skills and the art, science, and practice of equine orthopedic surgery and lameness in the veterinary teaching hospital setting.

Prerequisite: DVM student, Completion of 3rd year veterinary curriculum
Typically offered in Fall and Spring

VMC 971 Comp Animal Med II (4 credit hours)
1. Obtain a thorough history and perform a complete physical examination. 2. Identifying, defining, and prioritizing problems. 3. Developing and initiating rational diagnostic and therapeutic plans. 4. Performing certain diagnostic and therapeuticprocedures. 5. Interpreting results of diagnostic tests, and determining their importance to the patient. 6. Verbal and written communication with clinicians, clients, veterinary techniques, fellow student veterinarians, and referring veterinarians. 7. Determining the point at which it is time to refer a case to a colleague for Â¿another lookÂ¿, or to a referral center for specialized diagnostic testing or treatment. 8. Understanding how cases management in private practice compares with referral practice. 9. Approaching issues regarding euthanasia; your decision-making, assisting the owner.

Typically offered in Fall and Spring

VMC 972 Clinical Small Animal Veterinary Cardiology (2 credit hours)
Two-week clinical rotation to provide senior veterinary student training in diagnostic and therapeutic aspects of veterinary small animal cardiology. Clinical experience with patients and clents of Veterinary Teaching Hospital and topic and case review rounds.

Prerequisite: 4th yr. standing in the veterinary curriculum at the CVM, Successful completion of 3rd yr. of Veterinary Curriculum
Typically offered in Fall and Spring

VMC 973 Small Animal Surgery (2 credit hours)
Clinical rotation on the small animal surgery services. Students will be assigned to one of two services, general surgery or orthopedic surgery. Students see cases and assist with care of small animal surgical patients. Students will be on-call to assist with emergency surgery cases.

Prerequisite: Completion of third year veterinary curriculum
Typically offered in Fall, Spring, and Summer

VMC 974 Equine Dentistry and Podiatry (2 credit hours)
This course will provide practical instruction in commonly used skills and techniques necessary for equine dentistry and equine podiatry. It is an intensive, team taught series of didactic lectures, individual laboratories, and clinical case experiences with practitioners that provide students with a high level of experience in equine dentistry and equine podiatry. This course is designed for students in the fourth year of the DVM curriculum, with good horse handling skills and a desire to practice equine veterinary medicine upon graduation. This course is strongly recommended for students with an equine focus or mixed animal focus with an equine concentration. Students must have basic equine handling experience and/or have taken the Equine Behavior Selective. Equine, mixed animal, food animal, and exotics focus students will be given preference.

Typically offered in Fall and Spring

VMC 975 Equine General Surgery (2 credit hours)
Application of problem solving skills and the art, science, and practice of equine general surgery in the veterinary teaching hospital setting.

Prerequisite: DVM student, Completion of 3rd year veterinary curriculum
Typically offered in Fall and Spring

VMC 976 Veterinary Critical Care (2 credit hours)
Assessment and management of companion animal emergency and critical care patients, including several 'hands on' laboratories using cadavers to learn and practice emergency and critical care techniques. Principles of emergency and critical patient evaluation, stabilization, and organ system support are the focus of the course. Out-rotations at area emergency clinics are required. Open only to 4th year students in the small animal focus area.

Prerequisite: 4th year DVM student
Typically offered in Spring only

VMC 978 Equine Lameness and Imaging (2 credit hours)
Development and use of problem solving skills and techniques for diagnosis, treatment, and management of lameness in horses.

Prerequisite: DVM student, Completion of the third year of the veterinary curriculum
Typically offered in Spring only

VMC 979 Equine Medicine (2 credit hours)
Students are responsible for all aspects of patient care and are expected to be dedicated to their patients. Frequent and careful observation of the patients, attention to detail, diligent record keeping, accuracy in formulating and carrying out a treatment plan, and use of common sense are expected. The earlier you note potential problems, the earlier and easier they can be resolved. Irresponsibility, carelessness, lack of accuracy, untruthfulness, or a poor attitude will not be tolerated.

Typically offered in Fall and Spring

VMC 980 Vet Clini Oncology (2 credit hours)
This is a two-week, two credit elective rotation during the 4th year of CVM professional studies providing experience in the diagnosis and treatment of cancer in animals. Emphasis is on development of comprehensive cancer management strategies including ethical considerations, diagnostic techniques, treatment options, and client communication skills. Students will be assigned cases being seen by the oncology service as inpatients, outpatients, and new referral appointments.

Typically offered in Fall and Spring

VMC 981 Lab Animal Medicin (2 credit hours)
The block will provide practical experience in the diagnosis, treatment and prevention of diseases of laboratory animals. It will include special study of diseases of laboratory animals and the management of laboratory animal facilities. Opportunity to perform surgical procedures on common laboratory animals will be provided in a series of surgical labs. There will be field trips to other laboratory animal resource facilities within the Research Triangle Park and surrounding areas. The student will present a seminar on a selected topic for critical appraisal by students and faculty.

Typically offered in Fall and Spring

VMC 982 Ophthalmology (2 credit hours)
The purpose of the ophthalmology course is to acquaint the student with examinations, diagnostics and therapeutic practices, and principles of clinical veterinary medicine. There will be direct supervision by faculty and house officers. Attendanceis required at weekly clinical rounds, general medicine rounds, and the patient rounds and mini-seminars conducted within the service. Irregular and/or long hours may be required. Students will be expected to be neatly dressed, well groomed, and conduct themselves in a professional manner at all times.

VMC 983 Dermatology (2 credit hours)
Dermatological disease will represent a significant proportion of your case load, particularly in companion animal practice. Most of the patients that you will see have chronic relapsing disease that can be frustrating, and often costly for the owner. Therefore, whilst an accurate diagnosis represents the first step in dealing with a case, the challenge in this field of medicine is to successfully manage cases in the long term. This requires good and open communication with the client as well as regular patient evaluation. Most of the diagnostic techniques employed in dermatology are very simple and do not require expensive equipment or excessive amounts of time. The key to successful dermatological practice is to use these tools appropriately to recognize conditions such as parasitic infestations and bacterial or yeast infections for which there is a specific course of treatment. It specializes in the diagnosis and management of chronic ear disease and immunological dermatoses such as autoimmune skin diseases, food reactions and atopic dermatitis. The good practitioner however, recognizes that cutaneous manifestations may be a reflection of internal disease and a thorough systemic evaluation is also required. When studying the skin there is one big advantage, it is on the outside.

Typically offered in Fall and Spring

VMC 984 Intro Clin Neuro (2 credit hours)
This service provides diagnosis and management of nervous system disorders in animals, including nuclear imaging, myelography, CT scans, electromyography, neurosurgery, and postoperative patient rehabilitation including hydrotherapy and treadmill training. Attendance is required at weekly clinical rounds, general medicine rounds, and the patient rounds and mini-seminars conducted within the service. Irregular and/or long hours may be required. Students will be expected to be neatly dressed, well groomed, and conduct themselves in a professional manner at all times.

Typically offered in Fall and Spring

VMC 986 Adv Com An Int Med (2 credit hours)
This course provides a higher level experience to diagnosis and management of companion animals with complex medical problems. Students may choose to concentrate on particular aspects of internal medicine. Students are not required to participate in emergency/intensive care unit duty.

Typically offered in Fall and Spring

VMC 987 Aquatic Medicine (2 credit hours)
This course is designed as an elective clinical block rotation in field services, in the final year of the professional DVM curriculum. Students electing the course would have successfully completed the two theoretical/laboratory courses in specialspecies medicine providing the foundation for participation in this course. It is the only clinical course offering hands on experience with medical care delivery to aquatic species.

Typically offered in Fall only

VMC 988 Exotic Animal Medicine (2 credit hours)
This clinical rotation provides practical experience in the diagnosis, treatment and prevention of disease in privately owned small mammals, birds, reptiles, fish, and amphibians. In addition to assisting with the management of clinical cases, students will participate in daily teaching rounds, laboratory activities to increase their technical proficiency, and field visits to various exotic animal collections in NC. Presentation of a short seminar on a clinically relevant topic is required. Irregular and/or long hours, including on-call duty for after-hours emergencies, may be required.

Typically offered in Fall and Spring

VMC 989 Zoological Medicine (4 credit hours)
This course is designed to introduce the senior veterinary students to clinical zoological medicine. Students will gain practical experience in the diagnosis, treatment, and prevention of disease in captive zoological specimens maintained in zoos.Students participate in formal rounds, autodidactic exercises, and case management at the N.C. Zoological Park.

Prerequisite: VMC 964 or successful completion of 3 Zoological Medicine Focus Selectives; and Course Coordinator's Permission
Typically offered in Fall and Spring

VMC 991 SP Top in DOCS (1 credit hours)
One week special topic course in the Department of Clinical Sciences

Corequisite: Current enrollment in DVM program

VMC 992 SP Top in DOCS (1-4 credit hours)
Two week special topic course in the Department of Clinicial Sciences.

VMC 993 Equine Special Topics (2 credit hours)
This course is offered to students that have already signed up to take any two of the following courses: Preventative Health Care, Equine Medicine, Equine Surgery, or Equine Theriogenology. The course is designed to give additional experience in equine-oriented clinical services at NCSU. Students will not be able to participate in this block off campus, unless working directly with a NCSU faculty member. A faculty mentor must be identified within one month of signing up for this course and awritten proposal of activities planned submitted to Dr. Gardner.

Typically offered in Fall and Spring

VMC 994 Small Animal 4th Year Extramural Studies (1-6 credit hours)
This course is a recommended rotation designed to expand opportunities for senior veterinary students to participate in small animal private practice a) enhance and learn clinical and technical skills, b) develop effectice client communication skills and time management, and c) observe elements of small business management, including personnel involved and professional financial interactions with private clients. Students will work at a private or corporate veterinary practice under the directsupervision of a licensed veterinarian engaged in small animal practice. Must be senior student in the DVM program.

Typically offered in Fall and Spring

VMC 995 Clinical Conference (1 credit hours)
This weekly seminar course will incorporate a range of topics relevant to success in the clinical year and beyond, including preparation for the NAVLE exam, integration of themes and topics presented elsewhere in the DVM curriculum, job search strategies, employment contracts, financial literacy and loan repayment, critical reflection, and others. The course calendar is based on relevant topics to members of the senior class as they pass through the academic year. Topics will be addressed in an interactive and discussion-based manner and will be selected with input from the student body.

Restriction: Active DVM student in year 4 of the curriculum (successful completion of years 1-3)
Typically offered in Fall, Spring, and Summer

VMC 996 Advanced Exotic Animal Medicine (2 credit hours)
Students will work with client-owned exotic animals in the CVM hospital and our in-house teaching animal colonies to further refine skills in exotic animal handling, diagnostic sample collection for multiple species, and anesthesia and radiology acquisition and interpretation of multiple exotic animal species. Cadavers will be used to teach orthopedic and soft tissue surgical procedures in birds, reptiles, and mammals. Students and faculty will spend 1-5 days in the field, travel restrictions permitting, working with psittacine birds, waterfowl, and potentially raptors at several local parrot rescue organizations and wildlife facilities. Restricted to senior DVM students only that have already completed VMC 988.

P: VMC 988
Typically offered in Fall and Spring

VMC 997 Raptor Medicine and Rehabilitation (2 credit hours)
This elective senior year rotation allows students to obtain clinical experience in raptor medicine and rehabilitation at Carolina Raptor Center in Charlotte, N.C. Students will develop skills with species identification, capture and handling, physical examination, bandaging, diagnostic sample collection and interpretation, emergency stabilization and treatment techniques, necropsy, anesthesia and surgery assistance, and captive management and husbandry issues. A maximum of 2 students will be permitted in each 2-week clinical rotation. For students enrolled in DVM Curriculum. Will partially fulfill senior year requirement for elective clinical rotation credit in Zoo Focus Area.

Typically offered in Fall and Spring

VMC 998 Basic Wildlife Rehabilitation Medicine (2 credit hours)
Wildlife rehabilitation medicine, the delivery of health care and management to free-ranging native wildlife with the goal of re-release is an important component of clinical veterinary medicine. Students in this basic course will work with instructors to learn to apply practical medical and surgical techniques and methods for diagnosing disease, delivering health care, and implementing appropriate triage for injured and ill North Carolina native wildlife. Restricted to DVM Curriculum 4th year students.

Prerequisite: VMC 964 or successful completion of 3 Zoological Medicine Focus Selectives, VMC 989, and Course Coordinator's Permission
Typically offered in Fall and Spring

VMC 999 Advanced Wildlife Rehabilitation Medicine (2 credit hours)
Wildlife rehabilitation medicine, the delivery of health care and management to free-ranging native wildlife with the goal of re-release is an important component of clinical veterinary medicine. Students in this advanced course will apply practical medical and surgical techniques and methods learned in the basic course for diagnosing disease, delivering health care, and implementing appropriate triage for injured and ill North Carolina native wildlife. They will assist staff and faculty in managing cases native to North Carolina.

Prerequisite: VMC 964 or VMC 998
Typically offered in Fall and Spring

Veterinary Science - VMB (VMB)

VMB 900 Veterinary Pain: Physiology and Clinical Problem Solving (1 credit hours)
Course will review the neuroanatomy and physiology of pain with emphasis on veterinary species. The course will also cover clinical treatment options and ethical discussions.

Typically offered in Fall only

VMB 901 Molecular Medicine (1 credit hours)
This elective is designed for all DVM students to augment their training in clinical and basic sciences. Modern medicine is making increasing use of molecular approaches for advancing diagnostic and prognostic modalities, and for developing more effective therapeutic strategies for cancer, metabolic disorders and infectious diseases. This class will outline the concepts underlying current and emerging technologies in molecular medicine, and investigate their utility in a clinical setting. The goal is to equip students with a basic understanding of the appropriate and effective use of molecular strategies, whether directly for patient care, or within academic, industry or government research.

Typically offered in Spring only

VMB 909 Case Based Radiographic Interpretation (1 credit hours)
Using an entirely case based approach, disorders that are commonly diagnosed radiographically in both small and large animals will be discussed. The emphasis will be on radiographic interpretation. Important concepts in radiographic interpretation and how imaging can affect patient management will be discussed.

Typically offered in Spring only

VMB 911 Veterinary Anatomy I (5 credit hours)
Gross anatomy of the dog and cat. Neuroanatomy of the dog and cat. Dissection of embalmed (dog/cat) cadavers, study of prosections, slides, models, and imaging modalities.

P: Admission to professional veterinary program
Typically offered in Fall only

VMB 912 Introduction to Clinical Problem Solving in Veterinary Practice (2 credit hours)
A combination of lectures and in-class activities will be used to explore the clinical reasoning process and steps used in "working up" a veterinary clinical case. Specific topics include: patient signalment, chief complaint, history, physical exam, problem list, differential diagnosis. Also covered: introductory clinical skills, medical records (SOAP). Course limited to students enrolled in the DVM curriculum.

Typically offered in Fall only

VMB 913 Veterinary Physiology and Microanatomy I (5 credit hours)
First course in a two course series on veterinary physiology and microanatomy. Emphasis will be on structure and function which will provide a foundation upcoming courses (e.g. pharmacology, pathology, medicine).

P: Admission to professional veterinary program
Typically offered in Fall only

VMB 914 Histology and Cytology (2 credit hours)
This course focuses on the study of cells, basic tissues, and selected organs of domestic animals. The primary emphasis is on the molecular and structural basis for cell function, tissue organization, and organ systems.

P: Admission to professional veterinary program
Typically offered in Fall only

VMB 920 Small Group Problem Solving in Veterinary Medicine (1 credit hours)
Students will work in small groups with a faculty facilitator to examine case scenarios, and apply the problem-solving process discussed in VMB 912 to a variety of clinical and research problems. This course will provide a venue for integration of content presented in other courses, as well as application of small-group communication skills. Course limited to students enrolled in the DVM curriculum.

Typically offered in Spring only

VMB 921 Veterinary Comparative Anatomy (4 credit hours)
Gross anatomy of domestic ungulates (horse, ox, goat, pig). Involves dissection of embalmed specimens and study of prosections, models, and radiographs.

Typically offered in Spring only

VMB 923 Veterinary Physiology and Microanatomy II (4 credit hours)
A continuation course in veterinary physiology and microanatomy. Emphasis will be on structure and function which will provide a foundation upcoming courses (e.g. pharmacology, pathology, medicine).

Typically offered in Spring only

VMB 930 Anesthesiology (2 credit hours)
Anesthetic principles, agents, and techniques of multiple species.

Typically offered in Fall only

VMB 931 Veterinary Ethics and Animal Welfare (2 credit hours)
This course will explore the major ethical issues confronting the practices of veterinary medicine, biomedical science, and animal welfare. Students will become familiar with legal and institutional positions, consider and debate opposing arguments on the various topics, and examine relevant case studies. Provides the basic leadership and operational training necessary to become a Credentialed responder for the State of North Carolina. Limited to DVM students or by permission of instructor.

Typically offered in Fall only

VMB 932 Veterinary Medical Decision Making (1 credit hours)
A combination of lectures and Moodle activities will be used to explore the medical decision-making process in veterinary medicine and error prevention strategies. Main course themes are errors in: knowledge acquisition, data gathering, data processing and metacognition. Discussion of generation, refinement and testing of diagnostic hypotheses. Course limited to students enrolled in the DVM curriculum.

Typically offered in Fall only

VMB 933 Veterinary Pharmacology I (3 credit hours)
This course focuses on the action of drugs in animals and basic principles of drug disposition and pharmacokinetics. The course will provide presentations on the principles of pharmacology of medications used in animals. Principles of autonomic pharmacology will form a foundation that is important to other drug groups. Important drug groups discussed during the course will be sympathetic and parasympathetic agonists and antagonists, anesthetic, sedative, and tranquilizer drugs. We will then cover medications used to treat conditions of the brain and behavior, hemostatic, endocrine, and respiratory systems. The material you learn in this semester will be building blocks for additional systems therapeutics in the Spring semester (VMB 943). This course will consist of recorded lecture material, case presentations, in-class activities/discussions, individual and group assignments, and presentations by guest lecturers.

Typically offered in Fall only

VMB 936 Introduction to Radiology (1 credit hours)
This course describes and explains the principles of physics of diagnostic radiology and ultrasound, and the basics of image interpretation. Principles of thoracic radiography and radiographic anatomy will be covered. Radiographic interpretation of the cardiovascular system, lungs and airways and pleural space are discussed and related to physiology of the different organ systems. Principles of abdominal radiography and radiographic anatomy will be covered as well and the concepts of peritoneal detail, abdominal mass effect and intestinal ileus will be introduced.

Typically offered in Fall only

VMB 943 Veterinary Pharmacology II (3 credit hours)
A course in veterinary pharmacology with emphasis on the pharmacology of drugs affecting various body systems including digestive, endocrine, ocular, respiratory, central nervous, cardiovascular, or musculoskeletal. Drugs that produce analgesic and anti-inflammatory properties also are included.

Typically offered in Spring only

VMB 944 Veterinary Toxicology and Poisonous Plants (2 credit hours)
Toxicological basis and pathological features of diseases of animals and birds caused by common toxic chemicals and plants with emphasis on clinical manifestations, diagnosis, prevention, and treatment.

Typically offered in Spring only

VMB 952 Specialized Problem Solving in Veterinary Medicine (1 credit hours)
Specialized Problem-Solving is the fourth in a series of courses focusing on Clinical Reasoning and Problem Solving. In this class, you will build upon the skills developed in earlier courses, and work to diagnose, treat and trouble-shoot more complex cases. These cases may have external constraints that will limit your ability to order diagnostic tests, and/or may require identification and correction of medical errors. You will work in unsupervised teams, and then present the results of your decision-making processes to a facilitator for discussion, review and critique. Course limited to students enrolled in the DVM curriculum.

Typically offered in Fall only

VMB 960 Veterinary Radiology and Radiobiology (2 credit hours)
Fundamentals of radiographic diagnosis. The VMB 960 course is focused on the diagnostic imaging appearance of small and large animal thoracic, abdominal, musculoskeletal and neurologic disease. The main imaging modality that will be covered is diagnostic radiology and some diagnostic ultrasound but Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) will be introduced as well. The principles of image interpretation will be revisited and the imaging appearance of important and common diseases will be presented and discussed. Case examples will be shown and students may be asked to provide case interpretation in class.

Typically offered in Spring only

VMB 961 Success in the Clinics and Beyond (1 credit hours)
This course provides an opportunity for students to integrate and synthesize professional skills in preparation for clinical rotations and veterinary practice. An introduction to the current VH electronic medical record system will be provided. Students will apply their knowledge of clinical communication, teamwork, clinical reasoning, and ethics to a variety of case scenarios.

Typically offered in Spring only

VMB 962 Clinician Scientist Research Experience (1-10 credit hours)
This course is designed to give students an opportunity to take part in resaerch int he laboratory of their chosen mentor(s), resulting in a greater understanding of the research process. Students will be specifically required to complete at least three 2-week blocks, and to have at least two of these blocks scheduled consecutively (i.e., a 1-month time period in the laboratory). This course is restricted to students enrolled in the Clinician Scientist Focus Area of the DVM curriculum and requires approval by the student's CSFA mentor.

Prerequisite: All freshman-junior DVM courses allowing the student to enroll in senior DVM courses.
Typically offered in Fall and Spring

VMB 965 Veterinary Nutritional Health (2 credit hours)
The role of nutrition in veterinary medicine. Development, diagnosis and prevention of nutritional problems in a variety of species will be discussed, frequently employing a comparative approach.

Typically offered in Spring only

VMB 976 Radiology Rotation (2 credit hours)
This rotation will provide practical training in the production of quality radiographic examinations and will help develop interpretation skills in diagnostic radiology. Students are expected to be familiar with material covered in the junior radiology course (VMB 960) as it will be incorporated into this rotation. Review of the auto-tutorial teaching cases, located in the "Star Wars" room. The radiology rotation is oriented toward teaching and service. Learning experiences result from a combination of direct contact with the faculty, residents, technicians, and classmates. You will make diagnostic quality radiographs, participate in morning rounds and review didactic material, VMB 960 teaching files and ask questions.

VMB 977 Clinical Anesthesia Rotation (2 credit hours)
Students engage in the daily clinical service responsibilities of the CVM-VTH Anesthesia Section in the role of anesthetists assigned to the care of client-owned animals. The objective of this clinical course is to enable each student to achieve their maximum potential as neophyte anesthetists having limited experience. Student activities are supervised and conducted by CVM faculty anesthesiologists, and VTH staff anesthesia technicians. Supporting activities related to delivering clinical service include attending clinical rounds and case discussions, and oral presentation of a critical review of a recently published research paper relevant to anesthesia and it's supporting basic sciences.

Typically offered in Fall and Spring

VMB 978 Clinical Behavior & Nutrition (2 credit hours)
This 4th year clinical rotation will provide interested students with the opportunity to gain experience in both behavior and nutrition. During the week spent at the Animal Behavior Service, students will participate in the diagnosis and treatment of behavior problems in companion animals. During the week spent at the Nutrition Service, students will develop and initiate Nutrition Support plans for hospitalized and health companion animals. Relevant nutrition support skills will be practiced. This course is restricted to students in the DVM curriculum.

Prerequisite: VMC 927 or equivalent, DVM Curriculum Student Status
Typically offered in Fall and Spring

VMB 991 SP Top in MBS (1-2 credit hours)
One week special topic course in the Department of Molecular Biomedical Sciences.

VMB 992 SP Top in MBS (2 credit hours)
Two week special topic course in the Department of Molecular Biomedical Sciences.

Veterinary Science - VMP (VMP)

VMP 162/PO 162 Livestock and Poultry Disease Management (3 credit hours)
Basic principles of disease and disease management in livestock and poultry. Disease prevention through sanitation and vaccination. Diseases of horses, pigs, ruminants, poultry, and disease prevention programs for each species

Requisite: Agricultural Institute Only

VMP 401 Poultry Diseases (4 credit hours)
Concepts of factors contributing to or causing disease, disease cycle, host responses, and general approaches to prevention and control including management and biosecurity methods, immunization, and medication. Recognition, diagnosis, prevention, control, and treatment of economically significant infectious and noninfectious diseases affecting poultry.

Typically offered in Spring only

VMP 420 Disease of Farm Animals (3 credit hours)
Pathology of bacterial, viral, parasitic, nutritional, thermal and mechanical disease processes for farm animals. This emphasis practices for prevention and control of each disease.

Prerequisite: Junior standing.
Typically offered in Spring only

VMP 900 Global Health Research Project (5 credit hours)
This international elective (Global Health Research Project) will allow students to develop an understanding of methodological approaches and techniques used in global health research, including qualitative field work, quantitative surveys, experimental designs, intervention trials, and program evaluation. This elective will highlight the importance of understanding and addressing global health through multidisciplinary frameworks and collaborations. This elective is a required component of the Certificate in Global Health. Course Coordinator Permission required.

Typically offered in Summer only

VMP 901 Small Ruminant Medicine (1 credit hours)
This is course will present the key principles involved with management, reproduction and diseases of sheep, goats and camelids. This will include basic information such as recommended nutrition programs to more advanced material such as diagnostic, therapeutic and prophylactic measures necessary to correct, reduce or prevent common diseases. Course restricted to 3rd year veterinary students, unless special permission is granted by course coordinator.

Typically offered in Fall only

VMP 904 Swine Industry (1 credit hours)
This course will provide veterinary students with expertise to approach a clinical swine problem and also to understand and analyze different parameters from a swine production. Students will evaluate clinical signs, analyze and understand production records, understand regulations and economic analysis. Students will also learn how to set up clinical trials, to interpret serological and virological results, to perform necropsy and to understand swine reproductive management. Cap Max: 6 students

Restriction: Third Year DVM Students
Typically offered in Spring only

VMP 906 Bovine Assisted Reproduction Techniques (1 credit hours)
Students will gain hands-on experience with bovine rectal palpation, rectal ultrasonography, artificial insemination, embryo flushing, and in vitro fertilization. The course will provide didactic instruction on assisted reproduction techniques followed by lab time to practice discussed topics. Students will be required to travel to lab locations. This course won't embrace first-year students.

Typically offered in Fall and Spring

VMP 907 Cancer Pathogenesis and Diagnosis (1 credit hours)
This course will enable the student to describe the steps that lead from a normal cell to a fully malignant neoplasm, understand underlying molecular mechanisms, and correlate these mechanisms to relevant treatment options. Students will be able to classify different tumor types and deduce the impact of the neoplasm on the host and host responses. Students will also learn to assess clinical samples to make a relevant clinical diagnosis of tumor type and predicted behavior.

Prerequisite: 3rd year DVM student
Typically offered in Spring only

VMP 908 Advanced Ruminant Medicine and Surgery (2 credit hours)
This elective course will be a weekly lecture and lab that covers routine ruminant surgical procedures and advanced medicine techniques to supplement VMP 962 Ruminant Medicine and Surgery.

Typically offered in Spring only

VMP 909 Veterinary International Elective Experience (1-2 credit hours)
This course will provide students with practical experience in a foreign country working on a veterinary medicine related project being conducted in that country. Projects may focus on production medicine, occupational, zoological medicine, or basic research.Travel restricted to sites not included on the State Department alert/warning list. See http://travel.state.gov/content/passports/english/alertswarnings.html for details.

Corequisite: Current enrollment in DVM program
Typically offered in Fall and Summer

VMP 910 Infection and Immunity 1 (3 credit hours)
This course is intended to familiarize the student with the pathogenic bacteria and fungi of veterinary importance. The student will learn the properties and cultivation of these microorganisms and receive a general introduction to the diseases they can cause. Primary emphasis will be placed on how the biology of the pathogen influences disease pathogenesis, and microbiological identification of infectious agents. The laboratory exercises will complement the lectures and focus on standard procedures for microbial cultivation and identification.

Prerequisite:Admission to the DVM Curriculum
Typically offered in Fall only

VMP 916 Health Maintenance and Animal Production I (1 credit hours)
This course is part I of a series with VMP 936 and 956 designed to introduce students to procedures for health maintenance and care of horses and food-producing animals. Students learn how to prevent diseases and promote animal health in laboratories.

Typically offered in Fall and Spring

VMP 920 Infection and Immunity 2 (4 credit hours)
This course is intended to continue the topics introduced in Infection and Immunity 1. Specific bacterial, fungal and viral pathogens will be covered including pathogenesis and strategies used to control infection and/or development of disease. The course will also cover more advanced topics in immunology including the types of hypersensitivities, autoimmunity, immunity in the newborn and fetus, immune deficiencies and vaccination.

Prerequisite:Admission to the DVM Curriculum
Typically offered in Spring only

VMP 921 Problem Solving for Cases in Infectious Diseases and Immunity 1 (2 credit hours)
This course is intended to challenge first-year veterinary students to reach a diagnosis of realistic cases involving either infectious diseases or immune pathology. The first part of the course is an introduction to diagnostic laboratory procedures. The second portion of the course requires the students to develop a list of differential causes to assigned clinical cases, choose a presumptive diagnosis based on available data and ordering of diagnostic tests to confirm the presumptive diagnosis. The individual cases are discussed in a small group format with a faculty facilitator.

Prerequisite:Admission to the DVM Curriculum
Typically offered in Spring only

VMP 930 Infection and Immunity 3 (3 credit hours)
Infection and Immunity 3, VMP93X, is designed to serve as a continuation of Infection and Immunity 1 & 2 (first-year curriculum) for the second-year veterinary student. This course is designed to reinforce principles if infectious disease and immunity introduced in the first year of the DVM curriculum and expand upon specific groups of parasites. This course will cover the diagnosis, treatment and control of major endo and ecto parasites of domesticated animals.

Prerequisite:Admission to the DVM Curriculum
Typically offered in Fall only

VMP 931 Veterinary Pathology I (3 credit hours)
Introduction to the basic pathologic changes which occur in animal tissues. Developmental processes and resulting morphology observed at gross, cellular, and subcellular level emphasized.

Typically offered in Fall only

VMP 934 Problem Solving for Cases in Infectious Diseases & Immunity 2 (2 credit hours)
This course is intended to challenge first-year veterinary students to reach a diagnosis of realistic cases involving either infectious diseases or immune pathology. The first part of the course is an introduction to diagnostic laboratory procedures. The second portion of the course requires the students to develop a list of differential causes to assigned clinical cases, choose a presumptive diagnosis based on available data and ordering of diagnostic tests to confirm the presumptive diagnosis. The individual cases are discussed in a small group format with a faculty facilitator.

Prerequisite:Admission to the DVM Curriculum
Typically offered in Fall only

VMP 936 Health Maintenance and Animal Production II (1 credit hours)
This course is part II of a series with VMP 916 and 956 designed to introduce students to procedures for health maintenance and care of horses and food-producing animals. Students learn how to care for animals, prevent diseases, and milk cows in laboratories.

Prerequisite: VMP 916
Typically offered in Fall and Spring

VMP 941 Veterinary Pathology II (4 credit hours)
Systemic Pathology - A study of specific responses of organ systems to pathogenic influences in animals with emphasis on the effects on the body as a whole.

Typically offered in Spring only

VMP 942 Veterinary Clinical Pathology (3 credit hours)
Introduction to the mechanisms which produce abnormal physiologic parameters within the animal during illness, with emphasis on the techniques for determining those abnormalities in the living animal.

Typically offered in Spring only

VMP 945 Epidemiology & Public Health (3 credit hours)
The focus of this course is to construct a foundation for clinical medicine by acquiring a holistic view of disease, exploring optimal preventive medicine strategies while developing a critical thinking skills and quantitative reasoning techniques. The teaching/learning format of the course will include lecture, in-class exercises, discussions and case studies.

Prerequisite: VMP 912, DVM student
Typically offered in Spring only

VMP 956 Health Maintenance and Animal Production III (1 credit hours)
This course is part III of a series designed to instruct students in procedures for maintaining the health and well-being of horses and food-producing animals. Students learn how to prevent diseases and promote animal production, including production of safe meat and milk.

Typically offered in Fall only

VMP 962 Ruminant Medicine (3 credit hours)
The principles of medical disorders of ruminants are presented. This includes the cause of the disorders and the diagnostic, therapeutic and prophylactic measures necessary to correct, reduce or prevent these problems.

Typically offered in Spring only

VMP 964 Swine and Poultry Medicine (2 credit hours)
Lecture series supplemented with projected illustration on the most economically important diseases of poultry and swine. Emphasis is placed on definition of diseases, etiology, characteristics of the disease, and diagnosis. The economics related to occurrence, prevention, treatment, and control are presented.

Typically offered in Spring only

VMP 970 Ruminant Health Management I (2 credit hours)
This is a two-week block considering health management of ruminant species. During the two-week period, students accompany faculty on visits to farms to deliver health management programs, to investigate health problems, or to consider approaches to enhance productivity. A portion of the course also involves experience in providing individual animal health management and addressing medical/surgical disorders. Available to senior veterinary students.

Prerequisite: VMP 956 or VMP 974 or consent of the instructor
Typically offered in Fall and Spring

VMP 971 Food Animal Diagnostics for Disease Diagnosis, Control, and Population Surveilla (2 credit hours)
This course intended to instruct food animal veterinary students in: 1) underlying principles of veterinary diagnostic assays, 2) proper collection of samples, 3) effective testing approaches for diagnosis and management of disease, 4) strategies for efficient monitering of food animal population for infection by specific agent(s), and 5) analysis of data from veterinary diagnostic laboratory tests and optimal use of the results for making production management decisions. Priority given to students in Food Animal Focus area. Students in Mixed Animal Focus Area or special-case Epidemiology Focus Area students can enroll (if space remains) with the approval of Course Coordinator if they meet the criteria states in the above requisites.

Prerequisite: Prior undergraduate coursework, summer work experiences, and/or consistent enrollment and good performance in food animal selectives.
Typically offered in Fall only

VMP 972 Ruminant Health Management II (2 credit hours)
Senior veterinary students will experience advanced training in ruminant clinical medicine.

Prerequisite: VMF 970
Typically offered in Fall and Spring

VMP 973 Special Topics in Epidemiology (2 credit hours)
The main goal of this course is to provide senior veterinary students with the opportunity for pursuing a focused research topic in the area of veterinary epidemiology and population medicine under the direction of consenting faculty. The exact direction and scope of the topic is agreed upon between the instructor, the student and the course coordinator. The course is offered only by the permission of the participating instructor(s) and the course coordinator. The instructor and the student will work out the type of project, what exact objectives are to be met and how the success of obtaining those objectives will be evaluated. The objectives and methods of evaluation of performance will be negotiated between the veterinary student and the instructor and put into writing in the form of a Plan of Action PRIOR to course permission being granted by the course coordinator.

Typically offered in Fall and Spring

VMP 974 Food Supply Veterinary Medicine (2 credit hours)
This 2-week course provides exposure to the clinical principles of food supply veterinary medicine. It is primarily intended for individuals who are not in the NCSU-CVM Food Animal Focus Area. Ruminant, swine and poultry faculty provide an overview of the animal industries and production practices, as well as exposure to basic veterinary knowledge and clinical skills. Prerequisites may include consent of instructor.

Prerequisite: Completion of first 3 years of veterinary curriculum; consent of instructor for any enrollment >8.
Typically offered in Fall only

VMP 975 Advanced Topics in Veterinary Anatomic Pathology (1-6 credit hours)
This is a two-week senior veterinary clinical rotation that provides students with additional, focused experience in veterinary anatomic pathology. Students have the option of rotating through necropsy service and surgical biopsy service for two weeks to gain additional experience in pathology similar to VMP 977, the prerequisite for this course. Students have the option of designing a specialized pathology experience with the guidance of an approved pathology faculty member. Enrollment requires pre-approval by faculty assigned to the course.

Prerequisite: VMP 977
Typically offered in Fall and Spring

VMP 976 Food Animal Pharmacology (2 credit hours)
This course will outline the basic principles of pharmacology and therapy of the major diseases of ruminants, swine and poultry. Students will be expected to develop a thorough understanding of how properly to use drugs in food animal species and should be able to develop a treatment program for most major livestock diseases. The course will be restricted to students in the food animal and mixed animal focus areas.

Prerequisite: VMB 943; VMP 962; VMP 964
Typically offered in Fall only

VMP 977 Autopsy/ Clinical Pharmacology (2 credit hours)
Two clinical disciplines are completed during this clinical block - Autopsy Pathology and Clinical Pharmacology. The autopsy clinical rotation provides exposure to pathology techniques, observation skills and medical reasoning used to obtain and interpret autopsy and laboratory dat in order to develop diagnoses, understand disease processes and address clinical and/or farm problems. The clinical pharmacology portion of the rotation will expose the students to current veterinary clinical pharmacology and therapeutics.

Typically offered in Fall and Spring

VMP 978 Clinical Pathology and Laboratory Medicine (2 credit hours)
This course provides veterinary students with a practical case-based approach to learning all majors aspects of veterinary clinical pathology and laboratory medicine (parasitology, immunology, bacteriology) in a clinical setting. It is restricted to students enrolled in the fourth year of the DVM curriculum.

Typically offered in Fall and Spring

VMP 979 Epidemiology (2 credit hours)
The main goal is to provide senior veterinary students with the opportunity for pursuing a focused research topic in the area of veterinary epidemiology and population medicine under the direction of consenting faculty. The exact direction and scopeof the topic is agreed upon between the instructor, the student and the course coordinator. This course is offered only by the permission of the participating instructor(s) and the course coordinator. The instructor and the student will work out thetype of project, what exact objectives are to be met and how the success of obtaining those objectives will be evaluated. The objectives and methods of evaluation of performance will be negotiated between the veterinary student and the instructor and put into writing in the form of a Plan of Action PRIOR to course permission being granted by the course coordinator. No one textbook is required for this course.

Typically offered in Fall and Spring

VMP 982 Poultry Health Management I (2 credit hours)
Poultry Health Management I is a clinical rotation elective for 4 th year veterinary students with an interest in poultry health management or food animal production. This two-week course is offered 4 times each year. Diseases of turkeys and chickens will be discussed. Basic concepts in poultry disease diagnosis, prevention and treatment will be emphasized. The course will consist of lectures, laboratory and field experiences.

Typically offered in Fall only

VMP 983 Poultry Health Management II (2 credit hours)
Poultry Health Management II is a clinical rotation elective for 4 th year veterinary students with a commitment to pursue a career in poultry health management or food animal production. This two-week course is offered throughout the year and may be repeated with permission of the instructor. The course will consist of laboratory and/or field experiences designed to meet the student's career goals. A list of available externships in poultry health management, which may be applicable for this course can be found on the Association of Avian Pathologists web site: http://www.aaap.info/index.html, under Educational Opportunities, Senior Veterinary Student Externships approved by the Kenneth Eskelund Preceptorship Committee. Funds to help pay for travel expenses may be available through the Kenneth Eskelund Preceptorship, see information at the web site listed above.

Typically offered in Fall and Spring

VMP 984 Swine Health Management I (2 credit hours)
This course will provide senior veterinary students with techniques and expertise to approach a clinical swine problem. Students will evaluate clinical signs, analyze production records, assess facilities and management, institute a diagnostic plan and establish an economically feasible solution to the clinical problem. The outline for this course may vary slightly from year to year but the following topics will be covered: Necropsy procedures/sample techniques; Interpreting serologic/ virologicresults; Farm visits - review building/equipment designs; Practical swine reproductive management; Practical bacteriology; Practical swine nutrition/rations; Swine record systems/Pig Champ.

Typically offered in Fall only

VMP 985 Swine Medicine & Production II (2 credit hours)
This course will provide senior veterinary students with the opportunity to utilize the techniques and expertise gained in VMF 984. Students will evaluate clinical and production problems on a variety of swine farms. Practicum/field work and independent study will be conducted on commercial swine farms, usually with a veterinary practitioner or faculty member.

Typically offered in Fall and Spring

VMP 986 One Health: From Philosophy to Practice (2 credit hours)
Graduate/professional seminar (with team project) addressing intersections of veterinary medicine, human medicine, and environmental health. Co-listed at UNC CH Gillings School of Global Public Health and Duke University School of Medicine. Includes participants from these three institutions, plus related private-sector members, non-governmental organizations, and governmental professionals. Its purpose is to facilitate understanding of one health as a system of systems, and promote cross-campus and cross-discipline interactions. Weekly evening course held at NC Biotechnology Center, RTP. Limit: 15 students per university. Requires current graduate standing at NCSU or professional student standing within the College of Veterinary Medicine.

Typically offered in Fall only

VMP 987 Ruminant Topics (2 credit hours)
This two-week elective allows goal-directed educational enrichment in Ruminant Practice under the direction of consenting faculty. Formats include clinical experiences, clinical and applied investigations, etc. Topics and times are arranged by the student and consenting faculty. Available to 3 rd and 4 the year veterinary students only upon consent of faculty. VMF 970 may be a required prerequisite.

Typically offered in Fall and Spring

VMP 988 Advanced Topics in Clinical Pathology (2 credit hours)
The goal of the Advanced Topics in Clinical Pathology is to gain further experience in clinical pathology beyond the required prerequisite laboratory medicine rotation VMP978. This senior clinical rotation is designed around the interests and career goals of the student. The focused activities in this rotation are intended to enhance the student's abilities and knowledge within the field of Clinical Pathology. Examples of activities include but are not limited to: 1) self-directed practice in the examination and interpretation of cytology and hematology slides using teaching slides sets; 2) practice describing and interpreting hematology and cytology slides from current clinical cases; 3) interpretation and discussion of complex clinical chemistry cases; 4) development of short research projects; 5) training in flow cytometry and interpretation; and 6) development of educational materials on a topic in clinical pathology.

Prerequisite: VMP 978 (Clinical Pathology, Laboratory Medicine and Nutrition) is a prerequisite course although under special circumstances instructor could permit to take prior to VMP 978 based on student background. Instructor permission is required.
Typically offered in Fall and Spring

VMP 989 Animal Welfare Judging and Assessment (1 credit hours)
This course will provide veterinary and graduate students with practical skills for animal welfare assessment and evaluations using scientific evidence through peer-reviewed literature. Students will learn general criteria and a scientific approach to assess welfare across multiple species and settings. This course is open to students enrolled in the veterinary professional program. In addition, graduate students wishing to compete in the Intercollegiate Animal Welfare Judging Contest may be enrolled in the course based on instructor discretion. Participation in the Intercollegiate Animal Welfare Judging Contest is not a requirement for this course.

Prerequisites: VMP 916F and VMC 927. VMC 927 may be waived with instructor permission
Typically offered in Fall only

VMP 990 Extramural Experiences - Large Animal (2 credit hours)
Senior DVM students will have the opportunity to undertake an elective rotation in an approved practice externship in a large animal practice a) food animal/rural or b) equine/mixed animal. The practice opportunity will meet the need recognized by students, CVM faculty and private practice colleagues alike to increase "hands on" experience in a private practice setting. Private practice experiences are available for year 1 - 3 students through the selective offerings. Presently, senior studentshave the opportunity to experience private practice by arranging an externship as an elective. However, initiating an elective course will ensure consistency between experiences, with clear expectations to achieve an approved level of learning/skills objectives with verification from the practice. Practitioners will be valuable partners in the education process in the senior year, providing access to individual animal and herd-related clinical diversity that is increasingly difficult to offer in the academic setting.

Typically offered in Fall and Spring

VMP 991 SP Top in PHP (1 credit hours)
One week special topic course in the Department of Population Health & Pathobiology Department.

VMP 992 SP Top in PHP (1-2 credit hours)
One week special topic course in the Department of Population Health & Pathobiology Department.

VMP 993 Extramural in Epidemiology, Public Health, and Public Policy (2-6 credit hours)
This course is designed to expand opportunities for senior veterinary students to participate in a 2 week practicum in epidemiology, public health, or public policy under mentorship of experienced State, Federal, or private organization professionals. Students select their area or topic of interest and consult with the Focus Area Leader and submit a short proposal for review. Students work under supervision of an approved professional. Focus Area students may repeat the 2 week experience 3 times for a total of 6 weeks.

Typically offered in Fall and Spring

VMP 994 Extramural Experience in Pathology (1-4 credit hours)
This is a two-week externship experience in pathology. The student will arrange an extramural experience in an academic, diagnostic, government, industrial, or zoological/wildlife labratory setting under the supervision of a board certified veterinary anatomical or clinical pathologist. Fourth year DVM students only.

Typically offered in Fall and Spring

VMP 996 Ruminant Medicine and Surgery Clinical Rotation (1 credit hours)
This is a two-week block focused on medicine and surgery of the ruminant species. During the two-week period, students will stay at the veterinary school, working with the clinicians and house officers on outpatient and inpatient appointments. This two-week block will involve in-clinic experience, focusing on individual animal health management and addressing medical/surgical disorders. Available to senior veterinary students.

Typically offered in Fall, Spring, and Summer

VMP 998 Introduction to Farm Management for Veterinarians (2 credit hours)
This course is an introduction to different aspects of modern beef and dairy farm management. A combination of classroom instruction and practical application, the course will provide future veterinarians with knowledge and skills needed to help producers make informed animal health, production and financial decisions. NCSU CVM Teaching Animal Unit, NCSU Dairy Education Unit, and NCSU Beef Education Unit farms will be used as models for observation and evaluation.

Typically offered in Fall and Spring

VMP 999 Extramural in Vet International Programs (2 credit hours)
This course will provide students with practical experience in a foreign country working on a veterinary medicine related project being conducted in that country. Projects may focus on production medicine, occupational safety, zoological medicine, or basic research.

Typically offered in Fall and Spring

Visual and Performing Arts (VPGE)

VPGE 295 Visual and Performing Arts Special Topics (3 credit hours)
Special topics course offering for the general education Visual and Performing Arts category.

GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

Visual and Performing Arts and Glob Know (VPGK)

VPGK 295 Visual and Performing Arts and Global Knowledge Spec Topics (3 credit hours)
Special topics course offering for the general education Visual and Performing Arts and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Visual and Performing Arts (VPA) requirement.

GEP Global Knowledge, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

Visual and Performing Arts and U.S. Div (VPUS)

VPUS 295 Visual and Performing Arts and U.S. Diversity Special Topics (3 credit hours)
Special topics course offering for the general education Visual and Performing Arts and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Visual and Performing Arts (VPA) requirement.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Fall, Spring, and Summer

Women's, Gender and Sexuality Studies (WGS)

WGS 200 Introduction to Women's, Gender, and Sexuality Studies (3 credit hours)
Introduction to Women's, Gender, and Sexuality studies as an interdisciplinary field spanning the humanities, social sciences and natural sciences. Study of historical perspectives and contemporary understanding of women and gender. Theory, systematic analysis, and experiential accounts used to explore complexities of gender, and other identity determinants, mechanisms of power and privilege, and avenues for social change.

GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

WGS 204/SOC 204 Sociology of Family (3 credit hours)
Contemporary American family structures and processes and their development. Focus on socialization, mate selection, marital adjustment and dissolution. Includes core sociological concepts, methods, theories.

GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 210/STS 210 Women and Gender in Science and Technology (3 credit hours)
Interdisciplinary introduction to the reciprocal relationships between scientific/technological research and contemporary understanding of gender. Special emphasis on social factors influencing scientists and engineers in their professions.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall, Spring, and Summer

WGS 215 Abolitionist Futures (3 credit hours)
An interdisciplinary review of domination, oppression, and exploitation in the U.S., this course will introduce feminist theories, abolitionist histories and strategies, and critiques of colonization and capitalism. Abolitionist Futures will use a critical queer lens to generate new possibilities and paradigms for imagining a future beyond policing and incarceration, exploring alternatives such as transformative justice and mutual aid.

GEP Interdisciplinary Perspectives, GEP U.S. Diversity
Typically offered in Fall only

WGS 220 Men and Masculinity (3 credit hours)
An introduction to the study of men and masculinity as an interdisciplinary field spanning the humanities and social sciences. This course will draw on both historical perspectives and contemporary understanding of men and masculinity, with attention to key domains of men's lives such as the roles of men in fiction and film, race and masculinity, religion and masculinity, fatherhood, masculinity and sports, and male sexuality.

GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 293 Special Topics in Women's, Gender, and Sexuality Studies (3 credit hours)
Examination of varying topics on women and/or gender from an interdisciplinary perspective at an introductory level.

Typically offered in Fall and Spring

WGS 300 Introduction to Feminist Theories (3 credit hours)
This course provides an overview of primarily US and western feminist theoretical perspectives by focusing on the variety of viewpoints within feminism and their specific historical roots. More than half of the course is devoted to studying specific themes and issues in women's history. The historical background lays the foundation for examining specific feminist theories, including liberal feminism, difference feminism and black feminism/womanism. The course prepares students for further work in Women's and Gender Studies, including WGS 492.

Prerequisite: WGS 200
Typically offered in Fall only

WGS 304/SOC 304 Gender and Society (3 credit hours)
A sociological analysis of women and men in contemporary American society. Perpetuation of and change in gender stratification using sociological concepts, theories, and research. How gender expectations developed and transmitted. Historical data and research on diversity in American society used for analysis of causes and consequences of gender inequality.

P: 3 credits in SOC at the 200-level
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 305/ENG 305 Women and Literature (3 credit hours)
Nineteenth through twenty-first century women's literature, as shaped by the intersecting and competing claims of gender, race, sexuality, and culture. Focus on fiction, accompanied by critical readings from American studies, feminist literary criticism, and postmodern theory.

Prerequisite: Sophomore standing and above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 306/PS 306 Gender and Politics in the United States (3 credit hours)
This course explores the role of gender in contemporary American politics. The course examines the historical course of gender politics to see how we have arrived at the present state. It investigates the activities that women and men play in modern politics-voting, running for office, serving in office, etc., and how women and men perform these activities in different ways. The course also focuses on major areas of public policy that affect women and men in different ways.

Prerequisite: PS 201
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall only

WGS 308/ENG 308 Contemporary Issues in Ecofeminism (3 credit hours)
Contemporary issues in ecofeminism provides a historical introduction to and global perspectives on women's sociopolitical, ethical, and economic contributions to the 20th and 21st century environmental movement. Theory and political action as they interweave issues of gender, race, and class in western and non-western contexts will be emphasized. Students will read works by and about female scientists/activists/ writers and examine their own communities, analyzing the ways that individuals, community values, and dominant institutions impact women's relationships with the environment. Students will formulate questions, responses, and interpretations through critical reading practices, class discussion groups, self-reflective writing, and comparative analyses. Special attention will be paid to the role of literature--memoir, novel, short story, essay--in the dissemination of ecofeminist ideas.

GEP Humanities, GEP Interdisciplinary Perspectives
Typically offered in Spring only

WGS 310 Women's, Gender, and Sexuality Studies Internship (3 credit hours)
Internship program. Introduction to careers that deal specifically with women's issues. Ten-hours-per-week work at a nonprofit or governmental organization. Contextualization of that experience through additional academic requirements. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Typically offered in Fall and Spring

WGS 327/ENG 327 Language and Gender (3 credit hours)
Introduction to the use of language by men and women. Research in Linguistics and Women's Studies addressing issues such as the acquisition of gender-differentiated language, gender and conversational interaction, sexism in language, gender issues in society, and the relationship between language, gender, and other social constructs (e.g., class, culture, and ethnicity).

Prerequisite: ENG 101
Typically offered in Fall only

WGS 330 Women and Health (3 credit hours)
Women and Health utilizes an interdisciplinary approach to explore historical perspectives on health, access to health technologies, health policy research, and emerging topics in women's health. The humanities, social sciences, and biological sciences inform inquiry into "hot topics" in health policy, ethics, and the medical sciences. The health of women is dissected through a lens of gender equity and domestic and international perspectives are employed. Students are encouraged to identify and study topics of their own interest.

GEP Interdisciplinary Perspectives
Typically offered in Fall, Spring, and Summer

WGS 350 Emerging Issues in Women's, Gender, and Sexuality Studies (3 credit hours)
Exploration of advanced specialized topics in Women's and Gender Studies, to enhance in-depth undergraduate training in specific applied theories and methods. Seminar content will rotate, with attention to contemporary theoretical currents, and their application and effectiveness in addressing important emerging issues affecting individuals' well-being in society, particularly those faced by underrepresented groups.

Prerequisites: WGS 200 or WGS 210 or STS 210
Typically offered in Fall, Spring, and Summer

WGS 360/MUS 360 Women In Music (3 credit hours)
The role of women in music as patrons, teachers, composers, and performers, placing them within the social, economic, and political framework to which they belong. Emphasis on Western Art Music and the role of women in popular music. No previous formal training in music is required.

GEP U.S. Diversity, GEP Visual and Performing Arts
Typically offered in Spring only

WGS 362/COM 362 Communication and Gender (3 credit hours)
Effects of gender on the interpersonal communication process. Construction of gendered identities via communication practices. Examination of theories of gender and the role of gender in organizational, institutional, and media communication practices.

Prerequisite: Junior standing, COM 112
Typically offered in Fall only

WGS 370 Advanced Studies of Gender in Science (3 credit hours)
This course is designed to provide students with an in-depth view of recent research about the influence of contemporary gender relations on science and engineering. Readings address feminist theories about sex/gender, race/class/sexualities, the social construction of science, and technological innovation. Discussions will focus on scholarship that explores how, why, and when a "gender lens" brings value to understanding nature and knowledge.

Prerequisites: WGS 200 or (WGS 210 or STS 210)
GEP Interdisciplinary Perspectives
Typically offered in Spring only

WGS 380/AFS 380 Black Feminist Theory (3 credit hours)
Focused examination of Black feminist theory as a significant and distinct body of work. Interdisciplinary exploration of the impact of Black feminist theory on movements for social justice, the development of academic feminism generally, and the lived experience of Black women both in the United States and internationally.

Prerequisite: Any 200-level course in either WGS or AFS
GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 390 Queer Theory (3 credit hours)
Queer Theory provides an overview of the writings, art, identity/ies, work, politics, debates, histories, bodies, intimacies, kinship, and other lived realities of the people and experiences often organized under the LGBTQIA+ umbrella. As a critical theory, queer theory examines how circulations of power, dominance, and oppression constantly re/vision what it is to be queer, queering, and queered. The course will focus on how gender, race, class, functional diversity, sexuality, work, documentation status, age, etc. impact and are impacted by queer becoming.

P: Any 3-credit 200-level WGS course.
GEP Humanities
Typically offered in Fall and Summer

WGS 393 Special Topics in Women's, Gender, and Sexuality Studies (3 credit hours)
Special topics in Women's, Gender, and Sexuality Studies at the 300 level for offering courses on an experimental basis.

Typically offered in Fall, Spring, and Summer

WGS 406/PSY 406 Psychology of Gender (3 credit hours)
This course is designed to introduce students to the origins and significance of the study of gender differences and gender relations from a psychological perspective. The course focuses on current theory and research on perceived and actual biological, social, cognitive, personality and emotional similarities and differences of men and women throughout the lifespan as well as the construction and meaning of gender in our society.

Prerequisite: PSY 200 or WGS 200
GEP Social Sciences, GEP U.S. Diversity
Typically offered in Fall and Spring

WGS 407/SOC 407 Sociology of Sexualities (3 credit hours)
Exploration of sexuality in a social context. Relationship between sexuality, gender and power in the U.S. Historical trends in behaviors and identities: social movements and sexual issues; current behavioral trends. Some issues covered; identity, social construction, sexual meanings.

Prerequisite: 3 hours SOC 200 level, 300 level
Typically offered in Spring only

WGS 410/ENG 410 Studies in Gender and Genre (3 credit hours)
This course examines the ways in which women writers from diverse backgrounds have revised the literary genres to include the varied experiences of women. It will focus on a different generic area, such as poetry, fiction, drama or autobiography, depending on its instructor.

Requisite: Sophomore Standing or Above
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

WGS 418/PS 418 Gender Law and Policies (3 credit hours)
Law and policy pertaining to contemporary gender issues. Examination of agenda setting, policy formation, implementation, judicial interpretation and evaluation of selected issues, such as reproductive policies, equal employment and sexual abuse.

Prerequisite: 3 hours of Political Science
GEP U.S. Diversity
Typically offered in Spring only

WGS 444/ANT 544/WGS 544/ANT 444 Cross-Cultural Perspectives on Women (3 credit hours)
Comparison of women in a variety of societies: western and non-western; hunting and gathering to industrialized. Cross-cultural perspective on the similarity and diversity of women's statuses and roles. Effect of gender on social position

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

WGS 447/HI 547/WGS 547/HI 447 Women in America: From Contact to the Civil War (3 credit hours)
The historical experience of women in America from Native American and European contact through the colonial period to the immediate post-Civil-War years (to 1890). Topics include the history of women's work, education, legal and political status, religious experience, and sex roles, with consideration of age, class, race, sexual preference, and region as significant variables in women's experience in America. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

P: 3 Hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

WGS 448/HI 548/WGS 548/HI 448 American Women in the Twentieth Century (3 credit hours)
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

WGS 472/REL 472 Women and Religion (3 credit hours)
Historical, literary, and theological sources dealing with portrayals of women and women's religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women's religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.

Prerequisite: one course in religious studies or women's and gender studies
GEP Humanities
Typically offered in Spring only

WGS 473/REL 573/WGS 573/REL 473 Religion, Gender, and Reproductive Technologies (3 credit hours)
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for more than one of: REL 473, REL 573, WGS 473, WGS 573.

Prerequisite: One 3 cr course in Philosophy (PHI) or Religious Studies (REL) or Women's and Gender Studies (WGS). Credit is not allowed for more than one of REL 473, WGS 473.
Typically offered in Fall only

WGS 492 Theoretical Issues in Women's, Gender, and Sexuality Studies (3 credit hours)
Examination of feminist theory. Study of formative texts in modern feminism, drawn from various disciplines within the humanities, social sciences, and natural sciences. In-depth exploration of feminist perspectives on issues of race, class, gender, sexuality, work and mothering, among others. Analysis of local and global cultural practices using feminist theoretical frameworks.

Prerequisite: WGS 200
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

WGS 493 Special Topics in Women's, Gender, and Sexuality Studies (3 credit hours)
Examination of varying topics on women and/or gender from a multidisciplinary perspective.

Typically offered in Fall only

WGS 540/ECD 540 Gender Issues In Counseling (3 credit hours)
Exploration of gender as primary identity and social construct. Emphasis on gender dynamics in counseling, client empowerment and preventive approaches.

Prerequisite: Graduate standing or Six hrs. in ED or PSY
Typically offered in Spring and Summer

WGS 544/ANT 444/WGS 444/ANT 544 Cross-Cultural Perspectives on Women (3 credit hours)
Comparison of women in a variety of societies: western and non-western; hunting and gathering to industrialized. Cross-cultural perspective on the similarity and diversity of women's statuses and roles. Effect of gender on social position

Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346
Typically offered in Spring only

WGS 547/HI 447/WGS 447/HI 547 Women in America: From Contact to the Civil War (3 credit hours)
The historical experience of women in America from Native American and European contact through the colonial period to the immediate post-Civil-War years (to 1890). Topics include the history of women's work, education, legal and political status, religious experience, and sex roles, with consideration of age, class, race, sexual preference, and region as significant variables in women's experience in America. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

P: 3 Hours of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Fall only

WGS 548/HI 448/WGS 448/HI 548 American Women in the Twentieth Century (3 credit hours)
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

P: 3 hrs. of History
GEP Humanities, GEP U.S. Diversity
Typically offered in Spring only

WGS 572/REL 572 Women and Religion (3 credit hours)
Historical, literary, and theological sources dealing with portrayals of women and women's religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women's religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.

Prerequisite: Graduate Standing
Typically offered in Spring only

WGS 573/REL 473/WGS 473/REL 573 Religion, Gender, and Reproductive Technologies (3 credit hours)
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for more than one of: REL 473, REL 573, WGS 473, WGS 573.

Prerequisite: One 3 cr course in Philosophy (PHI) or Religious Studies (REL) or Women's and Gender Studies (WGS). Credit is not allowed for more than one of REL 473, WGS 473.
Typically offered in Fall only

WGS 593 Special Topics (1-6 credit hours)
Examination of a core topic on women and/or gender from an interdisciplinary perspective at the graduate level.

Typically offered in Fall and Spring

WGS 633 Independent Study (1-3 credit hours)
Typically offered in Summer only

WGS 706/PSY 706 Psychology of Gender (3 credit hours)
Current theory and research on perceived and actual biological, social, cognitive, personality, and emotional similarities and differences of men and women throughout lifespan. Construction and consequences of gender in our society and others.

Typically offered in Fall and Spring

WGS 737/SOC 737 Sociology Of Gender (3 credit hours)
Theories about the development and maintenance of gender. Historical development of gender stratification. How individuals "do gender" in their daily lives. Contemporary research and substantive readings about gender in public and intimate relationships.

Prerequisite: Graduate student, SOC 736 or 731
Typically offered in Fall only

WGS 739/SOC 739 Social Psychology Of Inequality (3 credit hours)
The effects of race, class and gender inequality on the formation of group consciousness, self-evaluations, emotions, values, attitudes and beliefs. Attention to interpersonal processes through to reproduction of inequality in everyday life.

Requisite: Admission to SOC Graduate Program
Typically offered in Spring only

Wood and Paper Science (WPS)

WPS 201 Sustainable Materials for Green Housing (2 credit hours)
The overall goal of the class is to make the students more informed and aware consumers of materials used in housing. The class will connect the economic and energy impacts of producing common materials with the environmental impacts, e.g., carbon, water, and pollutants. The concepts of embodied energy, water use, and land impacts will be used to examine common building materials. The concept of Life Cycle Analysis will be introduced and used to evaluate the use and trade-offs for different building materials. The opportunities and trade-offs for reuse and recycling materials at the 'end of life' will also be explored.

GEP Interdisciplinary Perspectives
Typically offered in Spring only

WPS 491 Special Topics in Wood and Paper Science (1-4 credit hours)
Independent study of management or technology problems selected with faculty approval or the offering of experimental courses.

Typically offered in Fall, Spring, and Summer

Zoology (ZO)

ZO 233 Human-Animal Interactions (3 credit hours)
This course is designed to explore the relationship humans share with other animals and nature. We will study the early history of animal domestication and the influence of animals on human culture and religion. We will also explore our relationships to animals as pets, food, research subjects, and wildlife. All subjects will be covered through interaction with quest speaker, assigned readings, case studies, and class discussion.

GEP Interdisciplinary Perspectives
Typically offered in Fall and Summer

ZO 250 Animal Anatomy and Physiology (4 credit hours)
Roles of physical laws, environmental challenges, and evolutionary history in shaping animal structure and function. Selected examples from invertebrates and vertebrates. Laboratory in anatomy and physiology, hypothesis generation and testing and data analysis and presentation.

Prerequisite: C- or better in BIO 183
Typically offered in Fall only

ZO 317 Primate Ecology and Evolution (3 credit hours)
A comprehensive survey of the behavior, evolution, and ecology of nonhuman primates. Special emphasis will be placed in the evolution of cognitive abilities, social systems, and behavioral patterns that are unique to primates, including the evolution of language. Topics include primate taxonomy, evolution of the extant primates, geographic distribution, social behavior, reproductive behavior and strategies, parental behavior, communication, and cognitive. Classes will consist of interactive lectures, films, and class discussions.

Prerequisite: C- or better in BIO 181 & BIO 183, and one of the following courses: ANT 251, BIO 212, BIO 240, BIO 245, BIO 250, BIO/PB 330, BIO 350, BIO/PB 360, BIO 410 , BIO 422, BIO 424, or BIO 488
Typically offered in Spring only

ZO 333 Captive Animal Biology (3 credit hours)
This course serves to introduce interested students to historical and current captive animal conservation efforts. We will discuss in detail a variety of issues essential to the management of wild animals in a captive setting including ethics, nutrition, reproduction, behavior, and population management.

Prerequisite: C- or better in BIO 181 and one of the following (BIO 140 or 250 or 260 or 350 or NTR 301 or ANS 150 or 205 or GN 311)
Typically offered in Spring only

ZO 334 Captive Animal Biology Field Laboratory (2 credit hours)
This laboratory course serves to introduce interested students to today's captive animal conservation efforts from the perspective of NC facilities on the front lines. Through the lens of these nearby institutions, we will investigate in detail a variety of factors essential to the management of wild animals in a captive setting. We will take topics (history, population management, genetics, nutrition, education, conservation) from the lecture course and expand them as we focus on challenges unique to these local captive facilities. While some activities will take place on campus, a number of off-campus field trips are required, including one 3-day laboratory at North Carolina Zoo. We will return to campus most days within the scheduled time frame, however students should plan for the possibility that labs may go overtime on some occasions.

Prerequisite: C- or better in BIO 181; Co-requisite: ZO 333; Sophomore standing and above.
Typically offered in Spring only

ZO 350 Animal Phylogeny and Diversity (4 credit hours)
Phylogenetic history and adaptive radiation of animals; contrast of environmental determinants of biodiversity in tropical and polar regions; modern approaches to phylogeny; role of humans in influencing biodiversity. Students may not receive credit for both ZO 350 and BIO 140 or ZO 402.

Prerequisite: A grade of C- or better in BIO 181 and sophomore standing. Credit is not allowed for both ZO 350 and ZO 402/
Typically offered in Spring only

ZO 402 Invertebrate Biology (4 credit hours)
Over 90% of all animals are invertebrates, and many invertebrate species have proven extremely useful in medical and research applications. This course will survey invertebrate groups or clades (excluding the Protista), and will emphasize their functional biology, phylogeny, ecology, behavior, and use as models in research. Lab will emphasize an experimental approach and will involve work primarily with live material. Students may not receive credit for both ZO 402 and ZO 350.

Prerequisite: A grade of C- or better in BIO 181 and BIO 183. Credit is not allowed for both ZO 402 and ZO 350.
Typically offered in Fall only

ZO 410 Introduction to Animal Behavior (3 credit hours)
Studies in animal behavior in vertebrates and invertebrates, focusing on the mechanisms and evolution of animal behavior. Topics include neural, hormonal, and genetic bases of behavior; foraging; anti-predator defenses; mating systems and sexual selection; social behavior; communication; parental care; territoriality and habitat selection.

Prerequisite: C- or better in BIO 181and BIO 183
Typically offered in Fall and Summer

ZO 486 Capstone Course in Zoology (3 credit hours)
Topical problems in zoology. BIO 486 provides a challenging opportunity for students to integrate and apply knowledge and skills gained from their major studies. Emphasis will be placed on collaborative learning and effective, professional communication. Topics and instructors will vary from semester to semester. Priority will initially be given to seniors in the SZO curriculum; other students with the necessary prerequisites will be admitted on a space available basis.

Prerequisite: C- or better in BIO 250, BIO/PB 360, and one of the following: BIO 350 or BIO 402/403 or GN 311 or ST 311.
Typically offered in Fall and Spring

ZO 524/PHY 524/PO 524 Comparative Endocrinology (3 credit hours)
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

Prerequisite: BIO 421 or PO 405
Typically offered in Spring only

ZO 582/ENT 582 Medical and Veterinary Entomology (3 credit hours)
The morphology, taxonomy, biology and control of the arthropod parasites and disease vectors of man and animals. The ecology and behavior of vectors in relation to disease transmission and control.

Prerequisite: ENT 425 and ZO 315
Typically offered in Spring only
